Old Bavaria, or Bavaria proper, was originally inhabited by the Boii, a Celtic tribe. Under Augustus it constituted the Roman province of Noricum. During the great migration of nations in the fourth and fifth centuries, the country was occupied by Germanic tribes, from which the confederation of the Boioari arose, which, though governed by its own princes, was dependent upon the kings of Austrasia. At the head of the confederation was the family of Agilolfingians, who are mentioned for the first time in 556, and were deprived of the ducal dignity by Charlemagne in 777. From this time until 911, when the Carlovingian house died out, Bavaria belonged to the Franconian empire. During the following 250 years Bavaria was disturbed by endless civil wars. In 1180 the count palatine, Otto von Wittelsbach, was invested with Bavaria. His descendants, with but short interruptions, have remained the rulers of the country to this day. Two of them were elected German emperors—Louis the Bavarian (as Emperor Louis IV., 1314–47) and the elector Charles (as Emperor Charles VII., 1742–45). From 1255 the country was generally divided between two lines—the counts of the Rhenish Palatinate and the dukes of Bavaria. The electoral dignity repeatedly passed from one branch to the other, until the peace of Westphalia (1648) conferred the fifth electoral dignity permanently upon the dukes of Bavaria, while an eighth electoral dignity was expressly created for the Palatine line. In 1777 the line of the electors of Bavaria became extinct, and the elector of the Rhenish Palatinate, Charles Theodore, became ruler of Bavaria. Austria, however, claimed a large portion of the country, and the weak elector was willing to concede this claim; but Frederick the Great supported the protest of the next agnate, the duke Charles of Zweibrücken, against this arrangement, and thus the bloodless "war of the Bavarian succession" arose, which was ended May 13, 1779, by the treaty of Teschen, which gave to Austria the region of the Inn, with the town of Braunau, and guaranteed the succession in the remainder of the dominions of Charles Theodore to the duke Charles of Zweibrücken. In 1784 the emperor Joseph I. made a new attempt to obtain the whole of Bavaria, by offering to the elector Charles Theodore, in exchange for Bavaria, the Austrian Netherlands, with the title of king; but again the plan was foiled by the opposition of the duke of Zweibrücken and Frederick the Great. Charles Theodore died Feb. 16, 1799, and, as in the mean while the duke Charles of Zweibrücken had died childless, his brother Maximilian IV. Joseph, duke of the Palatinate-Zweibrücken, became elector of Bavaria and the Palatinate. In the history of Germany the dukes of Bavaria are chiefly noted for the leading part which they took in the defence of the Catholic Church against the Reformation. Throughout the sixteenth, seventeenth, and eighteenth centuries they were the heads of the Catholic party among the princes and states of the empire. The elector Maximilian lost in the peace of Lunéville the Zweibrücken Palatinate, but in place of these districts received a number of secularized bishoprics, the change adding to his dominions 2100 square miles, with nearly 200,000 inhabitants. In the war of 1805 the elector joined France against the emperor of Germany, and received a further increase of about 8000 square miles and 800,000 inhabitants. On Jan. 1, 1806, the elector assumed the title of king, and in July of the same year he joined the Rhenish Confederation, which he left again in 1813, in order to unite with the allies against Napoleon. The peace of Paris and that of Vienna regulated the territory of Bavaria as it has remained since, with the exception of a very small district which in 1866 was ceded to Prussia. In 1818 the constitutional form of government was introduced. Louis I. (1825 to 1848), the successor of Maximilian, was a liberal patron of the arts, and at the same time greatly favored the interests of the Catholic Church. His relation to the notorious Lola Montez led in 1848 to disturbances, in consequence of which he abdicated. The support which he had given to the insurrection of the Greeks against the rule of the Turks had secured the election of his second son, Otho, as king of Greece. In Bavaria he was succeeded by his eldest son, Maximilian II. (1848–64), who, like his father, liberally patronized science and art, but in politics had throughout his reign anti-liberal cabinets. In the Sleswick-Holstein question the Bavarian government acted as an ardent champion of the cause of German nationality. Maximilian, who died Mar. 10, 1864, was succeeded by his son, Louis II., who in 1866, in the war between Austria and Prussia, sided with Austria, and at the conclusion of peace had to pay 30,000,000 florins as expenses of war, and to cede a small district to Prussia. At the same time an offensive and defensive alliance was concluded with Prussia, and the relations of the two governments during the following years were of a friendly character. The Catholic party was greatly opposed, not only to the foreign policy of the prime minister, Prince Hohenlohe (appointed at the close of the year 1866), but still more to the educational and other reforms which he endeavored to introduce. When the new elections in 1869 gave to the Catholic party (the "Patriots") a majority in the second chamber, Prince Hohenlohe resigned (Jan., 1870). The new prime minister, Bray, remained, however, faithful to the treaties with Prussia, and after the outbreak of the war between France and Prussia, Bavaria at once joined Prussia and placed two army corps under the command of the crown-prince of Prussia. In Nov., 1870, the Bavarian government concluded a treaty providing for the entrance of Bavaria into the German empire, and in Jan., 1871, the treaty was ratified by both chambers, although the special committee of the second chamber proposed its rejection. A. J. Schem.

Bawr, de (Alexandrine Sophie Goury de Champgrand), Baroness, a novelist of French extraction, born at Stuttgart in 1776. She became the wife of Saint-Simon, the famous Socialist, who obtained a divorce, although he had no cause for complaint, except that she was not an equal mate for "the foremost man in the world." She wrote several popular works, among which is "Raoul, ou l'Enéide," a novel. Died Jan. 1, 1861.

Bax'ter (De Witt C.), an American officer of volunteers, born in Dorchester, Mass., Mar. 9, 1829, entered the army in 1861 as lieutenant, and passed through the suc-

cessive grades to that of colonel of "Baxter's Fire Zouaves" (brevet brigadier-general U. S. volunteers). He is author of "Baxter's Manual and Company Tactics," 1861, and was naval officer of the port of Philadelphia 1869–71.

Baxter (Richard), an eminent divine, born at Rowdon, in Shropshire, England, Nov. 12, 1615. He was not educated at any college. Having been ordained in 1638, he became vicar of Kidderminster in 1640, and gained distinction as an eloquent preacher. He was neutral or moderate in the civil war, being friendly to the Puritans, but favorable to a monarchy. In 1650 he produced the "Saint's Everlasting Rest," which is highly esteemed. At the Restoration (1660) he was appointed one of the chaplains to Charles II., and refused the offer of a bishopric. In consequence of the passage of the Act of Uniformity, 1662, he seceded or was ejected from the Anglican Church. He became a resident of London in 1672, and preached there to a meeting of nonconformists. Among his numerous works are a "Call to the Unconverted" (1669), "Methodus Theologiæ" (1674), and "Catholic Theology." The notorious Judge Jeffries in 1685 fined him 500 marks on a charge of sedition, which was founded on a passage in his writings. For failure to pay the fine he was imprisoned nearly eighteen months. Died Dec. 8, 1691. He was a voluminous writer, having published 168 treatises. (See his "Autobiography," 1696; E. Calamy, "Life of Baxter," 1713; William Orme, "Life and Times of R. Baxter," 1830; August Neander, "R. Baxter, ein Mann der Wahrhaft rechten Mitte," 1833; Macaulay, "History of England," vol. i. chap. iv., and vol. iii. chap. xi.; "Miscellanies," by Wm. R. Williams.)

Baxte'rians, the term formerly applied to the adherents of Baxter's theological system, the doctrines of which were—1, that though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2, the rejection of the dogma of reprobation; 3, that it is possible for even saints to fall away from saving grace.

Baxter Springs, a city of Cherokee co., Kan., 159 miles S. of Kansas City, Mo., at the terminus of the Missouri River Fort Scott and Gulf R. R., 1½ miles from the State line. It has one national bank, one weekly paper, and one lead-smelting furnace. It is a shipping depôt for Texas cattle. The principal minerals are lead, zinc, and coal. On the 6th of Oct., 1863, Quantrell, with 600 guerillas, attacked a U. S. escort and encampment of three companies at this place. The escort was dispersed and all the wounded murdered; the attack on the encampment was repulsed. P. 1284. A. T. Lea, Ed. "Baxter Springs Republican."

Bay [Fr. *baie*], in geography, an inlet of the sea, or a portion of the sea extending into the land. The terms *bay* and *gulf* are vaguely and promiscuously applied to bodies of water of various forms and dimensions. Hudson's Bay, for example, might properly be called a gulf. The word *bay* is generally applied to smaller portions than *gulf*.

Bay, or **Bay Tree,** a name of the laurel tree (*Laurus nobilis*), which is sometimes called sweet bay. The *Prunus laurocerasus* is sometimes called bay laurel. Several other trees are popularly called *bay*. The "sweet bay" of the U. S. is the *Magnolia glauca*, which has fragrant flowers. The "red bay" of the South is the *Persea Carolinienesis*, an evergreen laurel tree with fine red timber. The "loblolly bay" (*Gordonia Lasianthus*) is a fine tree of the Southern States, with mahogany-colored wood. A smaller species (*Gordonia pubescens*) is cultivated at the North as a shrub, and has large and fragrant white blossoms. Some of the rhododendrons and azaleas are called rose bays. The leaves of the bay have long been subjects of popular superstition, and have been used with other evergreens to decorate churches at Christmas. *Bays* in the plural signifies an honorary garland or crown, bestowed as a prize for victory or meritorious action. It is not known what kind of tree is meant by the word in the Bible translated "bay tree."

Bay, a county in the E. of Michigan. Area, 725 square miles. It is bounded on the E. by Saginaw Bay, and intersected by the Saginaw and Rifle rivers. The soil is fertile. Wheat, oats, hay, and dairy products are raised. It contains forests of pine, from which lumber is exported. Coal is found, and salt is produced from salt-wells. It is intersected by the Jackson Lansing and Saginaw R. R. Capital, Bay City. Pop. 15,900.

Bay, a township of Ottawa co., O. Pop. 509.

Ba'ya (*Ploceus Philippi'nus*), a small East Indian bird of the family of Fringillidæ, and allied to the weaver-bird. It has been called *Loxia Philippina* by some ornithologists. It has a large conical beak. Its color is yellow, spotted with brown. It builds a curious nest, shaped like a Florence flask, and suspended from a small twig of a high branch. The entrance is in the lower part of the nest. The baya can be easily tamed and trained to obey commands.

Bayadere [from Port. *bailadeira*, a "dancer"], a name given by Europeans to the dancing-girls and singing-girls of India, also called nâtch- (or nautch-) girls. They are of two classes, the first of which are called *Dévadâsi* ("servants of the gods"), and belong partly to the caste of Vaisyas and partly to that of Sudras. Having passed through a course of systematic physical training, and acquired great agility and suppleness of joints, they are employed to sing the praises of some god at festivals, and to dance before his image or in his temple. Those of the higher rank are not permitted to leave the enclosure of the temple, and are forbidden to marry, but they are permitted to accept a lover of one of the higher castes. Dévadâsis of the Sudra caste live outside of the temple and have more freedom. There is another distinct class of singing-girls who travel about the country in troops, perform at private feasts, and entertain the people at taverns, etc. by singing and dancing. Their dance is, however, more properly a pantomime.

Baya'mo, or **San Salvador,** a town in the E. part of Cuba, 60 miles N. W. of Santiago, is near the river Canto. It has eight churches and four schools. Pop. in 1861, 7411.

Bay'ard (Gen. George D.) was born in New York in 1835, and graduated at West Point in 1856. He entered the U. S. cavalry, and became, after the civil war broke out, colonel of the First Pennsylvania Cavalry. In 1862 he was made brigadier-general of volunteers. He served with the highest honor in the Army of the Potomac, and was killed at the battle of Fredericksburg Dec. 14, 1862, where he fought with the left wing, under Franklin.

Bayard (James Ashton), an American statesman and lawyer, born at Philadelphia July 28, 1767, graduated at Princeton in 1784. He began to practise law in Delaware, and in 1796 became a Federalist member of Congress, in which he attained eminence as an orator. The contest between Jefferson and Burr in 1801 was decided in favor of the former by the votes of Federalists acting under the influence of Mr. Bayard. He was elected U. S. Senator for Delaware in 1804, and remained in that body until 1813. He was one of the commissioners that negotiated the treaty of Ghent in 1814. Died Aug. 6, 1815.

Bayard (James Ashton, second), born in Delaware, graduated at Princeton, was U. S. Senator from his native State (1851–64 and 1867–69), resigning twice this office, to which he was four times elected, and once appointed to fill a vacancy.

Bayard (Jean François Alfred), a French *littérateur*, born at Charolles Mar. 17, 1796, wrote over 200 popular comedies and vaudevilles, among which were "La reine de seize ans," and "Les gamins de Paris," which was performed with great success 463 times in succession. Died Feb. 19, 1853.

Bayard (Pierre du Terrail), Chevalier, a heroic French knight, called "le chevalier sans peur et sans reproche" ("the knight without fear and without reproach"), was born at Castle Bayard, near Grenoble, in 1475. He was remarkable for his modesty, piety, magnanimity, and his various accomplishments. He served under Charles VIII. in his expedition against Naples in 1494, and distinguished himself at the battle of Tornovo. After the accession of Louis XII. of France, Bayard performed several remarkable exploits in war against the Spaniards and English. In the service of Francis I. he took Prosper Colonna prisoner, and gained a victory at Marignano in 1515. He defended Mézières with success against the invading army of the emperor Charles V. in 1522, and for this important service was saluted as the saviour of the country. He was killed in battle at the river Sesia April 30, 1524, having won the reputation of being a model of nearly every virtue. (See Symphorien Champier, "La Vie et les Gestes de Bayard," 1525; Guyard de Berville, "Histoire du Chevalier Bayard," 1760; Rev. Joseph Sterling, "Life of Chevalier Bayard," 1781; P. Cohen, "Histoire de Pierre du Terrail," 1821; W. Gilmore Simms, "Life of Chevalier Bayard," New York, 1847; Buchholz, "Bayard," Berlin, 1891.)

Bayard (Richard Bassett), son of James A. Bayard, was born at Wilmington, Del., in 1796, graduated at Princeton in 1814, became a lawyer, was U. S. Senator from Delaware (1836–39 and 1841–45), and U. S. chargé d'affaires at Brussels in 1850. Died Mar. 4, 1868.

Bayard (Thomas Francis), born at Wilmington, Del., Oct. 29, 1828, was elected for the term of six years (1869–75) to the U. S. Senate, to succeed his father, Hon. J. A. Bayard.

Bayazid' (often called **Baj'azet**) **I.,** sultan of the Turks or Ottomans, surnamed Ilderim (*i. e.* "the light-

ning"), was born in 1347. He succeeded his father, Amurath I., in 1389, and soon conquered Bulgaria, the greater part of Asia Minor, and part of Greece. In 1396 he gained a victory at Nicopolis over Sigismund, king of Hungary, and his allies, the Poles and French. His career of conquest was arrested by Tamerlane (or Timur), who invaded Asia Minor, and defeated Bayazid near Angora in June, 1401. Bayazid was taken prisoner here, and confined until he died Mar. 9, 1403. (See VON HAMMER, "Geschichte des Osmanischen Reichs.")

Bayazid II., sultan of the Turks, was born in 1447. He ascended the Ottoman throne on the death of his father, Mahomet II., in 1481. He built many mosques in Constantinople, his capital. He was involved in almost continual wars against the Hungarians, Poles, Persians, and Venetians. He died May 26, 1512, and was succeeded by his son Selim.

Bay'berry, the fruit of the bay tree; also the fruit of the wax-myrtle (*Myri'ca cerif'era*), a shrub which produces a kind of wax, sometimes called "bayberry tallow," and used in pharmacy. It has also been employed in making candles. The bayberry grows chiefly along our Atlantic coast, becoming an evergreen tree in the South. It has active medicinal qualities. The wax is found on the outside of the berries, and is obtained by boiling.

Bay'boro', a post-township of Horry co., S. C. Pop. 885.

Bay Bulls, a port of entry and post-town of Newfoundland, 19 miles S. of St. John's; lat. 47° 18′ N., lon. 52° 47′ W. It has an excellent harbor, which is much frequented as a port of refuge. Fishing and agriculture are carried on. Pop. 734.

Bay City, one of the most flourishing cities of the North-west, the capital of Bay co., Mich., is on the right (E.) bank of the Saginaw River, 4 miles from its mouth and at the head of navigation. It deals principally in lumber and salt, immense quantities of which are produced. It has excellent school facilities, one national and four private banks, two parks, the Holly Waterworks, one street railway, several important manufacturing interests, two railroads (a branch of the Flint and Père Marquette, and the Detroit and Bay City road, just opened). Several lines of steamers connect it with all lake points. It has two daily and four weekly newspapers. Pop. 7064.

E. D. COWLES, ED. "SEMI-WEEKLY HERALD."

Bay de Verds, an important post-village of Newfoundland, 38 miles N. of Carbonear. It has no harbor, but its cod-fisheries are among the best in the province, yielding $50,000 worth of fish annually. Agriculture is also carried on. Pop. 650.

Bayeux (anc. *Baicas'ses*), a city of France, in Normandy, and in the department of Calvados, is on the river Aure, 21 miles by rail W. N. W. of Caen. It has manufactures of porcelain, lace, damasks, calico, and leather. Pop. in 1866, 9138. Here is a cathedral which is said to be the oldest in Normandy, in which was preserved for a long time the famous BAYEUX TAPESTRY (which see).

Bayeux Tapestry, a web of canvas or linen cloth 214 feet long by 20 inches wide, on which is embroidered, with woollen threads of various colors, a representation of the invasion and conquest of England by the Normans. According to tradition, it was embroidered by Matilda, the wife of William the Conqueror. Some persons believe that she directed the work, which was performed by her maids or the ladies of her court. It is considered a valuable historical document, as it gives a correct and minute portraiture of the manners and customs of that age and of the Norman costumes. It contains the figures of about 625 men, 200 horses, 55 dogs, 40 ships and boats, and numerous quadrupeds, birds, etc. The tapestry was discovered in the cathedral of Bayeux about 1730, and is now preserved in the hôtel de ville of that place. (See BRUCE, "Bayeux Tapestry Elucidated," London, 1855; DUCAREL, "Anglo-Norman Antiquities," 1767.)

Bay'field, a port on Lake Huron, at the mouth of Bayfield River, in Stanley township, Huron co., province of Ontario, Canada, has an extensive trade in grain and fish.

Bayfield (formerly **La Pointe**), a county which forms the N. extremity of Wisconsin. Area, 1000 square miles. It is bounded on the N. by Lake Superior. It is partly covered with forests of pine. The soil is not extensively cultivated. Capital, Bayfield. Pop. 344.

Bayfield, a post-village, the capital of the above county, on an arm of Lake Superior, 281 miles N. N. W. of Madison. It has an excellent harbor. P. of township, 344.

Bayfield (HENRY WOOLSEY), a rear-admiral of the British navy, entered the service in 1806, served against the U. S. in 1814 on the great lakes, and surveyed the lakes, the St. Lawrence River and Gulf (1815–27), of which he published valuable charts.

Bay Hundred, a post-township of Talbot co., Md. Pop. 1322.

Bay Islands, a group of small islands in the Bay of Honduras. Ruatan, the largest, is about 30 miles from the N. coast of Honduras. The other islands are named Bonacca, Utila, Barbaretta, and Helena. This group became a British colony in 1854, but in consequence of a protest of the U. S. they were restored to Honduras in 1856.

Bayle (PIERRE), a celebrated French philosopher and critic, born at Carlat, now in Ariège, Nov. 18, 1647, was a son of a Protestant preacher. He studied at the College of Toulouse, and was employed for some years as a private tutor at Geneva and Rouen. In 1675 he obtained the chair of philosophy in the Protestant College of Sedan, which was closed or suppressed by the government in 1681. He then became professor of philosophy and history at Rotterdam, and commenced in 1684 a critical monthly review called "Nouvelles de la République des Lettres," which he continued to edit until 1687. Instigated by Jurieu, who accused Bayle of heretical or unsound opinions, the magistrates of Rotterdam deprived him of his professorship in 1693. Bayle was a skeptic, an eloquent advocate of religious liberty, and a very independent thinker. His most important work is a "Historical and Critical Dictionary" ("Dictionnaire historique et critique," 2 vols. folio, 1696), which exercised a great influence over literature and philosophy, and had a European reputation. Bayle was fond of paradox, was a subtle reasoner, a witty writer, and an excellent dialectician. He was amiable, courageous, and disinterested. According to Warburton, he had "a soul superior to the sharpest attacks of fortune, and a heart practised to the best philosophy." Died Dec. 28, 1706.

Baylen', or **Bailen',** a town of Spain, in the province of Jaen, 22 miles N. N. E. of Jaen. It has manufactures of linen, glass, soap, bricks, etc. The Spanish general De Castaños here gained a victory in July, 1808, over the French general Dupont, and took 18,000 prisoners. Pop. 7831.

Bay'ley (Most Rev. JAMES ROOSEVELT), D. D., a grandson of Dr. Richard Bayley and nephew of Mother Seton (who founded the original American congregation of Sisters of Charity), was born in New York City Aug. 23, 1814, graduated at Trinity College, Hartford, Conn., in 1835, was for a time a clergyman of the Protestant Episcopal Church, but became a Roman Catholic, studied theology in Paris and Rome, and was ordained a priest in 1842. He became professor of belles lettres at St. John's College, Fordham, and was its president (1845–46). In 1853 he became bishop of Newark, N. J., and in 1872 archbishop of Baltimore, Md. He has published "Memoirs of Bishop Bruté" and other works, and is distinguished by his ability as a prelate.

Bayley (RICHARD), an American physician, born in Fairfield, Conn., in 1745, began the practice of medicine in 1772. He introduced a new method of treating the croup, which was extensively used. He became in 1793 professor of surgery in Columbia College, N. Y. Died Aug. 17, 1801.

Bay'lor, a county in the N. part of Texas. Area, 900 square miles. It is traversed by Brazos River and the Big Wichita, and the soil along the banks of the former is very fertile, but the surface is generally high and rocky. Between the Brazos and the Little Wichita it is of a mountainous character. Stock-raising is the only important pursuit at present. No population in the census of 1870.

Baylor (WALKER KEITH), a native of Kentucky, settled in 1830 in Alabama, where he engaged in the practice of law. He entered the Senate in 1841, and in 1843 he was appointed judge of the third circuit, which position he held until the fall of 1845, when he was killed accidentally. He was very fond of astronomy.

Baylor University. This institution is situated at Independence, Washington co., Tex. It is 12 miles from the Brazos River, 12 miles from Brenham, on the western branch of the Houston and Texas Central R. R., and 18 miles from Navisota, on the main trunk of the same road. The vicinity is beautifully diversified by prairie, hill, valley, and live-oak groves. The village of Independence is near the centre of population, wealth, commerce, and railroads in the State. The university was chartered by the republic of Texas in 1845. One-third of its trustees are annually chosen by the Baptist State Convention of Texas. It owns nearly 700 acres of good land. The whole amount of endowment will not exceed $60,000; value of buildings, $30,000; libraries, 3700 volumes; apparatus respectable; reading-room good. The course of study is modelled after that of the University of Virginia. It is complete and thoroughly prosecuted. Whole number of students entered since 1845, 2700; college graduates, 38; law graduates, 31; law professors, 3; college officers, 6; whole number of

students, according to last catalogue, 126, six of whom were law students. Its presidents have been the Rev. Henry L. Graves, Rev. Rufus C. Burleson, D. D., Rev. George W. Baines, Rev. William Carey Crane, D. D., LL.D. Efforts promising entire success are now in progress fully to endow all the chairs, and otherwise to promote the efficiency of the institution. Hon. R. E. B. Baylor, LL.D., former member of Congress from Alabama, and for twenty-five years a judge in Texas, gave name to the university.

Bay'ly (Lewis), bishop of Bangor in Wales, is worthy of mention as the author of "The Practice of Piety," one of the most popular religious books ever written. It is mentioned by Bunyan as one of the books owned by his wife. In 1714 it had passed through fifty-one editions in England, besides several translations published in foreign lands. Bayly was born at Caermarthen, educated at Oxford, and consecrated as bishop in 1616. He died in 1632. He must not be confounded with Thomas Bayly, Anglican bishop of Killala in Ireland, who died in 1670.—Bishop Lewis Bayly had a son Thomas, who became a zealous Roman Catholic, and published "The End of Controversy" (Douai, 1654), besides other works.

Bayly (Thomas Haynes), an English *littérateur*, born in 1797 near Bath, was the son of a wealthy solicitor, and was educated at Oxford. He married in 1826, and in 1831 lost his fortune, and was thrown into poverty. He entered with the greatest industry upon a literary life, composing numerous plays, novels, and poems. He is best known by his very numerous songs, some of which will always be popular, though few are of a very high literary order. Among them are "Oh no, we Never Mention Her," "The Soldier's Tear," and "Why Don't the Men Propose?" He died in 1839.

Bayly (Thomas Henry), an American lawyer, born in Accomac co., Va., in 1810, graduated at the University of Virginia, and was a judge in the State courts. He became a member of Congress in 1844, and was chairman of the committee of ways and means in several sessions. Died June 22, 1856.

Bayn'am (William), an American surgeon and anatomist, born in Virginia in 1749, was educated in England, where he long resided. He performed many difficult operations with success. Died Dec. 10, 1814.

Baynes (Robert Hall), Anglican bishop of Madagascar, was born at Wellington, Somersetshire, England, Mar. 10, 1831. He was educated at Bath and at St. Edmond's Hall, Oxford, where he took his master's degree in 1859. He received a number of English church preferments, and in 1870 became bishop of Madagascar, now a Protestant Christian nation. He is the author of numerous religious works, among which are a "Book of Common Praise" (1863), "Lyra Anglicana," "Autumn Memories and other Verses" (1869), and "Sermons."

Bay of Islands, a large bay of the W. coast of Newfoundland. It abounds in islands, and its scenery is very fine. Good timber, gypsum, and marble abound. About 30,000 barrels of herring are annually taken here, besides cod and other fish. Agriculture is pursued to some extent. Pop. of settlements, 947.

Bay'onet [Fr. *baïonette*], so called, it is said, because invented or first used at Bayonne, in France, about the middle of the seventeenth century. It was originally a triangular-shaped blade, to be screwed into the muzzle of the musket, and used by infantry as an offensive or defensive weapon. Previous to its introduction pikemen formed a portion of an army, but, though retained in service to some extent till near the middle of the eighteenth century, the bayonet finally superseded them. By the original arrangement the musket could not be discharged while the bayonet was fixed; this contrivance was improved upon at a later day, and the bayonet was fitted exteriorly to the piece, thus permitting it to be fired without unfixing the bayonet. The French were undoubtedly the first to use the bayonet, and the first infantry charge made with this weapon was at the battle of Spire in 1703. Various modifications have been made in the mode of fastening the weapon, as well as in its shape. Among other forms is the "sabre" bayonet; the latest improvement being the "trowel" bayonet, capable of being used by infantry as a spade in throwing up earthworks, as well as in making or resisting a charge.

Bayonne, bā-yonn' (anc. *Lapur'dum*), a fortified city of France, near its S. W. extremity, in the department of Basses-Pyrénées, on the river Adour, about 3 miles from the Bay of Biscay and 66 miles W. N. W. of Pau; lat. 43° 29′ N., lon. 1° 29′ W. It is pleasantly situated near the foot of the Pyrenees, at the mouth of the river Nive, and is well built. It has an old cathedral, a citadel built by Vauban, a mint, a theatre, and schools of commerce and navigation. Here are shipyards, glass-works, sugar-refineries, and distilleries. The chief articles of export are timber, tar, corks, liqueurs, hams, etc. Bayonne has often been besieged, but never taken. Here occurred an interview between Charles IV. of Spain and Napoleon I., who extorted from the former and his son a renunciation of the crown in 1808. Pop. in 1866, 26,333.

Bayonne, a post-township of Hudson co., N. J. Bayonne City, in this township, on the N. J. Central R. R., 4 miles from Jersey City, is a place of residence for people doing business in New York City. It has two weekly newspapers. Pop. 3834.

Bayou, bī'oo [supposed to be corrupted from the French word *boyau*, a "bowel" or "gut," and hence signifying "channel"], strictly means a stream which is not fed by springs, but flows from a lake or other stream. It is very often used, however, in the Southern U. S. as synonymous with "creek," and frequently designates the tidal channels occurring in swamps on the Gulf coast.

Bayou, a township of Pulaski co., Ark. Pop. 500.

Bayou, a township of Ozark co., Mo. Pop. 480.

Bayou Macon, a township of Chicot co., Ark. Pop. 753.

Bayou Metor, a township of Arkansas co., Ark. Pop. 306.

Bayou Sara, a post-village of West Feliciana parish, La., on the Mississippi River, at the mouth of the bayou of the same name, 36 miles above Baton Rouge. It is the southern terminus of a railroad to Woodville, Miss., and has considerable trade in corn and cotton. Pop. 440.

Bayr'hoffer (Karl Theodor), a German philosopher, born at Marburg in 1812, became in 1838 professor of philosophy in his native town, and in 1850 was forced to go to the U. S. He advocated the doctrines of Hegel, and wrote, among other works, "Ueber den Deutsch-Katholicismus" (1845), "Idee des Christenthums" (1836), and "Idee und Geschichte der Philosophie" (1838).

Bay Rob'erts, a port of entry of Newfoundland, 8 miles S. of Harbor Grace, on Conception Bay. Its inhabitants are chiefly engaged in the Labrador fisheries. It is visited by regular lines of coasting steamers, and has considerable imports. Pop. about 1000.

Bay Rum (*Spiritus myrciæ*, U. S. P.), a fragrant liquid obtained by distilling with rum the leaves of the *Myrcia acris*, and probably of other trees of the genus. These are large trees growing in Jamaica and other West India islands, and belonging to the Myrtaceæ. Bay rum is imported in large quantities, and is used as a perfume and as a cosmetic.

Bay Shore, a post-village of Islip township, Suffolk co., N. Y., on the South Side R. R. of Long Island, 40½ miles from New York. It is finely laid out with gravelled streets, and is in a good agricultural region. It is a fine summer resort, being one-fourth of a mile from Fire Island Bay. Pop. 1200.

Bay Side, a post-village of Flushing township, Queen's co., N. Y., on the New York and Flushing R. R. It has many fine country-seats of New York merchants. It is one of the most famous places for clambakes on Long Island.

Bay'town, a township of Washington co., Minn. Pop. 594.

Bay View, a post-village of Gloucester township, Essex co., Mass., has extensive quarries of granite. It is a place of summer resort.

Bay Win'dow, sometimes corrupted into **Bow Window,** a window which projects outward from a room, and often occurs in Gothic architecture. The external walls of such windows are generally polygonal or semicircular. The lower end of bay windows is often nearly on a level with the floor of the room. They are frequently supplied with a seat called a *bay stall*.

Ba'za (anc. *Basti*), a city of Spain, in the province of Granada, about 52 miles N. E. of Granada, is in a fertile plain. It is famous for its red wine. In 1489 it was taken from the Moors by the Spaniards after a long siege. The French marshal Soult here defeated the Spaniards Aug. 10, 1810. Pop. 7272.

Bazaar', or **Bazar,** an Oriental market-place, either open or covered with a roof; an Oriental assemblage of shops in which goods of various kinds are exposed to sale. Each bazaar is occupied by a number of retail traders, and is often divided into streets or passages having on each side a row of small shops, stands, or counters. The term is also applied in European and Western cities to a hall or suite of rooms fitted up with counters or stands for the sale of goods (mostly fancy articles).

Bazaar, a post-township of Chase co., Kan. Pop. 364.

Bazaine (François Achille), born at Versailles Feb. 13, 1811, and, after passing through all the intermediate grades, marshal of France Sept. 5, 1864. The son of a prominent and wealthy officer, he could have readily obtained an officer's commission, but he declared it his pride to seek his marshal's bâton from the knapsack in which for "every French soldier" the proverb potentially places one; and that bâton, when found, bore the inscription "Simple soldat en 1831, Maréchal de France en 1864."

His campaigns are thus stated: Africa—Constantina and Oran, 1833, 1834, 1835 (first half). Spain—1835 (second half), 1836, 1837, 1838. Africa—Algiers and Oran, 1840, 1841, 1842, 1843, 1844, 1845, 1846, 1847, 1848, 1849, 1850, 1851, 1852, 1853, 1854 (first half). Crimea—1854 (second half), 1855, 1856. Africa—1857. Italy—1859, 1860. Mexico—1862, 1863, 1864, 1865, 1866, 1867 (first half). Army of the Rhine—1870. Total 35 years of active service, of which 32 in campaigns, in the course of which he received six wounds or contusions. In the Legion of Honor he was Knight (Nov. 22, 1835), Combat of La Macta (Africa); Officer (Nov. 5, 1845), Combat of Sidy Kafir; Commander (Aug. 16, 1856), Taking of Kinburn (Crimea); Grand Officer (June 20, 1859), Combat of Marignan (Italy); Grand Cross (July 2, 1863), Battle of San Lorenzo (Mexico); Military Medal (April 28, 1865), Storming of Oajaca (Mexico); Medals of the Crimea, Italy, and Mexico.

On the breaking out of the war with Prussia Marshal Bazaine, who had expected the command of one of two powerful armies destined to the invasion of Prussia, in accordance with plans which had been prepared by the late Marshal Niel, found himself, in consequence of the sudden and unexpected decision of the Emperor to unite all the forces in the single "Armée du Rhin," in command of only a single corps. The disasters of Woerth and Forbach, compelling the Emperor to relinquish the command, and his sole competitor, MacMahon, being put *hors de concours* by his recent defeat, Marshal Bazaine on the 13th of August succeeded to the command of the Army of the Rhine. Reorganization and concentration compelled a falling back upon Metz, and thence upon Verdun, where the shattered commands of MacMahon's corps and the reserves of France were being concentrated. The execution of the resolution, too tardily taken, was, in consequence, further delayed by the battle of Borny (Aug. 14), brought on by the Prussians for that sole purpose. In continuing the retreat through Metz his columns were vigorously attacked by the Prussians, and the battle of Rézonville (Gravelotte) resulted. Undertaken by the advanced Prussian troops hastily thrown over the Moselle above Metz, solely to disorder and delay the French march, the attack was successfully repulsed, and, to the French, "the moment had arrived to strike a great blow and to resume the offensive, ... to drive back the Prussians in disorder upon the Moselle." Before evening, however, the Prussians had been so greatly reinforced as to recover their position and resume the offensive conflict, but with the advantage, on the whole, on the French side. There was yet opportunity to continue the march on Verdun, but the Marshal spent the next day in forming a line of battle from Rozereuilles to St. Privat, with his back on Metz, while the Prussians were allowed, unmolested, to march across his front to form their line. The battle of St. Privat was fought defensively in position, on the 18th, without an order from the Marshal,* or a reinforcement to, or change in, the position of any part of the French line. The French left and centre were strongly posted—the right "dans l'air" at St. Privat. Without natural obstacles on which to rest, powerful artillery alone could have given to it adequate power of resistance. It was held by the 6th Corps (Canrobert's), which corps, alone, was deficient in its complement of artillery. The Guards (Bourbaki's) and Reserve artillery were stationed in ravines in the rear. The French effective force was 150,000 men—Prussians (eight corps) 240,000. That the Prussians, unsuccessful and even disastrously repulsed on the French left and centre, and at liberty to use their immense force where weakness exhibited itself, should, failing elsewhere, finally concentrate their artillery fire (272 guns) and their infantry masses (three corps, 80,000 men) on the French right, is natural; but not so, that the guard and reserve artillery should lie idle while the French right was overwhelmed and driven back (4th and 6th corps) disorganized, upon Metz and the Moselle. The remainder of the army, which had held its strong positions, was withdrawn the next day into the intrenched camp in which ten weeks later it was destined to lay down its arms.

But it is an error to say that Bazaine was *shut up* in the intrenchments of Metz. No portion of the Marshal's army was within the *enceinte* of Metz; and the new and (incomplete) advanced detached works *favored* rather than obstructed egress. The question is can an army of 200,000 men or less, "shut up," in an intrenched camp *any more than in open field*, another of nearly equal numbers? If, in open field, an army gives time and opportunity to its adversary to encircle it with intrenchments, such is their defensive capability with modern arms, that egress, even with equal numbers, *may* become impracticable; and the lines thrown up around Metz (see paper of Lt.-Col. Schaw, R. E., *Jour. U. S. Inst.*, No. 76) may ultimately have become too strong to be successfully assailed. On the other hand, the loss of *morale* and the resulting loss of confidence in the leaders may perhaps account for the few and futile attempts at sorties (Ml. Canrobert testifies that as late as Oct. 15 vigorous sorties could have been made); for the failure to cooperate with the movement of MacMahon on Sedan, the plea of failure to receive despatches announcing it, is put forward, and credibly substantiated.

His attempt to negotiate with the Prussians through the Empress at Hastings must be judged of by his own language at his trial: "My position was unprecedented. I was, in a certain sense, my own government. The duties of a military chief when a legal government exists are strictly defined. I by no means admit that to be the case in presence of an insurrectionary government. There was then no government; there was nothing;" coupled with the comment of the duc d'Aumale, "What! *France*, then, no longer existed?"

Thus exhausting the last days in which action was possible, the marshal surrendered on the 27th Oct., 1870, an army of 160,000 men, Metz, "la Pucelle," and its fortifications, and 1800 pieces of artillery.

He was arraigned Oct. 10, 1873, before a court consisting of the duc d'Aumale (president), General de la Motte Rouge, Baron de Chabaud-Latour, Generals Tripier, Martimprey, Princeteau, and Martinez-Dechesnez, charged:

First—Of having capitulated with the enemy, and surrendered the fortress of Metz, of which he had the superior command, without having exhausted all the means of defence.

Second—Of having, as the head of the army before Metz, signed a capitulation in the open field, the result of which was to cause his troops to lay down their arms; and of not having, before treating verbally and by writing, done everything which he was bound to do by duty and honor—offences provided for and punished by articles 209 and 210 of the Code of Military Justice.

After a trial of two months' duration he was unanimously pronounced guilty, sentenced to be degraded and shot, with equally unanimous recommendation that the sentence should not be carried into execution, in terms substantially as follows: "As jurymen, our conscience alone must guide us, and as judges it has been our duty to apply an inexorable law. The marshal, however, received the command of the army under the most unfortunate circumstances, and the court cannot forget that under fire he was always equal to himself; that at Borny, Gravelotte, and Noisseville no one surpassed him in bravery; and that on 16th of Aug. (Gravelotte) he maintained the centre of his line of battle by the firmness of his attitude. Neither can the army forget the glorious services rendered by the Volunteer of 1831."

His sentence was promptly commuted by President MacMahon to twenty years' imprisonment in a fortress, without military degradation.

In conclusion I venture to use the words of Niemann's military description of the French campaign. "The conduct of the marshal at Metz roused the conjecture that he wished to act not only as a general, but as a statesman; that he wished independently to make military action accord with political events; that even he believed he could pursue his own ambitious views, and at the same time the interests of France. The temptation of playing an important political *rôle* in the general overthrow of existing affairs, while at the head of the largest military body which France possessed, no doubt came home to the ambitious Bonapartist general."

That his conduct of the military operations from Aug. 13 to Aug. 18 was inefficient; that his so-called sorties had scarce the energy in them to reveal a serious intention to go out; that he allowed himself to waste the last precious days of his army's efficiency in what were futile—and some would call treasonable—attempts to negotiate with the empress; and finally crushed the rising—the *last*—hopes of France by a premature surrender at the very moment when a protraction might have modified the history of the war, must, I think, be the conviction of all who have impartially studied his career.

*"In a combat where the enemy arrayed nearly two-thirds of the force with which he had invaded France, the general artillery reserve was left in its camp at more than 6 kilimeters distance, the cavalry of the Guard did not put foot to stirrup, the heavy cavalry remained at Longueville (a suburb of Metz), and as to the infantry of the Guard, it lay without orders till 6 P. M. at more than a league from the field of battle." (*Metz, Campagne et Negotiations.*)

On the 9th of Aug., 1874, Bazaine, aided by his wife, escaped from his fortress prison, 116 St. Marguerite, pleading in justification (*Letter addressed to the Minister of War*), while alleging that "respect for the military uniform which he has very honorably worn for nearly half a century" would have deterred him from this step but for the "humiliating régime to which he was subjected, from which his past career ought to have saved him," that maxim of public law, that "no sentence is legal unless pronounced by the peers of the accused." J. G. Barnard, *U. S. Army.*

Bazalgette (Joseph William), C. B., an English civil engineer of French descent, was born in 1819. He has won great fame in the construction of sewers, street alterations, and other departments of city engineering. As engineer-in-chief to the Metropolitan Board of Works, London, he has constructed many hundreds of miles of sewers and river embankments, and has introduced subterranean passages for the carrying of gas and water pipes and telegraph wires, so that it is not necessary to break up the pavements for repairs. He has also furnished plans for the drainage of many British and foreign cities.

Bazancourt, de (César), Baron, a French historian, born in 1810, wrote a "History of Sicily under the Norman Rule" (2 vols., 1846), histories of the Crimean, Italian, Chinese, and Cochin-Chinese wars of Napoleon III., a treatise on Fencing, and many novels. Under Louis Philippe, De Bazancourt was a director of the library of Compiègne, and under Napoleon III. he was official historiographer. Died at Paris Jan. 25, 1865.

Bazard (Amand), the founder of French Carbonarism, was born in Paris Sept. 19, 1791. He organized societies of Carbonari about 1820, and afterwards became a disciple of Saint-Simon the Socialist, and editor of the "Producteur," a Saint-Simonian journal. After the death of Saint-Simon (1825), Bazard and Enfantin were the chief priests of the sect, and they published an "Exposition of the Doctrine of Saint-Simon" (1828–30). Bazard became disgusted with the extreme innovations of Enfantin (who advocated a community of wives), and he seceded from the sect in 1831. Died July 29, 1832. (See Michaud et Villenave, "Histoire du Saint-Simonisme," 1847.)

Bazet'ta, a post-township of Trumbull co., O. It contains the village of Baconsburg (pop. 449), on the Atlantic and Great Western R. R. Pop. 1240.

Bazin (Antoine Pierre Ernest), a French dermatologist, born Feb. 20, 1807, at St. Brice, came of a long line of medical men. In 1847 he became physician and professor of dermatology in the hospital of St. Louis, Paris. He has written able works on venereal and skin diseases.

Bazin (Antoine Pierre Louis), a brother of the preceding, born Mar. 26, 1799, was a professor of the Chinese language, and published in 1856 a grammar of the Mandarin dialect. He also made many translations from the Chinese. Died in Jan., 1863.

Baz'ley (Sir Thomas), Bart., was born at Gilnow, Lancashire, England, in 1797. He learned cotton-spinning in his youth, went into business on his own account at Bolton in 1818, and removed in 1826 to Manchester, where his manufactory of fine cotton and lace thread was the largest in the world, employing more than 1000 persons, for whom he established schools, free lectures, and reading-rooms. An early anti-corn-law man and free-trader, he became a prominent liberal politician, first entering Parliament in 1858. In 1862 he retired from business, and in 1869 became a baronet.

Bdel'lium [Gr. βδέλλιον], a gum-resin resembling myrrh, but weaker and more acrid, was esteemed by the ancients for its supposed medicinal virtues. It is not often used by modern physicians. Two varieties of bdellium are obtained from the *Amyris commiphora* of India and the *Heudelotia Africana*, a tree or shrub of Senegal.

Beach, a township of La Fayette co., Ark. Pop. 984.

Beach, a township of Mower co., Minn. Pop. 101.

Beach (Abraham), D. D., a Protestant Episcopal divine, was born at Cheshire, Conn., Sept. 9, 1740, graduated at Yale College in 1757, and was ordained by the bishop of London in 1767. He was until 1783 rector of a church at New Brunswick, N. J., and afterwards an assistant minister of Trinity church, N. Y., for thirty years (1783–1813). He was the author of some religious works. In his last years he was a farmer in New Jersey. The degree of D. D. was conferred upon him by Columbia College in 1789. He was a strict Episcopalian, and opposed the liberalism of Bishop White. Died Sept. 11, 1828.

Beach (John), a Protestant Episcopal divine, born in 1700, graduated at Yale in 1721, and was for some years Congregational minister of Newtown, Conn. He conformed in 1732, was ordained by the bishop of London, and was for fifty years a minister of the English Church in Connecticut. He published sermons and polemical tracts. Died Mar. 8, 1782.

Beach (John Wesley), D. D., an able preacher of the Methodist Episcopal Church, was born at Trumbull, Conn., Dec. 26, 1825, graduated in 1845 at Wesleyan University, Middletown, Conn., was for nine years a teacher, and in 1854 entered the ministry. His labors have been mostly in New York City and vicinity. In 1872 he received the degree of D. D. from his *alma mater*, and in 1873 he became pastor of a church in New Haven, Conn.

Beach (Moses Yale), an American inventor and publisher, born at Wallingford, Conn., Jan. 7, 1800. He learned the trade of a cabinet-maker in youth, and afterwards experimented in machines for propelling balloons. He invented a rag-cutting machine, now in general use in paper-mills. In 1835 he became interested in the "New York Sun," and is regarded as a pioneer in the penny newspaper business. In 1857 he left his profession and retired to his native town, where he died July 18, 1868.

Beach Isle, a township of Hancock co., Me. Pop. 9.

Beach Plum, the *Prunus maritima*, a shrub of the order Rosaceæ, growing along the sea-beaches of the Atlantic coast of the U. S. It bears an edible fruit, sometimes not much smaller than that of the cultivated plum, which it resembles. Away from the sea-shore it degenerates.

Beach'ville, a post-village of Oxford co., Ontario, Canada, on the Great Western Railway and the river Thames, 4 miles from Woodstock, has three churches, manufactures of lumber, linen, cordage, machinery, castings, flour, etc., and an extensive trade. Pop. about 700.

Beach'y Head, the highest headland on the S. coast of England, 2½ miles S. S. W. of Eastbourne, Sussex. It consists of perpendicular chalk cliffs 564 feet high, forming the E. end of the South Downs. Here is a lighthouse 285 feet high. The French fleet defeated the Dutch and English near this point in 1690.

Bea'con. The Anglo-Saxon root is the same as that of the noun *beck* and the verb *beckon;* hence the word implies something which constitutes a significant sign or signal. Before other means of *rapid* telegraphy were invented, *fires*, kindled on the tops of mountains or prominent points of the coast, were an obvious resort as alarm-signals, giving warning of the approach of hostile fleets or armies. So, too, as a guide to mariners, to whom the dangers of a contiguous coast are enhanced by darkness, blazing fires or "lights" of some kind (see Lighthouse) were ever the most obvious *beacons;* hence a "fiery signal" is associated with the classic signification of the word. The word *beacon* (in a special signification) is now almost exclusively restricted to the last-mentioned uses, denoting a mark or sign erected on coasts for guiding and preserving vessels at sea by night or by day. Practically, it is still further restricted by being divested, almost entirely, of reference to "light" or "fire," and applied to fixed structures or material marks erected on rocks or shoals in harbors or narrow channels; nevertheless, a small light-tower erected for no other than this limited purpose is sometimes called a "*beacon-light*" (as distinct from the lighthouse proper); while fixed *un*-illuminated signal structures are called "*day*-beacons."

J. G. Barnard, *U. S. Army.*

Bead, or **Bede,** in Anglo-Saxon and Old English signified a prayer, and hence the small perforated balls, of whatever material, used for keeping an account of the number of prayers repeated. Beads are small perforated globular bodies worn as ornaments by women and children around the neck and on other parts of the person, for which purpose they are arranged on strings. They are made of various materials—gold, amber, coral, pearl, crystal, glass, etc. More beads are made of glass than of any other material. They are often used in the ornamentation of slippers, purses, and other articles. The ancient Egyptians understood the art of making glass beads, which are now extensively manufactured at Murano, near Venice, and in China. There are three kinds of beads—the hollow, the common, and the bugle. Roman Catholics use a string of beads, called a "rosary," in saying prayers. Similar chaplets are used by Mohammedans and by some sects of Boodhists. Great quantities of beads are shipped to Africa, India, and the Eastern Archipelago.

Bea'dle [Ger. *Büttel*], in England, is an inferior parish officer appointed by the vestry. His business is to attend the vestry, to act as their messenger, to give notice of their meetings, to execute their orders, to assist the constable, etc.

Beads, Saint Cuthbert's, a name given to the single joints of the articulated stem of a fossil animal called Encrinite (which see). They have natural perforations, so that they can be strung like beads, and they were formerly used as rosaries, and popularly believed to have been made by Saint Cuthbert.

Bea'gle, a small variety of hound, formerly employed in England for hunting hares, but now nearly supplanted by the harrier. The beagle is about ten inches high at the shoulder, is compactly formed, and has long pendulous ears and smooth hair. It is remarkable for its keenness of scent and perseverance. During the chase it utters a musical cry. A small variety is used as a lap-dog.

Beak [Lat. *ros'trum;* Fr. *bec*], the bill of a bird: in other words, the hard, horny mouth of a bird, consisting of two parts, called the upper and lower mandible. (See BILL.) The term was also applied to a pointed piece of wood fortified with metal, and fastened to the fore end of ancient galleys and modern steam-rams, in order to pierce the vessels of the enemy.

Bea'ker, a name formerly given to a kind of drinking-bowl or cup, derived from the same root as the German *becher.* The name is now applied to a glass vessel used in chemical laboratories.

Beale, a township of Juniata co., Pa. Pop. 1039.

Beale (LIONEL SMITH), F. R. S., an accomplished English microscopist and physiologist, born in 1828, graduated M. B. at the University of London in 1851, in which institution he was afterwards appointed professor. Many remarkable books and monographs upon histology and biology have been published by Dr. Beale. His papers written against the Darwinian hypothesis (1870) have attracted much attention. Among his numerous works are "How to Work with the Microscope" (1858), "The Structure of the Tissues of the Body" (1861), "Protoplasm" (1870).

Beam [Ger. *Baum,* a "tree"], any large piece of timber; the principal piece of timber in a building, that lies across the walls and serves to support the rafters; also a collection of luminous rays emitted from the sun or other luminary. The word has several technical applications. The part of a balance from the ends of which the scales are suspended is called the beam; a weaver's beam is a wooden cylinder on which the web is wound. The term is also applied to the part of a steam-engine to which the piston is attached. In ships, a beam is a great main cross-timber, extending across the hull, supporting the deck, and preventing the sides from collapsing. Each of these beams is made of one solid piece of good timber, if possible, and is upheld at or near the middle by a pillar or pillars. In large steamships iron beams are often used instead of wood. A ship is said to be "on her beam ends" when so much inclined to one side that the beams become nearly vertical. The word also occurs in the phrase "on the starboard beam," which is applied to the position of an object at sea which is seen towards the right by a person who face is turned towards the bow.

Beaman (FERNANDO C.). See APPENDIX.

Beams'ville, a post-village of Clinton township, Lincoln co., Ontario, Canada, on the Great Western Railway, 11 miles W. of St. Catherine's, has manufactures of farming tools, carriages, etc. Pop. about 1000.

Beam Tree, White (*Py'rus A'ria*), a tree which is a native of Europe and Asia, grows to the height of from twenty-five to forty feet. It has ovate and serrate leaves, which are white and downy beneath, flowers in terminal corymbs, and bears a scarlet fruit about as large as a pea. This fruit, which is sometimes called sorb or service-berry, is acid and astringent, and is used to make beer. The hard, fine-grained wood is useful for cog-wheels.

Bean (*Fa'ba*), a genus of annual herbaceous plants of the order Leguminosæ, sub-order Papilionaceæ, was included by Linnæus in the genus *Vicia,* from which it may be distinguished by its leathery, tumid pods and a large scar on the end of the seed. The common European bean (*Faba vulgaris*) has been cultivated in Asia and Europe since the earliest ages. It has pinnate leaves, without tendrils, and fragrant flowers. The seeds, which are nutritious food, are enclosed in long pods which are woolly on the inside. Many varieties of this species are cultivated in gardens and fields, and are used as food for men, cattle, swine, etc. This plant prefers a dry and moderately rich soil. Garden beans are planted in the spring in rows. The kidney-bean or haricot (*Phaseolus vulgaris*) is a totally distinct plant from the proper bean. The beans cultivated for use in America are of various species of *Phaseolus.*

Bean Blossom, a township of Monroe co., Ind. Pop. 1316.

Bean'ville, a village of Willing township, Allegany co., N. Y., on the Genesee River, has manufactures of lumber, leather, etc.

Bear [Lat. *ur'sus,* female *ur'sa;* Ger. *Bär*], a genus of quadrupeds of the order Carnivora and tribe Plantigrada, is the type of the family of Ursidæ. Bears walk on the soles of their feet, have five toes on each foot, and have claws which are not retractile, but are adapted for digging in the earth or climbing trees. Their tails are very short. They have six cutting teeth in each jaw, and one canine tooth on each side in each jaw. Bears are found both in warm and cold climates in Europe, Asia, and America, but they are not known to live in Africa. The species that inhabit cold climates are generally more fierce and carnivorous than those of tropical regions. Some species pass the winter in a state of torpidity and hibernation, during which they eat nothing and remain stationary in hollow trees or holes in the ground.

The brown bear (*Ursus arctos*) is widely distributed over the continents of Europe and Asia, but it has been extirpated from the British Islands. It is generally believed to be the only European species. It is solitary, infests mountains and forests, eats fish and other animals, and subsists partly on fruits and vegetable food. The flesh of this bear is eaten by the people of Kamtchatka and other regions.

The black bear (*Ursus Americanus*) is found in all parts of North America. Its total length is about five feet. It prefers vegetable food, but when pressed by hunger will kill and eat small animals. It kills its prey by hugging or squeezing with its fore paws. Great numbers of black bears are killed for their skins, which have a smooth, glossy fur, and are valuable for cloaks, caps, etc. This animal is an expert climber, is very fond of honey and green corn (maize), and is less fierce and dangerous to man than the brown bear.

The Rocky Mountains and adjacent parts of North America are infested by the grizzly bear (*Ursus ferox* or *horribilis*), which is much larger and more carnivorous than the black bear. It sometimes measures nine feet from the nose to the tail, which is very short. The hair is long, and its color is a mixture of brown, white, and black. This bear, which is very tenacious of life, is the most formidable

Grizzly Bear.

beast of prey on the continent of America. It is able to master a buffalo (bison) and carry away its huge carcass. It is stated that it hunts for prey both by day and night. It can run swiftly, but does not climb trees.

The largest of all the family of Ursidæ is the polar bear

Polar Bear.

(*Ursus maritimus*), called also the white bear, the fur of

which is an impure white. It sometimes measures nearly ten feet long and five feet high. It is strictly marine in its habits, is never found far from the sea, and inhabits the most northern shores of Greenland, Asia, etc. It subsists chiefly on animal food, and pursues seals and fishes both on the ice and in the water. These bears display a remarkable affection for their cubs. It has not been ascertained whether the polar bear usually hibernates or not.

The bear mentioned in the Bible was probably the Syrian bear (*Ursus Syriacus*), which resembles the brown bear in its habits, and has a stiff mane of erect hairs between the shoulders. The color of its hair is mostly dingy white or brown. Among the other species is the *Ursus labiatus*, or long lipped bear of the East Indies, an inoffensive and gentle animal, which is often led about by Indian jugglers for exhibition. Among the Andes of Chili occurs the *Ursus ornatus*, called spectacled bear, which is black except two semicircular yellow marks above its eyes. Remains of several extinct species of bears have been found in caves in England and Germany. Of these, *Ursus spelæus*, called the cave bear, is the best known. It is now thought that the "cave bear" was identical with *Ursus horribilis*, the "grizzly" of America. The bears are by some naturalists all arranged in one genus; by others in several genera.

REVISED BY J. S. NEWBERRY.

Bear-Baiting. A custom was formerly prevalent in many countries of baiting bears with dogs. The place in which the bears were kept was called a "bear-garden." Bear-baiting was a favorite sport in England, not only for the common people, but also for the higher classes. Queen Elizabeth is said to have enjoyed it. It was hated by the Puritans, Macaulay wittily says, "not because it gave pain to the bear, but because it gave pleasure to the spectators." This coarse and inhuman entertainment gradually died out, and was finally prohibited by act of Parliament Sept. 9, 1835.

Beard, a name applied to the hair which grows upon the lower part of the face of a man, and in exceptional cases upon the faces of women, or even children. The wearing of the beard is universal in the East, where it has long been regarded as a mark of honor and dignity. Some races of men, like the American Indians, carefully pluck out the beard, which with them and others, such as the Mongolians and Bedouins, is scanty. Most white races have beards with hairs differing decidedly in structure and appearance from those of the scalp. The wearing or not of beards in European nations has been regulated partly by fashion and partly by legal enactments for or against the practice. The beard is believed to protect the throat and chest from colds.

Beard (RICHARD), D. D., a clergyman of the Cumberland Presbyterian Church, was born Nov. 27, 1799, in Sumner co., Tenn. His early education was not without care, yet limited. His education preparatory to the ministry was conducted better than usual for the time in his Church. He was licensed and commenced preaching in 1820, and was several years exclusively devoted to the work of the ministry. His health failing, he spent two or three years teaching. He was two and a half years at Cumberland College, Princeton, Ky., and graduated. He was immediately appointed professor of languages in that college. He afterwards spent five years at Sharon, Miss., in connection with Sharon College. In 1843 he became president of Cumberland College, Ky., and remained there ten years and a half, giving a great impetus to the classic training of young men, especially those seeking the ministry. In 1854, when the Cumberland Presbyterian Church established a chair of systematic theology in Cumberland University, at Lebanon, Tenn., his high character as a scholar and educator at once called him to that position, which he has ever since held. He has given to the Church an able and standard work on "Systematic Theology," in 3 vols. 8vo. It is regarded as the crystallization of Cumberland Presbyterian thought and faith. He has published two octavo volumes of biographical sketches of ministers. Also, "Why am I a Cumberland Presbyterian?" 1 vol. His contributions to the "Quarterly" and general literature of the Church have been constant and most valuable. His great dignity, purity, and gentleness of character have marked him as a representative man, calling him to the moderator's chair times almost without number. He is yet vigorous and earnest in the great work of education.

Beard (WILLIAM H.), an American painter, born at Painesville, O., about 1826. Among his most popular works are "Bears on a Bender" and "Grimalkin's Dream."

Beard'in's, a station of Etowah co., Ala. Pop. 445.

Beard's, a township of Pickens co., Ala. Pop. 446.

Beard's Bluff, a township of Marshall co., Ala. Pop. 373.

Beard'slee (LESTER A.), U. S. N., born Feb. 1, 1836, in Little Falls, N. Y., entered the navy as a midshipman Mar. 5, 1850, became a passed midshipman in 1856, a lieutenant in 1859, a lieutenant-commander in 1862, and a commander in 1869. He served in the iron-clad Nantasket in the engagement with Fort Sumter of April 7, 1863, and is thus commended by his commanding officer, Captain Fairfax, in his official report to Rear-Admiral Dupont of April 8, 1863: "I am gratified to be able to say that the officers and crew behaved with becoming coolness and bravery. Lieutenant-Commander L. A. Beardslee, the executive officer, and the senior engineer, Mr. George H. White, rendered me great assistance in the working of the guns, turret, and even the vessel."

FOXHALL A. PARKER, U. S. N.

Bear'field, a township of Perry co., O. Pop. 901.

Beards'ley (EDWARDS), D. D., LL.D., born in 1808 in Fairfield co., Conn., graduated at Trinity College, Hartford, in 1832, where he was two years a tutor. He was for a time principal of the academy at Cheshire, Conn., took orders in the Protestant Episcopal Church in 1835, and has been rector of a church in New Haven since 1848. He is the author of a "History of the Episcopal Church in Connecticut" (2 vols. 8vo) and a "Life of Samuel Johnson, D. D.," both valuable works.

Beardsley (SAMUEL), LL.D., a native of Otsego co., N. Y., practised law in Rome and Utica, N. Y., held various State offices, was a member of Congress from New York (1831–36 and 1843–1845), attorney-general of the State (1837), became a judge of the State supreme court in 1844, and its chief-justice in 1847. Died May 6, 1860.

Beards'town, the county-seat of Cass co., Ill., situated on the bank of the Illinois River. It is the terminus of the Springfield and Illinois South-eastern R. R., and is on the Rockford Rock Island and St. Louis R. R. It ranks as one of the oldest towns in the State. The celebrated "Lithia Springs" are here. The hotel accommodations are superior. There is a fine park near the business portion of the city. The Rockford machine-shops are located here, which employ from 100 to 200 men. There is a foundry, flouring, woollen, and two saw-mills, one large wagon manufactory, a distillery, and a very extensive brewery. The surrounding country consists of rich bottom-lands of a sandy nature, and produces abundant crops of grapes, corn, sweet potatoes, melons, and general marketing. A fine bay, on which saw-mills are established, affords a fine resort for boating and fishing. The railroad bridge of the Rockford road crosses the river at this point, and is a fine structure, costing some $300,000. The piers are of iron. It has two weekly newspapers. Pop. 2588; total pop. of Beardstown township, 3582.

J. S. NICHOLSON, ED. "CENTRAL ILLINOISIAN."

Bear Grove, a township of Fayette co., Ill. P. 992.

Bear Grove, a township of Cass co., Ia. Pop. 163.

Bear Grove, a post-township of Guthrie co., Ia. Pop. 417.

Bear House, a township of Ashley co., Ark. P. 525.

Bear Isle, a township of Hancock co., Me. Pop. 13.

Bear Lake, a post-township of Manistee co., Mich. Pop. 417.

Bear Mountain, in Pennsylvania, rises in the N. E. part of Dauphin co., to the height of about 750 feet. The

valley of Bear Creek, which flows at the base of this mountain, contains valuable beds of anthracite coal.

Bear River, a port of entry of Digby co. and township, Nova Scotia, at the head of navigation, has quite extensive manufactures of lumber, leather, etc.; shipbuilding is also carried on. It has a large trade in firewood and lumber, which are sent to the U. S. and West Indies. Pop. about 900.

Bear River, a river of the U. S., rises in the N. part of Utah, flows northward into Idaho, and changes its course abruptly towards the S. Having again crossed the S. boundary of Idaho into Utah, it flows south-westward, and enters Great Salt Lake about 25 miles N. W. of Ogden. The total length is about 400 miles.

Bears and Bulls, a phrase often used in connection with the purchase and sale of stocks, and applied to persons who speculate in government securities and in the stocks of railroads and other corporations. The "bears" are those who wish to depress the value of stocks, and the "bulls" are those whose interest prompts them to act in the other direction. If two men have contracted, the one to deliver and the other to take a certain stock at a specified price on an appointed future day, the former party will naturally belong to the bears, and the latter to the bulls.

Bear's Grease, or **Bear's Oil,** is said to be efficacious in promoting the growth of human hair. The genuine article being insufficient to supply the demand, perfumers and others sell under the name of bear's oil large quantities of beef-marrow, hog's lard, spermaceti, etc.

Bear'ytown, a village of Fayette and Varick townships, Seneca co., N. Y., has three churches and manufactures of staves and lumber.

Beas'ley (Frederick), D. D., an American clergyman and philosopher, born near Edenton, N. C., in 1777, graduated at Princeton in 1797, became an Episcopalian minister, and was long provost of the University of Pennsylvania. Among his works, which attracted attention in Europe, are "A Search of Truth in the Science of the Human Mind," and a "Reply to the Views of Dr. Channing." Died at Elizabethtown, N. J., Nov. 2, 1845.

Bea'son's Store, a township of St. Clair co., Ala. Pop. 305.

Beatifica'tion [Lat. *beatifica'tio*, from *bea'tus*, "blessed," and *fa'cio*, *fac'tum*, to "make"] in the Roman Catholic Church is a solemn act by which the pope pronounces a person blessed. It is the first step towards canonization, and permits the term "blessed" to be given to the new saint. This honor is reserved for those who have performed miracles, have suffered martyrdom, or have died in the odor of sanctity. The first solemn beatification was that of Saint Francis de Sales by Alexander VIII., Jan. 8, 1662.

Beating the Bounds, a popular phrase used in England to denote the periodical survey or perambulation by which the boundaries of parishes are preserved. It is the custom that the clergyman of the parish, with the parochial officers and the boys of the parish school, should march to the boundaries, which the boys strike with willow rods. The boys themselves were sometimes whipped in proximity to an important landmark, in order to impress the subject durably on their memories.

Bea'ton, Beatoun, or **Bethune** (David), a Scottish cardinal, born in 1494, was a zealous opponent of the Protestant Reformation. He was appointed lord privy seal in 1528, and was sent as ambassador to France in 1533. He became a cardinal in 1538, and succeeded his uncle as archbishop of St. Andrew's in 1539. On the death of James V., in 1542, Beaton produced a forged will of that king, appointing himself, with three others, regent of the kingdom; but his artifice failed, and the earl of Arran became the regent. Cardinal Beaton was a cruel persecutor of the Protestants, and caused George Wishart to be burned at the stake. He was assassinated in his own castle by Norman Leslie and others May 29, 1546. (See Knox, "History of the Reformation in Scotland;" Froude, "History of England," vol. iv.; Robertson, "History of Scotland.")

Be'atrice, a city, capital of Gage co., Neb., in a township of the same name, on the Big Blue River, 90 miles S. S. W. of Omaha. It has a weekly paper. It is the southern terminus of the Omaha and South-western R. R. It is noted for its fine water-power and excellent building-stone. The U. S. land-office for the Nemaha district is located here. Pop. of township, 624.

Theodore Coleman, Ed. of "Beatrice Express."

Beatri'ce Portina'ri, a beautiful Italian lady, a native of Florence, who excited the admiration of Dante, and was immortalized by him in his "Divina Commedia." She was married to Simone dei Bardi, and died in 1290, aged about twenty-four.

Beat'tie (James), LL.D., D. C. L., a Scottish poet, born in the county of Kincardine Oct. 25, 1735. He became in 1760 professor of moral philosophy in Marischal College, Aberdeen. To refute the doctrines of Hume he published his "Essay on Truth" (1770), which was extremely successful. His most popular poem is "The Minstrel" (1771–74), which excited general admiration. Among his other works are "The Evidences of the Christian Religion, briefly and plainly stated" (1786), and "The Elements of Moral Science" (1793). Died Aug. 18, 1803. (See Sir William Forbes, "Life of James Beattie," 2 vols., 1806; Alexander Bower, "Life of James Beattie," 1804.)

Beat'ty, a post-village of Westmoreland co., Pa.

Beatty (John), born near Sandusky, O., Dec. 16, 1828, was engaged in banking, but entered the Third Ohio Infantry as a private in 1861, became its lieutenant-colonel in that year, its colonel in 1862, and brigadier-general of volunteers in the same year. He distinguished himself in many important battles in West Virginia, Kentucky, and Tennessee in the late civil war.

Beat'tyville, a post-village, capital of Lee co., Ky. Pop. 123.

Beaucaire, a town of France, in the department of Gard, on the right (W.) bank of the Rhone, and on a railway from Cette to Tarascon, 15 miles by rail E. of Nimes. A bridge nearly one mile long here crosses the Rhone. It has an active trade, which is facilitated by a canal extending to the Mediterranean. Here is held annually a great fair (July 25–28), which was formerly perhaps the largest in Europe. It is said to have been instituted by Count Raymond II. of Toulouse in 1217, although we do not find it mentioned until 1315. It has declined in modern times, but it is still frequented by merchants from all parts of Europe and the Levant. The number of annual visitors was formerly estimated at 100,000, but has at present greatly declined. The chief articles sold at this fair are silks, wine, oil, drugs, wool, leather, and spices. Pop. in 1866, 9395.

Beauce, a county of Canada, in the S. E. part of Quebec, intersected by the Chaudière River. Area, 1150 square miles. It has mines of copper. Capital, St. Joseph de Beauce. Pop. in 1871, 27,253.

Beauchamp, de (Alphonse), a French historian and publicist, born at Monaco, in Italy, in 1767, resided in Paris. He contributed to the "Moniteur" and the "Gazette de France," and published many works, among which are a "History of La Vendée" (3 vols., 1806), a "History of Brazil" (1815), and a "Life of General Moreau" (1814). Died June 1, 1832.

Beau'champ, Earls of, Viscounts Elmley (1815), Barons Beauchamp (1806, in the United Kingdom), a noble family of Great Britain.—Frederick Lygon, the sixth earl, was born Nov. 10, 1830, and succeeded his brother in 1866. He was lord of the admiralty in 1859, member of Parliament for Tewksbury 1857–63, and for West Worcestershire 1863–66.

Beau'ford, a post-township of Blue Earth co., Minn. Pop. 336.

Beau'fort,* a county of North Carolina, bordering on Pamlico Sound, is intersected by the navigable Pamlico River. The surface is level; the soil is sandy, and in some parts marshy. Corn, rice, tobacco, and cotton are raised. Capital, Washington. Pop. 13,011.

Beaufort,* a county which forms the southern extremity of South Carolina. Area, 1540 square miles. It is bounded on the N. E. by the Combahee River, on the S. E. by the Atlantic Ocean, and on the W. by the Savannah River. The surface is a level, alluvial plain; the soil is sandy, but produces good crops of cotton, maize, rice, and sweet potatoes. The county is intersected by the Charleston and Savannah and the Port Royal R. Rs. Capital, Beaufort. Pop. 34,359.

Beaufort, a port of entry, capital of Carteret co., N. C., at the mouth of Newport River, about 4 miles from the ocean and 168 miles E. S. E. of Raleigh. Its harbor is the best in the State, and is defended by Fort Macon. There is a lighthouse 156 feet high at Cape Lookout, 11 miles S. E. of Beaufort, in lat. 34° 37′ 16″ N., lon. 76° 31′ 07″ W. Pop. 2430; of the township, 2850.

Beaufort, a port of entry, capital of Beaufort co., S. C., on Port Royal Island, and on an arm of the sea called Port Royal River, about 55 miles W. S. W. of

* This name is usually pronounced bu'fort in South Carolina, and bō'fort in North Carolina.

Charleston. It has a good harbor, with nearly sixteen feet of water over the bar at the entrance. Lumber, rice, and cotton are exported. It has five churches and three weekly newspapers. Pop. 1739; of the township, 5511.

Ed. "Barnwell County Times."

Beau'fort (Henry), Cardinal, an ambitious English prelate, born about 1375, was a natural son of John of Gaunt and half-brother of King Henry IV. He became bishop of Lincoln in 1398, bishop of Winchester in 1405, lord chancellor in 1403, again in 1413, and a third time in 1424. He acted a prominent part in political affairs, for which he had superior abilities. During the minority of Henry VI. he was very powerful, and was a rival of his nephew, the duke of Gloucester. He was suspected of complicity in the murder of that rival. Died April 11, 1447. (See Lord Campbell, "Lives of the Lord Chancellors.")

Beaufort, de (François de Vendôme), Duc, born in Paris in 1616, was a grandson of Henry IV. of France, and a son of César de Vendôme. He was a leader of the malcontents or opponents of the court in the civil war of the Fronde. Having returned to his allegiance, he was appointed commander of the fleet by Louis XIV. about 1662. He was killed at the siege of Candia in 1669.

Beaufort, Dukes of (1682), marquesses of Worcester (1642); earls of Worcester (1514); earls of Glamorgan, Viscounts Grosmont, and Barons Beaufort (1642); Barons Herbert (1461); Barons Herbert of Ragland, Chepstow, and Gower (1506); Barons Bottetourt (1308, in England), an old and prominent family of Great Britain.—Henry Charles Fitzroy Somerset, the eighth duke, was born Feb. 1, 1824, and succeeded his father in 1853. He was member of Parliament for East Gloucestershire 1846–53, master of the horse 1858–59 and 1866–68, and is at present lord lieutenant of Monmouthshire.

Beaugency, an old town of France, in the department of Loiret, on the right bank of the Loire, and on the railway from Paris to Bordeaux, 16 miles S. W. of Orleans. It has manufactures of woollen and leather goods, and a trade in wine, grain, and wool. Pop. 5029.

Beauharnais, de (Eugène), a son of Vicomte Alexandre de Beauharnais, was born in Paris Sept. 3, 1781. His mother, Josephine, became the wife of Bonaparte, whom he accompanied to Egypt in 1798. He was rapidly promoted in the army, was appointed viceroy of Italy in 1805, and married the princess Amalie Augusta, a daughter of the king of Bavaria, in 1806. His functions as viceroy were performed with ability, prudence, and moderation. He also displayed superior military talents in the campaign against Austria in 1809 and in the invasion of Russia in 1812. Having obtained command of the army in Russia after it had suffered great disasters, he acted with remarkable firmness and constancy, and made a masterly retreat. After the battle of Lützen, May, 1813, in which he took part, he went to Italy, which he defended against the Austrians until the deposition of Napoleon. He afterwards resided at Munich, and obtained from the king of Bavaria the title and estate of duke of Leuchtenberg. Died in Munich Feb. 21, 1824. One of his sons married Dona Maria, queen of Portugal, in 1835. (See Léonard Gallois, "Histoire du Prince Eugène de Beauharnais," 1821; A. Aubriet, "Vie de Eugène de Beauharnais," 1824.)

Beauharnois, a county of Canada, in the S. W. part of Quebec, has an area of 200 square miles. It is bounded on the N. W. by the river St. Lawrence, and is drained by the Châteauguay River. The soil is productive. Butter, cheese, wool, and oats are the chief crops. Capital, Beauharnois. Pop. in 1871, 14,757.

Beauharnois, a post-village, capital of the above county, is on the St. Lawrence River, 27 miles S. W. of Montreal. It has a number of flax-mills, potteries, and factories, and one weekly paper. Pop. in 1871, 1423.

Beaumarchais, de (Pierre Augustin Caron), a French dramatist remarkable for his wit and versatility, and whose adventurous career and vicissitudes of fortune obtained for him great celebrity, was born at Paris Jan. 24, 1732, and was the son of a clockmaker. Although sent to the college (Anglicè, *school*) at Alfort, he was at the early age of thirteen apprenticed to his father. He soon discovered a decided taste for literature and an excessive fondness for music, in which art he became so proficient that he was enabled to procure an introduction to the court of Louis XV., and was employed to teach the princesses, his daughters, to play upon the harp, in the performance upon which he was skilled, and in the pedals of which he introduced an improvement. At the concerts given at the court he made the acquaintance of Duverney, the celebrated financier of that period, whom he was enabled to aid, by his influence with the princesses, in the accomplishment of certain projects in which the banker was at that time engaged. In return, Duverney instructed him in the affairs of finance, and aided him with funds and credit. The first literary production which attracted attention to Beaumarchais was his drama of "Eugénie," published in 1767, which, however, did not meet with success. In Nov., 1768, Beaumarchais's second wife died, and in July of the same year, Duverney. Although one-half of his wife's fortune was in a life annuity, and the settlement of Duverney's affairs discovered a balance in favor of Beaumarchais, a rumor prevailed that he had poisoned his wife, and he was accused by Comte de la Blache, Duverney's heir, of embezzlement, fraud, and forgery. A seven years' litigation in securing the amount due him from Duverney was the occasion of his masterly "Mémoires" in his defence, which obtained for him great notoriety. These productions are admitted to be masterpieces in their way, and the interest and excitement produced by them is described as magical and electrical. Although thus occupied in the law and in his favorite literary pursuits, Beaumarchais was still actively engaged in various business speculations. He was prompt to foresee the success of our American Revolution, and engaged by connivance with, though unaided by, the French government, in supplying the Americans with arms and ammunition. How his services in this direction were appreciated the following will show: "By express order of the Congress sitting at Philadelphia, to M. de Beaumarchais: Sir,—The Congress of the U. S. of America, grateful for the great efforts you have made in their favor, presents you its thanks, and the assurance of its esteem. It grieves for the misfortunes you have suffered in support of its States. Unfortunate circumstances have prevented the accomplishment of its desires, but it will take the promptest measures for acquitting itself of the debts it has contracted with you. The generous sentiments and the exalted views which alone could dictate a conduct such as yours are your greatest eulogium, and are an honor to your character. Whilst by your great talents you have rendered yourself useful to your prince, you have gained the esteem of this rising republic, and merited the deserved applause of the New World. John Jay, *President*."

Notwithstanding this, his claim, which Alexander Hamilton approved, was not paid until 1835, thirty-six years after his death, and then but one-fourth part of the principal.

In the midst of his manifold labors he undertook at this time an expensive reproduction of the works of Voltaire, one edition of which was to be in 92 volumes, by which he sustained a very heavy loss. Notwithstanding he gave his support to the principles of the French Revolution, and imported firearms for the use of the French, his property was confiscated, and he was for a time an exile from his native land. After undergoing persecution and accusation, he returned to France after the Revolution was over. His sufferings during this period were described by him in a published work entitled "Mes Six Époques." He recovered possession of his beautiful villa at Faubourg St. Antoine, where he remained till his death. The evening of May 17, 1799, he passed with his family and a few friends; on the morning of the 18th he was found dead in his bed.

Beaumarchais, besides the works mentioned, is also the author of various dramatic productions. "Le Mariage de Figaro," his masterpiece, produced the greatest excitement in Paris, and his "Barbier de Séville," which preceded it, was also a great success. The first formed an epoch in the dramatic, social, and political annals of France, and was styled by Napoleon "the Revolution already in action." It is but proper to add that no conception of its wit, vivacity, and telling social and political allusions and sarcasms can be had at the present day, especially from the opera librettos with which we are familiar. (See L. de Loménie, "Beaumarchais, sa Vie et son Temps," 1852; Saint-Marc Girardin, "Notice sur la Vie de Beaumarchais," 1835; E. Berger, "Essai sur la Vie et les Ouvrages de Beaumarchais," 1847; "Edinburgh Review," vol. civ., 1856; "London Quarterly Review," July, 1873, etc.)

J. G. Barnard, *U. S. Army.*

Beauma'ris, a seaport of Wales, and the capital of the island and county of Anglesea, is on the E. coast of the island, 3 miles N. of Bangor and about 2 miles from the N. end of Menai Strait. It is a favorite place of resort for sea-bathing. The Bay of Beaumaris affords here safe anchorage. Here is a ruined castle built by Edward I. Pop. 2558.

Beau'mont, the capital of Jefferson co., Tex., on the Texas and New Orleans R. R., 85 miles E. by N. of Houston and 68 miles N. E. of Galveston, and at the head of tide-water navigation on the Neches River, which is navigable for 331 miles from the sea by steamers. The yellow pine and cypress lumber and shingles manufactured on the

Neches River (which has eight or ten mills) are shipped in steamers and schooners from Beaumont *viâ* Sabine Pass. It has one weekly paper.

W. F. M'Clanahan, Ed. of "News-Beacon."

Beaumont (Francis), an English dramatic poet, born in Leicestershire in 1586, was educated at Oxford. After he left college he associated with Ben Jonson in London, and became an intimate friend of John Fletcher, in partnership with whom he wrote several popular dramas, among which are "Philaster" (1611), "The Coxcomb" (1613), and "Cupid's Revenge" (1613). Beaumont also wrote "The Masque of the Inner Temple" (1612), and other poems. Died Mar., 1616. Beaumont and Fletcher are lyrical and descriptive poets of the highest order, but they are offensively coarse and licentious.

Beaumont (John C.), U. S. N., born Aug. 27, 1821, in Pennsylvania, entered the navy as a midshipman Mar. 1, 1838, became a passed midshipman in 1844, a lieutenant in 1855, a commander in 1862, and a captain in 1872. While commanding the steamer Aroostook, North Atlantic blockading squadron, he took part in the shelling of Drury's Bluff, May 15, 1862, and commanded the steamer Mackinaw in both attacks upon Fort Fisher, and for his services on these occasions was recommended for promotion by Admiral Porter in his official despatch of Jan. 28, 1865.

Foxhall A. Parker, U. S. N.

Beaumont (William), M. D., an American surgeon, born at Lebanon, Conn., in 1785. While in the U. S. army in 1825 a young man (Alexis St.-Martin) was brought to him who had received a wound from a musket discharged at the distance of only a few feet. The wound healed, and left an aperture about two and a half inches in diameter, through which the process of digestion could be seen. Doctor Beaumont availed himself of this to make various experiments on digestion, the results of which are extremely interesting and of great importance to physiological science. They were published in 1838, and afterwards in England and on the Continent. Died at St. Louis April 25, 1853.

Beaumont de la Bonnière, de (Gustave), an eminent French publicist and advocate, was born in Sarthe Feb. 16, 1802. He was a grandson of La Fayette. He visited the U. S. in 1831, in company with De Tocqueville, in order to study American systems of prison discipline. He wrote an able work "On the Penitentiary System of the U. S., etc." (2 vols., 1832), and "Slavery in the U. S." (1835). He was elected to the Chamber of Deputies in 1840, and was a moderate republican member of the National Assembly of 1848. Having opposed the *coup-d'état* of Dec., 1851, he was imprisoned for a short time. Died Mar. 2, 1866.

Beaune (anc. *Vellaunodu'num*), an old town of France, in the department of Côte-d'Or, is on the river Bouzoise, and on the Paris and Lyons Railway, 23 miles by rail S. S. W. of Dijon. It has the beautiful church of Notre Dame, and a splendid hospital founded in 1443. Here are manufactures of woollen cloth, cutlery, leather, etc. Good burgundy wine is produced in this vicinity. Pop. in 1866, 10,907.

Beauport, a post-village and parish of Quebec co., Canada, 3½ miles N. E. of Quebec. It has extensive manufactures and trade in flour, lumber, nails, etc., and is the seat of Beauport Lunatic Asylum, a large and well-conducted institution. Pop. about 1300.

Beauregard, a township of Drew co., Ark. Pop. 598.

Beauregard, a station on the New Orleans Jackson and Great Northern R. R., 139 miles N. by W. of New Orleans. It has one weekly newspaper.

Beauregard (Peter Gustavus Toutant), an American officer and engineer, born in 1818 near New Orleans, La., graduated at West Point in 1838, captain of engineers, U. S. A., Mar. 3, 1853, and general July 21, 1861, in the Southern army. He served in constructing fortifications 1838–45 and 1848–52, in the war with Mexico 1846–48, engineer at Tampico (erecting defences), Vera Cruz, Cerro Gordo, Pedregal, Contreras (brevet captain), Chapultepec (brevet major), and city of Mexico (twice wounded); as member of special engineer boards for harbor and river improvements and Gulf of Mexico defences 1852–58, and in construction of the New Orleans custom-house, marine hospital, and quarantine warehouses 1853–60. Resigning from the army Feb. 20, 1861, he joined the Southern Confederacy, taking an active part in the civil war; in command of the bombardment of Fort Sumter, S. C., 1861, in the Manassas campaign at Bull Run, Va., 1861, of the Corinth army 1862, after the death of Gen. A. S. Johnston at Shiloh; in defence of Corinth till compelled by Gen. Halleck to evacuate it, 1862; of the military department of South Carolina and Georgia, including the defence of Charleston, 1862–64; defence of Petersburg, Va., 1864; of the military division of the West 1864, and of Charleston, S. C.; from which he retired and joined Gen. J. E. Johnston upon the approach of Gen. Sherman, to whom his forces were surrendered at Durham Station, N. C., April 26, 1865. Since the war he has been a civil engineer in the South.

George W. Cullum, *U. S. Army.*

Beausobre, de (Isaac), a learned French Protestant writer, born at Niort Mar. 8, 1659. He was ordained in 1683, but was compelled by persecution to go into exile in 1685. In 1694 he went to Berlin, and became pastor of the French church. Here he remained till his death (June 6, 1738), though his great talents caused him to receive frequent and tempting calls to go to London, Hamburg, and other Protestant cities. Beausobre's fame rests chiefly on his "Histoire Critique de Manicheisme" (2 vols., 1734–39), a work of vast labor, learning, and ability. He also published a "History of the Reformation" (1785) and other important works, and, with L'Enfant, translated a part of the New Testament. He is charged with Socinian tendencies.

Beautiful, Science of the. See Æsthetics.

Beauvais (anc. *Bellov'acum*), an old city of France, capital of the department of Oise, is situated on the river Thérain, and in a rich valley enclosed by wooded hills, 64 miles by rail N. N. W. of Paris. It has a fine large but unfinished Gothic cathedral, a public library, a museum, and a college. Here are extensive manufactures of woollen cloths, flannels, shawls, Gobelin tapestry, printed cottons, and carpets. Pop. in 1866, 15,307. It was the chief town of the Bellovaci in the time of Cæsar. In 1443 it was besieged in vain by the English. The citizens of Beauvais, aided by the heroine La Hachette and other women, repulsed Charles the Bold, duke of Burgundy, who besieged the city in 1472.

Beauvais, a township of Sainte Genevieve co., Mo. Pop. 1306.

Bea'ver [Fr. *bièvre;* Lat. *cas'tor* and *fi'ber;* Ger. *Bi'ber*], (the *Castor Fiber* of the naturalists), a remarkable quadruped of the order Rodentia, is a native of Europe, Asia, and North America. Beavers were once abundant in the U. S., but they have gradually disappeared before the advance of civilization. They are characterized by industry, sagacity, and instinctive skill in building dams and houses. They have strong incisors or cutting teeth, in which a sharp, chisel-like edge is always preserved by the unequal abrasion of the hard enamel and the other part, which is softer. The body of the beaver is about two feet long. The toes of the hind feet are long, spreading, and webbed to the nails. Among its remarkable characteristics is a tail of an oval form, about ten inches long, horizontally flattened, and about three inches wide. The tail

Beaver.

is covered with horny scales, but the body is covered with a very fine and valuable fur, the color of which is sometimes chestnut-brown; this fur is used for making hats and caps. Its food consists of bark of trees, leaves, roots, and berries. The favorite haunts of beavers are rivers and lakes which are bordered by forests. "Their work is all performed in the night," says Dr. Godman. When they find a stream that is not sufficiently deep for their purpose, they build a dam across it with wonderful ingenuity and industry. The dam, which is formed of sticks, roots, stones, and mud strangely combined, is watertight, and presents a convex surface towards the current. To obtain material for it they cut down the trees growing on the margin of the stream above the dam, and float them down. They prefer small trees, but sometimes fell those that are ten inches or more in diameter. It is stated that they have built dams nearly 300 yards long. The sides of the dam incline towards each other, so that the bottom of it is much thicker than the top. There is a popular opinion that beavers use their tails as trowels in plastering. It is more

probable that the tail serves as a prop or support when they work with their fore feet or carry burdens with them. They pass the winter in houses or lodges which are two or three feet high, are built on the edge of the water, and afford them protection from wolves and other wild beasts. They also have holes or burrows in the ground (adjacent to their lodges), with entrances under the water, in which they take refuge if their lodges are destroyed or become untenable.

The houses or huts of beavers are not built of sticks first, and then plastered, but all the materials, sticks, mud, and stones, are mixed together, and this composition is employed from the foundation to the summit. "The tops of the houses," says Godman, "are generally from four to six feet thick at the apex of the cone." "The outside of the hut is covered or plastered with mud late in the autumn, and after frost has begun to appear. By freezing it soon becomes almost as hard as stone, effectually excluding their great enemy, the wolverine, during the winter. The door or hole leading into the beaver-hut is always on the side farthest from the land, and is near the foundation of the hut or at a considerable depth under water." When they are much disturbed by the presence of hunters and settlers, beavers renounce their original programme, cease to build dams and houses, and, adapting themselves to their altered circumstances, excavate in the banks of rivers holes for their residence—a signal manifestation of sagacity.

Beavers are easily tamed, but no wooden cage will keep them confined, because they gnaw through. Many of them are caught in traps by the Indians and other trappers. In 1820, 60,000 beaver skins were sold by the Hudson's Bay Company. Their numbers are rapidly diminishing in consequence of the exterminating warfare waged against them by hunters, who often kill the young before they have attained half their growth. The bait which is used to entice beavers is prepared from the substance called castor (*castoreum*), obtained from glandular pouches connected with the reproductive organs of the male beavers. "The only species of beaver known," says Dr. Godman, "is the one we have described," but others believe the Old World and New World beavers to be distinct species. The remains of an extinct beaver, very much larger than the living species, have been found in the surface deposits of Ohio and New York. It was first described by Col. J. W. Foster, and by him was called *Castoroides*. (See MORGAN, "The American Beaver," 1867.) REVISED BY J. S. NEWBERRY.

Beaver, a county of Pennsylvania, bordering on Ohio. Area, 650 square miles. It is intersected by the Ohio and Beaver rivers. The surface is undulating; the soil is very fertile. Grain, wool, hay, and dairy products are extensively raised. Bituminous coal and limestone abound in this county, which is liberally supplied with water-power. The Pittsburg Fort Wayne and Chicago and Cleveland and Pittsburg R. Rs. traverse the county. It has many important manufactures. Capital, Beaver. Pop. 36,148.

Beaver, a large county in the S. of Utah, bordering on Nevada. It is intersected by Green River. Cattle, wool, and wheat are the chief exports. Lead, silver, and iron are found here. Capital, Beaver. Pop. 2007.

Beaver, a township of Saline co., Ark. Pop. 240.

Beaver, a township of Iroquois co., Ill. Pop. 1278.

Beaver, a township of Newton co., Ind. Pop. 637.

Beaver, a township of Pulaski co., Ind. Pop. 489.

Beaver, a township of Butler co., Ia. Pop. 1084.

Beaver, a township of Dallas co., Ia. Pop. 343.

Beaver, a township of Grundy co., Ia. Pop. 401.

Beaver, a township of Guthrie co., Ia. Pop. 520.

Beaver, a township of Polk co., Ia. Pop. 1213.

Beaver, a township of Bay co., Mich. Pop. 141.

Beaver, a township of Newaygo co., Mich. Pop. 142.

Beaver, a township of Fillmore co., Minn. Pop. 419.

Beaver, a township of Renville co., Minn. Pop. 569.

Beaver, a township of Taney co., Mo. Pop. 581.

Beaver, a township of Mahoning co., O. Pop. 1933.

Beaver, a township of Noble co., O. Pop. 1684.

Beaver, a post-township of Pike co., O. Pop. 694.

Beaver, a post-borough, capital of Beaver co., Pa., on the right bank of the Ohio River, 2 miles below the mouth of the Beaver River, and on the Cleveland and Pittsburg R. R., 27 miles N. W. of Pittsburg. It is the seat of Beaver College, a female seminary, an academy, good union schools, and four churches. There is a fine park in the centre of the village. It has three weekly newspapers. Pop. 1120.
ED. "RADICAL."

Beaver, a township of Clarion co., Pa. Pop. 1338.

Beaver, a township of Columbia co., Pa. Pop. 958.

Beaver, a township of Crawford co., Pa. Pop. 1177

Beaver, a township of Jefferson co., Pa. Pop. 1094.

Beaver, a township of Snyder co., Pa. Pop. 1766.

Beaver, a post-village, capital of Beaver co., Utah, is on Beaver River, about 50 miles S. by W. from Fillmore. Copper and lead are found in the vicinity.

Beaver Bay, a post-village, capital of Lake co., Minn., in a township of the same name, on Lake Superior, at the mouth of Beaver Bay River, 55 miles N. E. of Duluth; lat. 47° 12′ N., lon. 91° 20′ W. Pop. of township, 119.

Beaver Creek, a post-township of Dale co., Ala. Pop. 400.

Beaver Creek, a post-township of Bond co., Ill. Pop. 1490.

Beaver Creek, a post-township of Washington co., Md. Pop. 1366.

Beaver Creek, a post-township of Seward co., Neb. Pop. 365.

Beaver Creek, a township of York co., Neb. P. 129.

Beaver Creek, a township of Jones co., N. C. P. 1408.

Beaver Creek, a township of Wilkes co., N. C. Pop. 960.

Beaver Creek, a township of Greene co., O. P. 2289.

Beaver Dam, a township of Butler co., Mo. P. 786.

Beaver Dam, a township of Bladen co., N. C. P. 619.

Beaver Dam, a township of Cherokee co., N. C. Pop. 763.

Beaver Dam, a township of Haywood co., N. C. Pop. 1745.

Beaver Dam, a township of Richmond co., N. C. Pop. 635.

Beaver Dam, a township of Watauga co., N. C. Pop. 413.

Beaver Dam, a post-village and township of Hanover co., Va., on the Chesapeake and Ohio R. R., 40 miles N. N. W. of Richmond. Pop. of township, 3237.

Beaver Dam, a city of Dodge co., Wis., on Beaver Dam Creek and on the Milwaukee and St. Paul R. R., 61 miles N. W. of Milwaukee. It is the seat of Wayland University, and has a fine water-power, two woollen factories, a large seeder establishment, two large grist-mills, two newspapers, and various small manufactures. It is the commercial centre of a large and rich country. Pop. 3265; including Beaver Dam township, 4726.
ED. OF "BEAVER DAM ARGUS."

Beaver Falls, the capital of Renville co., Minn., on the Beaver River, about 2 miles above where it empties into the Minnesota, and 108 miles S. S. W. of St. Paul. It has mills and splendid water-power, breweries, stores, county buildings, and one newspaper. It is in an excellent agricultural region.
D. S. HALL, ED. "RENVILLE TIMES."

Beaver Falls, a post-borough of Beaver co., Pa., on Beaver River, 4 miles above its junction with the Ohio, and on the Pittsburg Fort Wayne and Chicago R. R., 31 miles N. W. of Pittsburg. It has important manufactures. Pop. 3112.

Beaver Head, a county of the S. W. part of Montana, bordering on Idaho. Area, 4393 square miles. It is drained by the Jefferson River, a branch of the Missouri. The surface is partly mountainous. Stock-raising is carried on. The Rocky Mountain chain extends along the S. W. border. Gold is found in it. Capital, Bannack City. Pop. 722.

Beaver Indians, a name given to a former tribe of Algonquins who lived on the Canada side of Lake Huron. It is also applied to a tribe allied to the Chippewyans. They live on the Peace River in the British N. W. provinces of North America.

Beaver Island, a township of Stokes co., N. C. Pop. 1247.

Beaver Islands, a group of islands in the N. part of Lake Michigan, are a part of the county of MANITOU (which see) in Michigan. St. James, on Big Beaver Island, is the chief town. Here a branch of the Mormons, under Joseph Strong, settled in 1846.

Beaver Meadow, a mining village of Carbon co., Pa., 11 miles N. W. of Mauch Chunk. Here are valuable coal-mines, from which the coal is conveyed by a railroad to the Lehigh River.

Beaver Pond, a township of Mercer co., West Va. Pop. 1277.

Bea'vertail, the S. point of Conanicut Island, in Narragansett Bay, R. I., has a square granite lighthouse 74 feet high, with a fixed white light of the third order 96 feet above the sea; lat. 41° 26′ 56″ N., lon. 71° 23′ 39″ W.

Bea'verton, a post-village of Ontario co., Canada, on the E. shore of Lake Simcoe, 60 miles N. by E. from Toronto. It is the N. W. terminus of the Midland Railway of Canada. It has one weekly paper.

Beaverton, a post-village of Croghan and New Bremen townships, Lewis co., N. Y., at the head of navigation of Beaver River, has extensive manufactures of lumber and a tannery.

Bea'vertown, a post-village of Beaver township, Snyder co., Pa., on the Sunbury and Lewistown R. R., 25 miles W. by S. of Sunbury. It has one weekly newspaper.

Bebee'ria, or **Bebee'rine** ($C_{19}H_{21}NO_3$), a vegetable alkali or alkaloid obtained from the bark of the bebeeru, or green-heart, a tree of British Guiana. It is used in medicine as a substitute for quinine, which it resembles in properties.

Bebee'ru, Bibiru, or **Beebeeru** (*Nectandra Rodiæi*), a tree of British Guiana, the timber of which is known in commerce by the name of green-heart. It is of the natural order Lauraceæ. (See GREEN-HEART.)

Becancour, a post-village, capital of Nicolet co., Quebec, Canada, 85 miles S. W. of Quebec, has a large trade in flour and lumber. Pop. about 600.

Beccafi'co, *i. e.* "fig-eater" (*Syl'via horten'sis* or *Curru'ca horten'sis*), a small bird of the family of Sylviadæ or warblers, is sometimes called the garden warbler. It is abundant in Southern Europe as a summer bird of passage. The flesh of it is esteemed as a delicate food by the Italians. It has an agreeable song.

Beccamoschi'no, the Italian name of the *Syl'via cistic'ola,* a small bird of the family of warblers, found in Italy. It builds a remarkable nest, which resembles that of the tailor-bird.

Becca'ria, a township of Clearfield co., Pa. Pop. 1239.

Beccari'a, di (CESARE BONESANA), MARQUIS, an eminent Italian economist and writer on penal laws, was born at Milan Mar. 15, 1738. His principles were formed by the influence of Montesquieu. His most important work is a "Treatise on Crimes and Punishments" ("Trattato dei Delitti e delle Pene," 1764), in which he advanced eloquent arguments against the severities and abuses of criminal law. It obtained great popularity, and was translated into many languages. Voltaire admired it, and wrote a commentary on it. In 1768 he was appointed professor of political philosophy at Milan. Died Nov. 28, 1794. (See C. P. VILLA, "Vita del Marchese C. Beccaria," 1821; P. CUSTODI, "Vita di C. Beccaria.")

Bêche-de-Mer [Fr. for "sea-spade," because they are pressed and dried in a shape not unlike that of a spade], or **Trepang,** a name given to the dried bodies of several species of *Holothu'ria,* or sea-cucumber, which are abundant in shallow lagoons and on reefs between Australia, the Fejee Islands, and the S. E. coasts of Asia. They are esteemed a luxurious article of food by the Chinese. The Malay divers catch them and prepare them in large quantities for the Chinese market. This animal is usually about nine inches long, but sometimes measures two feet. It is stated that 8000 hundredweight of the trepang are annually exported from Macassar to China. (See HOLOTHURIDÆ.)

Be'cher (JOHANN JOACHIM), a German chemist, born at Speyer in 1645, is called the author of the first theory of chemistry. He became aulic councillor at Vienna, but soon fell into disgrace, and removed to Mayence. He was addicted to speculation, and wrote, besides other works, "Physica Subterranea" (1669). His theory was the basis of that which was developed by Stahl. He died in London in Oct., 1682.

Becher (SEIGFRIED), a German political economist, born at Plan, in Bohemia, Feb. 28, 1806. Since 1835 he has been professor of history and geography in the Polytechnic Institute in Vienna. Among his works are "Das Oesterreichische Münzsystem von 1524–1838" (2 vols., 1838), "Organization des Gewerbwesens" (1851), and "Die Volkswirthschaft" (1853).

Bechua'na, Betjuans, Bechuans, or **Boshuana,** a nation of Southern Africa, occupying the country between 22° and 29° E. lon. Their southern boundary is near 28° S. lat. They are divided into numerous tribes, each governed by its chief. They are unwarlike and gentle in disposition, and are said to be superior to the Caffres in arts and civilization. They cultivate the soil with skill and diligence. Sheep and cows form an important part of their riches. The Bechuana worship several species of animals. Their language is called "Sechuana." "Bechuana" is a plural form; "Mochuana" is the singular. (See Dr. LIVINGSTONE, "Travels in Southern Africa;" MOFFAT'S "Southern Africa.")

Beck (CHARLES), PH. D., LL.D., a German philologist, born at Heidelberg Aug. 19, 1798. Having removed to America in 1824, he became in 1832 professor of the Latin language and literature at Cambridge, Mass. He obtained the degree of LL.D. from Harvard University in 1865. He published "The Manuscripts of the Satyricon of Petronius Arbiter Described and Collated" (1863), and other works. Died Mar. 19, 1866.

Beck (JOHN BRODHEAD), M. D., an American physician, born at Schenectady, N. Y., Sept. 18, 1794, graduated at Columbia College in 1813. He became in 1826 professor of materia medica in the College of Physicians and Surgeons in New York City. He published "Infant Therapeutics" (1849). Died April 9, 1851.

Beck (LEWIS C.), M. D., a brother of the preceding, was born at Schenectady Oct. 4, 1798. He graduated at Union College in 1817, became professor of chemistry in the medical college of Albany in 1840, and wrote several works on chemistry and botany. His report on the mineralogy of New York was published by the State in 1842. Died April 21, 1853.

Beck (THEODORIC ROMEYN), M. D., LL.D., a medical writer, a brother of the preceding, was born at Schenectady Aug. 11, 1791. He graduated at Union College in 1804, practised at Albany, and obtained in 1840 the chair of materia medica in the medical college of that city. He published "Elements of Medical Jurisprudence" (1823). Died Nov. 19, 1855.

Beck'er, a county of the W. N. W. part of Minnesota. Area, 1400 square miles. It is drained by the Red River of the North, which rises within its limits, and contains several lakes. The surface is elevated about 1680 feet above the sea. Since the census of 1870 it has been rapidly settled. The soil is productive. The grain crop is important. It is intersected by the Northern Pacific R. R. Pop. 308.

Becker (HERMANN HEINRICH), a German politician, called DER ROTHE BECKER (*i. e.* "the Red Becker," on account of his extreme radical views in politics), was born Sept. 15, 1820, took part in the revolutionary movement in 1848, and was imprisoned for several years. In 1862 he was elected a member of the Prussian house of deputies, and in 1867 and 1868 of the North German Parliament, and is one of the recognized leaders of the liberal party.

Becker (JAKOB), a German genre-painter of the Düsseldorf school, born Mar. 15, 1810. His best works present village scenes and idyllic subjects. Died Dec. 22, 1872.

Becker (JOHANN PHILIPP), a German patriot and radical, born at Frankenthal Mar. 19, 1809. He emigrated to Switzerland in 1837, and fought against the Sonderbund in 1847–48. During the revolutionary movements of 1848 and 1849 he served in the army of insurgents in Baden.

Becker (KARL), a German painter, born Dec. 18, 1820, painted in Berlin. His paintings are numerous, representing mostly old Venetian life.

Becker (KARL FERDINAND), writer on music, was born at Leipsic July 17, 1804. He composed for the organ, and wrote, besides other works, "Trios" (1844) and "Die Tonkünstler des 19 Jahrhunderts" (1849).

Becker (KARL F.), philologist. See APPENDIX.

Becker (THOMAS A.), the first Catholic bishop of the diocese of Wilmington, Del., was born of German Protestant parents in Pittsburg, studied in Munich, where he joined the Catholic Church, and was consecrated as bishop Aug. 23, 1868.

Becker (WILHELM ADOLF), a learned German author, born at Dresden in 1796. He attempted to reproduce the social life of ancient Rome in "Gallus" (1838), and that of ancient Greece in his "Charicles" (1840), both of which were translated into English by Metcalfe. His chief work is "Handbuch der röm. Alterthümer" (1843–46). Died Sept. 30, 1846.

Beck'et, a post-township of Berkshire co. Mass., on the Boston and Albany R. R. Pop. 1346.

Beck'et (THOMAS À), archbishop of Canterbury, was born in London in 1109. He studied at Oxford and Paris, and was appointed high chancellor in 1158, being the first native Englishman who filled a high office after the Conquest. His style of living was sumptuous in this part of his life, but when he became archbishop of Canterbury in 1162 a remarkable change took place in his habits and deportment. He practised or affected great austerity, and appeared as a zealous champion of the Church against the aggressions of the king, whose policy tended to keep the clergy in subordination to the civil power. Becket having been involved in a conflict with Henry II., escaped in 1164 to France, and appealed to the pope, by whom he was supported. Henry confiscated his property and sequestered the revenues of his see, and received in return a menace of

a papal interdict. In 1170 a formal but hollow reconciliation was made between the king and the obstinate and haughty prelate, who returned to England and resumed his office. He also renewed his defiance of the royal authority, but on the 29th of Dec., 1170, was assassinated by four barons, servants of the king. He was regarded as a martyr by many patriotic Saxons, as well as by the zealous votaries of the Church. He was canonized by the pope in 1173, and his bones were deposited in a splendid shrine at Canterbury, which became the object of one of the great pilgrimages of Christendom.

Beckett (James M.), M. D., was a native of South Carolina, where he received his medical and literary education. He became a resident of Pickens, Ala., was a trustee of the State University in 1840, and entered the Senate as a State Rights Democrat in 1847. He acquired reputation as a debater, but his public life closed with the session of 1849.

Beck'ford (William), a celebrated author, was born in 1760. He inherited from his father an immense fortune, including the estate of Fonthill, in Wiltshire. His annual income was about £100,000. He married in 1783 Lady Margaret Gordon, a daughter of the earl of Aboyne. In 1784 he published his principal work, "Vathek," an Eastern tale (written in French), which was highly commended by Lord Byron. He was elected to Parliament in 1790, resided some years in Portugal, and expended an enormous sum in the erection of Fonthill Abbey, which he filled with rare and expensive works of art. In 1822 he sold this palace and the estate of Fonthill for £350,000, and built another palace at Bath. He published in 1834 a series of letters entitled "Italy, with Sketches of Spain and Portugal," 2 vols. He was a witty and graphic writer, and had much talent for sarcasm. Died May 2, 1844. (See "Memoirs of William Beckford," London, 2 vols., 1859; "Quarterly Review" for Mar. and June, 1834.)

Beckx (Peter John), a Belgian Jesuit, was born Feb. 8, 1795. He joined the Society of Jesus in 1819, was elected procurator of the province of Austria in 1847, was appointed, after the restoration of the Jesuits in Austria, provincial for Austria, and was elected in 1853 general of the order, in which position he has displayed great energy.

Becquerel (Antoine César), an eminent French savant, born at Chatillon-sur-Loing (Loiret) Mar. 8, 1788. He served in the army as an officer of engineers from 1810 till 1815, after which he gave special attention to the study of electricity, and made discoveries in electro-chemistry. He refuted and exploded Volta's theory of contact, and constructed the first constant pile. In 1837 he received the Copley medal of the Royal Society of London. He invented a method of electrotyping. He published, besides other works, "Traité expérimental de l'électricité et du magnetisme" (7 vols., 1834–40). He became a member of the Academy of Sciences in 1829.—His sons, Alexandre Edmond (born Mar. 24, 1820), a physicist, and Louis Alfred, a physician, born in 1814, have each attained distinction as scientific men.

Becse, Old (Hun. *O'Becse*), a market-town of Hungary, in the county of Bacs, 48 miles S. of Szegedin, on the Theiss. Pop. in 1869, 14,058.

Becse, New (Hun. *Uj-Becse*), a town of Hungary, in the county of Torontal, on the Theiss, 8 miles E. of Old Becse. Pop. in 1869, 7193.

Becskerek, Nagy ("Great Becskerek"), a town of Hungary, in the county of Torontal, on the left bank of the Bega, 59 miles S. W. of Temesvár, with which it is connected by a canal. It has a considerable trade. Pop. in 1869, 19,666.

Bed, in geology, a stratum or layer of stratified sedimentary rock of variable thickness. A bed often consists of numerous thin laminæ or plates, resulting from intermissions in the supply of materials, produced by such causes as the ebb and flow of the tide, and variable degrees of the turbidness of the water under which they were deposited. Seams become beds, or are so called if they have a considerable thickness, as coal-beds.

Bed of Justice [Fr. *lit de justice*], a term applied to the seat or throne occupied by the king of France when he was present at a session of Parliament; also to such a session, or the conference of the Parliament with the king, who came to overrule the decisions of Parliament and enforce edicts or ordinances to which that body was opposed. Decrees promulgated at such a session were more authoritative than the ordinary decisions of Parliament. The ceremony became synonymous with an act of arbitrary power. The last "bed of justice" was held by Louis XVI., in 1787.

Bédarieux, a town of France, in the department of Hérault, on the river Orbe, 27 miles by rail N. of Béziers. It is well built, and has manufactures of fine cloths, hosiery, cotton stuffs, paper, hats, and soap. Pop. 8985.

Bed-bug, a well-known hemipterous insect, the *Cimex lectularius*, infesting beds, houses, dove-cots, and the nests of swallows, bats, etc. The eggs are oval and white; the young vermin flat and transparent. In eleven weeks the insect reaches its full size. It is tenacious of life, and has been kept alive more than a year in a sealed bottle without food. Cockroaches devour them in large numbers. Mercurial solutions, benzine, etc. will extirpate these vermin, but prevention by cleanliness is better than cure.

Bed'-chamber, Lords of the, twelve officers of the British royal household who in the reign of a king wait in turn on the person of the sovereign. They are under the groom of the stole, who attends His Majesty only in public ceremonies and on occasions of state. During the reign of a queen these offices are performed by ladies of the bed-chamber and the mistress of the robes, who is substituted for the groom of the stole. Queen Victoria has about eleven ladies and extra ladies of the bed-chamber. These offices are usually filled by the "prime nobility" of the kingdom, who are appointed by the sovereign, and are not removed on each change of the ministry.

Bed'dington, a post-township of Washington co., Me. Pop. 134.

Bed'does (Thomas), M. D., an eminent English physician and writer, born at Shiffnal, in Shropshire, April 13, 1760. He was educated at Oxford, and was well versed in the Latin and other languages. He married Anna, a sister of Maria Edgeworth, and in 1788 was appointed to the chemical lectureship in the University of Oxford. In 1792 he resigned this position. He wrote for the benefit of the working-classes a popular work called "The History of Isaac Jenkins." He opened in 1798 at Bristol a pneumatic hospital for the cure of disease by medicated gases, in which Humphry Davy was his assistant. Among his works is "Hygeia, or Essays, Moral and Medical" (3 vols., 1802). Died Nov. or Dec. 24, 1808. (See E. Stock, "Life of T. Beddoes," 1811.)

Beddoes (Thomas Lovell), M. D., a poet, a son of the preceding, was born at Clifton July 20, 1803. He was a nephew of Maria Edgeworth. He studied medicine and anatomy at Göttingen, and resided many years in Germany. In 1822 he produced "The Bride's Tragedy," which excited general admiration by its profound thoughts, though not free from extravagance. Among his productions is a tragedy called "Death's Jest-Book" (1851), which displays great richness of imagery and passionate eloquence. He died at Bâle Jan. 26, 1849, in consequence of a dissection wound received in 1848.

Bede [Lat. *Be'da*], surnamed the Venerable, an illustrious and pious English scholar and monk, was born in the county of Durham in 673 A. D. He was ordained a priest at the age of thirty, and devoted much time to study and literary pursuits. His name is regarded as the greatest in the ancient literature of Britain. He wrote on astronomy, grammar, music, etc. His most important work is an "Ecclesiastical History of the English Nation" ("Historia Ecclesiastica Gentis Anglorum"), which King Alfred translated into Anglo-Saxon, and which has often been reprinted. He died May 26, 735 A. D. His whole works were published by Dr. Giles (London, 6 vols., 1844), including an English translation of his "Ecclesiastical History." (See Gehle, "De Bedæ Venerabilis Vita et Scriptis," 1838; J. A. Giles, "Life of Bede," prefixed to his complete works, 1844.)

Bedeau (Marie Alphonse), a French general, was born in Vertou, near Nantes, Aug. 10, 1804. He served with distinction in Algeria (1836–47), and became a general of division in Sept., 1844. He had the command (under Bugeaud) of the troops in Paris when the Parisians revolted in Feb., 1848, and under the new republican régime he became commander-in-chief of that city. As a member of the National Assembly (1849–51) he acted with the republicans and opposed Louis Napoleon. Died Oct. 29, 1863.

Bed'egar, or Bedeguar, a name of a remarkable gall which is sometimes called sweet-brier sponge, and is found on the branches of the sweet-brier and other species of rose. It is produced by the *Cynips rosæ* and other insects, and is often one inch or more in diameter. It was once used in medicine.

Be'del (Timothy), a Revolutionary patriot, born at Salem, N. H., removed to Haverhill, N. H., and was a lieutenant in 1760, serving in Canada. He became in 1775 a captain of rangers, and in 1776 colonel of the first regiment of New Hampshire troops, and served at Montreal and under Schuyler, and afterwards was major-general of New Hampshire militia. Died at Haverhill, N. H., in Feb., 1787.

Bedell' (Gregory Thurston), D. D., son of the following, an American Protestant Episcopal bishop, born

at Hudson, N. Y., Aug. 27, 1817, educated at Flushing, L. I., and Bristol College, Pa. He is at present bishop of the diocese of Ohio. He is the author of "The Divinity of Christ," "The Profit of Godliness," "Sacredness of the Grave," "The Principles of Pastorship," "The Age of Indifference," "Episcopacy—Fact and Law," etc.; his sermons have been published in the U. S. and in Scotland.

Bedell (Gregory Townsend), D. D., an eminent American Episcopal clergyman, born on Staten Island, N. Y., Oct. 28, 1793. He graduated at Columbia College in 1811, was greatly admired as a pulpit orator, and wrote, among other religious works, "Onward, or Christian Progression," "Renunciation," and two volumes of sermons. Died at Baltimore Aug. 30, 1834. (See his "Life" by Rev. Dr. Tyng, 1836.)

Bedell (William), an English Protestant prelate distinguished for his wisdom and virtue, was born in Essex in 1570. He went to Venice in 1604 as chaplain to Sir Henry Wotton, the English ambassador, and remained there eight years. In 1627 he was elected provost of Trinity College, Dublin, and in 1629 became bishop of Kilmore and Ardagh. He reformed abuses in his diocese, and acquired much influence by his acts of charity and his other virtues. He procured the translation of the Old Testament into Irish. Died Feb. 7, 1642. (See Burnet, "Life of Bishop Bedell," 1685; H. J. Monck Mason, "Life of W. Bedell," 1842.)

Bedesman (*i. e. beadsman*), [from the Saxon *bead*, a "prayer"], equivalent to petitioner, was a common affix at the end of English letters in the fifteenth and sixteenth centuries. A common form of signature at one time was, "Your bounden bedesman," or "Your humble bedeswoman."

Bed'ford, an old market-town of England, capital of Bedfordshire, is on the river Ouse, here crossed by a bridge, 48 miles by rail N. N. W. of London. Several railroads pass here. It has more charitable institutions and public endowments, in proportion to its size, than any town in England. It has several fine Gothic churches, a public library, a famous grammar-school, a lunatic asylum, a jail, a penitentiary, numerous schools and charities, including about sixty almshouses. Bedford has manufactures of farming implements, lace, and straw hats, and a trade in corn, malt, and timber. John Bunyan wrote "Pilgrim's Progress" in Bedford jail. Pop. in 1871, 16,849.

Bedford, a post-village, capital of Missisquoi co., Quebec, Canada, is in Stanbridge township, 2 miles from Stanbridge, and has good water-power and manufactures.

Bedford, a thriving post-village of Halifax co., Nova Scotia, on Bedford Basin and on the Nova Scotia Railway, 8 miles N. W. of Halifax. It has a large woollen mill. Pop. about 250.

Bedford, a county of Pennsylvania, bordering on Maryland. Area, 1000 square miles. It is intersected by the Raystown Branch of the Juniata River. The surface is mountainous, being diversified by several ridges of the Alleghanies, named Dunning's Mountain, Warrior Ridge, etc. The main Alleghany range extends along the W. border of the county. In the N. E. part of this county are the Broad Top coal-mines. Grain, cattle, and wool are important products. It has considerable manufactures. Capital, Bedford. Pop. 29,635.

Bedford, a county of Middle Tennessee. Area, 550 square miles. It is intersected by Duck River. The surface is undulating; the soil is fertile. Maize is the staple production. Wheat, cattle, tobacco, and wool are also raised. The Nashville and Chattanooga R. R. passes through this county. Capital, Shelbyville. Pop. 24,333.

Bedford, a county in the S. of Virginia. Area, 504 square miles. It is bounded on the N. E. by the James River, and on the S. W. by the Staunton River. The Blue Ridge, which extends along the N. W. border of the county, presents beautiful scenery. The Peaks of Otter rise to the height of 3993 feet on the boundary of this county, which is intersected by the Virginia and Tennessee R. R. The soil is fertile. Grain, tobacco, and wool are the chief crops. The "Bedford Alum Springs" afford a valuable chalybeate water. Capital, Liberty. Pop. 25,327.

Bedford, a township of Cross co., Ark. Pop. 319.

Bedford, a township of Wayne co., Ill. Pop. 1336.

Bedford, capital of Lawrence co., Ind., on the Louisville New Albany and Chicago R. R., 71 miles N. W. of New Albany. It has five churches, an academy, a college, eight school-houses, a large town-hall, a fine stone courthouse, three newspapers, one monthly magazine, and one national bank. Ed. of "Bedford Independent."

Bedford, a post-village, capital of Taylor co., Ia., is on a prairie and on the river One-Hundred-and-Two, about 100 miles S. W. of Des Moines. It is on the branch of the Burlington and Missouri River R. R., 35 miles S. of Creston, and has considerable trade. It has a weekly newspaper. Pop. 720.

Bedford, a post-village, capital of Trimble co., Ky., about 40 miles N. W. of Frankfort. Pop. 200.

Bedford, a post-township of Middlesex co., Mass., on the Middlesex Central R.R. It has a mineral spring. P. 849.

Bedford, a post-township of Calhoun co., Mich. Pop. 1466.

Bedford, a township of Monroe co., Mich. Pop. 1459.

Bedford, a township of Lincoln co., Mo. Pop. 2325.

Bedford, a township of Nehama co., Neb. Pop. 195.

Bedford, a post-township of Hillsborough co., N. H., 21 miles S. of Concord. It has manufactures of brick, lumber, etc. Pop. 1221.

Bedford, a post-village and semi-capital of Westchester co., N. Y., in a township of the same name, on the New York and Harlem R. R., 39¾ miles from New York. There are twelve churches in the town. Pop. of township, 3697.

Bedford, a township of Coshocton co., O. It has beds of good cannel coal. Pop. 918.

Bedford, a post-village of Cuyahoga co., O., on the Cleveland and Pittsburgh R. R., 14 miles S. E. of Cleveland. Pop. 828; of Bedford township, 1788.

Bedford, a township of Meigs co., O. Pop. 1645.

Bedford, a post-borough, capital of Bedford co., Pa., is on the Raystown Branch of the Juniata, and on a railroad, 94 miles W. S. W. from Harrisburg. It is pleasantly situated on high ground and between two ridges, one of which rises about 1200 feet above the valley. The Bedford Springs, about one mile distant, are a fashionable place of summer resort. Iron ores abound, and iron is here manufactured. It has two weekly newspapers. P. 1247; of the township, 2333. Ed. "Bedford Gazette."

Bedford, a post-village of Bedford co., Tenn.

Bedford, Dukes of (1694); earls of Bedford (1550); marquess of Tavistock (1694); Barons Russell of Cheneys (1539); Barons Russell of Thornaugh (1603); Barons Howland (1695, in England), a prominent family of Great Britain.—William Russell, the eighth duke (of this family), was born June 30, 1809, and succeeded his father in 1861. He was member of Parliament for Tavistock 1832–41.

Bedford (Gunning), a patriot of Delaware, served against the French in 1755, was a native of Philadelphia, an officer of the Revolutionary army, was wounded at White Plains, became mustermaster-general in 1776, was a member of Congress (1783–85), and governor of Delaware (1796–97). Died Sept. 30, 1797.

Bedford (Gunning), a cousin of the preceding, born in Philadelphia in 1747, and graduated at Princeton in 1771, was a member of Congress from Delaware (1785–86), and of the convention (1789) that formed the U. S. Constitution. He was U. S. district judge (1789–1812). Died Mar. 30, 1812.

Bedford (Gunning S.), M. D., was born at Baltimore in 1806, and graduated at Mount St. Mary's College in 1825. After serving as professor in Charleston, S. C., and at Albany Medical College, he settled in 1836 in New York City, where he was professor of midwifery in the University of New York (1840–42). He published an excellent treatise on obstetrics and "Lectures on the Diseases of Women," besides valuable translations from the French. Died at New York Sept. 5, 1870.

Bedford (John Plantagenet), Duke of, the third son of King Henry IV. of England, was born in 1389. He was created duke of Bedford in 1414, and was commander-in-chief of the forces in England during the absence of Henry V., who was his brother. After the death of Henry V. (1422) the duke of Bedford was regent of France, and waged war with success against the French dauphin. He gained a victory over the French at Verneuil in 1424, but his conquests were soon checked by Joan of Arc. He died at Rouen Sept. 19, 1735. His memory is stained by his abetting the murder of Joan of Arc. (See Hume, "History of England.")

Bedford Level, or **The Fens,** a tract of flat land in the eastern part of England, is bounded on the E. by the German Ocean, and comprises parts of Huntingdon, Northampton, Cambridge, Lincoln, Norfolk, and Suffolk. Its inland boundary is a range of highlands in the form of a horseshoe. Nearly all the marshy district called The Fens is included in the Bedford Level, which is intersected by the Cam, Ouse, Nene, and Welland rivers. It was formerly a vast morass, and was named in honor of Francis, duke of Bedford, who in 1634 undertook to reclaim it, and expended £100,000 in draining it. The work was completed

by his son, William, duke of Bedford, who spent £300,000 on it. This tract now produces good crops of grain and flax, and grass for pasture. Its drainage has been improved in the present century.

Bed'fordshire, an inland county of England, bounded on the N. E. by Huntingdon, on the E. by Cambridge, on the S. E. and S. by Hertford, on the S. W. by Bucks, and on the N. W. by Northampton. Area, 463 square miles. The surface is undulating or nearly level, except the Chiltern Hills in the S. part. The principal river is the Ouse. The southern part of the county consists of chalk, thinly covered with a soil which is fit only for sheepwalks. Stiff clay and rich loams occur in other parts of the county, which is more exclusively agricultural than any other in England. There are some manufactures of straw hats and of lace. Capital, Bedford. Pop. in 1871, 146,256.

Bedford Springs, Bedford co., Pa., are 1 mile from Bedford, yield valuable medicinal water, and are also attractive from their cool climate in summer, their pleasant mountain-scenery, and their agreeable society. The springs are—Anderson's (saline chalybeate), the Sweet Spring (nearly pure), the Sulphur, the Chalybeate, Fletcher's (saline chalybeate), and the Limestone. The waters are generally laxative and tonic, and act upon the skin and kidneys.

Bed'lam, a corruption of **Bethlehem,** which was the name of a religious house in London converted in 1547 into a hospital for lunatics. When Henry VIII. suppressed the religious houses, one of these, coming into the control of the corporation of London, was converted into an asylum for the insane. In 1814 the insane patients were removed to a new asylum in St. George's Fields, which has good accommodations for almost 500 patients, and is managed in an excellent manner. Bedlam is sometimes used as synonymous with a mad-house, or a place of uproar.

Bedle (Joseph D.). See Appendix.

Bed'loe's Island, in New York harbor and in the city of New York, 1½ miles S. W. of the Battery. It was named from a former owner. In 1800 it was ceded to the U. S. government, and in 1841 Fort Wood, mounting seventy-seven guns, was erected upon it. Pop. 97.

Bedmar', de (Alfonso de la Cueva), Marquis, a Spaniard, born in 1572. He was sent as ambassador to Venice by Philip II. in 1607, and formed a daring and nefarious plot to betray the Venetian city and state into the power of the king of Spain. The plot was detected one day before that appointed for its execution, and Bedmar was expelled from Venice. He became a cardinal in 1622, and died in 1655. His conspiracy is the subject of Otway's "Venice Preserved." (See Daru, "Histoire de Venise;" Saint-Real, "Conspiration contre Venise.")

Bed'minster, a township of Somerset co., N. J. Pop. 1881.

Bedminster, a post-village and township of Bucks co., Pa., 38 miles N. of Philadelphia. Pop. of township, 2370.

Bedos de Celles (Jean François), a French Benedictine monk, born at Caux in 1706. He made several good organs at Toulouse, and wrote a work called "L'Art du Facteur d'Orgues" (4 vols., 1770), which is highly commended. Died in 1779.

Bed'ouin, or **Beduin,** written also **Bedaween** and **Bedawee** ("inhabitants of the desert"), nomadic Arabs who are, according to tradition, the descendants of Ishmael and the aborigines of Arabia. They are a pastoral people, having no houses but tents, and no permanent places of residence. They form the greater portion of the population of Arabia, but are not confined to that country. Though they are not united by a strong national organization, they have never been entirely subjugated by any foreign conqueror, as the desert into which they can retreat forms an almost insuperable obstacle to an invading army. They are now widely distributed over Northern Africa, Syria, etc. As they have no general government or political institutions, religious traditions and customs form the only bond of order and union among them. They are divided into tribes, each of which is ruled by a sheik, whose authority is patriarchal. Their riches consist chiefly in flocks of sheep, camels, horses, goats, etc. They are ignorant, fierce, depraved, addicted to robbery and fighting, and reckless of the rights of property. They profess the Mohammedan religion, but are not very strict in the practice of its discipline. Their complexion is brown of various shades. In person they are generally lean, sinewy, and active. An admirable picture of Bedouin life and character may be found in Palmer's "Desert of the Exodus," 1871.

Bed'straw (*Ga'lium*), a name of a genus of herbaceous plants of the order Rubiaceæ, distinguished by a wheel-shaped corolla, and a fruit which is dry or fleshy, 2-lobed, separating when ripe into two seed-like, indehiscent, 1-seeded carpels. It comprises numerous species, natives of Europe, Asia, and the U. S. The roots of several species, as *Galium verum*, *Galium tinctorium*, etc., contain a red coloring-matter which is said to be equal to madder. The *Galium verum*, which is a common weed in England, is sometimes called cheese rennet, because it has the property of curdling milk. It is naturalized to some extent in the U. S. The *Galium tuberosum* is cultivated by the Chinese, who eat its farinaceous roots. *Galium Aparine*, or cleavers, is a valuable diuretic.

Bee [Gr. μέλισσα: Lat. *apis;* Fr. *abeille;* Ger. *Biene*], the name of a large family of insects of the order Hymenoptera. All bees were included by Linnæus in the genus *Apis*, but they are now divided into many genera. The name Apiaria is now used to include the entire family, which has also been styled Anthophila ("flower loving") and Mellifera ("honey-producing") by different naturalists. The insects of this extensive family, when in their perfect state, feed on saccharine juices, such as the nectar of flowers, honey, and the juice of ripe fruit. The honey-bee, on account of the large quantities of honey which it collects and stores, has attracted the attention of man in all countries, and has been celebrated for its remarkable habits in both ancient and modern times. A late writer justly remarks: "That within so small a body should be contained apparatus for converting the various sweets which it collects into one kind of nourishment for itself, another for the common brood, a third for the royal brood, glue for its carpentry, wax for its cells, poison for its enemies, honey for its master, with a proboscis as long as the body itself, microscopic in several parts, telescopic in its mode of action, with a sting so exceedingly sharp that were it magnified by the same glass which makes a needle's point seem a quarter of an inch, it would yet itself be invisible, and this, too, a hollow tube,—that all these varied operations and contrivances should be included within half an inch of length and two grains of matter is surely enough to crush all thoughts of atheism and materialism."

This small insect has doubtless excited more admiration than any other individual of the whole animal creation, except man himself, and, with the exception of the silk-worm and cochineal, is almost the only insect of any commercial value. Professor Jaeger remarks: "It is impossible for any reflecting person to look at a bee-hive in full operation without being astonished at the activity and surprising industry of its inhabitants. We see crowds constantly arriving from the woods, meadows, fields, and gardens, laden with provisions and materials for future use, while others are continually flying off on similar collecting expeditions. Some are carrying out the dead, others are removing dirt and offal, while others are giving battle to any strangers that may dare intrude. Suddenly a cloud appears, and the bees hurry home, thronging at the entrances to the hives by thousands, until all are gradually received within their enclosure. In the interior of the hive we see with what skill they work their combs and deposit the honey; and when their labor is over for the day, they rest in chains suspended from the ceiling of their habitation, one bee clinging with its fore feet to the hind feet of the one above it, until it seems impossible that the upper one can be strong enough to support the weight of so many hundreds."

Every swarm is composed of three different kinds or classes—the queen, the workers, and the drones. The

Fig. 1. Fig. 2. Fig. 3.

Drone. Worker. Queen.

"queen" is the only perfect female in the hive, and during the propagating season lays from one to two thousand eggs in a day. She is longer than either the drones or workers, but her size in other respects is a medium between the two; in color darker on the upper side, with legs and under side yellowish. When the season for swarming approaches, which is always early in the season (usually June in our Northern States), she deposits eggs, first for the workers, then in drone and queen cells, from which males and queens are developed. There seems to be no difference between the eggs for producing a worker or a queen, but the nature of the cell and the food effects the difference. The queen lives much longer than any other bee, or often four or five years, although this longevity is disputed by some writers

on theoretical grounds, but observation appears to have fully established the age to be from three to five years. She is furnished with a sting, which she uses exclusively in combat with other queens.

It was well known in ancient times that a large bee with long body and short wings existed in every hive, and this was called the "king," to whom also was attributed great wisdom in governing the whole swarm. This opinion was common till within two hundred years, when Swammerdam proved by anatomical investigation that this supposed king was a female, which lays all the eggs for the multiplication and growth of the throng of individuals which she governs. Aristotle and Virgil held the opinion that this bee laid no eggs, but brought home from flowers and fruits a peculiar substance from which first the maggots and then the bees originated.

The best way of making the acquaintance of the queen is to divide a swarm and place each portion in separate hives. The portion which retains possession of the queen will soon become quiet and contented. The swarm without the queen, although apparently satisfied at first, will soon be restless and uneasy, and cease working. Then if the apiarian (who has previously provided himself with an extra queen taken from the queen-cells of a hive) offers them a queen, they receive her with a peculiar buzz of triumph, which is quickly conveyed like a telegraphic despatch through the hive, and in a few seconds they become quiet and satisfied. In order to prove that bees always follow the queen, Swammerdam tied one by means of a fine hair to the top of a pole, which he then stuck in the ground in his garden. The whole swarm immediately followed, and surrounded the queen on all sides, and he was enabled to carry them all wherever he pleased. It is in this way that certain self-styled "bee-charmers" cause the swarm to alight on the hat, beard, or other place, by securing the queen within a gauze bag or cage.

The worker-bees are imperfect or undeveloped female bees, comprising most of the hive, usually nine-tenths or more, and commonly twelve or fifteen thousand in a single hive. All the labor is performed by the workers; they gather all the honey, bee-glue, and pollen, carrying the latter in little baskets on their thighs, and the former in a little sack; they secrete wax from honey, construct the combs, feed the young, and clean the hives. They usually live about six months through the winter, and not more than two or three months during the working season. A hive is therefore a community renewed repeatedly through the year, the queen only seeing successive seasons, and on her producing many thousands of eggs the existence of the colony depends. When deprived of a queen from accident or death the hive soon dwindles and dies out.

The drones are the male bees of the hive. They have no sting, they do no work, and their only use is in the propagation of progeny. Huber, the celebrated blind naturalist of Geneva, in Switzerland, who made more discoveries of the habits of the bee by means of an assistant than any other person, asserted that the drones while on the wing meet the queen for this purpose, and this opinion is commonly adopted, but other writers think the drones only fecundate the eggs after they are deposited, in the same manner that male fishes fructify the spawn. They are larger than the working bee, have a rounder head, and are generally more clumsy in their movements. They are destroyed by the workers soon after the close of the honey season.

Bees begin to breed early in spring, and they have usually increased their numbers greatly by the month of June. After the queen has deposited eggs, it requires about twenty-two days before the worker comes out a perfect insect, and about twenty-five days for the drone. The time for the development of the queen is only sixteen days from the laying of the egg. The egg is fastened by one end to the bottom of the cell, so that it appears as if suspended in the air. It is soft and smooth, and five times as long as thick. It is first developed into a maggot which has little motion, with two white eyes, a mouth like a caterpillar, and ten respiratory holes on the sides. The maggot is fed by the workers for about a week, after which a wax cover is placed over the cell, and it becomes a pupa, remains ten days in this condition, and then breaks its wax cover, creeps out, dries its wings, and in a short time passes out of the hive, and flies away with its companions for the collection of honey and materials.

The first swarm, in the climate of the Northern and Middle States, usually leaves the hive in the month of June. The migration seems to depend in a great measure on the want of space in the mother-hive, and not on an instinctive desire for change; for skilful apiarians sometimes, by making additions to the hive, retain the increase and prevent swarming. No certain signs have been discovered to indicate the time when the first swarm will issue from the parent hive. If the weather and yield of honey are both favorable, swarming may be looked for when the bees become crowded for room and hang in large numbers outside the hive (although this often takes place without swarming), and when the hive is well filled with comb and stores. The indications are increased if it is found on examination that the royal cells for new queens are in a forward state of preparation. The old queen invariably leads forth the first swarm, usually in the heat of the day, and if rainy weather has occurred the swarming is more likely to occur on the appearance of bright sunshine. It is supposed that the queen takes the lead, and it is certain that the swarm always keeps with her, and she exercises an inscrutable influence over all the movements of the thousands which compose it. Wherever she alights they follow, and if from any cause she returns to the old hive, they all return with her.

In about nine days from the first swarming a second may be looked for, if the swarm is a strong one and the weather and honey-harvest are favorable. If a third swarm should follow, it is commonly about three days after the second. The occurrence of these two swarmings may be commonly determined with accuracy by what is termed "the piping of the queen." The apiarian places his ear near or against the hive in the evening of the seventh or eighth day, and if a second swarm is to issue he will hear a peculiar whining and peeping note within the hive. The whining sound comes from the new queen which has been left to reign by the departure of the old one; and this sound is commonly followed by a lower and quicker note from the third queen, who is to remain when the second queen quits the hive with her swarm. As this insect sovereign appears to be impelled by strong jealousy of all rivals, she endeavors to sting to death in their cells all the young queens which the workers have been feeding; and when restrained by the guard placed for their protection, it is supposed that she utters a complaint known as "piping." This is probably a fanciful supposition; but every one who has listened attentively to these sounds has been struck with the strong resemblance which the notes of the older queen bear to the tone of complaint, and those of the younger to that of defiance. Whenever these notes are heard, which is always a week or so after the departure of the first swarm, the apiarian confidently expects a second or a third, as the case may be, within a day or two, the weather permitting and no accident supervening.

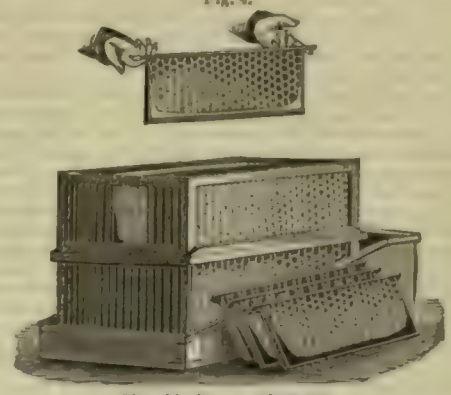
The swarming of the first colony usually takes place between the hours of ten A. M. and three P. M., but second and third swarms often leave earlier or later in the day. The bees issue by many thousands, and the air is filled with them for a space of from twenty to fifty feet as dense as a snow-shower. In a short time they settle, usually on the limb of a tree, from which they hang in the form of a bag. To prevent their alighting too high up for hiving, it is best to have no high trees near the apiary, and hiving may be greatly facilitated by providing artificial supports to attract them. These are made in many different ways, all with the same object in view. A block of wood, cut in the shape of a bag or settled swarm, may be covered with dark-brown or black cloth, and hung by a hook in a convenient shady place in sight of the hives as a decoy. A few dead bees, or a portion of the seed-stalks of the mullen, strung to the block, increase the attractions. A number of these may be placed in different parts of the yard. When the swarm has settled, the support may be unhooked and carried carefully to the place for hiving, and the bees shaken off on the hiving-board. Another contrivance is the hiving-box, consisting simply of any box holding nearly half a bushel, with one side open, and attached to a pole. When the swarm comes out, the operator takes his box by the handle or pole, the box being held over his head, and walks slowly in the midst of the flying swarm. They will be likely to alight upon it and enter its open side. As soon as this takes place, it is put in a fixed position, resting against a fence, or with the pole thrust into a hole made with a crowbar by an assistant. When the bees have all settled, it is carried to the hive already prepared for the new swarm. A third contrivance is made by taking a board about the size of the bottom of the hive, boring several holes and inserting corncobs dyed brown or the seed-stalks of the mullen, nailing a smaller board at the top to form a hood, and attaching it by nails to a pole eight or ten feet long. When the bees begin to alight upon it it is placed, facing downward, in a sloping position in a crowbar hole, as already mentioned. A broad projecting board, inserted under the hive intended for the swarm, allows the operator to empty the bees upon it, from which they will readily pass in. When the bees have entered the board is withdrawn. The whole process is usually completed in a few minutes. If the swarm should not enter the hiving-box, but alight on some tree, the box is to be held against the spot as soon as they begin to cluster, when they will usually leave the tree and pass into the box;

or if they do not, a few jars with the side of the box will induce them to loosen their hold and enter it. The operation is easily performed, and only a minute or two is occupied in their clustering. It is well to have one or two boxes with longer poles, to secure such swarms as settle too high up for ordinary reach. The weight of swarms is usually five or six pounds, small ones four pounds, and very large ones eight or ten pounds.

The loss of newly-hived swarms, occasioned by their leaving the hive, which frequently happens under ordinary management, may be prevented by simply placing the hive flat on the bottom board for a few days, after which it may be raised on supports at the corners a third of an inch, as is always practised with established swarms. Another effectual mode is to contract the entrance to a breadth of exactly ten sixty-fourths of an inch, which allows the workers to pass, but confines the queen. Without her the bees will never leave. A strip of tin may be tacked on for this purpose, to be removed in three or four days.

Hives.—The first or original hives selected by the bees were the hollow trunks of trees, which they cleansed from dust and rubbish, gnawing off with their mandibles any asperities or projections which might interfere with the future construction of the comb. Next, they were made artificially somewhat of a bell-shape, and constructed of straw and willow twigs; and lastly in the form of oblong or cubical boxes, with various modifications and appendages. For small apiaries, when the owner desires honey simply for home consumption, and can give only occasional attention, a simple box-hive with holes through the top, and a simple rough box to hold twenty-five or thirty pounds to set over, answers a good purpose. The size of the hive should not exceed a capacity of 2000 cubic inches; it should be smaller rather than larger, and some good apiarians prefer 1700 or 1800 cubic inches, or about twelve inches each way inside. Sticks are set across for the support of the combs. It is convenient to have a pane of glass set in one side, covered and kept shut by a wooden door, for occasional examination of the interior. If *guide-combs* (or small portions of empty combs) are attached to the ceiling of the hive, the combs may be so directed that their edges will rest against the glass, and enable the operator to see between them.

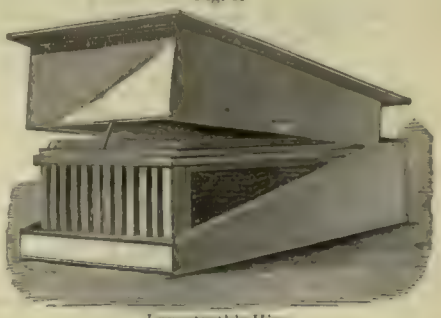
If the honey which is obtained from the upper movable box is made in small glass boxes placed within this upper box, or in a corresponding chamber made in the upper portion of the hive, it will present a finer appearance and sell at higher prices in market. This chamber may be entered by a side door, and four boxes may be placed within it.



Artificial Swarms.—It often happens that the apiarian wishes to control the time and frequency of swarming, without leaving the bees themselves to decide this question at their own will. This is effected by making artificial swarms. The bees of the hive are separated into two nearly equal portions, as already alluded to, and the apiarian, having previously secured a new queen by cutting off a queen cell when she is about to come out, offers her to the unsupplied portion.

In performing all operations of this kind the bees will be rendered more quiet, and they may be handled more easily, by previously blowing upon them the smoke of rotten wood through a pipe made for the purpose. Cotton rags answer the same purpose, but tobacco smoke is too deadly. In addition to this a mask of gauze and thick gloves will afford ample protection.

Movable-comb Hives.—Apiarians who have a large number of hives for commercial purposes, who can give much personal attention, and who do not fear to approach and handle bees freely, have adopted of late years a contrivance known as movable-comb hives. These hives enable the owner to examine minutely every part of the interior, and any evil is readily discovered and remedied, each comb being made on a separate frame, which may be lifted out from the rest. If the hive should happen to be queenless, the fact may be at once determined without waiting till the numbers are ruinously reduced. Should the queen produce nothing but drones, the discovery may be at once made, and her place supplied with a more profitable incumbent. If too much drone-comb has been made, it may be replaced with worker-comb. If the moth has effected an entrance, the larvæ may be seen and at once taken out. He can limit the number of swarms, by taking out the combs and removing all the queen cells but one. When one hive has a surplus of honey and another is deficient, an equilibrium may be effected by exchanging a few combs. Old combs may be removed, all that is necessary being to substitute empty frames. Movable-comb hives greatly facilitate the making of artificial swarms.



The simplest form of the frame for the movable comb is shown by Fig. 4. Guide-combs are attached to the bars to have the bees work them straight. Langstroth's hive (Fig. 5) consists of a series of these frames, so arranged that any one may be taken out separately from the rest. Many other forms of the movable-comb hive have been

Fig. 4.

Movable frames taken out.

Fig. 5.

Langstroth's Hive.

lately devised, obviating difficulties connected with those first made.

The following detailed description of the mode of making artificial swarms by the use of movable-comb hives is given by L. L. Fairchild in vol. iv. of "Rural Affairs." *Artificial swarms*, equal in value to natural swarms, can be made in this way. It should only be practised when the bees are gathering honey abundantly, and there are plenty of drones to mate with the young queens. A little before, or about the time of natural swarming, is the time to practise it. A good way is to make one good swarm from two strong stocks. Take the combs from a hive (No. 1), and shake the bees back into the hive, brushing off with a wing any that may remain after a shake or two. Put these combs, destitute of bees, into a new hive. Leave one comb, containing eggs and brood, and the queen, in the old hive. Put in empty frames to fill the place of those taken out, and leave the hive on its old stand. Remove a strong stock (No. 2) to a new location, and put the hive containing the combs taken from No. 1 on the stand formerly occupied by No. 2. If this is done while the bees are in full flight, those in the field belonging to No. 2 will enter the new hive containing the combs, brood, and stores taken from No. 1. Finding their queenless condition, they will immediately set to work and build queen cells, and, if everything works right, will have a queen ready to emerge from her cell the fourteenth day. Plenty of brood will hatch from day to day to keep up the strength of the swarm until the young queen commences laying. The old stock will prosper, as it retains its fertile queen, and is in nearly the condition of a natural swarm. If a few frames containing empty comb could be given to them, it would be a great help, as every pound of comb they build consumes fifteen or twenty pounds of honey in its elaboration. There are many other ways of making artificial swarms, but this is about the safest method for the inexperienced, and produces a moderate increase of stocks, and yields a good supply of surplus honey. It will be found very safe, and profitable in the long run. The inexperienced had better not divide or increase their stocks more than fifty per cent. in any one year. Too great an increase of stocks is the rock that many an apiarian has split upon when endeavoring to increase his apiary by artificial swarming. There is a considerable saving to be made by rearing queens artificially to supply every new artificial swarm, but it should only be attempted by those well versed in the natural history and management of the bee. If you give the

new swarm a sealed queen cell, it will save them time in rearing a queen.

As soon as a hive is occupied by a new swarm the first thing is to begin the manufacture of cells.

The formation of the wax is a singular and complex operation. Huber says, "The wax-makers, having taken a due portion of honey or sugar, from either of which wax can be elaborated, suspend themselves to each other, the claws of the fore legs of the lowermost being attached to those of the hind pair of the uppermost, and form themselves into a cluster, the exterior layer of which looks like a kind of curtain. This cluster consists of a series of festoons or garlands, which cross each other in all directions, and in which most of the bees turn their back upon the observer: the curtain has no other motion than what it receives from the interior layers, the fluctuations of which are communicated to it. All this time the nurse-bees preserve their wonted activity, and pursue their usual employments. The wax-makers remain immovable for about twenty-four hours, during which period the formation of wax takes place, and thin laminæ of this material may be generally perceived under their abdomen. One of these bees is now seen to detach itself from one of the central garlands of the cluster, to make a way amongst its companions to the middle of the vault or top of the hive, and by turning itself round to form a kind of void, in which it can move itself freely. It then suspends itself to the centre of the space which it has cleared, the diameter of which is about an inch. It next seizes one of the laminæ of wax with a pincer formed by the posterior metatarsus and tibia, and drawing it from beneath the abdominal segment, one of the anterior legs takes it with its claws and carries it to the mouth."

Fig. 6.

Brush and Pincers of the Bee (greatly magnified).

The wax has, perhaps, a nearer analogy to the sebaceous secretion of the integument than to any other animal secretion: it is formed beneath the scales on the under side of the abdomen, and, when accumulated there, seems to irritate the part, for the bee may then be observed wagging her body, and running round, or to and fro, as if endeavoring to shake out the little scales: and she is generally followed by one or two other bees which have been attracted by her movements, and are ready to seize upon the plates of wax as they fall. How the bees mould the scales into the walls of the cells is not yet exactly understood. Some have supposed that they bite pieces off and join them together; but the smooth and uniform surface of the cell shows that some other operation must take place: besides, the wall of the cell is sometimes thicker than a scale of wax. We must, therefore, suppose that the bees have the power of applying some dissolving or softening menstruum to the wax scales, by which they are enabled to knead and blend them into a ductile paste. And when we remember that the secretion of the salivary tubes of insects is generally alkaline, and that wax may be softened by alkali, it has been naturally supposed that it is by this means that the wax-scales are brought into a workable state. Reaumur, indeed, observed a frothy substance exuding from the mouth of a bee while working at a cell, which was applied to the proper place by the nimble tongue, and then kneaded in by the mandibles; and Huber has described the process very circumstantially: he says that the bee holds the laminæ of wax with its claws vertically—the tongue rolled up serving for a support—and by elevating or depressing it at will causes the whole of its circumference to be exposed to the action of the mandibles, so that the margin is soon gnawed into pieces, which drop, as they are detached, into the double cavity, bordered with hairs, of the mandibles. These fragments, pressed by others newly separated, fall on one side of the mouth, and issue from it in the form of a very narrow ribbon. They are then presented to the tongue, which impregnates them with a frothy liquor. During this operation the tongue assumes all sorts of forms: sometimes it is flattened like a spatula: then like a trowel, which applies itself to the ribbon of wax; at other times it resembles a pencil, terminating in a point. After having moistened the whole of the ribbon, the tongue pushes it so as to make it re-enter the mandibles, but in an opposite direction, where it is worked up anew. The liquor mixed with the wax communicates to it a whiteness and opacity which it had not before, and doubtless gives it that ductility and tenacity which it possesses in its perfect state.

Fig. 7.

Bee seen from below, with its ventral segments of wax (magnified).

Bees commonly begin at the top or roof of their chamber, and build downward, at first working irregularly, and as it were pasting over the surface, and then building horizontal cells of a more perfect form. These at length become so numerous that they extend downward in the form of a vertical wall; other congeries of cells are formed in succession, until the whole comb assumes the form of a series of perpendicular plates or partitions. Each plate consists of a double set of cells, the bottoms of which are applied to each other and form the partition between each set. The plates are not always regular, and the irregularities which may be observed are not always necessary adaptations to a peculiar form of the cavity in which they are built. The cells are not all of the same size, but a sufficient number of a given depth are reserved for receiving the eggs, and which are necessarily adapted to the size of the future maggot: the smaller or shallower cells are those in which the honey is stored. The breeding and store cells are placed horizontally, but the mouth of the cell is sometimes a little raised, the better to retain the honey. The interspace between the vertical combs is generally about half an inch; these streets, as they may be termed, in this city of industry, being just wide enough to allow two bees busied upon the opposite cells to pass without incommoding each other. In addition to these interspaces, the combs are perforated in various places, so as to allow a passage for the bees from one street to another, thus saving them much time.

The shape of each cell is not, as might have been expected, cylindrical, or that which seems best adapted to the form of the maggot, or even of the constructor bee; but it is hexagonal—the only form which allows the cell to be of the largest size in proportion to the quantity of matter employed, and at the same time to be so disposed as to occupy in the hive the least possible space. The form of the base of each cell, which is in apposition with the one on the opposite side, is also such as to gain greater strength, and more capacity, with less expenditure of wax; the latter consideration being one of great importance to bees, which do not secrete a very large quantity of this material; and the most profound mathematicians and most skilful geometers have found the solution of the problem, relating to the attainment of the preceding objects, as derived from the infinitesimal calculus, to have a surprising agreement with the actual measure of the different angles formed by the walls of the cell.

Bees do not gather honey indiscriminately from every flower. The oleander, which yields poisonous honey fatal to thousands of flies, is carefully avoided by bees, and the white nectaries of the crown-imperial tempt them in vain. The flowers of the white clover and of the basswood are especially attractive to them, and their hum may be heard among the branches of the latter at a considerable distance. Those flowers which yield a nectar innocuous to the bees themselves, but possessing poisonous qualities when taken by man (among which may be mentioned the *Kalmia latifolia*), are sometimes frequented by bees, and the honey derived from them acts like a poison.

The collection of the farina or pollen of flowers is a great object of the industry of bees. In large flowers, as the tulip, the bee dives in; and if the pollen receptacle or anther be not burst, she bites it open, and comes out singularly disguised, being covered over entirely with the fertilizing

dust, which adheres readily to the fringed hairs of her body and legs.

Aristotle, who was well acquainted with much that is interesting in the economy of the bee, was the first to observe that a bee during each single excursion from the hive limits her visits to one species of flower. Modern naturalists have confirmed the general accuracy of this statement, and have noticed that the pollen with which a bee comes home laden is always of the same color. The necessity of this instinct arises out of the operation which the pollen first undergoes when collected by the bee. She rakes it out with incredible quickness by means of the first pair of legs; then passes it to the middle pair, which transfer it to the hind legs, by which it is wrought up into little pellets. Now, if the pollen were taken indiscriminately from different flowers, it is probable that the grains, being heterogeneous, would not cohere so effectually. Certain it is, that bees enter the hive, some with yellow pellets, others with orange, pink, white, or even green-colored ones, but they are never observed to be party-colored. Through this instinct, another important end is gained in relation to the impregnation of flowers; the production of hybrid plants by the application of the pollen of one species to the stigma of another is avoided, while those flowers are more effectually fertilized which require the aid of insects for that purpose.

When a pollen-laden bee arrives at the hive, she generally walks or stands upon the comb beating her wings, and three or four of her fellow-citizens assist in lightening her of her load; or the laden bee puts her two hind legs into a cell, and with the intermediate pair or the extremity of the abdomen brushes off the pellets. These are then kneaded into a paste at the bottom of the cell, and several cells are thus filled with the packed and softened pollen, which is called bee-bread.

Besides the honey and farina, bees also collect a peculiar substance like gum-resin, which was called "propolis" by Pliny; and this they obtain principally from the balsamic buds of the horse-chestnut, birch, and poplar, especially the *Populus balsamifera*. The propolis is soft, red, will pull out in a thread, and is aromatic. It is employed in the hive not only in finishing the combs, but also in stopping up every chink or orifice by which cold, wet, or any enemy can enter. Like the pellets of pollen, it is carried on the posterior tibiæ, but the masses are lenticular. Having thus traced the operations of the working bees relating to the collection of the substances required in the economy of the hive, we shall now return to the larvæ, which are the immediate objects of all this industry.

The bees may be readily detected feeding the young maggot, which opens its lateral jaws to receive the bee-bread, and swallows it. The well-fed maggot soon grows too large for its tough outer skin, and accordingly casts it; when its bulk has increased so that it fills its cell, it then requires no more food, and is ready to be enclosed for the chrysalis state. The last care of the foster-parents is to cover over the mouth of the cell with a substance of a light brown color, apparently a mixture of wax and farina. This takes place generally four days after the larva has been excluded from the egg. The enclosed larva now begins to line the cell and the covering of the aperture before mentioned with a silk, which it spins from glandular tubes similar to those of the silkworm. When the first three segments of the trunk to which the locomotive organs of the perfect insect are attached begin to be enlarged, the last larva-skin splits along the back, and is pushed off from the head backward, and deposited at the bottom of the cell, and it then becomes a chrysalis. Now the wonderful changes take place, partly by a formation of new organs, partly by a development of pre-existing ones, which end at last in the completion of the perfect bee.

Bees, although inactive during winter, are not in a torpid state, but continue to devour honey and to maintain their animal warmth.

Mr. Hunter found during an evening in July, when the temperature of the atmosphere was 54° Fahrenheit, that of the interior of a hive full of bees was 82°; and in December, the external atmosphere being 35°, the bees preserved a temperature of 73°; and, what is at this season extremely rare in the lower animals, they maintain their digestive powers and subsist on the produce of the summer and autumn. Accordingly, they are ready to take advantage of any fine or mild day, and may be seen then flying abroad and appearing to enjoy it. They void their excrements at this time, for they are insects of singular cleanliness and propriety; and when purposely confined in the hive, with abundance of food, they have been known to fall a sacrifice to this instinctive repugnance to defile the hive.

In conclusion, we may remark that the keeping and management of bees was formerly considered as very precarious and uncertain. But modern science, and the various improvements which it has effected, have made the business in practised hands as certain and successful as most agricultural pursuits. Full, populous stocks only are profitable. A weak hive will cost many times the care required for a strong one, and pays nothing back. When many hives are kept, a few spare combs on movable frames, with sealed brood, may be introduced into a weak hive. Facilities for examining and controlling are the foundation of success. As with other kinds of business, the management of bees requires attention, vigilance, and industry, combined with a knowledge of the natural history of the insect.

The Italian bee, which has been introduced of late years, is distinguished from the common bee by the yellow bands on its body and by its more vigorous habits. It commences working earlier in the morning, and continues at work later in the evening. It has a longer proboscis, which enables it to take honey from the red clover. When properly managed, it has furnished large stores of honey, but apiarians are not fully agreed as to its general value and adaptation to common management, and some years will probably be required to settle the question. JOHN J. THOMAS.

Bee (BARNARD E.), a Confederate general, born in South Carolina 1824, graduated at West Point 1845 in the artillery, and served with distinction throughout the Mexican war (wounded at Cerro Gordo), his gallant conduct being recognized by his native State by the presentation of a sword of honor. He was on frontier duty principally from 1848 to Mar. 3, 1861, when he resigned, and was appointed a brigadier-general in the Confederate army. At the first battle of Bull Run, July 21, 1861, he was killed.

Bee, a county in the S. part of Texas. Area, 900 square miles. It is drained by the Aransas River, which rises within its limits, and is bounded on the N. E. by Blanco River. The surface is nearly level. The climate is healthful. Cattle and sheep are bred in great numbers. The soil is sandy, and wood and water are scarce. Capital, Beeville. P. 1082.

Bee Branch, a township of Chariton co., Mo. P. 1593.

Beech [Ger. *Buche*], (*Fa'gus*), a genus of trees of the order Cupuliferæ, natives of Europe, America, and Australasia. The sterile flowers have a bell-shaped calyx five to seven cleft, with eight to sixteen stamens. The fertile (or female) flowers grow on the same tree, the fruit of which is a triangular or sharply three-sided nut, two of which are enclosed in an urn-shaped, coriaceous involucre or husk. These nuts, called beechmast, are edible, and are valuable as food for swine. They yield a large proportion of a bland fixed oil which is used as food and burned in lamps by Europeans; the husks contain a volatile, narcotic, poisonous principle called *fagine*. The genus comprises several species of beautiful forest trees, with a close and smooth ash-gray bark and a light horizontal spray. The *Fagus sylvatica*, or common beech of Europe, forms whole forests in many parts of that continent. It grows to the height of about 100 feet, and sometimes has a diameter of four feet, and is a very ornamental tree, especially when it stands alone. The wood is hard and valuable for fuel, and, being durable under water, is employed in the erection of mills. The French use it extensively in the fabrication of *sabots* or wooden shoes. The white beech, which is a common tree in some parts of the U. S., is, according to some botanists, the same species as that which has been just described. The *Fagus ferruginea* (red beech or American beech) is abundant in the Northern U. S., sometimes growing gregariously in forests which contain few other trees. Its leaves are oblong-ovate, taper-pointed, distinctly and often coarsely toothed or serrate. This is an ornamental tree, which sometimes attains a height of 100 feet, and surpasses most trees in the depth of shade produced by its rich green and shining foliage. The wood is hard, heavy, good for fuel, plane-stocks, shoe-lasts, tool-handles, and other purposes. The color of the wood is a light brown or reddish; hence the name. Among the other species is the myrtle tree of Tasmania (*Fagus betuloides* or *Fagus Forsteri*), a very large and ornamental tree, with evergreen and coriaceous leaves, which resemble birch leaves in form. *Fagus procera*, which attains a lofty stature in the Andes of Chili, is a valuable timber tree. The *Fagus antarctica* is a characteristic tree or shrub of far antarctic regions, and is said to be found farther S. than any other shrub.

Beech'er (Catharine Esther), an American writer, a daughter of Lyman, noticed below, was born at East Hampton, Long Island, Sept. 6, 1800. She published, besides other works, "Domestic Service," "Treatise on Domestic Economy," "True Remedy for the Wrongs of Women," "Manual of Arithmetic," "Elementary Book of Instructive Theology," "Physiology and Calisthenics," and "Common Sense applied to Religion."

Beecher (Rev. Charles), a preacher and writer, a brother of the preceding, was born at Litchfield, Conn., in 1815. Among his works are a "Review of Spiritual Manifestations" (1853) and "Pen-Pictures of the Bible" (1855).

Beecher (Edward), D. D., a brother of the preceding, was born in 1804. He graduated at Yale in 1822, was president of Illinois College from 1831 to 1844, and pastor of Salem Street church, Boston, from 1846 to 1856. He published "The Conflict of Ages" (1856) and other works, including an able work on Baptism.

Beecher (Henry Ward), a celebrated American author and divine, son of Dr. Lyman Beecher, noticed below, was born at Litchfield, Conn., June 24, 1813. At an early age he had a strong predilection for a seafaring life, which, however, he renounced in consequence of the deep religious impressions which he experienced during a revival. Having graduated at Amherst College in 1834, he devoted himself to the study of theology at Lane Seminary under the tuition of his father, who was then president of that institution. He became in 1847 pastor of the Plymouth (Congregational) church in Brooklyn, where his genial and original eloquence has continued to attract the largest congregation, it is said, in the U. S. He was editor of the "Independent" from 1861 to 1863, when he visited Europe for the benefit of his health. His earnest addresses to large audiences on the subject of the American war appear to have had considerable influence in turning the current of public opinion in Great Britain in favor of the Union cause. Mr. Beecher has also been a prominent advocate of anti-slavery and temperance reform, and more recently of the rights of women. Among his principal works are "Lectures to Young Men" (1850), "Star Papers" (1855), "Life Thoughts" (1858), "Royal Truths" (1864), a novel, "Norwood" (1864), and "Life of Christ," vol. i., 1871. He became editor of the "Christian Union" in 1870.

Beecher (Lyman), D. D., an eminent American theologian, born at New Haven, Conn., Oct. 12, 1775. He graduated at Yale College in 1797, studied theology under President Dwight, and became in 1810 minister of the Congregational church at Litchfield, Conn. He was a popular preacher, and acquired great influence among the orthodox churches. To oppose the rapid progress of Unitarian doctrines he removed to Boston about 1826, and preached in the Hanover Street church. He was president of Lane Seminary at Cincinnati 1832–51. He published, besides other works, "Views in Theology" and "Sermons on Temperance," which had a great circulation. He was a man of very energetic character. Died at Brooklyn, N. Y., Jan. 10, 1863. (See his "Autobiography and Correspondence," edited by his son, Charles Beecher, 2 vols., 1864.)

Beecher (Thomas Kennicutt), an able Congregational minister, son of the preceding, born Feb. 10, 1824, graduated at Illinois College (Jacksonville, Ill.) in 1843. For about twenty years he has been pastor of a church in Elmira, N. Y. He is an influential speaker and writer, and distinguished for philanthropy. His especial work seems to be to discourage sectarian feeling in the churches, and to promote a fraternal spirit among Christian people.

Beech'ey (Frederick William), an English navigator, born in London Feb. 17, 1796. He accompanied Sir Edward Parry in an Arctic expedition in 1819, and explored the northern coasts of Africa in 1821. Having obtained the rank of commander or captain, he conducted an exploring expedition to the Polar Sea *viâ* Behring Strait. He discovered Port Clarence and Port Grantley, returned in 1828, and published a narrative of his voyage in 1831. He became a rear-admiral of the blue in 1854. Died Nov. 29, 1856. (See "Edinburgh Review" for Mar., 1831.)

Beechey (Sir William), R. A., an eminent English portrait-painter, the father of the preceding, was born in Oxfordshire Dec. 12, 1753. Died Jan. 28, 1839.

Beech Spring, a township of Spartanburg co., S. C. Pop. 3280.

Bee Creek, a township of Mitchell co., N. C. Pop. 189.

Bee'der, or **Bider,** a fortified city of Hindostan, capital of a district of the same name, is near the Manjera River and in the Nizam's dominions, about 75 miles N. W. of Hyderâbâd. It was formerly an important place, but is now chiefly remarkable for the manufacture of tutenag wares of an alloy of tin and copper.

Bee-Eater, a name given to various birds of the order Insessores, tribe Fissirostres and family Meropidæ, which

The Namaqua Bee-Eater.

is allied to that of kingfishers. The genus *Merops* comprises numerous species, found in Asia, Africa, and Europe, which feed on bees and other hymenopterous insects. The common bee-eater (*Merops apiaster*) abounds in the S. of Europe as a summer bird of passage. It seizes bees as they fly in the air, and watches for them near their hives. It breeds in holes which it excavates in the banks of rivers. There are several other genera called bee-eaters. The Namaqua bee-eater (*Rhinopomastes cyanomelas*) is a West and South African bird.

Beef-Eater, a term applied jocularly to certain British functionaries belonging to the yeomen of the guard, who form part of the train of royalty, and attend the sovereign at royal banquets, coronations, etc. This term appears to be a corruption of the French *buffetier,* one who serves at the *buffet* (sideboard).

Beef-Eater (*Bu'phaga*), a genus of birds of the order Insessores and tribe Conirostres, sometimes called ox-pecker. They are exclusively African, and have a remarkable habit of sitting on the backs of oxen, buffaloes, camels, etc., in order to feed on the larvæ of flies which they find on their hides. This genus comprises the species called buffalo-bird of South Africa.

Beefield, a township of Greenville co., Va. Pop. 2809.

Beef Tea, an article of diet of the greatest importance in the treatment of the sick and the nurture of infants. To prepare palatable beef tea is a matter of some difficulty, but the following rules are excellent and easy to follow: Take one pound of juicy, lean beef from the shoulder or the round, and mince it with a sharp knife on a board or a mincing-block. Put it with its juice into an earthen vessel containing a pint of tepid water, and let it stand for two hours. Strain off the liquid through a clean cloth, squeezing well the meat, and add a little salt. Place the whole of the juice thus obtained over the fire, but remove it as soon as it has become browned. Never let it boil, otherwise most of the nutritious matter of the beef will be thrown down as a sediment. A little pepper or allspice may be added if preferred.

Beehive House, a name given to certain ancient dome-shaped buildings found in Ireland, and supposed to have been erected in the twelfth century or earlier. They are round edifices, built, without cement, of long thin stones placed in horizontal layers, each slightly overlapping another, and so gradually converging to the top. They are supposed to have been dwellings of priests. In some places occur several hive-shaped subterranean chambers, connected by a passage or gallery.

Beek'man, a post-township of Dutchess co., N. Y. It contains limestone, slate, and mines of iron ore (hematite). Pop. 1486.

Beek'mantown, a village of Mount Pleasant town-

ship, Westchester co., N. Y., on Pocantico River. Pop. 2206.

Beekmantown, a post-village and township of Clinton co., N. Y., on the Montreal and Plattsburg R. R., 4 miles N. of Plattsburg. The township is on Lake Champlain. Pop. of township, 2552.

Beel'zebub [Gr. Βεελζεβουλ, *Beelzeboul*, or *Beelzebul*], (*i. e.* "the god of dung or of flies"), the name of a god worshipped by the people of Ekron, in Philistia. As the heathen deities were all regarded as demons by the Jews, the name Beelzebub came in course of time to be commonly applied to a prince or chief of evil spirits, and in this sense it is employed in the Gospels. This name is found only in the New Testament. The original and authorized spelling is Beelzebul, which appears to have been afterwards changed so as to resemble Baalzebub, which was the proper name of the heathen divinity.

Beer [Ger. *Bier*; Fr. *bière*]. The common beer known as *beer, ale, porter, stout*, etc. is the fermented infusion of malted barley, flavored with hops. In a wider sense the term *beer* is applied to beverages prepared from cereals, barley, rye, wheat, Indian corn, millet, etc., the chief constituent of which is starch. The treatment involves the preliminary operations of *malting* and *mashing*, or changing the starch to gum (dextrine) and sugar (glucose) by the aid of the natural process of germination. The term *wine*, on the other hand, is restricted to alcoholic liquids obtained by fermenting the saccharine juices of fruits, as the grape, apple, pear, currant, and gooseberry, or the sap of such plants as the sugar-cane, palm, American aloe, etc. There are, however, many beverages of inferior quality called beer, which consist of saccharine liquors more or less completely fermented, and flavored with various substances, such as spruce beer, ginger beer, root beer, etc.

The manufacture of beer from barley is divided into two distinct processes—*malting* and *brewing*—which are conducted in different establishments, the *malt-house* and the *brewery*; the brewer often purchasing his malt from the maltster. *Malting* consists of four successive operations: (1) *Steeping*. The barley is placed in wooden cisterns, covered with cold water, and allowed to soak for two or three days, when the water is drained off. By this operation the barley absorbs from 10 to 50 per cent. of water, softening and swelling up at the same time. (2) *Couching*. The softened barley is thrown out upon the floor of the malt-house in heaps or *couches*, where it heats spontaneously and begins to germinate, throwing out rootlets or *radicles*, and shoots or *acrospires*. At the same time it evolves a portion of its water, the operation being called *sweating*. (3) *Flooring* is resorted to in order to check the germination by reducing the temperature. It consists in spreading the barley over the floor, and repeatedly turning and respreading it over a constantly widening area in layers of diminishing thickness. When the process of germination has proceeded as far as is desirable, it is completely stopped by (4) *Kiln-drying*. This is effected in a large room with brick or tile floors, the *kiln*, which is heated to the desired temperature. Here the germinated barley is rendered perfectly dry and crisp. It is then *malt*. The appearance of the malt, and the color of the beer made from it, depend upon the temperature of the kiln. At between 90° and 100° F. pale malt results; at 120°–125°, amber malt; 150°–170°, brown malt for porter and stout. Black malt is prepared by roasting the malt in cylinders, at 360° to 400° F., such as are used for roasting coffee. It is used as a coloring for porter. During the process of malting the barley increases in volume and diminishes in weight; 100 measures of barley yield 101 to 109 of malt, but 100 pounds yield only about 80 pounds of malt. The loss in weight is largely due to the perfect drying in the kiln, fresh barley containing 10 to 16 per cent. of water. It is, however, in part due to the removal of some soluble constituents in the steeping, to the destruction of some during germination, and evolution in the form of carbonic acid, water, hydrogen, nitrogen, etc., and to the shoots and rootlets. An experiment made by C. John gave the following results, leaving out the percentages of water: 100 parts of barley lost in the steeping 0.391; 100 parts of steeped barley yielded—

Malt	83.09
Shoots	3.56
Rootlets	4.99
Gases	8.36
	100.00

The object of changing the barley to malt is to render its constituents soluble, and bring them into a condition suitable for fermentation. During germination the albuminous substances are changed to *diastase*, a body which exerts a wonderful action upon starch. One part of diastase is said to change 2000 parts of starch (which is insoluble) to dextrine (gum), and then to glucose (grape-sugar), both of which are soluble in water. It is very doubtful whether what Payen and Persoz called *diastase* is a distinct body, but the name is a convenient one for the albuminous matters, modified and rendered soluble by germination, which act as ferments, and possess the important properties above mentioned.

Germination is considered to have gone far enough when the acrospire has advanced two-thirds the length of the grain. Were the process of germination allowed to proceed farther, the various constituents of the seed would be assimilated by the young plant, and transformed into insoluble tissues, as they really constitute the supply of food designed to sustain the germ during its early development, until having acquired leaves and roots it can obtain its food from the atmosphere and soil. It was formerly supposed that the conversion of the starch into dextrine and glucose took place to a large extent during the malting, and the following analyses by Proust have long been quoted to sustain this view:

	Barley.	Malt
Gluten	3	1
Starch	87	68
Gum	4	15
Sugar	5	15
Resin	1	1
	100	100

More recent investigations and analyses made by improved methods have shown that very little starch is changed to dextrine and sugar during the early stages of germination to which the barley is subjected during malting. While a larger quantity of starch is converted into dextrine during the kiln-drying, especially in the preparation of dark-colored malt, the starch is but little affected until the brewer exposes the malt to the action of warm water in his mash-tub. Here the changes supposed by Proust to occur during the malting actually take place.

The exact analysis of malt is attended with almost insurmountable difficulties, and it has not yet been possible to ascertain the precise nature of the chemical processes involved in its formation. Dr. Stein investigated the subject in 1860 (*Wilda's Centralblatt*, 1860, ii., p. 8) and C. John in 1869 (*Byer. Bierbrauer*, 1869, No. 5, p. 101). John found that in the conversion of barley into malt, not counting the shoots and rootlets, the fat diminished from 2.73 to 1.906 per cent., cellulose 12.24 to 7.18, while the dextrine increased to 8.600, the glucose from 0.34 to 1.49, and the substances soluble in alcohol and in water from 5.949 to 16.72. Stein reports that the fat diminished from 3.56 to 2.09, the cellulose 19.86 to 18.76, the starch 54.48 to 47.43, the insoluble albuminoids from 11.02 to 9.02, while the dextrine increased from 6.50 to 6.95, the soluble albuminoids from 1.26 to 1.96, the non-nitrogenous extractive matters from 0.90 to 3.68. These differences appear very slight; but although analysis thus fails to reveal the character of the changes, their extent and importance are at once seen on exposing barley and malt to the action of warm water. The former is hardly affected, while the latter quickly yields a sweet wort, containing large quantities of dextrine, glucose, albumen, etc.

The diastase of malt is capable of changing to glucose a much larger quantity of starch than exists in the barley; hence unmalted grain is sometimes added to the malt during the subsequent operation of mashing. In Belgium potato starch is largely employed.

Brewing.—The first operation of the brewer is the *bruising* or crushing of the malt, which is accomplished by passing it between iron rollers. It is then placed in the mash-tub with warm water, and raised gradually to about 167° F. It is here that the starch is transformed into dextrine and glucose, which, with the soluble albuminous and saline constituents, are taken into solution by the water. From one to four bushels of malt are used for each barrel of beer. When the price of malt is high, a portion of it is replaced by cheaper amylaceous or saccharine substances, such as potato starch, or glucose prepared from it by the action of sulphuric acid. The insoluble residuum from the malt is sold under the name of brewers' grains for feeding cows. The infusion is allowed to stand for a few hours to clarify or set, and the sweet clear *wort* is then drawn off into a copper boiler, when it is boiled with the hops. From one to five pounds of hops are added for each barrel of beer, the quantity varying with the strength of the beer, the length of time it is to be kept, and the climate to which it is going. The hops are the female flowers of the *Humulus Lupulus*; they contain a peculiar essential aromatic oil, a bitter principle, *lupuline*, tannic acid, resin, etc. They communicate an agreeable flavor to the beer, add to its tonic and stimulating properties, aid in clearing it by the action of the tannic acid on the albumen, and diminish its liability to spoil on keeping. (See Hops.) Dr. C. A. Seeley of New York has prepared an extract of hops by means of gasolene (petroleum spirits) which he con-

siders much preferable to the entire hops. The boiled wort is cooled as quickly as possible, either by placing it in shallow vessels or passing it over a series of tubes through which cold water circulates. It is then run into the fermenting vats or tuns, which in large breweries sometimes have a capacity of 1200 or 1500 barrels. The temperature of the wort best suited to successful fermentation depends upon the season. In summer, with the atmosphere at 75° F., it should stand at about 55°; with air at 55°, at 60°; while in the winter it should have a temperature of at least 64°. If a very quick fermentation is desired, it may be considerably higher. For every 100 gallons of wort about 1 gallon of yeast is added, which has been produced in a previous brewing of the same kind of beer. The yeast is usually mixed with a little wort, and left in a warm place till it begins to ferment. This *lobb*, as it is called, is then added to the tun. More yeast is employed in winter than in summer; twice as much at 50° F. as at 68°. In six or eight hours fermentation becomes active; the wort begins to work, the glucose, under the influence of the active ferment *yeast*, undergoes decomposition, yielding alcohol and carbonic acid, the latter escaping in bubbles, and bearing to the surface particles of yeast, which form a scum. The yeast itself, being a plant, develops rapidly, largely at the expense of the nitrogenous albuminous matters of the wort, which are thus withdrawn. (See YEAST.) The temperature rapidly increases, rising many degrees. This fermentation continues for six or eight days. When it has reached the proper point, the beer is separated from the yeast, and transferred to the *cleansing butts*. Here a slow, almost imperceptible, fermentation takes place. The solid particles of the yeast rise to the surface and escape through the bungholes of the casks. Finings are sometimes added to clear the beer; they generally consist of isinglass dissolved in a little sour beer. The beer is then transferred to store-casks, where a slow fermentation occurs, which produces no perceptible quantity of yeast; the beer develops its finer qualities, and is here finished for use. (See FERMENTATION.)

The composition of the water used in brewing is supposed to exert an important influence on the success of the process. Lime salts are said to aid in clearing the beer, as they form insoluble compounds with some of the acids present. Sulphate of lime, or gypsum, is sometimes added to the water. The spring water at Burton-on-Trent is said to contain considerable sulphate of lime. The strength and taste of beer depend upon the quantities of malt and hops employed and the mode of conducting each of the several operations, especially the fermentation. *Strong* beers contain much alcohol; *substantial* beers are those which have not been fermented so thoroughly, and which consequently contain more of the extractive matters of the malt. Bitter beers contain more of the hop extract.

Ale is prepared from pale malt, and the active fermentation is checked while there still remains a considerable quantity of sugar unchanged. This, by subsequent fermentation in the barrel or bottle, keeps up the briskness. *Pale ale* is made from malt dried in the sun or by steam. It is not allowed to rise above 72° during the fermentation. The formation of acetic acid is thus prevented, and the unpleasant flavor due to the solution of the yeast by the alcohol is avoided. *Scotch ale* is a sweet strong ale. *Small beer* is a weak liquor made by using little malt, or by mashing with fresh water the malt residuum left after the wort for ale or porter has been drawn off. *Porter* is a dark-colored beer made from a mixture of pale, amber, brown, and black malt. *Stout* is strong porter. *Berlin white beer* (*weiss beer*) is prepared by quick fermentation from a mixture of 1 part of barley malt and 5 parts of wheat malt with half a pound of hops per bushel.

Lager Beer.—The beer of Bavaria, which has of late years been so extensively manufactured in the U. S. under the name of *lager beer*, owes its name (from *lager*, a "storehouse") to the fact that it is stored in cool cellars or vaults for several months before it is used, and its remarkable keeping qualities and highly prized properties to the peculiar kind of fermentation by which it is produced. The fermentation of ordinary beer and ale takes place at high temperatures; it is consequently rapid, and the carbonic acid, evolved in bubbles, carries a portion of the yeast to the surface, forming a thick scum. This scum protects the beer from the oxygen of the air. The conversion of gluten into yeast is in part a process of oxidation, and the oxygen being excluded considerable gluten remains unchanged, and acting as a ferment leads to the subsequent change of alcohol to acetic acid. The fermentation of lager beer is conducted at a low temperature—between 40° and 50° F. It proceeds more slowly, and the carbonic acid does not carry the yeast to the surface. Consequently, the air has a freer access, and the gluten is more completely converted into yeast. This beer is usually fermented in the winter, or, if in summer, in rooms cooled by ice. This is called sedimentary or under-fermentation, to distinguish it from the ordinary surface fermentation. The yeast, called bottom yeast, is quite different from ordinary yeast, and has a tendency to induce the kind of fermentation by which it was produced. The following is a brief outline of the process employed at one of the largest lager-beer breweries in New York. The barley is soaked two or three days, changing the waters; it germinates six to ten days, till the radicles are brownish; it is then kiln-dried. It is crushed between rollers, mashed at 120° to 140° F., the temperature being raised by the addition of boiling water to 160° or 170°. By adding hot water to the residue a second wort is obtained. The first wort is boiled with the hops; the second wort is let in, and the whole is boiled three or four hours. After cooling to between 44° and 50° F., it is run into open fermenting tuns. One gallon of yeast is added for every twenty to twenty-five barrels. Fermentation continues from ten to twenty days. There is a heavy froth at first, which subsides, leaving the surface clear. It is racked off into hogsheads, when the yeast is found at the bottom of the tuns. It stands in these hogsheads with the bung open. A few days before it is to be put in barrels for use the bung is driven in to accumulate carbonic acid for *life*.

Three varieties of this beer are made: (1) "*Lager*," or summer beer, for which 3 bushels of malt and 1½ to 3 pounds of hops are used per barrel, and which is not ready for use in less than from four to six months. (2) "*Schenk*," winter or present-use beer: 2 to 3 bushels malt and 1 pound hops per barrel; ready in four to six weeks. (3) *Bock* bier, which is an extra strong beer, made in small quantity and served to customers in the spring, during the interval between the giving out of the schenk beer and the tapping of the lager. In its manufacture 3½ bushels of malt and 1 pound of hops per barrel are used, and it requires two months for its preparation.

The barrels for lager are coated with pitch on the inside, to prevent the beer soaking into the wood and giving rise to acetic acid when they are empty. Lager is therefore the product of a peculiar slow under-fermentation, which takes place at low temperatures.

Chica, or maize beer, was used by the South American Indians before the Spanish conquest. *Bourza*, or millet beer, is made by the Crim Tartars. *Quass*, or rye beer, is a sharp acid beverage prized by the Russians. *Koumiss*, or milk beer, is prepared by the Tartars from mares' milk, which they dilute and ferment.

Composition of Beer.—The stimulant and tonic properties of beer are due to the alcohol and the bitter principle of the hop, while its nutritive value is ascribed to the extractive matters derived chiefly from the malt. The exact character of many of the constituents of beer is not known. Besides water, alcohol, dextrine, and grape-sugar, the following substances have been identified: glycerine, succinic, acetic, lactic, propionic, glucic, and carbonic acids, albumen and albuminous principles, bitter and resinous matters and essential oil from the hop, and alkaline and earthy salts. The latter, which amount to from 0.15 to 0.28 per cent. of the beer, are from one-half to two-thirds alkaline and earthy phosphates. The unrecognized constituents of beer are grouped under the term extractive matters. In the following table the term *extract* includes all the substances left when the alcohol and water are removed by evaporation:

Analysis of Beer.

KINDS.	Percentages.		Contents per Imperial Pint.	
	Alcohol.	Extract.	Alcohol, fl. ounces.	Extract, ounces.
Burton ale (Allsopp's)	8.25	13.32	2.16	2.77
Bass's barley wine	8.41	11.75	2.18	2.42
Edinburgh ale	4.41	3.58	1.12	.72
Guinness's stout	6.81	6.17	1.74	1.25
Truman, Hanbury & Co.'s porter	4.02	5.12	1.03	1.01
Whitebread's porter	4.28	5.15	1.09	1.03
Hoare's porter	4.18	5.04	1.06	1.03
Perry's ale	3.87	3.65	0.98	0.73
Munich lager	4.70	6.10	1.19	1.22
New York lager	5.86	4.32	1.48	0.88
Munich schenk	3.90	5.7	1.00	1.16
Munich bock	4.60	9.2	1.17	1.90

Adulteration of Beer.—There is a popular impression that beer is extensively and injuriously adulterated; that potato starch, grape-sugar, glycerine, and molasses are added as substitutes for malt; pine bark, quassia, walnut leaf, wormwood, bitter clover, aloes, picric acid, cocculus indicus, and strychnine as substitutes for hops; and various chemicals to neutralize acidity or conceal dilution. A few of the first mentioned would not be objectionable, and it is not probable that many, if any, of the others are ever used.

C. F. CHANDLER.

Beer'sheba (*i. e.* the "well of the oath," or "well of the seven"), an ancient frontier place of Palestine, situated about 50 miles S. S. W. of Jerusalem, and near the border of the desert. Abraham, Isaac, and Jacob often dwelt there. The phrase "from Dan to Beersheba" was used proverbially to express the whole extent of the land of Israel. There are still to be seen seven wells of ancient masonry, from five to twelve and a half feet in diameter; but only two of them now contain water.

Beershe'ba Springs, a post-village of Grundy co., Tenn., on the summit of a spur of Cumberland Mountain, 12 miles N. E. of McMinnville, has valuable tonic, saline, and chalybeate mineral waters, and very beautiful scenery. This is a fashionable watering-place for the people of the South-west.

Bees'wax [Lat. *ce'ra*], a substance manufactured or secreted by the honey bee, is the material of which its cells and combs are constructed, and is an important article of commerce. In order to separate the wax from the honey, the honeycomb is subjected to pressure, which squeezes out nearly all the honey; the residual comb is then heated in water and stirred till the wax melts, when the whole is passed through hair bags. The wax is received in a vessel of cold water, where it is cooled and solidifies as a thick cake on the surface of the water. The natural yellow color is sometimes changed to white by exposure to the joint action of the sun, the ozone of the air, and moisture. Purified beeswax is tasteless, odorless, and colorless. Its specific gravity is about .960. It fuses at 145° F., is insoluble in water, and partly soluble in boiling alcohol. Beeswax is extensively used in the manufacture of candles and tapers, and for other purposes. The candles which are burned in Roman Catholic churches are always made of wax, which is also an ingredient in the cerates of pharmacy. Beeswax consists of—(1) myricin, which is insoluble in boiling alcohol, and is chiefly myricic palmitate, $C_{30}H_{61}.C_{16}H_{31}O_2$; (2) cerotic acid, $C_{27}H_{54}O_2$, which dissolves in boiling alcohol, but crystallizes out on cooling; (3) cerolein, which remains dissolved in the cold alcohol, probably a mixture of several substances.

Beet [Ger. *Beete*], (*Beta*), a genus of plants of the order Chenopodiaceæ, extensively cultivated for their esculent roots, which are large and succulent. The species of *Beta*, which are not numerous, are mostly biennial, with smooth, ovate, and petiolate radical leaves. They are natives of the temperate parts of the Eastern hemisphere. The common beet (*Beta vulgaris*) is indigenous on the shores of the Mediterranean, and is extensively cultivated in gardens and fields. The boiled roots are a common article of food in most civilized countries of Europe and North America. Large quantities of sugar are extracted from the roots of the beet in France and Germany. The beet-sugar, when refined, is identical with that of the sugar-cane. The beet prefers a rich, light soil. The variety chiefly cultivated in gardens is the red beet, so called from the color of the root, which is sometimes conical. A coarser variety of beet, called mangold-wurzel, is a valuable food for cattle. (See Sugar.)

Bee'thoven, van (Ludwig), a famous musical composer, born at Bonn Dec. 17, 1770. He was the second of four children, of whom the first died an infant. His father, Johann van Beethoven, tenor singer in the chapel of the elector, being poor, mainly in consequence of bad habits, discerned the remarkable musical talents of his son, and prepared early to press them into service by teaching him to play the harpsichord before he was five years old. Having outgrown his father's instruction, the lad was put under the tuition of Pfeiffer, oboist in the chapel, and then under that of Van der Eder, reputed the best organist in Bonn. At the age of eleven he was transferred from Van der Eder to his successor in the chapel, Neefe, who spoke warmly of the boy's proficiency and mastery of the music adapted to the harpsichord. The master himself seems to have given him special instruction in the science of composition, and even had published some of his compositions. At this period the lad dedicated to the elector three pianoforte sonatas, which also were printed. From this time his reputation increased, and his prosperity, under the auspices of eminent patrons, brightened. When but fourteen he was made assistant court-organist, and three years later was sent to Vienna, at the elector's expense, to pursue his studies under the direction of Mozart, then at the height of his fame. In Vienna he finally made his home, after an incidental residence of several years in Rome, where his efforts were required to support his two younger brothers. On his return to Vienna he studied hard with Haydn and Albrechtsberger, the celebrated contrapuntist, making himself perfect master of the science of musical composition. His favorite instrument at this time was the pianoforte, on which he soon rivalled the best performers. His technical education being completed, his powers trained, his method formed, works came from his hand with astonishing rapidity. There is difficulty in fixing the dates of his compositions, but before he was thirty years old he had published as many as twenty sonatas for the pianoforte, nine for piano and instruments, two concertos for piano and orchestra, trios, quartetts, quintetts, septetts, a ballet, "The Men of Prometheus," and two orchestral symphonies. At this period he moved in the best society, was noticed by persons of rank, and recognized by all as a genius of the first order. These were his happy, hopeful days, but they did not last long: they were soon clouded by the one great calamity of his life—a misfortune that to a musician would seem almost fatal to achievement. Already in 1800 he speaks sadly of a defect in his hearing which occasioned serious inconvenience. It increased so rapidly that before long, in the course of two or three years, during which he had a violent sickness, he became totally deaf. This affliction clouded his inner life, made him distrustful, restless, suspicious, melancholy, and unsocial. From this time books, meditation, and solitary walks in the country were his sole recreation. His society was limited to a few select friends, with whom he could forget himself. He lived in his work, and his work went on increasing in volume, gaining in power and deepening in intensity from year to year. The achievements of his genius cannot be described in few words. In less than five years were produced the "Heroic Symphony," "Fidelio," Symphonies Fourth, Fifth, and Sixth, with the grand mass in C. In 1813 came the Seventh Symphony; three years later the Eighth, in 1824 the Ninth or "Choral" Symphony, by many thought the most wonderful of all—by Beethoven himself regarded as the most significant; and in the intervals between these gigantic creations was produced some of his most perfect music. To give here any account of these works is impossible; they cannot so much as be named, for they cover nearly every species of composition, and are so remarkable that nearly every one merits special notice. They are as extraordinary for their wealth of thought and feeling as for their mastery of the laws of composition. They constitute a musical library by themselves. The nine symphonies and the grand sonatas for the pianoforte are monuments of genius which alone would give immortality to their creator.

Beethoven died Mar. 26, 1827, of dropsy, following a violent inflammation of the lungs. His constitution, naturally strong, had been tried by severe shocks of illness. His life was solitary; he was never married. His strongest natural attachment was for a nephew who proved unworthy of his uncle's devotion. Though his deafness made him a recluse, he was not selfish, sordid, or narrow-souled. On the contrary, his human feeling was of the deepest, and, though he could never have been rich, he showed himself capable of generosity. An enthusiastic republican in his belief, and an ardent sympathizer with his countrymen in their struggles for political liberty, Beethoven suffered bitterly for the woes of his Fatherland, and poured out through his music the passion of his proud, agonized heart. There are worlds of sorrow in his compositions. They are, in every sense of the words, modern and living. Though so thoroughly accomplished in musical science, Beethoven was never scholastic; though so deeply charged with emotion, he was never sentimental. His works convey the profound, various, comprehensive feeling which was natural to a sensitive spirit, keenly responsive to all the joy and sorrow of the new age. To this is due their extraordinary hold on people who are quite unable to appreciate their technical excellence.

That Beethoven was a man of vast intellect his compositions testify. But he was something besides a musician. He read much and thought much; he was by no means unfamiliar with the literature of Germany, and even with Italian letters. When interested, his conversation was animated, brilliant, and instructive.

In person Beethoven is said to have been of middle size, stout and apparently strong. His statues, busts, and portraits represent him with a massive head, broad brow, a dignified, sombre expression of countenance, and features of harsh but heroic cast. The bronze statue erected in the public square of his native city in 1845 is of majestic aspect. His latest and most careful biographer, however, Mr. A. W. Thayer, an American, describes him as looking much like a mulatto, short and sallow, with wide nostrils and projecting teeth, heavy lips, and high cheek bones. A great deal has been written about him. Until the biography of Mr. Thayer the authorities were his contemporary, Moscheles (whose work has been republished in this country), and Schindler.

O. B. Frothingham.

Bee'tle, a common name given to several species of insects of the order Coleoptera. Most writers on natural history extend the meaning of the term, and apply it to all coleopterous insects, the species of which are very numer-

ous. They may be distinguished and recognized by the two hard sheaths or *elytra* which cover the pair of true membranous wings and organs of flight. Many beetles are remarkable for their singular forms and the brilliant colors and ornamental markings of their elytra. Each beetle has two antennæ, two mandibles of a horny consistence, two compound eyes, and six legs. (See COLEOPTERA and SCARABÆUS.)

Bee'tle Stones, a name given by the lapidaries of Edinburgh to hard nodules of clay iron-stone found abundantly at Newhaven, a suburb of that city. They take a fine polish, and are used to make ornamental articles. The name is derived from a fossil which often occurs as a nucleus of the nodule, and was erroneously supposed to be a fossil beetle, but is really a coprolite.

Bee'town, a post-township of Grant co., Wis. P. 1624.

Beet-root Sugar, a kind of sugar made in France and Germany. The beet root contains about 10 per cent. of saccharine matter. The Prussian chemist Achard was the first who succeeded in extracting sugar from beets. (See SUGAR.)

Bee'ville, a post-village, capital of Bee co., Tex., 127 miles S. of Austin City.

Be'gas (KARL), a German painter, born at Heinsburg Sept. 30, 1794. He became about 1818 a resident of Berlin and court-painter to the king of Prussia. He painted "The Finding of Moses" and many other scriptural subjects; also excellent portraits of eminent authors and artists, including Humboldt and Schelling. Died Nov. 24, 1854.

Beg'gar, a person who solicits charitable aid from the public at large. In all ages and countries persons have practised various arts in order to enlist the sympathies of the benevolent. Severe enactments have from time to time been made against them. By a law of Richard II. (1388) able-bodied beggars were punished and compelled to labor, and provision was made for the helpless. By an act of Henry VIII. (1530) licenses were given to impotent persons to beg within fixed limits, but unlicensed beggars were whipped, and all persons giving alms to such forfeited ten times the amount given. In the reign of Elizabeth beggars above the age of fourteen were grievously whipped, burned through the ear with a hot iron, and for the third offence were put to death. This regulation was repealed in 1593.

Begging Friars. See MENDICANT ORDERS.

Beg'hards [Lat. *Beghardi, Begchardi,* and sometimes *Beguini*], a name of uncertain derivation (for which see BEGUINES, below), applied to semi-monastic societies of men, originating in the Netherlands, and dating from the early part of the thirteenth century, or not very long after similar societies of women had been formed. At first the Beghards were distinguished for piety and works of beneficence. Some connected themselves with the Tertiaries of the monastic orders; some became wildly fanatical; and some fell off into heresies. They were severely handled by the Inquisition, but spread into Germany, France, Switzerland, Italy, and even Sicily, and continued down to the Reformation. (See MOSHEIM, "De Beghardis et Beguinabus Commentarius" 1790; and HALLMANN, "Geschichte d. Ursprungs d. belgischen Beghinen," 1843.)

Beghar'mi, or **Bagir'mi,** a country of Central Africa, is bounded on the N. by Lake Tchad, on the E. by the kingdom of Wadaï, and on the W. by the river Shari, which separates it from Bornu. Area, 56,600 square miles. The greatest length is about 250 miles. Capital, Masena. The surface is for the most part nearly level; the soil is the most fertile and the best watered of the Soodan. It was founded by a heathen chief about 300 years ago, but Mohammedanism soon became the ruling religion. It is tributary to both Bornu and Wadaï. The natives are physically well-formed and warlike. Begharmi was visited by Dr. Barth in 1852. Pop. about 1,500,000. (See BARTH, "Travels in Central Africa.")

Bego'nia, a genus of tropical plants, the type of the natural order Begoniaceæ. Some of them are cultivated in hot-houses for the sake of the flowers. The leaves, which are oblique at the base, have a reddish tinge. The succulent stems and leaves of *Begonia tuberosa* and other species are used as potherbs and eaten in the form of tarts. The name *Begonia* was given in honor of Michel Bégon, a patron of science.

Begonia'ceæ (so named from *Bego'nia,* one of the genera), a natural order of exogenous plants, mostly herbaceous, have alternate leaves, oblique at the base, and cymes of unisexual pink flowers, with a colored perianth and numerous stamens. There are also white and deep scarlet varieties. They are nearly all tropical plants, but one species of *Begonia* grows on the Himalayas 11,500 feet above the sea. The order comprises about 160 species. Some of the Mexican species are used as drastic purgatives.

Béguines, bā-geen' [Lat. *Beguinæ, Begutæ,* some say from the old Saxon *beggen,* "to beg" or "to pray;" others from the supposed founder, Lambert le Bègue or Bèghe], the name given to semi-monastic societies of women, originating in Belgium, perhaps at Liege, about 1180 A. D. These societies grew in part out of the numerical inequality between the sexes caused by the Crusades. The women, without assuming monastic vows, lived in houses by themselves, labored for their own support, and took care of the sick. A few of these establishments are still found in Belgium. (For the literature, see BEGHARDS.)

Be'gum [bā'gŭm, the feminine form of the Tartar *beg* or *bey,* a "lord" or "prince"], a title of honor given in the East Indies to princesses and the sultanas of seraglios. Among the charges against Warren Hastings was his cruelty to two rich begums of Oude, the mother and the wife of Sujah Dowlah. In order to extort money from them, Hastings or his agents invaded the privacy of their zenanas, and reduced them to the alternative of delivering their treasures or exposing their faces to the view of strange men. They preferred the former of these two evils.

Be'haim, or **Be'hem** (MARTIN), an eminent cosmographer and navigator, born at Nuremberg about 1459. He became a merchant, and visited foreign countries in that capacity. In 1484 and 1485 he accompanied the navigator Diogo Cam in a voyage of exploration along the W. coast of Africa. He gained distinction as a maker of maps and globes. A large globe which he made in 1492 is still preserved by his descendants in Nuremberg, and is prized as a monument and record of the progress of geography. Died July 29, 1506. (See GHILLANY, "Geschichte des Seefahrers Ritter Martin Behaim," 1853; C. G. VON MURR, "Diplomatische Geschichte des Ritters M. Behaim," 1778.)

Be'ham (BARTHOLOMEW), a German portrait-painter and engraver, born in 1496, was a scholar of Dürer. Died in 1540.—His nephew, HANS SEBALD BEHAM, born in 1500, one of the best of the Nuremberg engravers, chose grotesque, sometimes coarse subjects.

Beheading. See CAPITAL PUNISHMENT.

Be'hemoth, a huge animal described in the book of Job (xl. 15–24). Some critics consider the Hebrew term a plural noun for cattle in general. Others think some extinct species of animal is referred to. Others think the elephant is meant. But most writers say the hippopotamus.

Behes'tian, a township of Ouachita co., Ark. P. 396.

Behistun' [Lat. *Bagista'nus;* Pers. *Baghistan', i. e.* "place of gardens"], an ancient and ruined town of Persia, in Irak-Ajemi, 21 miles E. of Kermanshah. Here is a remarkable limestone mountain (the ancient *Mons Bagistanus,* on the confines of Media), which rises to the height of 1700 feet, and is almost perpendicular on one side. According to Diodorus, the famous Semiramis, on her march from Babylon to Ecbatana, encamped here and prepared a residence, and having cut away the lower part of the rock of Bagistanus, caused her portrait to be carved or sculptured there. The geography of this locality has been carefully investigated by Rawlinson and Masson. A peculiar interest attaches to the rock of Behistun on account of its cuneiform inscriptions, which were made by order of Darius I., king of Persia, about 515 B. C., and have been deciphered by Sir H. Rawlinson. Close to these inscriptions are thirteen human figures, one of which represents Darius. "The labor," says Rawlinson, "bestowed on the whole work must have been enormous. . . . But the real wonder of the work consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequalled in the world. It is evident that after the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. This varnish is of infinitely greater hardness than the limestone rock beneath it. It has been washed down in several places by the trickling of water for three-and-twenty centuries, and it lies in flakes upon the foot-ledge like thin layers of lava." (*Journal of the Asiatic Society,* vol. x.) The Persian inscriptions which Rawlinson deciphered are contained in five columns, one of which has ninety-six lines, and the others each nearly as many. There are on the same rock inscriptions in the Median and Babylonian languages. (See RAWLINSON'S "Herodotus," vols. i. and ii.)

Behn (APHRA), a female writer in the reign of Charles II., born in 1640. She wrote seventeen plays, besides novels and poems which were witty, but licentious. She was employed as a spy at Antwerp. Died in 1689.

Behring, or **Beering** (VITUS), a Danish navigator,

born in Jutland in 1680. He entered the Russian navy at an early age, and fought with distinction against the Swedes. In 1725 he was appointed the commander of an expedition sent to explore the Sea of Kamtchatka. During this voyage, which occupied several years, he discovered Behring Strait (1728), and ascertained that Asia was not joined to America. In a subsequent voyage he was wrecked on Behring's Island, where he died Dec. 8, 1741.

Behring Sea, or **Sea of Kamtchatka,** the most northern part of the Pacific Ocean, extending between the peninsulas of Alaska and Kamtchatka. It is connected by Behring Strait with the Arctic Ocean.

Behring Strait, a channel which connects the Pacific with the Arctic Ocean, and separates Asia from America. It was discovered by Vitus Behring in 1728. Its width is about 45 miles at the narrowest part, between East Cape (Asia) and Cape Prince of Wales (America). The depth of this strait near the middle is about 30 fathoms.

Beilan, a town and pass of Northern Syria, on the E. side of the Gulf of Iskanderoon, one of only two passes between Cilicia and Syria. It is thought by some to be the same as the ancient *Amanian Gates*. The town of Beilan is situated on a crest 1500 feet above the sea. Pop. about 5000. It has numerous aqueducts.

Beira, or **Beyra,** bā'rȧ, a province of Portugal, bounded on the N. by Entre-Douro-e-Minho and Tras-os-Montes, on the E. by Spain, on the S. by Estremadura and Alemtejo, and on the W. by the Atlantic. Area, 9244 square miles. Besides the Douro, which flows along its N. boundary, and the Tagus, which touches it in the S. E. corner, Beira is also drained by the Mondegos. The surface is mountainous; the soil is generally poor. Among the staple productions are wine, grain, and olives. Marble, iron, and coal are found here. Capital, Coimbra. Pop. in 1868, 1,288,994.

Beirout, or **Bairut.** See Beyroot.

Beis'sel (Johann Conrad), born at Eberbach, in Germany, in 1690, removed in 1720 to Pennsylvania, and became the founder of the religious community at Ephratah, in Lancaster county. He died in 1768, leaving several theological works.

Beit-el-Fa'kih ("house of a saint"), a town of Arabia, in Yemen, on the Red Sea, 90 miles N. of Mocha. The heat here is very great, the thermometer rising to 104° F. in the shade, and 145° in the sun. It has a citadel and a mosque. Pop. about 8000. It is one of the largest marts for coffee in Arabia.

Be'ja (anc. *Pax Ju'lia*), a fortified town of Portugal, in Alemtejo, 57 miles by rail S. of Evora. It has a castle, a cathedral, and manufactures of earthenware and leather. It is the seat of a Roman Catholic bishop. Two annual fairs are held here in the fall. Pop. 7060.

Bejar', a fortified Spanish town romantically situated on the Cuerpo de Hombre, 48 miles S. of Salamanca. It has manufactures of wool, and is noted for hams. Pop. 10,683.

Bejapoor' (*i. e.* "the victorious or unconquerable city"), a city of India, in the presidency of Bombay, 140 miles S. E. of Bombay. It was formerly the populous capital of the powerful Hindoo kingdom of the same name, which was founded by Tusnef (died 1510), was conquered by Aurungzeb in 1686, and was afterwards a part of the empire of the Grand Mogul. According to tradition, it contained 100,000 houses, but is at present in ruins. It presents a magnificent external show of domes and minarets, temples and mausoleums, some of which display exquisite workmanship; and lofty walls of hewn stone enclose this scene of splendid desolation. Among the ruins, which are of great extent, is a mausoleum of Mahmood Shah, the dome of which is visible at a distance of fourteen miles. Here are several brass cannon of enormous size.

Beke (Charles Tilstone), Ph. D., an English traveller, born in London Oct. 10, 1800. He explored Abyssinia (1841–44), and after his return published, besides other works, an "Essay on the Nile and its Tributaries" (1847), and "On the Sources of the Nile in the Mountains of the Moon" (1848). He has since made other visits to Africa. Died July 30, 1874.

Be'kes, a county of Central Hungary, is bounded on the N. by the county of Szabolcs, on the E. by Bihar, on the S. by Csanad, and on the W. by Csongrad. Area, 1321 square miles. The country consists of a plain, and is watered by the Black, White, and Rapid Körös. The climate is unhealthy, but the soil is extremely fertile, yielding large quantities of wheat of the first quality. Pop. in 1869, 209,729. Chief town, Bekes.

Bekes, or **Bekesvár,** bā'kĕsh-var, a town of Hungary, capital of the above county, is at the confluence of the White and Black Körös, 62 miles S. W. of Debreczin. It has considerable trade. Pop. in 1869, 22,547.

Bek'ker (Immanuel), a philologist, was born in Berlin in 1785, was a pupil of F. A. Wolf at Halle. He became professor of philology at Berlin in 1810, and published "Anecdota Græca" (3 vols., 1814–21). He produced good editions of many classics, among which are Plato (10 vols., 1814–21), "The Attic Orators" (7 vols., 1823), and Aristotle (7 vols., 1831). Died June 7, 1871.

Belai'a, Bielaja, or **Biela,** a river of Russia, rises in the Ural Mountains, flows through Orenburg, and, after a very tortuous course of about 650 miles, enters the river Kama.

Bel Air, a post-village and county-town of Harford co., Md., 22½ miles N. of Baltimore, and 9 miles from Edgewood Station on the Philadelphia Wilmington and Baltimore R. R., contains a court-house, jail, academy, 3 public schools, 4 churches, 3 hotels, 2 weekly papers, and 1 large carriage manufactory. It is situated in a fine agricultural section. Pop. of village, 633; of township, 5650.

A. H. Rutledge & Co., Pubs. "Harford Democrat."

Be'lia Tser'kof (*i. e.* "White Churches"), a town of Russia, in Kiev, on the river Ross. It has considerable trade. Pop. about 8000.

Belcher (Joseph), D. D., a Baptist divine, born in Birmingham, England, April 5, 1794, came to America in 1844, and published nearly 200 works, among which are "The Baptist Pulpit" (1850), "History of Religious Denominations" (1855), etc. Died at Philadelphia July 10, 1859.

Bel and the Dragon, History of, an apocryphal book of the Bible, regarded as a fable by the Jews, by Saint Jerome, and many eminent theologians. It is canonical in the Roman Catholic Church, being part of the fourteenth chapter of Daniel in the Vulgate. By the Anglican Church it is recommended to be read for edification.

Bel'cher (Sir Edward), F. R. S., an English vice-admiral, born in 1799. As commander of the Sulphur he sailed on a voyage around the world in 1836, and explored the western coasts of America. During this voyage he served in the naval operations against the Chinese in 1841. He became a post-captain in 1843, and commanded an expedition sent in search of Sir John Franklin in 1852. Returning without any success, and having lost his vessels, he was placed before a court-martial, but acquitted. In 1864 he became rear-admiral of the red. He published, besides other works, a "Narrative of a Voyage round the World in the Sulphur."

Belcher (Jonathan), a merchant, born in Cambridge, Mass., Jan., 1681, graduated at Harvard in 1699. He was governor of Massachusetts and New Hampshire from 1730 to 1741. Having been removed from office, he went to England to vindicate himself, and was appointed governor of New Jersey in 1747. Died Aug. 11, 1757.

Bel'chertown, a post-village and township of Hampshire co., Mass., on the New London Northern R. R., 10 miles N. N. W. of Palmer. It has important manufactures of carriages, etc. Pop. of township, 2428.

Bel'doc, a township of Barnwell co., S. C. Pop. 1176.

Bel'ed-el-Jereed' (*i. e.* "the country of dates"), an extensive region of Northern Africa, bordering on the Desert of Sahara, is bounded on the N. by Algeria, and on the W. by Morocco. The soil is mostly arid and sterile, except some oases, which produce the date-palm.

Belem. See Para.

Belem'nite [Lat. *belemni'tes*, from the Gr. *βέλεμνον*, a "dart" or "arrow"], a genus of fossil Mollusca of the order Cephalopoda, is the type of the family Belemnitidæ. The portion of the animal usually preserved is a cylindrical or conical mass of carbonate of lime, from two inches to a foot in length, one extremity generally acute, the other excavated to form a conical cavity. This organ is called the *guard;* it protruded from the body of a cuttle-fish, and doubtless served as a means of defence. The guard of the belemnite expanded above into a hollow, chambered cone, the "phragmacone;" and from one side of this projected a spatulate lamina of horny or shelly material, the homologue of the "cuttle-bone" of *Sepia* and the "pen" of *Loligo*. In a few instances the body of the belemnite is represented in the fossil state, and such a specimen is in the cabinet of Columbia College. These show that in form the belemnite resembled our common *Loligo*—that it had an ink-bag, and eight arms, which were furnished with many sharp hooks like the living *Onychoteuthis*. The belemnites begin in the St. Cassian beds, at the top of the trias, are very numerous in the Jurassic strata, but are not found in any more recent deposits. They are represented in the chalk by *Belemnitella*, but have no living analogue.

Belemnitel'la [dimin. of *Belemnites*], the name given

to the guard of a cuttle-fish closely allied to the belemnite, but distinguished by a slit which cuts the side of the phragmacone. It is characteristic of the cretaceous strata, and one species (*Belemnitella mucronata*), found on both sides of the Atlantic, is common in the cretaceous strata of New Jersey.

Belemni'tidæ, a family of extinct cephalopods, of which the type is the genus *Belemnites*. It also includes *Xiphoteuthis*, *Belemnoptera*, and *Belemnoteuthis*, of the Jurassic, and *Belemnitella*, etc., of the cretaceous.

Belfast', an important city and seaport of Ireland, in the county of Antrim and province of Ulster, is situated on Belfast Lough (an arm of the sea), at the mouth of the river Lagan, 101 miles by rail N. of Dublin, and 118 miles S. W. of Glasgow; lat. 54° 35′ N., lon. 5° 57′ W. The river is crossed by three bridges, the finest of which is the Queen's Bridge. Railways extend from this point to Dublin, Armagh, and Londonderry. The site of the city is low and level, but is partly enclosed by the ridge of Divis and Cave Hill, the former of which rises to the height of 1567 feet. The houses are mostly of brick and are well built; the streets are regular, spacious, well-lighted, and macadamized. Belfast is the most prosperous commercial town of Ireland, except Dublin. The principal public edifices are Queen's College, a beautiful structure in the Tudor style (opened in 1849); a Presbyterian and a Methodist college; the Royal Academical Institution, affiliated to the London University; the museum, the theatre, Linen Hall, the Corn Exchange, etc. In 1872 it had 80 churches, of which 28 were Presbyterian. Although the seat of the Roman Catholic bishop of Down and Connor, it is almost entirely Protestant, having only five Catholic churches. Fourteen newspapers were published here in 1872. The botanic garden of the Natural History Society occupies about seventeen acres. Belfast is the chief seat of the Irish manufactures of linen and cotton, and is the great dépôt of the linen trade. The linen manufacture was established here in 1637. The other chief branches of industry are weaving of linen and cotton, bleaching, dyeing, calico-printing, and iron-founding. Numerous steamers, engaged in the Channel trade, ply regularly between Belfast and Liverpool, Glasgow, Dublin, London, etc. The chief articles of export are linens, cotton goods, grain, flax, cattle, and provisions. This city has also a large foreign trade. The adjacent country is extremely beautiful. Belfast returns two members to Parliament. It first became an important place about 1604, and was chartered in 1611. Pop. in 1871, 174,394.

Belfast, a seaport, the capital of Waldo co., Me., is on the N. W. shore of Penobscot Bay (sometimes called Belfast Bay), 30 miles from the ocean and 30 miles S. by W. of Bangor. Belfast Bay, 9 miles wide, separates it from Castine. It has a spacious harbor, which is safe and sufficiently deep for large ships. Belfast is extensively engaged in trade, manufactures of paper, shoes, and iron, the fisheries, and in shipbuilding. It is the south-eastern terminus of the Maine Central R. R. (Belfast division). It has a national and savings bank and three weekly newspapers. Pop. 5278.

W. H. Simpson, Ed. "Republican Journal."

Belfast, a post-township of Allegany co., N. Y. It contains a seminary. Pop. 1488.

Belfast, a township of Fulton co., Pa. Pop. 856.

Belfort, an important fortified town of France, at the foot of the Vosges and on the river Savoureuse, 60 miles by rail N. E. of Besançon. Pop. in 1866, 8400. It has a citadel constructed by Vauban, a fine church, and a public library; also manufactures of iron, paper, and calico. It was ceded to France by Austria in 1648. In the winter of 1870–71 it was besieged and taken by the Germans. It was the only town of Alsace which the Germans permitted the French to retain when that province was annexed to Germany in 1871.

Bel'fort, a village of Croghan township, Lewis co., N. Y., has an extensive tannery.

Bel'fry, or **Beffroi,** the name of a military engine used in sieges in the Middle Ages and in ancient times. It was a movable tower about as high as the walls of the town in the siege of which it was employed. It was constructed of wood, with four or more stories or stages, and was moved on wheels. The lowest story was sometimes armed with a battering-ram, and the other stories were occupied with archers, slingers, etc. Near the top of the beffroi was a hinged drawbridge, which, when let down on the parapet of the wall, sometimes enabled the besiegers to storm the town.

Belfry [Fr. *beffroi*], a bell-tower or turret, usually forming part of a church, but sometimes detached from it. Towers built for such purposes in Italy are called campaniles. On the continent of Europe municipal belfries often occur as portions of the town-house (*maison de ville*).

Bel'gæ, the name given by Cæsar to the warlike tribes which in ancient times occupied one of the three great divisions of Gaul (*Gallia*). Their country, which was bounded on the N. W. by the ocean and on the E. by the Rhine, comprised the modern Belgium, part of Holland, and the N. E. part of France. This region was sometimes called *Belgica* or *Gallia Belgica*. It was separated from the territory of the Celtæ by the river *Sequana* (Seine) and its affluent the *Matrona* (Marne). Cæsar represents the Belgæ as distinct from the Celtæ proper and the Aquitani in language, usages, and political institutions. A part of the Belgæ were probably Germans or of German origin, and a part are believed to have been Cymric Celts. Some of the Belgæ had crossed the Channel and settled in the southern maritime parts of Britain, and were found there by Cæsar when he invaded the island. The Belgæ were a brave, warlike people. (See Cæsar, "Commentaries on the Gallic War;" Smith, "Dictionary of Ancient Geography.")

Bel'gard, written also **Bjaligrod,** a town of Prussia, in the province of Pomerania, 90 miles by rail N. E. of Stettin, has a castle, several churches, and manufactures of tobacco and woollen stuffs. Pop. in 1871, 6303.

Belgaum', a town of British India, in the presidency of Bombay, 105 miles S. W. of Bejapoor. It has solid, bastioned walls and ancient ruins, among them two temples. Pop. about 8000.

Bel'gium, a kingdom of Europe, situated on the German Sea between Holland, Prussia, and France, has an area of 11,373 square miles, and (in 1869) a population of 4,961,644 inhabitants. It is the most densely peopled of any European country, having 436 inhabitants to the square mile. The soil is partly fertile, partly (in the E.) sandy and marshy. The only mountains are some offshoots of the Ardennes in the S. The coast has a length of 46 miles, and is of a uniform character. The country is well watered by the Meuse and the Scheldt, and their affluents, the Sambre, Ourthe, Werze, Lys, Dender, and Rupel. There are no lakes of importance, but many canals. The climate in general is temperate. Among the chief products of Belgium belong cattle, fish, corn, fruit, wood; among those of the mineral kingdom, iron and coal. A coal region covering an area of 476 square miles traverses all Belgium, and embraces two large basins, one of which extends into France and the other into Prussia. Celebrated mineral springs are found at Spaa. The people belong, in almost equal proportion, to two different nationalities, the Flemish (German) and the Walloon (French). The Flemish language, which is spoken by about 2,500,000, prevails in the provinces of East Flanders, Antwerp, Limburg, West Flanders, and Brabant, while the Walloon is the predominant language in the provinces of Liege, Hainaut, Namur, and Luxemburg, and is spoken by a population of about 2,000,000. The French, though the language of the minority, has since 1794 been the official language of the state authorities and the court; of late, however, the Flemings have begun an active agitation for the recovery of equal rights for their idiom. The number of periodicals published in the Flemish language was, in 1871, about 40. With the exception of about 10,000 Protestants and 2000 Jews, the entire population belongs to the Roman Catholic Church, which has in Belgium one archbishop at Malines, and five bishops at Namur, Ghent, Bruges, Tournay, and Liege.

There are four universities—at Ghent, Liege, Louvain, and Brussels; the two first named are controlled by the state; the third by the Catholic bishops, and the last named by the Liberal party. Prominent among the other educational institutions of the country are the Academies of Fine Arts at Antwerp and Brussels, the Museum of Painting and Sculpture at Brussels, the Conservatories of Music at Brussels, Liege, and Ghent. The people are chiefly occupied with agriculture, and in this respect excel most nations of Europe. The working of mines also constitutes a most important part of the national industry. First in order are the coal-mines (with three great centres at Mons, Charleroi, and the city of Liege), which produce annually about 10,000,000 tons. The annual produce of the iron-mines, which are especially numerous in the district between the Sambre and the Meuse, amounts to about 7,200,000 hundredweight. Wool is the object of an immense industry, and the Belgian woollen cloths are greatly superior in quality to those produced in France. The linen cloths of Belgium have long been highly valued, and the manufacture of lace, though now less prosperous than formerly, has nothing to fear from foreign competition. The breweries amount to 2671, and beer is the common beverage of all classes. The commerce of the country is also in a

very prosperous condition, being greatly promoted by a dense net of railroads, which in 1871 had an aggregate length of 1936 miles. It is chiefly carried on with France, Holland, England, Prussia, North America, and Russia. The imports in 1869 amounted to 903,000,000 francs, the exports to 691,000,000. The commercial fleet, in 1869, consisted of 67 vessels (12 steamers), with an aggregate of 23,981 tons. The aggregate length of the telegraph lines was, in 1871, 2623 miles. The most important ports are those of Antwerp, Ostende, and Nieuwepoort; the most important centres of the commerce of the interior are Brussels, Ghent, Bruges, Liege, Namur, Courtray.

According to the constitution of Mar. 3, 1831, Belgium is a constitutional monarchy. The crown is hereditary, according to the right of primogeniture, in the male line only. The executive power is vested in the king alone; the legislative he shares with the senate and the house of representatives. The court of cassation at Brussels is the supreme court of the country; besides it there are three courts of appeal (Brussels, Ghent, and Liege). The jury has been introduced since 1831. The Code Napoléon is regarded as the judicial standard. The revenue and expenditures in 1870 amounted to 176,000,000 francs; the public debt to 696,000,000 francs. The army on the peace footing numbered (without officers) 98,770 men, 10,600 horses, and 152 pieces of ordnance; besides, the country has a civil guard consisting of 100,000 men, in 257 legions. The navy is unimportant. The most important fortresses are Antwerp, Mons, Charleroi, Philippeville, Marienbourg, Ath, Tournay, Menai, Ypres, Ghent, Namur. The measures and coins are the same as in France. In point of administration the country is divided into nine provinces: South Brabant, Antwerp, East and West Flanders, Hainaut, Namur, Liege, Limburg, Luxemburg. Brussels is the capital and residence of the king: during the summer months the king resides at Laeken. The national colors are red, yellow, and black, placed perpendicularly beside each other; the escutcheon, the lion of Brabant with the inscription, "L'union fait la force."

In the time of the Romans, the present Belgium, which was then inhabited by Celtic and Germanic tribes, formed, under the name of Gallia Belgica, a part of Gaul. The treaty of Verdun, in 843, united the southern districts with France, the northern with Germany. After the termination of the Carlovingian rule, the French districts were gradually converted into duchies and counties. In 1385 the county of Flanders fell to the House of Burgundy, which in the early part of the fifteenth century gradually obtained possession of all the provinces of the Netherlands. The marriage of Maria of Burgundy, the last scion of her house, with the emperor Maximilian I., incorporated the Netherlands with the extensive dominions of the House of Habsburg, and, under the name of the "Circle of Burgundy" (Burgundischer Kreis), with the German empire. When, after the abdication of Charles V. (1555), his states were divided, Belgium remained united with Spain, and this union continued after the northern provinces had successfully established their independence. Only from 1598 to 1621, Belgium constituted an independent state under the rule of Isabel, daughter of Philip II., and her husband, the archduke Albert. In the course of the seventeenth century Spain had repeatedly to cede portions of Belgian territory to France. The peace of Utrecht in 1713 gave Belgium to Austria.

In the Austrian war of succession the whole country was conquered by the French, but it was restored to Austria in the peace of Aix-la-Chapelle (Oct. 18, 1748). In consequence of the unpopular reforms and innovations which Joseph II. undertook to introduce, an insurrection broke out against Austrian rule in Dec., 1789, and on Jan. 11, 1790, the Belgian provinces (with the exception of Luxemburg) proclaimed their independence under the name of "United Belgium," but in Nov., 1790, the rule of the Austrians was re-established. After the battle of Jemappes (Nov. 7, 1792), Belgium was occupied by the French, and in 1794 the country was ceded by Austria to France. It was now divided into nine departments, and the administration wholly assimilated to that of France. In 1814 the first treaty of Paris united Belgium with Holland into the kingdom of the Netherlands. The union lasted until Aug., 1830, when the whole country rose in revolution against the Dutch government. On Sept. 20 a provisional government was formed, which, on Oct. 4, after the evacuation of the capital by the Dutch, proclaimed the independence of Belgium. On June 4, 1831, the prince Leopold of Saxe-Coburg was elected king. The preliminary treaty of 1833 between England, France, and Holland put an end to the efforts of the Dutch government for the recovery of Belgium, but the definite acceptance of the articles drawn up by the London Conference in 1831 for the regulation of the frontier between Holland and Belgium did not take place until 1838. The subsequent history of Belgium under Leopold I. (died Dec. 10, 1865) and his son Leopold II. has been one of quiet and steady development. The administration has been sometimes in the hands of the Catholic and sometimes in those of the Liberal party, but the peace of the country has never seriously been disturbed, not even by the European revolution of 1848. (See JUSTE, "Histoire de Belgique," 2 vols., 4th ed. 1868.)

A. J. SCHEM.

Belgium, a village of Clay township, Onondaga co., N. Y., on Seneca River. Pop. 166.

Belgium, a post-township of Ozaukee co., Wis., on Lake Michigan. Pop. 1979.

Belgo'rod, a town of Russia, in the government of Koorsk, on the river Donets, 88 miles S. S. E. of Koorsk, and on the railway from Moscow to Kharkof. It is an archbishop's see, and has numerous churches. Pop. in 1867, 15,200.

Belgrade, bĕl-grād' (anc. *Singidu'num*; Turk. *Bilgraad*; Ger. *Belgrad*), an important fortified town of Servia, is on the right bank of the Danube, at the mouth of the river Save, 42 miles S. E. of Peterwardein. The citadel, which is very strong, is situated on a point of land between the rivers, behind which rises the city with antique German edifices, a cathedral, and a palace. Belgrade had formerly an Oriental appearance, but it has been abandoned by many wealthy Turks, and mosques are partly superseded by churches. Here are manufactures of arms, cutlery, silk goods, saddlery, and carpets. It has a good port and an active trade, being the entrepôt of the commerce between Austria and Turkey. It is the seat of the chief authorities of Servia. In consequence of its importance as a strategical point, Belgrade has been the scene of many famous sieges and battles. It was besieged without success by the Turks in 1456, and taken by the sultan Solyman in 1522. In 1688 it was stormed and captured by the elector of Bavaria, but it was recovered by the Turks in 1690. Prince Eugene here defeated 200,000 Turks in 1717, after which it changed owners several times. It is now subject to Turkey. Pop. in 1866, 25,089.

Belgrade, a post-township of Kennebec co., Me., 67 miles N. E. of Portland, on the Maine Central R. R. It has manufactures of lumber, boxes, spools, "excelsior," etc. Pop. 1485.

Belgrade, a township of Nicollet co., Minn. Pop. 414.

Be'lial [Heb. "worthlessness"], a term used in the Bible, frequently occurring in the phrase "a son of Belial," which, by a common Hebrew idiom, signifies merely a worthless or very bad person; but in the New Testament it is generally believed that Belial sometimes is used as a proper name of Satan, though it is not universally admitted. Some commentators think that it is always used in the New Testament in its Old Testament signification.

Bélidor, de (BERNARD FOREST), an eminent French military engineer and writer, born in Catalonia in 1697. He served in the German campaign of 1742, and became a member of the Academy of Sciences. Among his works may be mentioned his "Hydraulic Architecture" (1737), a "New Course of Mathematics for the Use of Artillery" (1757), a "Traité de Fortification," and "La Science des Ingénieurs." Died Sept. 8, 1761.

Belisa'rius [Slavic, the "white tsar or chief"], a celebrated general to whom Justinian was chiefly indebted for the military glory of his reign, was born at Germania, in Illyria, about 505 A. D. Having been appointed general-in-chief of the army of the East, he defeated the Persians at Dara in 530, and suppressed a formidable sedition at Constantinople in 532. He gained two victories over the Vandals in Africa, and took their king, Gelimer, a prisoner, in 534 A. D. In 534 he obtained a triumph, and the office of consul in 535. He also commanded the army of Justinian in a long war against the Ostrogoths, who had made themselves masters of Italy. He occupied Rome in Dec., 536, and gained some other advantages, but was recalled in 540, after which he suffered adverse fortune through the enmity of the empress Theodora. In 544 A. D. he was again sent to Italy to oppose the Gothic king Totila, but his army was so inferior in number that he could not gain a decisive victory. He resigned the command in 548, and passed nearly ten years in inaction. He served with success against the Bulgarians in 559, and was imprisoned in 563 on a charge of treason. Died Mar. 13, 565 A. D. He was distinguished for his loyalty, humanity, and other virtues. (See Lord MAHON, "Life of Belisarius," 1829; GIBBON, "Decline and Fall of the Roman Empire;" C. F. ZELLER, "Belisarius," Tübingen, 1809; C. L. ROTH, "Ueber Belisars Ungnade," 1846.)

Bel'knap, a county in Central New Hampshire, is bounded on the N. E. by Winnepiseogee Lake. Area, 360

square miles. The surface is hilly. Wool, potatoes, grain, and butter are the chief products. The county is intersected by the Concord and Montreal R. R. Capital, Laconia. Pop. 17,681.

Belknap (George E.), U. S. N., born Jan. 22, 1832, in Newport, N. H., entered the navy as a midshipman Oct. 7, 1847, became a passed midshipman in 1853, a lieutenant in 1855, a lieutenant-commander in 1862, and a commander in 1866. In 1856, while attached to the sloop-of-war Plymouth, he took part in the assault and capture of the "Barrier Forts" at the mouth of the Canton River, China, and was executive officer of the iron-clad New Ironsides from 1862 to 1864 in her numerous engagements with the forts and batteries of Charleston harbor. In his official report to Rear-Admiral Dupont of the part taken by the New Ironsides in the first bombardment of Fort Sumter, April 7, 1863, Commodore Turner writes: "I should fall short of my duty, sir, if I omitted to present to your especial notice the first lieutenant of this ship, Lieutenant-Commander George E. Belknap. It was not in the hour of battle only that great demand was made upon him; there was a constant pressure upon the high qualities that distinguish him as an efficient officer to meet exigencies, which, through a week of toil and labor, he had to provide for. He was equal to his work, gave me a perfect support at all times; and I desire here, and through you, to commend him to the favorable consideration of the government as an officer of the highest merit." Captain (now Vice-Admiral) Rowan, in a report to Rear-Admiral Dahlgren of "the services of the New Ironsides against the defences of Charleston harbor," dated Sept. 10, 1863, says: "I particularly recommend to your notice and that of the department the services of Lieutenant-Commander Belknap, to whose zeal and ability as an executive officer I am so much indebted for his untiring efforts to make the ship efficient in every department, and for his fine judgment and bearing in carrying out my orders as commander of the gundeck during the fourteen times this ship has been under the fire of the enemy's batteries." He commanded the iron-clad Canonicus in both attacks on Fort Fisher. His services on these occasions are thus highly spoken of by Rear-Admiral Porter in his "commendatory letter" of Jan. 28, 1865: "I recommend that Commanders Parrott and Calhoun, and Lieutenant-Commanders Weaver and Belknap, be promoted. These officers have given a world-renowned name to the monitors, and have shown what they were capable of performing when properly placed and managed. They had the hardest part of the work, and there is no end to their energy, bravery and untiring zeal."

Foxhall A. Parker, U. S. N.

Belknap (Jeremy), D. D., born at Boston, Mass., June 4, 1744; graduated at Harvard 1762; taught school four years; studied theology; was pastor of the Congregational church at Dover, N. H., from Feb. 18, 1767, until 1786, and of the Federal street church at Boston from Apr. 4, 1787, for the remainder of his life; kept a diary in interleaved almanacs from his fifteenth year, and a series of MS. books called "Quotidiana Miscellanea," in which he jotted down abstracts of his reading; was an active patriot during the Revolution, but declined the chaplaincy of the New Hampshire troops at Cambridge 1775; projected in 1790 the Massachusetts Historical Society, which recognizes him as its founder; delivered before it, Oct. 23, 1792, a ter-centennial discourse on the discovery of America; devoted much of his life to historical and biographical labors, making good use of the library left by his early pastor, Rev. Thomas Prince, to the Old South church at Boston; received from the legislature of New Hampshire a grant of £50 in aid of his publications, and became in 1792 an overseer of Harvard College. D. at Boston, of paralysis, June 20, 1798. Author of a "History of New Hampshire" (3 vols., 1784–92; new ed. 1813), which "has long ranked at the head of the local State histories of the country;" "A Discourse intended to Commemorate the Discovery of America by Columbus, with Four Dissertations" (1792); "An Historical Account of those Persons who have been Distinguished in America," etc. (vol. i. 1792; vol. ii. 1798), generally known as the "American Biography" (new ed., 3 vols.); "The Foresters, an American Tale" (1796), being a humorous apologue which originally appeared in the "Columbian Magazine;" a "Collection of Psalms and Hymns" (1795); of a number of sermons and many miscellaneous pieces. To him was attributed by Mr. Bryant "the high merit of being the first to make American history attractive." A "Life, with Selections from his Correspondence" (1847), was published by a granddaughter.

Belknap (William G.), an American officer, born at Newburg, N. Y., Sept. 7, 1794, entered the service of the U. S. in 1813 as third lieutenant of infantry, and rose through successive grades to be lieutenant-colonel of the Fifth Infantry in 1847. He served with marked gallantry in the war with Great Britain (1812–15), in the Florida war against hostile Seminoles, and in the war with Mexico. For his services in Florida he was brevetted lieutenant-colonel, and for gallant conduct in Mexico he won the brevets of colonel and brigadier-general; served on frontier duty from 1848 to 1851 in command of his regiment and departments, and while on duty in Upper Texas he contracted a disease from which he died near Fort Washita, Nov. 10, 1851. G. C. Simmons.

Belknap (William Worth), son of Gen. William G., born at Newburg, N. Y., Sept. 22, 1829; graduated at Princeton 1848; studied law at Georgetown, D. C.; settled at Keokuk, Ia., 1851; was elected to the legislature as a Democrat 1857: entered the army as major of the 15th Iowa infantry Oct., 1861; served at Shiloh in Tennessee and in Sherman's march to the sea; became brigadier-general of volunteers July 30, 1864, and major-general Mar. 13, 1865; was collector of internal revenue 1865–69, and secretary of war from 1869 until 1876, when he resigned on account of charges of corruption, upon which he was impeached by Congress, but acquitted for technical reasons.

Bell [from the Ang. Sax. *bellan*, to "make a loud noise"], a hollow metallic instrument employed to give signals by its sounds. It is usually composed of Bell-Metal (which see), but steel bells have been cast with good results. From a remote antiquity hand-bells were used in religious ceremonies. In Egypt the feast of Osiris was announced by the ringing of bells; several bells of bronze have been found in the ruins of Nineveh; Jewish high priests wore golden bells attached to their vestments. In Palestine bells were used in personal adornment, as now in the East. The Hindoo and Burmese priests have long used them in their temples, and in Athens the priests of Cybele used bells in their rites. The Greeks employed bells (κώδωνες) in garrisons and markets; the Romans announced the hour by the *tintinnabulum*. The introduction of bells into churches is usually ascribed to Saint Paulinus, bishop of Nola in Campania (400 A. D.). Their use in churches and monasteries soon spread through Christendom. They were introduced into France about 550, and Benedict, abbot of Wearmouth, brought one from Italy into England about 680. Portable bells had long before been used in the Church. Several specimens, some of them, it is believed, as old as the sixth century, are still preserved in Ireland, Scotland, and Wales. Bells came into use in the East after 865. Church bells were then of a comparatively small size, and were frequently made of wrought instead of cast metal. It was not until the fourteenth century that they reached a large size. The "Jacqueline" of Paris, cast in 1300, weighed 15,000 pounds; another, cast in 1472, weighed 25,000 pounds. The famous bell of Rouen, cast in 1501, weighed 36,364 pounds. One at Toulouse weighs 66,000 pounds. The largest bell in the world is the Great Bell of Moscow, above 19 feet in height, and weighing 448,000 pounds. It was cast in 1734, but fell during a fire in 1737, was injured, and remained till 1837, when it was raised, and now forms the dome of a chapel. Another Moscow bell, cast in 1819, weighs 80 tons. The Great Bell at Pekin, 14 feet high, weighs 53½ tons.

Bells have long been connected with the services of the Christian Church, so that the Mohammedans substitute for them the cry of the muezzin from the tops of the mosques. Associated in various ways with the ritual of the Church, bells acquired a sacred character. They were cast with religious ceremonies, and consecrated by baptism; received names, had sponsors, were sprinkled with water, anointed, and covered with the white chrisom, like infants. This custom is still practised in Roman Catholic countries. Bells were believed to disperse storms and pestilence, drive away enemies, extinguish fires, etc. In the Middle Ages it was common to put some inscription on the bell, like the following:

"Vivos voco, mortuos plango, fulgura frango." *
"Funera plango, fulgura frango, Sabbata pango,
Excito lentos, dissipo ventos, paco cruentos." †
"Laudo Deum verum; plebem voco; congrego clerum;
Defunctos ploro; pestem fugo; festamque honoro." ‡

The notion that bells are efficacious in dispelling storms is by no means extinct.

It was a belief that bells had the power to terrify evil spirits, and the custom of ringing the *passing-bell* grew out of the belief that devils troubled the expiring patient, and

* Literally: "I call the living, I mourn the dead,
I break the lightnings" (or thunderbolts).

† "I mourn the deaths, I break the lightnings,
I mark the Sabbaths, I arouse the slow, I scatter the winds,
I appease the cruel."

‡ "I praise the true God; call the people; assemble the clergy; bewail the dead; put to flight the plague; honor the festivals."

lay in wait to afflict the soul the moment when it escaped from the body. The tolling of the passing-bell was retained at the Reformation, and the people were instructed that its use was to admonish the living and excite them to pray for the dying. The practice of tolling church-bells while funerals are being conducted is still a usage in various nations.

The ringing of the *curfew*, incorrectly supposed to have been introduced into England by William the Conqueror, was a custom of a civil nature, and its object was to warn the public to extinguish their fires and lights at eight o'clock. The eight o'clock ringing is still continued in many parts of England, Scotland, and the U. S.

The ringing of bells in chimes, and the playing of tunes upon them in church-towers, have been carried to the greatest perfection in the Netherlands; but many fine chimes are found in many other European countries and in the U. S.

REVISED BY R. D. HITCHCOCK.

Bell, a county of Western Tennessee, bordering on Mississippi, established since the census of 1870. It is a good cotton and corn region, and is intersected by the Memphis and Charleston and the Mississippi Central R. Rs. Capital, Grand Junction.

Bell, a county in Central Texas. Area, 1097 square miles. It is intersected by the Leon River, and also drained by Lampasas Creek. Much of the surface is fine prairie. It is healthy, well watered, and well timbered. The soil is adapted to pasturage and cotton and grain crops. Corn, wool, cotton, and cattle are raised. Capital, Belton. Pop. 9771.

Bell, a township of Clearfield co., Pa. Pop. 918.

Bell, a township of Jefferson co., Pa. Pop. 785.

Bell, a township of Westmoreland co., Pa. Pop. 810.

Bell (ANDREW), D.D, a Scottish teacher noted as the founder of the monitorial system (or Madras system) of education, was born at St. Andrew's in 1753. He took orders in the Anglican Church, and became chaplain of Fort St. George at Madras in 1789. Having obtained the direction of a school for male orphans at Madras, he employed the scholars in mutual instruction, and after his return to Britain published a treatise on his new method in 1797. Joseph Lancaster made some successful experiments in this method of education. Bell died Jan. 27, 1832, and left £120,000 sterling to found educational institutions. (See R. and C. C. SOUTHEY, "Life of Bell.")

Bell (ANDREW GRAHAM). See APPENDIX.

Bell (Sir CHARLES), F. R. S. (London), an eminent British anatomist and physiologist, the youngest brother of Andrew Bell, was born in Edinburgh in Nov., 1774. He removed in 1804 to London, where he lectured on anatomy and surgery, and published a "System of Operative Surgery" (1807). In 1814 he was elected one of the surgeons of the Middlesex Hospital. He gained distinction as a surgical operator, and excelled in the treatment of nervous affections. He made the important discovery that the nerve-filaments of sensation are distinct from those of motion. In 1836 he became professor of surgery in the University of Edinburgh. Among his works are an "Exposition of the Natural System of the Nerves of the Human Body" (1824), "Anatomy and Physiology of the Human Body" (3 vols., 1816), and "The Hand, its Mechanism and Vital Endowments as evincing Design" (1834). The last is one of the Bridgewater Treatises. Died April 29, 1842. (See A. SHAW, "Narrative of the Discoveries of Sir Charles Bell in the Nervous System," 1837; "Quarterly Review" for May, 1843; AMÉDÉE PICHOT, "Sir C. Bell," Paris, 1846.)

Bell (CHARLES H.), REAR-ADMIRAL, born in New York Aug. 15, 1798, became a midshipman of the U. S. navy in 1812, and served in the war with Great Britain, became captain in 1854, commodore in 1862, and rear-admiral in 1866. Died at New Brunswick, N. J., Feb. 19, 1875.

Bell (HENRY), a Scottish engineer, born in Linlithgowshire April 7, 1767, was the first who obtained success in steam navigation in Europe. He worked in London under Rennie. A small vessel called "The Comet," with an engine constructed by himself, was launched on the Clyde in 1812. Died Nov. 14, 1830.

Bell (HENRY H.), U. S. N., born Nov. 17, 1807, in Orange co., N. C., entered the navy as a midshipman Sept. 1, 1823, became a lieutenant in 1831, a commander in 1854, a captain in 1862, a commodore in 1863, and a rear-admiral in 1866. In 1861 he commanded the steamer Brooklyn, West Gulf blockading squadron. In 1862 he was selected as fleet captain by Rear-Admiral Farragut, and while acting in this capacity led the second division of gunboats at the attack upon Forts St. Philip and Jackson and capture of New Orleans, where his sound judgment and coolness were conspicuously shown and highly commended by the whole fleet. His services during the passage of the Hartford by the Vicksburg batteries, June 28, 1862, are thus referred to by Admiral Farragut: "The captain of the fleet, Commander H. H. Bell, was on the poop by my side, and not being able, as I before stated, to do much in the management of the fleet, owing to the darkness and the smoke, gave his attention to looking up the batteries, and pointing them out to the officers in charge of the guns, and assisting them with his judgment on all occasions." In 1863 he commanded, during the temporary absence of Admiral Farragut, the West Gulf blockading squadron. In 1865 he was appointed to the command of our squadron in the East Indies, where he was drowned, April 12, 1867, in an attempt to pass in his barge over the bar at the mouth of the Osaka River, Japan. Rear-Admiral Henry H. Bell was an able and gallant officer, and his death was much lamented.

FOXHALL A. PARKER, U. S. N.

Bell (JAMES), a brother of S. D. Bell, was born at Francestown, N. H., Nov. 13, 1804, and graduated at Bowdoin in 1822. He studied law at Litchfield, Conn., practised at Gilmanton, Exeter, and Guilford, N. H., and was U. S. Senator (1855–57). Died May 26, 1857.

Bell (JOHN), an eminent surgeon, born in Edinburgh May 12, 1763, was an elder brother of Sir Charles Bell. He began in 1786 to lecture on surgery, which he also practised with success in his native city. He published, besides other works, a "System of the Anatomy of the Human Body" (2 vols., 1793–98), to which his brother Charles added two more volumes, and "The Principles of Surgery" (3 vols., 1801–07). He was a good classical scholar, and one of the most skilful operators of his time. He died at Rome April 15, 1820, leaving "Observations on Italy," which was published by his widow in 1825.

Bell (JOHN), an American statesman, born near Nashville, Tenn., Feb. 15, 1797. He graduated at the University of Nashville in 1814. He was elected a member of Congress in 1827, and by successive re-elections continued in that body about fourteen years. He supported Gen. Jackson for the presidency in 1832, but joined the Whig party in 1833, and was chosen Speaker of the House of Representatives in 1834. He was an earnest advocate of a protective tariff. In Mar., 1841, he was appointed secretary of war by President Harrison. He resigned that office in Sept., 1841, because he disapproved the policy of Mr. Tyler. He was elected a Senator of the U. S. for Tennessee in 1847, was re-elected in 1853, and opposed the repeal of the Missouri Compromise in 1854. He was nominated in 1860 for President of the U. S. by the Constitutional Union party, having Lincoln, Douglas, and Breckenridge as his competitors. He received only thirty-nine electoral votes. Died Sept. 10, 1869.

Bell (JOHN), born at Londonderry, N. H., about 1765, was governor of New Hampshire (1829–30). He was a brother of Gov. Samuel Bell, and was long prominent in public affairs. Died at Chester, N. H., Mar. 22, 1836.

Bell (LUTHER V.), M. D., LL.D., a son of Gov. Samuel Bell, was born at Chester, N. H., Dec. 20, 1806, graduated at Bowdoin in 1823, and received his diploma in medicine at Dartmouth. He practised medicine in New York and Chester, N. H., and became an excellent surgeon, and was president of the McLean Insane Asylum, Somerville, Mass. (1837–56). He published able professional writings. In 1845 he visited Europe by invitation of the trustees of the Butler Hospital for the Insane at Providence, R. I., the plans for which he prepared. In Aug., 1861, he was appointed brigade surgeon in the U. S. army, and at the time of his death was medical director of Hooker's division. Died in camp at Budd's Ferry, Md., Feb. 11, 1862.

Bell (ROBERT), a journalist, born at Cork, in Ireland, Jan. 10, 1800, passed his mature life in London. In conjunction with Sir E. Bulwer and Dr. Lardner he founded in 1841 "The Monthly Chronicle," which he edited. Among his numerous works are a "History of Russia" (3 vols., 1838–38), "Lives of the English Poets" (2 vols., 1839), a "Life of George Canning" (1846), and several dramas and tales. He died in London April 12, 1867.

Bell (SAMUEL), LL.D., was born in Londonderry, N. H., Feb. 9, 1770, and graduated at Dartmouth in 1793. He became a lawyer, and held many public offices. He was a judge of the supreme court of New Hampshire (1816–19), governor (1819–23), U. S. Senator (1823–35).—His sons, JAMES, SAMUEL DANA, LUTHER V., and Col. LEWIS BELL (1836–65, mortally wounded at Fort Fisher), all attained distinction.

Bell (SAMUEL DANA), LL.D., son of the above, was born at Francestown, N. H., Oct. 9, 1798, and graduated at Harvard College in 1816. Besides many minor offices, he was justice of the superior court of New Hampshire (1849–55), justice of the supreme court (1855–59), chief-justice

(1859–64), and was one of the most eminent and profound jurists that New England has ever produced. Died July 31, 1868.

Bell (Thomas), F. R. S., an English naturalist, born in Dorsetshire Oct. 11, 1792. He became a member of the College of Surgeons in London in 1815, and professor of zoology in King's College, London, in 1832. In 1853 he was elected president of the Linnæan Society. Among his works are a "History of British Quadrupeds" (1836) and a "History of British Stalk-eyed Crustacea" (1853).

Bel'la, a town of Italy, in the province of Potenza, 14 miles S. W. of Malfi. Pop. in 1861, 5202.

Belladon'na* (*At'ropa*† *Belladon'na*), an herbaceous perennial plant of the natural order Solanaceæ, is sometimes called **Deadly Nightshade.** It is a native of Europe, has ovate leaves, bell-shaped flowers of a lurid, purple color, and berries which when ripe are black, shining, and sweetish in taste. All parts of the plant are narcotic and very poisonous, and contain an alkaloid called *atropia* or *atropine*, on which its active properties depend. The belladonna is considered a valuable medicine and a powerful remedy for certain nervous diseases, neuralgia, paralysis, etc. It is administered both internally and externally. It is a physiological antidote for opium-poisoning. When applied to the eye it has the remarkable property of greatly dilating the pupil, and it is often used by oculists both in examinations and operations. The medicinal preparation of belladonna commonly used in the U. S. is an extract from the leaves.

Belladonna Lily (*Amaryl'lis Belladon'na*), a beautiful rose-colored flower which grows wild about the Cape of Good Hope, and is cultivated in the gardens of England and France. The drooping flowers are clustered at the top of a leafless stem, which is about eighteen inches high.

Bellair', a township of Appanoose co., Ia. Pop. 655.

Bellaire, a city of Belmont co., O., on the Ohio River, 5 miles S. of Wheeling and 137 miles E. of Columbus. It is at the terminus of the Central Ohio, the Baltimore and Ohio, and the Cleveland and Pittsburg R. Rs. It has water and gas works, 1 national and 1 private bank, 1 manufactory of window-glass and 4 of flint-glass, 1 nail-mill, 1 blast furnace, 1 lantern-factory, and 2 weekly papers. Coal, iron, and limestone are abundant. It is a rapidly growing town. Pop. 4033. James F. Anderson, Ed. "Independent."

Bel'lamy (Jacobus), an eminent Dutch poet, born at Flushing Nov. 42, 1757. He published a collection of verses in 1782, and on the occasion of the war of 1785 a volume of patriotic poems ("Vaderlandsche Gezangen"). Among his most popular works is "Roosje," a poem. He had good taste and a glowing fancy, and contributed largely to the improvement of the national literature. Died Mar. 11, 1786. (See Q. Knipers, "Notice sur Bellamy.")

Bel'lamy (Joseph), D. D., born in North Cheshire, Conn., in 1719, graduated at Yale College (1735), and was pastor of the Congregational church at Bethlehem, Conn. (1740–90). He was a powerful preacher and a renowned teacher of theology. Several volumes of his sermons and theological works have been published. Among them are "True Religion Delineated" (1750), "Letters and Dialogues" (1761), and "Complete Works" (3 vols., 1811). Died Mar. 6, 1790.

Bel'larmine (Robert), [It. *Roberto Bellarmino*], a celebrated theologian and cardinal, born in Tuscany Oct. 4, 1542. He entered the order of Jesuits in 1560, and became professor of theology at Louvain in 1569. He was a zealous champion of orthodoxy, and was highly distinguished as an able controversial writer against heretics. His principal work is "Disputationes de Controversiis Fidei adversus hujus Temporis Hæreticos" (3 vols., 1581). He became a cardinal in 1598, archbishop of Capua in 1601, and librarian of the Vatican in 1605. Died at Rome Sept. 17, 1621. He was a man of mild and pacific disposition. "The Church of Rome," says Hallam, "brought forward her most renowned and formidable champion, Bellarmin. . . . His abilities are best tested by Protestant theologians, not only in their terms of eulogy, but indirectly in the peculiar zeal with which they chose him as their worthiest adversary." (*Introduction to the Literature of Europe.*) (See G. Fuligati, "Vita del Cardinal R. Bellarmino," 1624, a work based upon an Autobiography; Daniello Bartoli, "Della Vita di R. Bellarmino," 1678; P. Frizon, "Vie du Cardinal Bellarmin," 1708.)

*The name *Belladonna*, an Italian phrase signifying "beautiful lady," is said to have been given to this plant from its having been used to improve the complexion, as well as to make the eye appear dark and lustrous.

†From *Atropos*, the name of one of the Fates.

Bella'ry, a town of India, in the province of Madras, 135 miles N. of Seringapatam, is one of the chief military stations in the province, and has a fort on a rock 450 feet high. Pop. about 30,000.

Bell Bird [Sp. *campane'ro*], (*Arapunga alba* or *Casmarynchus carunculata*), found in Guiana and other parts of South America, is nearly as large as a pigeon. It utters a note of metallic sound, resembling the tolling of a bell, which, it is said, can be heard at a distance of three miles. It is distinguished by a broad and depressed bill, which is soft and flexible at the base. The plumage of the male is snowy white. From its forehead grows a curious horn-like and tubular appendage, which when empty is pendulous, but when the bird is excited is filled with air and rises to the height of three inches. The Australian bell bird (*Myzantha melanophrys*), "one of the honey-eaters," produces a peculiar tinkling sound; it is an entirely different species from the above.

Bell, Book, and Candle. The excommunication by bell, book, and candle is a solemnity belonging to the Roman Catholic Church. The priest pronounces the formula of excommunication, consisting of maledictions on the head of the person anathematized, and closes the sentence by shutting the book from which it is read, taking a lighted candle and casting it to the ground, and tolling the bell as for the dead. This mode of excommunication appears to have existed in the Western churches as early as the eighth century. The form of excommunication concluded substantially as follows: "Cursed be they from the crown of the head to the sole of the foot. Out be they taken of the book of life. And as this candle is cast from the sight of men, so be their souls cast from the sight of God into the deepest pit of hell. Amen."

Bell Brook, p.-v. of Sugar Cr. tp., Greene co., O. P. 369.

Bell Creek, a post-twp. of Goodhue co., Minn. P. 820.

Bellechasse, a county of Quebec, bordering on the State of Maine, is bounded on the N. W. by the St. Lawrence River. Area, 720 square miles. The staple productions are maple-sugar, hay, flax, and oats. Capital, St. Michel. Pop. 17,637.

Belle Creek, a post-twp. of Washington co., Neb. P. 200.

Bellefontaine, a post-village, county-seat of Logan co., O., at the crossing of the Cincinnati and Sandusky and Cleveland and Indianapolis R. Rs. It is the eastern terminus of the Evansville R. R. (building). It is about 110 miles N. of Cincinnati and 55 miles N. W. of Columbus. It has the highest elevation of any town in the State. It has a good trade, 2 banks (1 national), 3 newspapers, 10 churches, 5 schools, a fine court-house, and is noted for its health and beauty. P. 3182. J. Q. A. Campbell, Ed. "Republican."

Bellefonte, a post-twp. of Jackson co., Ala. Pop. 957.

Bellefonte, a village of Boone co., Ark. It has one weekly newspaper.

Bellefonte, the county-seat of Centre co., Pa., is beautifully situated at the foot of Bald Eagle Mountain, 87 miles N. W. of Harrisburg. The Bald Eagle Valley R. R., connecting with the Philadelphia and Erie R. R. at Lock Haven, and with the Pennsylvania R. R. at Tyrone, passes through the town. Of late it is a place of summer resort. It has a celebrated spring, and the surrounding scenery is very fine. It has two furnaces, three rolling-mills, two foundries, an axe-factory, extensive car-works, glass-works, and a number of smaller manufactories, one monthly and three weekly papers, four printing-offices, three banks, an academy, and a large number of fine private residences. P. of borough, 2655. P. Gray Meek, Ed. "Watchman."

Bellefonte, a township of Nottoway co., Va. P. 2837.

Belle-Isle-en-Mer, an island belonging to the French department of Morbihan, is in the Atlantic. It is 8 miles from the shore, and has an area of 12 square miles. Pop. 10,076, mostly engaged in the pilchard-fishery. Excellent horses and grain are raised here. Here is a fortified seaport named Le Palais.

Belle Isle, North. (1) An island in the strait of the same name, between Newfoundland and Labrador, is 21 miles in circuit, and has a small harbor; lat. 52° 13′ N., lon. 55° 19.1′ W. (2) Belle Isle, South, an island at the entrance of White Bay, on the N. E. side of Newfoundland; lat. 50° 49′ N., lon. 55° 29′ W. It is a fishing-station. Pop. 53. (3) Belle Isle, a fertile island, 9 miles long and 3 broad, in Conception Bay, Newfoundland. It has considerable fishing interests. Pop. 500.

Belle Isle, Strait of, between Labrador and Newfoundland, is 80 miles long, 12 miles wide, and dangerous of navigation.

Bel'lenden (William), a Scottish author of whose personal history little is known. He was a professor in the University of Paris, and was distinguished for the elegance

of his Latinity. He published in 1608 at Paris a compilation from the works of Cicero, entitled "Ciceronis Princeps." Among his other works are "De Statu Prisci Orbis" ("On the Condition of the Primitive World," 1615), and "De Tribus Luminibus Romanorum" (1634). Died before 1633. His three principal works were reprinted in 1787, with a Latin preface by Dr. Parr. The preface was noted for its elegant Latinity and its allusions to contemporary politics. The preface attracted much more attention than the reprint.

Belle Plain, a township of Marshall co., Ill. P. 1092.

Belle Plaine, a post-village of Benton co., Ia., 116 miles W. of Clinton, on the Omaha line of the Chicago and North-western Railway, being the first division station on that road from the Mississippi River. It has a round-house and shops of the road, four grain-elevators, a national bank, and one weekly newspaper. Pop. 1488.
D. H. Frost, Ed. "Union."

Belle Plaine, a post-village of Sumner co., Kan., is situated on the Ninneseah River, in the midst of a fine agricultural district. It has one weekly newspaper.

Belle Plaine, a post-village of Scott co., Minn., on the Minnesota River and on the St. Paul and Sioux City R. R., 47 miles S. W. of St. Paul. Pop. 497; of Belle Plaine township, 2375.

Belle Plaine, a post-township of Shawanaw co., Wis. Pop. 576.

Belle Prai'rie, a township of Livingston co., Ill. Pop. 630.

Belle Prairie, a post-township of Morrison co., Minn. Pop. 344.

Beller'ophon [Gr. Βελλεροφόντης, "slayer of Bellerus"], originally called **Hippon'ous,** a personage of the Greek mythology, was a son of Glaucus, king of Corinth. Having killed Bellerus by accident, he fled to Prœtus, king of Argos, who was instigated by his wife to send him to Iobates, king of Lycia. He carried a sealed letter requesting Iobates to kill him, but that king imposed on him the dangerous mission of fighting with the Chimæra. He killed this monster and defeated the Amazons. He attempted to soar to Olympus on the winged horse Pegasus, but fell to the earth.

Bellerophon, a genus of fossil univalve gasteropod mollusks. The shell is symmetrically convolute, with few and occasionally sculptured whorls, globular or discoidal, and having a dorsal keel, which terminates in a deep notch. Many species of it have been found in the Silurian, Devonian, and carboniferous rocks in various parts of the world.

Belles-Lettres, a French term often used in English and other languages as synonymous with polite literature or the more refined departments of learning, including poetry, rhetoric, history, and fiction. It is a term of mediæval origin, and is used in a vague manner. Authorities are not agreed in respect to its exact definition and application.

Bellever'non, a post-borough of Fayette co., Penn., on the Monongahela River, 26 miles S. of Pittsburg. Pop. 906.

Belleview', a township of Dallas co., Ala. Pop. 1535.

Belleview, a post-township of Calhoun co., Ill. P. 947.

Belleview, or **Bellevue,** a post-village, capital of Bossier parish, La., is about 20 miles N. E. of Shreveport, and 1 mile S. E. of Lake Bodeau. It has one weekly newspaper.

Belleview, a township of Morrison co., Minn. P. 92.

Belleview, a township of Washington co., Mo. Pop. 1867.

Belleville, a port of entry, the capital of Hastings co., Ontario (Canada), on the Bay of Quinté, and on the Grand Trunk Railway, 113 miles E. N. E. of Toronto. It is a beautiful town, and has fine public buildings, including a court-house, jail, numerous public and private schools, nine churches, and a custom-house. It is the seat of Albert University (Methodist Episcopal), which consists of Albert College for young men and Alexandra College for ladies. One mile W. of the town is the deaf and dumb asylum, a fine building, opened in 1870. The river Moira furnishes water-power, and the lumber trade is very extensive. There are two woollen mills, four sash and blind factories, a large box-shop, furniture-works, four foundries, two locomotive-shops, a sewing-machine factory, a pottery, several large saw-mills, besides breweries, distilleries, chandleries, shipyards, etc. There are three steamboat lines, a gas company, two banks, a board of trade, and two daily and three weekly papers. Pop. in 1871, 7305.

Belleville, a post-township of Conecuh co., Ala. Pop. 1584.

Belleville, a township of San Bernardino co., Cal. Pop. 56.

Belleville, a city, capital of St. Clair co., Ill., 14 miles S. E. of St. Louis. Four railroads centre here. It contains numerous manufactories of almost every description, and one of the largest rolling-mills in the West; also a fine convent, numerous churches, and splendid school-houses. It is thoroughly gas-lighted. Five papers (two dailies) are published here. It is in a region abounding in coal. Pop. 8146.
J. R. O'Neil, Ed. "Advocate."

Belleville, a post-village and capital of Republic co., Kan., is situated in a rich mining district, and has one weekly newspaper.

Belleville, a post-village of Essex co., N. J., on the Passaic River, 3 miles above Newark, and 10 miles W. by N. of New York. It has four or more churches, and several manufactories. Pop. of township, 3644.

Belleville, a post-village of Ellisburg township, Jefferson co., N. Y., on North Sandy Creek, is the seat of an academy.

Belleville, a post-village of Jefferson township, Richland co., O., on the Sandusky Mansfield and Newark R. R., 68 miles S. by E. from Sandusky. It has considerable manufacturing industry and one weekly newspaper. Pop. 720.

Belleville (Bell's Station P. O.), a village of Crockett co., Tenn., on the Memphis and Louisville R. R., 69 miles N. E. of Memphis. It has one weekly newspaper.

Bellevue, a post-village of Jackson co., Ia., pleasantly situated on the Mississippi River, 24 miles below Dubuque and 13 miles S. of Galena. It stands on a high bank, and has a good landing, with a gravelly beach. Produce is shipped here in steamboats and by the C. C. and D. R. R. It is a summer resort and noted for beautiful scenery. The population is largely German. It has an extensive railroad trade in grain, stock, produce, etc. It has one weekly newspaper. Pop. 1353; of Bellevue township, 2402.
Ed. "Jackson Leader."

Bellevue, a post-village and township of Eaton co., Mich., 32 miles S. W. of Lansing, on the Peninsular R. R. It has important manufactures and produces excellent lime. It has one weekly newspaper. Pop. of village, 608; of township, 1985. Edwin S. Hoskins, Pub. "Gazette."

Bellevue, a post-village, capital of Sarpy co., Neb., in a township of the same name, on the Missouri River, 15 miles by water below Omaha, and on the Omaha and South-western R. R., 57 miles N. E. of Lincoln. It has a court-house and several churches. Pop. of township, 961.

Bellevue, a post-village of Huron co., O., on the Lake Shore R. R., 45 miles S. E. of Toledo. It is largely devoted to manufacturing, and is a good grain-market. Water-works are being constructed. It has doubled its number of buildings and inhabitants within five years. It has one weekly newspaper. Pop. 1219. Ed. of "Gazette."

Bellevue, a borough of Allegheny co., Pa. Pop. 384.

Bellevue, a township of Brown co., Wis. Pop. 822.

Bellew' (John Chippendall Montesquieu), a celebrated reader, was born in Lancaster, England, in 1823, of an ancient and noble Irish stock. His name in youth was Higgin, but he assumed his mother's maiden name on coming of age. He was educated at Oxford, and entered the Anglican ministry in 1848, and won great distinction as a preacher. In 1868 he joined the Roman Catholic Church, and has since given with great success public readings in Great Britain and the U. S. Died June 19, 1874.

Bell Ew'art, a post-village of Innisfil township, Simcoe co., Ontario (Canada), on Lake Simcoe and on the Northern Railway, 10 miles from Barrie. It is visited by regular lines of steamboats. Pop. about 600.

Bell Flower, a township of McLean co., Ill. P. 659.

Bellinger (John), M. D. See Appendix.

Bel'lingham, a post-township of Norfolk co., Mass., on the New York and New England R. R. It has three woollen mills and other manufactories. Pop. 1282.

Bellingham (Richard), a lawyer born in England in 1592, emigrated to America in 1634. He was lieutenant-governor of Massachusetts for thirteen years, and governor for ten years. Died Dec. 7, 1672.

Bellingham Bay, in almost the extreme northern part of Washington Territory, in Whatcom co., is 14 miles long, 3 miles wide, with a depth of from 3 to 20 fathoms. Great quantities of lignitic bituminous coal are mined here, the shaft being only one-quarter of a mile from the harbor. It is generally considered the best coal on the Pacific coast. Whatcom is the chief point of this coal-trade.

Bellini (Giovanni), an excellent painter, was born at Venice in 1426. He was the master of Titian, and was

called the founder of the Venetian school. Among his best works are a "Madonna and Child," "The Coronation of the Virgin," and "Christ Talking to the Woman of Samaria." Died Nov. 29, 1516.

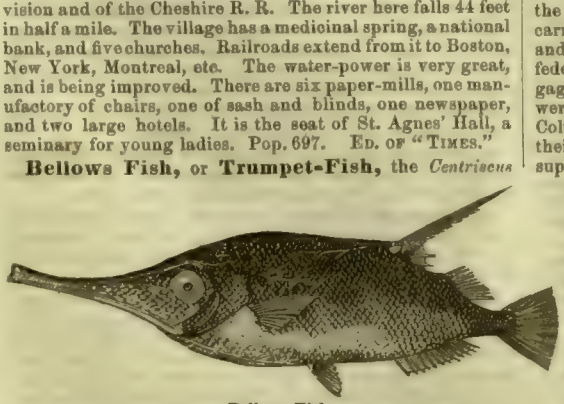
Bellini (Vincenzo), a celebrated Italian composer, son and grandson of musicians of moderate ability, was born at Catania, Sicily, Nov. 3, 1802. He was a pupil of Zingarelli. In 1827 he produced "Il Pirata," an opera which was performed at Milan with great success. His fame was widely extended by "La Straniera" (1828), "La Sonnambula" (1831), and "La Norma" (1831). He afterwards went to Paris and London, where he was warmly applauded, and composed "I Puritani" (1834). Died in Paris Sept. 24, 1835. (See Pongin, "Bellini," 1868.)

Bellinzo'na [Ger. *Bellenz*], a town of Switzerland, and one of the capitals of the canton of Ticino, is on the river Ticino, here crossed by a bridge, 16 miles N. of Lugano. It is defended by several old castles, and has an active transit trade. Pop. in 1870, 2501.

Bellmann (Gustav). See Appendix.

Bell Metal, a hard, dense, brittle, and sonorous alloy of copper with tin, zinc, or some other metal. The proportion in English bells is usually 75 per cent. of copper and 25 of tin. The bell metal of commerce usually contains 80 of copper to 20 of tin, or else 78 of copper to 22 of tin.

Bell Mills, a township of Tehama co., Cal. Pop. 79.



Bello'na, the goddess of war in the ancient Roman mythology, was represented as the companion and sister or wife of Mars. She was described by the poets as armed with a scourge and holding a torch in her hand. Her priests were called *Bellonarii*.

Bel'lows [from Anglo-Saxon *bylig*, a "bag;" Ger. *Bälgen*], a very ancient contrivance for producing a blast of air. It consisted, in its rudest form, of a bag which was compressed, allowed to become full, compressed again, and so on. Representations of bellows have been found in some of the earliest Egyptian sculptures, and Sir Gardiner Wilkinson believes he has found a valve as early as the time of Moses. The natives of India and China have employed the bellows from time immemorial. Rude forms of the bellows are found in many of the lowest tribes of Africa. Ordinary bellows, as now used, are practically leather bags which are compressed and then expanded so as to allow air to enter through a valve opening inward, which on compression of the bellows allows no air to escape, except through the nozzle. In modern manufactories, furnaces, etc. the bellows has been partly superseded by machines of different kinds which produce the blast of air with greater efficiency and uniformity than ordinary bellows.

Bel'lows (Henry Whitney), S. T. D., LL.D., an eminent Unitarian minister, born in Walpole, N. H., June 10, 1814, graduated at Harvard in 1832, and became pastor of a church in the city of New York in 1838. He gained distinction as an eloquent public speaker, and lectured on a variety of subjects, especially social, educational, and patriotic enterprises. In 1846 he was one of the founders of the "Christian Inquirer." Among his works are "Lectures on the Treatment of Social Diseases" (1857) and "The Old World in its New Face" (1868). He was the principal promoter and first president of the U. S. Sanitary Commission, established in 1862.

Bellows Falls, a post-village of Windham co., Vt., on the W. bank of the Conn. River, and on the Vt. Central R. R., 53 miles S. E. of Rutland, at the junction of the Rutland division and of the Cheshire R. R. The river here falls 44 feet in half a mile. The village has a medicinal spring, a national bank, and five churches. Railroads extend from it to Boston, New York, Montreal, etc. The water-power is very great, and is being improved. There are six paper-mills, one manufactory of chairs, one of sash and blinds, one newspaper, and two large hotels. It is the seat of St. Agnes' Hall, a seminary for young ladies. Pop. 697. Ed. of "Times."

Bellows Fish, or **Trumpet-Fish,** the *Centriscus scolopax*, a spiny-finned fish of the family Aulostomidæ, feeds upon small animals found at the bottom of the sea, chiefly in the Mediterranean and on the W. coasts of Europe. It is good eating, though small, seldom exceeding five inches in length.

Bellows Fish.

Bell'port, a post-village of Brookhaven township, Suffolk co., N. Y., on Bellport Bay. It is the seat of an academy. Bellport Station, in the same township, is 5 miles N. of Bellport, on the Long Island R. R., 56½ miles from Hunter's Point.

Bells, in nautical language, is a term having a peculiar meaning, and is used as a substitute for those expressions by which people on land indicate the hour. The sailor's day or night is divided into watches or periods, each of four hours' duration, and the bell is struck once at the expiration of each half hour. The number of strokes denotes the number of half hours that have elapsed in that particular watch. If the watch commences at 6 P. M., eight bells would be a signal for the end of the watch at 10 P. M.

Bell's Landing, a post-township of Monroe co., Ala. Pop. 1310.

Bellu'no (anc. *Bellu'num*), a city of Italy, capital of the above province, on the Piave, 49 miles N. of Venice. It is a bishop's see, and has a cathedral designed by Palladio, a rich hospital, a public library, a handsome aqueduct, and a beautiful triumphal arch; also manufactures of silk stuffs, hats, leather, and earthenware. Pop. in 1857, 13,552.

Bell'ville, a township of Howard co., Kan. Pop. 1240.

Bellville, a post-village, the capital of Austin co., Tex., near the Brazos River, 55 miles W. N. W. of Houston.

Bel'mond, a thriving village of Pleasant township, Wright co., Ia., is finely situated on the Iowa River, at the junction of two prospective railroads. It is in a good and well-settled farming region. It has good public schools, churches, etc., and one weekly paper. Pop. 327.

A. M. Allen, Ed. "Belmond Mirror."

Bel'mont, a county of Ohio, bordering on West Virginia. Area, 520 square miles. It is bounded on the E. by the Ohio River, and drained by Wheeling and Captina creeks. The surface is diversified by hills, which are cultivated to the summit; the soil is fertile. Dairy products, grain, wool, fruit, and tobacco are extensively raised. The county is intersected by the Central Ohio R. R., and contains coal. Capital, St. Clairsville. Pop. 39,714.

Belmont, a township of Sumpter co., Ala. Pop. 2916.

Belmont, a township of Iroquois co., Ill. Pop. 833.

Belmont, a township of Warren co., Ia. Pop. 1048.

Belmont, a post-township of Woodson co., Kan. Pop. 622.

Belmont, a post-township of Waldo co., Me. Pop. 628.

Belmont, a post-township of Middlesex co., Mass. It is one of the finest suburbs of Boston. Pop. 1513.

Belmont, a township of Jackson co., Minn. Pop. 625.

Belmont, a post-village of Mississippi co., Mo., on the Mississippi River, opposite Columbus, Ky., 197 miles S. S. E. of St. Louis. In 1861 this place was occupied as a Confederate camp. On Nov. 6, Gen. Grant, in command at Cairo, descended the river with about 4000 troops, remaining over night about 10 miles above Columbus, Ky. On the morning of the 7th this force was debarked on the Missouri shore a short distance above Belmont, and at once moved forward to the capture of the Confederate camp, supposed to contain about 3000 men. After several hours' severe fighting the Federal troops forced their way through the obstructions on either side. An irresistible charge carried the camp, drove the Confederates in all directions, and left the field in possession of the Federals. The Confederate camp, with all its supplies, ammunition, and baggage, was fired and destroyed. The defeated Confederates were, however, strongly reinforced by Maj.-Gen. Polk from Columbus, and in turn drove the Federal troops back to their boats, fighting all the way against a now vastly superior Confederate force, while the batteries on the Kentucky side kept up a damaging fire which could not be returned. By 5 P. M. the troops were all on board their boats without the loss of a gun, while they had with them two guns captured from the Confederates. The Federal loss was 84 killed, 150 wounded, and a similar number missing; the Confederate loss is stated at from 500 to 600, killed and wounded.

Belmont, a township of Otoe co., Neb. Pop. 508.

Belmont, a post-village, capital of Nye co., Nev., in a township of the same name, about 150 miles in a direct line E. S. E. of Carson City. Pop. of township, 244.

Belmont, a post-township of Belknap co., N. H. It has manufactures of hosiery and of lumber. Pop. 1165.

Belmont, a post-village, semi-capital of Allegany co., N. Y., on the Genesee River and on the Erie R. R., 92 miles W. by N. of Elmira, and 94 miles E. S. E. of Dunkirk. It contains a court-house and several barrel-factories. It has one weekly newspaper. Pop. 795.

Belmont, a township of Franklin co., N. Y. P. 1619.

Belmont, a post-twp. of La Fayette co., Wis. P. 1303.

Belmont, a township of Portage co., Wis. Pop. 508.

Belmont, a village of Westchester co., N. Y., now a part of New York City. Pop. 171.

Belmont (August), born at Alzey, in Germany, in 1816, emigrated to America in 1837 as the representative of the Rothschilds, and became an active politician of the Democratic party. He was chairman of the executive committee at the national Democratic convention at Charleston in 1860. He is a prominent man in the financial world of New York.

Beloit', the capital of Mitchell co., Kan., on the S. bank of Solomon River, has a weekly paper, an iron bridge, important mills and manufactures, and an active trade. Pop. of Beloit township, 173. Ed. "Beloit Gazette."

Beloit, a city of Rock co., Wis., is on Rock River and on the Chicago and North-western R. R., 91 miles N. W. of Chicago and 47 miles S. S. E. of Madison. It is also on the Western Union R. R., which connects it with Milwaukee and Rock Island, Ill., and is on the S. boundary of the State. It is partly built on a plain which is about seventy feet higher than the river. It is the seat of Beloit College. It has a national and one other bank, and considerable manufactures of paper, reapers and mowers, ploughs, water-wheels, etc. It has one weekly and one monthly newspaper. Pop. 4396; of the township, 5139.
C. Ingersoll, Ed. "Beloit Free Press."

Beloit College, at Beloit, Wis., originated in the deliberations of ministers and laymen of Congregational and Presbyterian churches in Wisconsin and Northern Illinois. In May, 1845, a convention of sixty-nine members decided unanimously that a college of the highest order for young men ought to be established at Beloit. A self-perpetuating board of trustees then elected was incorporated by charter from the Territorial legislature of Wisconsin in 1846. The corner-stone of the first building was laid in June, 1847, and in the fall of the same year five young men were received to the first college class. Jackson J. Bushnell, A. M., and Joseph Emerson, A. M., both graduates of Yale College in the class of 1841, were the first regularly appointed professors. Rev. Aaron L. Chapin of Milwaukee, also a graduate of Yale, was elected first president in 1849, and continues (1874) still in office. The institution embraces a collegiate department and a preparatory school. The collegiate department offers two parallel courses of four years, called respectively the classical and the philosophical course. In the classical course the branches of study and the standard of scholarship correspond with those of the best colleges of New England. The philosophical course combines, with such an amount of Latin and Greek as is considered essential to the best proficiency in any art or science, a more varied range of study and a more extensive culture of science. In the preparatory school also two parallel courses are defined, called respectively the classical course and the elementary scientific course. These courses occupy three years, and are adapted to meet the requisitions for admission to the two courses of the collegiate department. For such as do not contemplate entering college they offer opportunities for advanced general culture, well balanced and thorough, as far as it goes.

The faculty of the college is now (1874) composed of the president, eight professors, and two instructors of the preparatory school. About 2000 young men have received more or less of culture in the institution, and the graduates of the full course number 210. Its graduates occupy positions of influence in our own country and many foreign lands. For its endowment and support Beloit College depends entirely on private benefactions. It has received generous donations from friends in both the East and the West, but large additions to its resources are much needed. The college is beautifully situated on the banks of Rock River. Its most prominent building is the Memorial Hall, erected in honor of the sons of the college who fell in the late war, and devoted to the collections of the cabinet and library, for the steady increase of which generous provision is made.
Aaron L. Chapin.

Beloochistan', or **Belujistan** (anc. *Gedrosia*), a country of Southern Asia, bounded on the N. by Afghanistan, on the E. by Sinde, on the S. by the Arabian Sea, and on the W. by Persia. Its area is estimated at 107,000 square miles, and the pop. at 2,000,000.

This region, which is almost destitute of rivers or permanent streams, consists of high mountains and barren, sandy plains. The peak of Takkatoo, in the N. part, is said to be 11,000 feet high, and some of the plains or valleys have an elevation of 6000 feet above the sea. The largest river is the Doostee, which has been found only twenty inches deep and twenty yards wide at its mouth. It enters the Arabian Sea. The climate presents great extremes of heat and cold. Most of the fruits known in Europe, as well as plantains and guavas, are common. Melons attain such size that a man cannot lift them. Some of the valleys produce rice, cotton, tobacco, indigo, barley, pulse, etc. Among the mineral resources are copper, antimony, lead, iron, sulphur, and alum. The inhabitants are divided into the Beluches in the N. and W., who are a mixture of Persians, Hindoos, and Semitic tribes, and are indolent, warlike, and cruel; the Brahuis, the remains of the original inhabitants, in the E.; and the Lamri in the S. E. The entire population consists of Sunnite Mohammedans. They subsist mostly by pastoral pursuits, raising sheep, goats, and camels or dromedaries. They are subject to a khan, who rules with despotic power. Kelât was stormed and taken by the British in 1839, and the khan was killed.

Belpas'so, an Italian town, in the province of Catania, at the side of Mount Etna, 7 miles N. W. from Catania. Pop. 7038.

Bel'per, a market-town of England, in Derbyshire, on the Midland Railway, 10 miles by rail N. of Derby. It has several churches, a public library, and a stone bridge over the river Derwent. It has large manufactures of silk and cotton hosiery. Pop. 9509.

Bel'pre, a post-village of Washington co., O., is on the Ohio River, opposite Parkersburg, West Va., and about 12 miles below Marietta. It is the eastern terminus of the Marietta and Cincinnati R. R., connecting here with the Baltimore and Ohio R. R. by a great bridge, which crosses the Ohio and is more than a mile long. Pop. 911; of Belpre township, 2462.

Belshaz'zar [*Bel-shar-uzur;* Fr. *Balthasar*], son of Nabonadius (Labynetus), who was the sixth and last king of the second Babylonian period. His mother was a daughter of Nebuchadnezzar, and probably the widow of Neriglissar, the fourth king of the period. When of sufficient age he was associated with his father on the throne, and in the book of Daniel is therefore called king. At the fall of Babylon in 538 B. C. he was slain, and his father, Nabonadius, then at Borsippa, was taken prisoner.

Belt, a girdle, a band, a zone. This term is applied in surgery to a band or bandage; in astronomy to several dark bands, variable in number, which extend across the disk of the planet Jupiter and are parallel to its equator.

Leather belts or bands are extensively used in machinery to connect a revolving shaft with another shaft or pulley. It is a contrivance for transmitting power with less noise and friction than attend the use of toothed gearing. These belts are generally used between parallel shafts, and when the shafts must turn in opposite directions the belt is crossed. When the shafts are not parallel, and their axes produced intersect each other, they may be connected by using a third shaft. Gutta-percha and India rubber are sometimes used instead of leather. To render leather belts durable, they should be carefully protected against moisture.

Belt Creek, a township of Burt co., Neb. Pop. 287.

Bel'ton, a post-township of Anderson co., S. C. It is on the Greenville and Columbia R. R., 26 miles S. of Greenville, at the junction of the Anderson branch. Pop. 1364.

Belton, a post-village, the capital of Bell co., Tex., is situated on Leon River, 60 miles N. N. E. of Austin City. It has one weekly newspaper. Pop. 281.

Belton (Rev. James S.). See Appendix.

Beltra'mi, a large county in the N. W. of Minnesota. A considerable part of the surface is covered with lakes, among which are the Red Lake, Cass, Itasca (the head source of the Mississippi), and a number of smaller ones, all connected together. Area, 3100 square miles. Pop. 80.

Belts, Great and **Little,** are two straits which connect the Baltic with the Cattegat. The former separates the island of Fünen from Seeland, is 36 miles long, and has an average width of about 18 miles. The depth ranges between 6 and 26 fathoms, and the current is so strong that the Belt is seldom frozen over. The navigation of both Belts is dangerous or difficult. The Little Belt, which separates Fünen from Jutland, also forms a communication between the Baltic and the Cattegat. It is 32 miles long. The widest part of it is about 10 miles, and the narrowest about 2500 feet. From these Belts (Lat. *baltei*) the Baltic Sea is supposed to take its name.

Belu'ga, a genus of Mammalia, of the order Cetacea and of the family Delphinidæ or dolphins. They are distinguished by a blunt and broad head and the absence of a

dorsal fin. They abound in the Arctic seas, are gregarious, and afford to the Greenlanders an important article of food. The *Beluga globiceps* sometimes attains a length of thirteen feet. *Round-headed cachalot* is one of the synonyms of this animal. The white whale of the St. Lawrence (*Beluga borealis*) is common in northern waters, both salt and fresh. It is caught in the St. Lawrence and the Saguenay, is from ten to twenty feet long, and is prized for its excellent oil and its skin, which makes a very fine leather.

The name Beluga is often applied to a large sturgeon of Southern Russia (*Acipenser huso*), which affords great quantities of isinglass and caviare. (See STURGEON.)

Be'lus [Gr. Βῆλος], in classic mythology, a king of Phœnicia, was said to be a son of Neptune, a brother of Agenor, and the father of Egyptus. He is considered by some persons as identical with BAAL (which see).

Belus [Βηλεύς, now called *Nahr Naaman;* perhaps the *Bealoth* of the Hebrew text of the Bible], a small stream of Palestine, which enters the sea near Acre. On its banks it is said that the art of glass-making was discovered.

Belus, Temple of, a famous temple of enormous size in the city of Babylon, rebuilt by Nebuchadnezzar shortly after 604 B. C. According to some authorities, it was destroyed by Xerxes, king of Persia. Some writers identify its ruins with *Birs-Nimrud* (a huge mound 6 miles S. W. of Hillah), which appears to have been originally about 156 feet high. Others identify its ruins with *Babil* (another mound some 6 miles N. of Hillah), whose height is about 140 feet.

Belvede're (*i. e.* "fair view"), an Italian word applied to a pavilion on the top of a house, or a structure designed to afford a fine prospect of the surrounding country; also an artificial eminence in a garden. In France and other countries of Europe the term is often used as the name of a palace, villa, or summer-house. The famous statue of Apollo Belvedere derived its name from a gallery of the Vatican called Belvedere.

Bel'vedere (*Chenopodium scoparium*, or *Salsola scoparia*), an annual plant of the order Chenopodiaceæ, is a native of Europe and Asia, and is sometimes called summer cypress. It is cultivated in gardens, but not for its flowers, which have no beauty. It has a close, pyramidal, rigid form and narrow leaves, and resembles a miniature cypress.

Belvedere, a town of Southern Italy, province of Cosenza, 26 miles N. N. W. of Cosenza, has a trade in wine and raisins. Pop. 5600.

Bel'videre, the county-seat of Boone co., Ill., on the Kishwaukee River and on the Chicago and North-western Railway (Galena division), 78 miles W. N. W. of Chicago. It is the terminus also of the St. Paul division of the North-western Railway, and is projecting a railroad S. E. It has a national bank, two newspapers, a planing-mill, a number of mills, elegant churches, and fine schools. Pop. 3231, and is rapidly increasing; of Belvidere township, 4410.

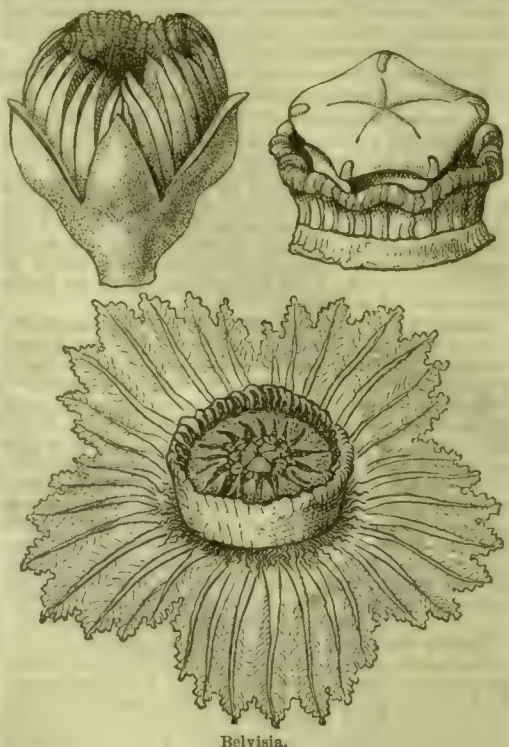
R. W. COON, ED. "BELVIDERE NORTH-WESTERN."

Belvidere, a post-township of Monona co., Ia. P. 272.

Belvidere, a township of Montcalm co., Mich. P. 54.

Belvidere, a township of Goodhue co., Minn. P. 626.

Belvidere, a post-village, the capital of Warren co., N. J., on the Delaware River and on the Belvidere Delaware R. R., 13 miles above Easton and 95 miles N. of Philadelphia. The Pequest Creek enters the river here, and affords a valuable water-power. Belvidere has an academy, five churches, one national bank, several mills, and a cotton factory. It has three weekly newspapers. Pop. of the township, 1882.



Belvidere, a post-township of Perquimans co., N. C. Pop. 2403.

Belvidere, a township of Lamoille co., Vt. It has manufactures of lumber. Pop. 369.

Belvidere, a township of Buffalo co., Wis. Pop. 632.

Bel'vin, a township of Pitt co., N. C. Pop. 2151.

Belvis'ia (also called **Napoleo'na**), a genus of exogenous plants, the type of the natural order Belvisiaceæ. The few species of this order which are known are natives of tropical Africa, and are large shrubs with simple alternate, coriaceous leaves. The flowers, each of which has twenty stamens, are sessile, beautiful, and have a very singular form. The calyx is a leathery cup, divided into five ovate segments. The corolla consists of three concentric and distinct rings, each of which is monopetalous; the lower or outer one, 5-lobed and furnished with thirty-five stiff ribs, by means of which it is strongly plaited; when fully blown it turns back over the calyx so as to hide it completely; the second, a narrow membrane, is divided into many fine regular segments like a fringe; the third, an erect, cup-shaped membrane, whose edge is cut into many fine segments turned downward. The fruit is a large berry, similar to a pomegranate in size and form, enclosing several reniform seeds, one inch long. One species

Belvisia.

of *Belvisia* bears an edible fruit. According to Lindley, this order belongs to the Myrtal alliance, and is allied to Rhizophoraceæ.

Belzo'ni (GIOVANNI BATTISTA), an Italian traveller, born at Padua Nov. 5, 1778, emigrated to England in 1803, and gained a subsistence by exhibiting himself as an athlete. In 1815 he visited Egypt at the invitation of Mehemet Ali, who desired him to construct a hydraulic machine. He soon directed his attention to the exploration of Egyptian antiquities. He removed to England the colossal bust called "Young Memnon," which is now in the British Museum. He opened the temple of Ipsambool and the pyramid of Cephren (or the second pyramid of Gizeh). He published in 1821 a very interesting "Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, etc. in Egypt and Nubia." He undertook a journey to Timbuctu, but died near Benin Dec. 3, 1823.

Bem (JOSEPH), a Polish general, born at Tarnov, in Galicia, in 1795. He served in the Polish army in the revolution of 1830, after which he passed some years in France. In 1848 he joined the Hungarian patriots, and obtained command of the army of Transylvania. He defeated the Austrians in several actions, and took part in the battle of Temesvár (1849), which was disastrous to Hungary. Having fled to Turkey and conformed to Islamism, he was raised to the rank of pasha. Died Dec. 10, 1850. (See PATAKY, "Bem in Siebenbürgen," 1850; N. N. LÁJOS, "Le Général Bem," Paris, 1851.)

Bembeci'dæ [Gr. βεμβήξ, a "top"], a family of hymenopterous insects, the popular name of which is "sand-wasps," are mostly natives of warm climates. They resemble wasps or bees in appearance, and the females make burrows in sandy banks, in which they deposit their eggs. Some of them emit an odor like that of roses. The U. S. have several species.

Bem'bo (PIETRO), a celebrated Italian scholar and cardinal, born at Venice May 20, 1470. He removed to Rome in 1512, and became secretary to Pope Leo X. In 1539 he was raised to the dignity of cardinal. He wrote, besides other works, a Latin "History of Venice" (1551). Died Jan. 18, 1547. He was eminent as a restorer of pure Latinity. His collected works were published at Venice in 4 vols., 1729. (See BECCADELLI, "Vita di P. Pembo;" J. D. LA CASA, "Vita Bembi.")

Bem'bridge Beds, a division of the upper eocene strata found in the Isle of Wight, and containing many fossil shells of the *Paludina*, *Planorbis*, etc. This division comprises, besides several beds of marl and clay, the Bem-

bridge limestone, a cream-colored stone, often compact and sometimes vesicular and concretionary. Here are found remains of the *Anoplotherium*, an extinct animal.

Bement', a post-township of Piatt co., Ill. Pop. 1471.

Bemiss (Samuel Merrifield), M. D. See Appendix.

Be'mis's Heights, a post-village of Stillwater township, Saratoga, co., N. Y., on the Champlain Canal and near the Hudson River, was the scene of the first battle of Stillwater, Sept. 19, 1777.

Ben, a Gaelic term prefixed to the names of many mountains of Scotland, as Ben Lomond, Ben Nevis, etc. It signifies "head" or "summit."

Ben, a Hebrew word signifying "son," and equivalent to the Arabic *Ibn*, forms the first syllable of many scriptural names, as Ben-hadad, Benjamin, etc. *Beni*, the plural of Ben, occurs in the names of many Arabian tribes.

Ben, Oil of, a fixed oil extracted by pressure from the fruits of *Moringa aptera* and other species, leguminous trees growing in the Levant and the East and West Indies. It is colorless or slightly yellow, is odorless, and does not readily become rancid. It is used to extract the odoriferous principles of fragrant plants.

Bena'res (anc. *Varanashi* and *Kasi*), a famous and populous city of Hindostan, situated on the left bank of the Ganges, about 428 miles by rail N. W. of Calcutta, and 477 miles by rail S. E. of Delhi. It is the holy city of the Brahmans, the chief seat of their science, and may be called the Hindoo capital of India. Flights of stone steps called *ghâts* lead down the steep banks of the Ganges, which is here about half a mile wide. The external appearance of the city, as seen from the river, is rendered very imposing by the minarets of about 300 mosques and the pinnacles of nearly 1000 pagodas. The streets are very narrow, and the houses, which are mostly built of stone, are generally lofty, some of them six stories high. Among the remarkable public edifices are the great mosque of Aurungzeb, 232 feet high, many Hindoo temples, a vast and old astronomical observatory, and the Hindoo Sanscrit college, the chief seat of native learning in India. As the holy city of the Hindoos and the central seat of Brahmanical learning, Benares attracts on the occasion of certain festivals an immense multitude of pilgrims, estimated at 100,000. The permanent population was, in 1866, 200,000. Benares is a wealthy and industrious city, having extensive manufactures of silk, cotton, and woollen stuffs. It is a great emporium for the shawls of the north, the diamonds of the south, and the muslins of Dacca and the eastern provinces. The Hindoo Sanscrit college was founded here in 1791, and an English department was added to it about 1827. The residences of the Europeans are mostly at Secrole, which is three miles from Benares, and contains many fine mansions. It is connected by a railway with Calcutta and Delhi. A mutiny of Sepoys broke out here in June, 1857, but was soon quelled.

Ben'bow (John), a brave English admiral, born in Shropshire in 1650, served first under James II. He became a rear-admiral in the reign of William III., who reposed great confidence in him. In Aug., 1702, he encountered a superior force under the French admiral Ducasse, near Jamaica. He maintained a running fight for four days, was mortally wounded, and died Nov. 29, 1702. (See Campbell, "Lives of the British Admirals.")

Bench, or **Banc** [Law Lat. *bancus*], in law, has several significations: 1. A court or tribunal for the administration of justice. The word originally meant the seat occupied by the judges in court. In England two of the leading courts are termed king's or queen's bench and common bench. The latter tribunal is also called the court of common pleas. 2. The word is also used to designate the judges as contrasted with the practitioners in their court, as in the phrase "the bench and the bar." 3. Another signification is the full number of judges acting as a court of review, as distinguished from a single member of their body, also acting judicially. Thus, decisions rendered by a single judge at a trial are said to take place at *nisi prius*, while those which are made by members of the court sitting together are said to be made in bench or in *banc* or in *banco*.

Bench Warrant, an order issued by or from a bench for the arrest of a person, either in case of contempt or after an indictment has been found, or from a judge to apprehend a person charged with an offence.

Bench'ers, the principal officers of the English inns of court, entrusted with their government and with the power of admitting persons to the bar, and of disbarring practitioners, though the exercise of these powers is subject to the supervision of the judges of the higher courts.

Ben'demann' (Eduard), a German painter of the Düsseldorf school, was born in Berlin Dec. 3, 1811, and was director of the academy at Düsseldorf from 1859 to 1868. He painted the "Captive Jews in Babylon" and "Jeremiah on the Ruins of Jerusalem" (1837).

Bendemeer, or **Bendemir.** See Bundemeer.

Ben'der, or **Ben'dery,** a fortified town of Russia, in Bessarabia, on the right bank of the Dniester, 65 miles N. W. of Odessa. Here is a strong citadel on an eminence. Bender has several paper-mills, forges, and tanneries. Pop. in 1867, 24,143.

Bend'sin, a town of Russian Poland, in the government of Petrokov, 100 miles by rail S. of Petrokov. Pop. in 1867, 6231.

Be'ne, a town of Northern Italy, in the province of Cuneo, on a hill 16 miles N. E. of Coni. It has an old castle. Pop. 6127.

Ben'edek, von (Ludwig), an Austrian general, born at Odenburg, in Hungary, in 1804. He fought with the rank of colonel against the Italians in 1848, and became a major-general in April, 1849, after which he served with distinction against the Hungarian patriots. He directed a corps in the Italian campaign of 1859 and at Solferino. In June, 1866, he took the command of the grand Austrian army, and remained on the defensive in Bohemia. He was defeated by the Prussians at the decisive battle of Sadowa, July 3, 1866.

Benedet'ti (Vincent), Count, a French diplomatist, born in Corsica about 1815. He was sent as ambassador to the kingdom of Italy in 1861. In 1870 he was employed by Napoleon III. in important negotiations with the court of Prussia, and had a personal interview with King William at Ems just before the emperor declared war against Prussia.

Ben'edict [Lat. *Benedic'tus*], Saint, a celebrated Italian religionist, called the founder of monachism in the West, was born at Nursia, in Umbria, in 480 A. D. He renounced the world in early youth, passed some years in solitude, and acquired a wide reputation for sanctity. He founded a famous monastery on Monte Cassino, near Naples, and composed a system of monastic rules which was largely adopted by the Western monks, and was known as the Rule of Saint Benedict. Under this system the monks were employed in manual labor and in the instruction of the young. (See Benedictines.) Died Mar. 21, 543 A. D. (See Juan de Castaniza, "Vida de S. Benito," 1583; J. B. Planchette, "Vie du grand S. Benoît," 1652; Anton Sulger, "Vita divi Benedicti," 1691; J. G. Waitzmann, "Leben und Wirken des heiligen Benedict," 1825.)

Benedict I. became pope of Rome in 574 A. D. Died in 578.—Benedict II., a native of Rome, was elected pope in 683 A. D., and died in 685.—Benedict III. succeeded Pope Leo IV. in 855. He died in 858, leaving a good reputation for piety.—Benedict IV. was elected pope in 900, as the successor of John IX. Died in 903.—Benedict V. was chosen pope in 964, but was banished from Rome by the emperor Otho I. Leo VIII. was pope at the same time with him, and both are recognized by Roman Catholic historians. Died in 965.—Benedict VI. was elected pope in 972, and was killed by the rebellious Romans in 974.—Benedict VII. succeeded Pope Benedict VI. in 975. He is said to have ruled with ability. Died in 984.—Benedict VIII., a son of the count of Tusculum, became pope in 1012. He crowned the emperor Henry II. in 1013, and defeated the Saracens, who had invaded the Papal States. Died in 1024.—Benedict IX. (Theophylactus of Tusculum), sometimes called the "boy-pope," was chosen pope in 1033. He was extremely licentious, and was expelled by the Romans. Sylvester III. became antipope. Benedict was deposed by the emperor Henry III. about 1046.—Benedict X., called the Stupid, was chosen pope in 1058, removed through the influence of Hildebrand in 1059, and died in prison in the same year.—Benedict XI. (Saint), born in 1240, a native of Treviso, succeeded Boniface VIII. in 1303. He was noted for humility. Died in 1304.—Benedict XII. (originally Jacques Fournier), a native of France, was chosen pope in 1334. He was the third pope who reigned at Avignon, and was eminent as a canonist and theologian. He wrote several works. He died in 1342, and was succeeded by Clement VI. Pope Benedict XII. was an excellent man.—Benedict XIII. succeeded Innocent XIII. in 1724. He was distinguished for moderation and other virtues, and promoted the peace of Europe. Died in 1730. (See Clemente da Cruz, "Vida de Benedicto XIII.," 1739.)—Benedict XIII. (anti-pope), (Pedro de Luna), was born in Aragon, and was elected pope by certain cardinals at Avignon in 1394. Another party elected Boniface IX. at Rome, and a schism of the Church ensued. He was deposed by the Council of Constance in 1417. Died in 1424. Benedict XIV. (Pros-

PERO LAMBERTINI), born at Bologna in 1675, was a man of superior talents. He was well versed in history, theology, and classical learning. He succeeded Clement XII. in 1740, and showed himself a liberal patron of literature and science. He was also distinguished for his moderation and enlightened piety, and was the author of several esteemed religious works. Died in 1758. (See FABRONI, "Vita di Benedetto XIV.," 1787.)

Benedict (DAVID), D. D., born at Norwalk, Conn., Oct. 10, 1779, graduated at Brown University in 1806, and was for twenty-five years pastor of the First Baptist church in Pawtucket, R. I. He has written a "History of the Baptists" (2 vols., 1813; 3d vol., 1848), "History of All Religions" (1824), "Fifty Years among the Baptists" (1860), "History of the Donatists," "Compendium of Church History," and other works. Died Dec. 5, 1874.

Benedict (ERASTUS CORNELIUS), LL.D., was born at Branford, Conn., Mar. 19, 1800, and graduated in 1821 at Williams College. In 1824 was called to the bar, and has been president of the New York Board of Education and a regent of the university, etc. He published "American Admiralty" (1850), "A Run through Europe" (1860), "The Hymn of Hildebert" (1868), and other works.

Benedict (Sir JULIUS), a musical composer, born at Stuttgart Nov. 27, 1804. He has written "The Gypsy's Warning" (1838), "Brides of Venice," "Lily of Killarney" (1862), all popular operas; "Undine," a cantata, and "St. Peter" (1870), an oratorio.

Benedict (LEWIS), an American lawyer and general of volunteers, born in Albany, N. Y., Sept. 2, 1817, graduated at Williams College, studied law, and was admitted to the bar in 1841. He was actively engaged in politics for many years, and held various important local offices. He entered the army as lieutenant-colonel Seventy-third N. Y. Volunteers, engaged at Yorktown, captured at Williamsburg, exchanged Sept., 1862, appointed colonel One-Hundred-and-Sixty-second N. Y. Volunteers, and was attached to the Army of the Gulf. He was in command of a brigade at the battle of Port Hudson and during the Red River expedition, where he greatly distinguished himself. Killed at battle of Pleasant Hill, La., April 9, 1864, while leading his brigade to a charge. (Brevet brigadier-general U. S. volunteers for gallant conduct.)

G. C. SIMMONS, *Clerk Board of Eng'rs.*

Benedic'ta, a township of Aroostook co., Me. Pop. 415.

Benedic'tine Editions of the Fathers. The following is a complete list of these highly esteemed and now very costly works: 1, Barnabas (Menard), 4to, 1642; 2, Lanfranc (D'Achery), fol., 1648; 3, Bernard (Mabillon), 2 vols. fol., 1667; 4, Anselm (Gerberon), fol., 1675; 5, Augustine (Delfan and others), 11 vols. fol., 1679–1700; 6, Cassiodorus (Garet), 2 vols. fol., 1679; 7, Ambrose (Du Frische and Le Nourri), 2 vols., 1686–90; 8, Hilary (Constant), fol., 1693; 9, Jerome (Martiany and others), 5 vols. fol., 1693–1706; 10, Athanasius (Montfaucon), 3 vols. fol., 1698; 11, Gregory of Tours (Ruinart), fol., 1699; 12, Gregory the Great (De Sainte-Marthe), 4 vols. fol., 1705; 13, Hildebert (Beaugendre), fol., 1708; 14, Irenæus (Massuet), fol., 1710; 15, Lucius Cæcilius (Le Nourri), 8vo, 1710; 16, Chrysostom (Montfaucon), 13 vols. fol., 1718–38; 17, Cyril of Jerusalem (Toultée and Maran), fol., 1720; 18, Basil (Garnier and Maran), 3 vols. fol., 1721–30; 19, Cyprian (Maran), fol., 1726; 20, Justin Martyr (Maran), fol., 1742; 21, Origen (De la Rue), 4 vols. fol., 1733–59; 22, Gregory Nazianzen (Clemencet), 1 vol. fol., 1778; 2d vol., 1842.

Benedic'tines, or **Benedictine Order,** the name of the monks who observe the rule of Saint Benedict. This order was one of the most ancient and learned religious orders of Western Europe. The first Benedictine monastery was that founded by Saint Benedict on Monte Cassino, near Naples, in 528 A. D. The order spread rapidly and widely in several countries of Europe, and it is said had at one period 37,000 monasteries. The Benedictines boasted that their order had produced 24 popes, 200 cardinals, 4000 bishops, and 1500 saints. The rule of Saint Benedict was less severe than that which the Eastern ascetics practised. It required that the monks should live frugally, avoid laughter, hold no private property, and be industrious. To them we are especially indebted for the preservation and transmission of many of the ancient classics through the Dark Ages down to the present time. Among the most celebrated houses or societies of this order was the Congregation of Saint-Maur (dating from 1621), on the river Loire, to which all the Benedictine houses in France were affiliated. Connected with it were many learned men, including Mabillon, Montfaucon, and Sainte-Marthe. They published good editions of the Fathers (see above) and numerous valuable works, among which are "L'Antiquité Expliquée" (15 vols. fol., 1719–24), "Veterum Scriptorum Spicilegium" (13 vols., 1653–77), "Acta Sanctorum S. Benedicti" (9 vols., 1688–1702), and "Histoire Littéraire de la France" (9 vols. 4to, 1733–49). The Cistercians, Carthusians, Camaldules, Clunians, Celestines, and Trappists were branches of the Benedictine order. In 1870 the order numbered 3089 monks, in eight congregations, two of which comprise the monasteries in the U. S. There are also Benedictine nuns, with twelve convents, in the U. S. (See "Annales Ordinis S. Benedicti," 6 vols., 1713–39; TASSIN, "Histoire de la Congregation de St.-Maur," 1770; MONTALEMBERT, "The Monks of the West," 5 vols., 1860.)

Ben'edix (JULIUS RODERICK), a German author, was born Jan. 21, 1811. He has written many successful plays, among them, "Bemoostes Haupt," "Der Steckbrief," "Der Störenfried," "Mathilde," etc., and a novel, "Bilder aus dem Schauspielerleben." Died Sept. 27, 1873.

Ben'efice [Lat. *beneficium*, a "favor"], originally, a bounty in land given to a meritorious Roman soldier. In mediæval history the term denoted an estate in land conferred by a superior by way of recompense for service. As late as the twelfth century the word was used synonymously with *fœdum*. The earlier historians of the Middle Ages adopted the view that benefices were given successively, as revocable, as temporary, as estates for life, and finally as estates in perpetuity. This view has been refuted by Guizot (see "Civilization in France," vol. iii.). In the canon law it designates a right inhering in a clergyman of sharing the income of church property in return for the performance of spiritual duties. The Roman Catholic Church includes all clerical offices, even the papal, among benefices; but the Church of England, which long made the term include all preferments except bishoprics, now excludes also all cathedral preferments, such as deaneries, canonries, arch-deaconries, etc.

Ben'efit of Cler'gy, in English criminal law, the privilege of the clergy, a clerk's privilege. During the Middle Ages benefit of clergy in various European countries extended to a total exemption in favor of clergymen from the process of a secular judge in criminal cases. In England, however, it was not carried beyond an exemption from capital punishment in felony and petit treason. It was never granted in cases of high treason or offences below felonies. Offences were thus divided into those which were clergyable and not clergyable. This exemption, at first allowed only to clergymen, soon was extended to all the officers and clerks of the Church, and then to every one who could read, an ability to read being confined almost wholly to those in the service of the Church. But when learning became more generally diffused, a distinction was made between those in orders and laymen who could read, the latter being allowed the privilege only once, and then (unless they were peers or peeresses) being branded in the left thumb. A woman, unless she was a peeress, could not claim this exemption, though this inequality was rectified by statute. At first, the criminals who were allowed this privilege were handed over to the ordinary or bishop to be dealt with according to the canons of the Church; but in the reign of Elizabeth it was enacted that they should be discharged from prison, with the proviso that the court might in its discretion keep the offender in prison for a year; and by subsequent statutes various punishments, such as whipping, fine, and imprisonment, were imposed on criminals entitled to benefit of clergy, who were practically all convicts. Whenever Parliament desired to make an offence strictly capital, the practice was to introduce into the enactment the words "without benefit of clergy." By statute of 7 Geo. IV., c. 28, s. 6, benefit of clergy was abolished. Its retention for so long a time was plainly owing to the fact that it could be used to mitigate the rigor of the English criminal law. (For details as to this exemption, consult 4 BLACKSTONE'S "Commentaries," 365.) T. W. DWIGHT.

Be'neke (FRIEDRICH EDUARD), a German philosopher, born in Berlin Feb. 17, 1798. He became extraordinary professor of philosophy in the University of Berlin in 1832. Among his works are "Psychological Sketches" (2 vols., 1825–27), a "System of Logic" (2 vols., 1842), and "Pragmatic Psychology" (1850). His system of psychology is called "empirical." He disappeared Mar. 1, 1854, and his body was found in a canal in June, 1855.

Benét (STEPHEN VINCENT). See APPENDIX.

Beneven'to, a province of Italy, is bounded on the N. by Campobasso, on the E. by Foggia, on the S. by Avellino, and on the W. by Caserta. Area, 676 square miles. The country is level, and the soil generally fertile. The chief articles of export are cattle, grain, wine, oil, etc. It has changed masters very often, and was annexed by Italy at the same time as Naples. Pop. in 1871, 231,914.

Benevento [Lat. *Beneven'tum*], a walled city of Southern Italy, capital of the above province, is situated on a hill or declivity and on the river Calore, 33 miles N. E. of Naples. Pop. in 1872, 20,133. It has a citadel or castle, a fine old cathedral, several palaces and churches. It is the see of an archbishop, and has several annual fairs. Among the many ancient remains found here is the magnificent Arch of Trajan, erected in 114 A. D., now nearly perfect. *Beneventum* was a place of great antiquity, having become a Roman town as early as 274 B. C., and it was an important city during the Roman empire. It was conquered in the sixth century by the Lombards, under whom it continued to flourish, and became the capital of the powerful duchy of Benevento. The city, with some adjacent territory, was given to the pope in 1053. In 1806 it was erected into a principality by Napoleon, who gave Talleyrand the title of prince of Benevento.

Ben'ezet (Anthony), a French philanthropist, born at Saint-Quentin Jan. 31, 1713. He joined the Society of Friends, and emigrated in 1731 to Philadelphia, where he taught school for many years. He was eminent as an opponent of the slave-trade and slavery, and a benefactor of the negroes. He wrote several tracts on slavery and the slave-trade, etc. Died May 3, 1784. (See Vaux, "Memoir of A. Benezet," 1817.)

Ben'fey (Theodor), born at Noerten, near Göttingen, Jan. 28, 1809, became in 1834 professor of Sanscrit and comparative grammar at Göttingen. He has published, besides other valuable works, a "Lexicon of Greek Roots" (1839–42), "The Cuneiform Inscriptions" (1847), "The Hymns of Sama-Veda" (1848), "The History of Oriental Philosophy in Germany" (1869), and a "Sanscrit-English Dictionary."

Bengal', the largest and most important province of British India, is bounded on the N. by Nepaul and Bootan, on the E. by Burmah, on the S. by the Bay of Bengal, and on the W. by the North-western and the Central Provinces. It has an area of 200,724 square miles. The greater part of Bengal consists of the great alluvial plain or valley of the Ganges and Brahmapootra. The combined delta of these great rivers commences 280 miles from the sea, near which the delta-islands, here called Sunderbunds, are covered with a very dense vegetation, and infested by serpents, crocodiles, and tigers. Farther N. the country is marvellously prolific of rice, cotton, opium, sugar, indigo, and a great variety of tropical fruits. The chief exports are opium, saltpetre, rice, hides, and indigo. The climate of Bengal is subject to great extremes of heat, and is very destructive to the health of both Europeans and natives, but in this respect great improvement is reported in the last few years. Pop. in 1871, 40,352,960.

Among the most important cities of Bengal presidency are Calcutta, the capital, Delhi, Benares, Patna, Agra, and Moorshedâbâd. The people are Hindoos, Mohammedans, Sikhs, and various wild tribes in the hill-country. The native Bengalese are a facile, deceitful, cowardly race. Their morals are much debased. The English first established themselves in Bengal in 1656. From the smallest beginnings their great empire of the East has grown up. The Bengalese language has a basis of Sanscrit, but is modified by words of Arabic, Malay, and Persian origin. Its literature has been much neglected till of late.

Bengal, a post-township of Clinton co., Mich. P. 1086.

Bengal, Bay of (anc. *Ganget'icus Si'nus*), a part of the Indian Ocean extending between Hindostan and Farther India. Its southern boundary is variously placed by geographers, according to some of whom it is a line about 1200 miles long, drawn from Coromandel to the peninsula of Malacca. Others assign as its southern limit a line drawn from the delta of the Godavery to Cape Negrais. Its chief affluents are the Ganges, the Brahmapootra, and the Irrawaddy. There are no good harbors on the western coast, but several safe ports occur on the E. side, at Aracan, Chedubs, Negrais, etc. The tide sometimes rises to the height of seventy feet in this bay. The north-east monsoon prevails here in summer and the south-west monsoon in winter. In this bay are the Andaman and the Nicobar Islands.

Bengal Light, or **Blue Light,** a brilliant signal-light used at sea during shipwreck, and in ordinary pyrotechny for illuminating a tract of country. It is produced by the combustion of a mixture of nitre, sulphur, and tersulphide of antimony. These materials are first reduced to a fine powder, then dried, and mixed in the proportions of 6 pounds of nitre, 2 of sulphur, and 1 of the tersulphide.

Benga'zi, or **Benghasy** (anc. *Bereni'ce*), a seaport-town of Northern Africa and the capital of Barca, on the E. coast of the Gulf of Sidra, 420 miles E. S. E. of Tripoli. The port is shallow, and nearly filled with sand. It has some trade in oxen, sheep, corn, and wool. It is supposed by some to occupy the site of the ancient *Hesperis* and the Gardens of the Hesperides. Pop. estimated at from 6000 to 7000.

Beng'el (Johann Albrecht), D. D., a German Lutheran theologian, was born at Winnenden, in Würtemberg, June 24, 1687. He was probably the first Protestant who treated the exegesis of the New Testament in a thoroughly critical spirit. His edition of the Greek Testament (1734) is highly esteemed. He wrote, besides other works, the celebrated "Gnomon Novi Testamenti" (1742), and an "Exposition of the Revelation of St. John" (1740). Died Nov. 2, 1752. (See a "Memoir of the Life of J. A. Bengel," translated from the German; also J. C. F. Burk, "Dr. J. A. Bengels Leben und Wirken," 1831.)

Bengue'la, a country of Western Africa, the limits of which cannot be accurately defined. It is bounded on the N. by the Coanza River, which separates it from Angola, on the S. by Mossamedes, and on the W. by the Atlantic Ocean. It is watered by numerous rivers which flow westward into the Atlantic; none of which, however, are of great importance. The surface is mountainous. The soil is fertile, and produces a very luxuriant and varied vegetation. The climate is hot, humid, and unhealthy, especially near the coast. The forests are infested by lions and other beasts of prey. Benguela is nominally subject to Portugal. Capital, São Felipe de Benguela.

Ben'ham (A. E. K.), U. S. N., born April 15, 1832, in Pennsylvania, entered the navy as a midshipman Nov. 24, 1847, became a passed midshipman in 1853, a lieutenant in 1855, a lieutenant-commander in 1862, and a commander in 1867. On Nov. 7, 1861, while attached to the steamer Bienville, he took part in the battle of Port Royal. From 1863 to 1865 he commanded the steamer Penobscot, Western Gulf blockading squadron.

Foxhall A. Parker, U. S. N.

Benham (Gen. Henry W.) was born at Cheshire, Conn., graduated at West Point with the highest honors in 1837, entered the engineers, served in Mexico, and was wounded at Buena Vista. He was afterwards employed on the coast survey, and was superintendent of the construction of defensive works around New York City, Boston, etc. In 1861 he was made brigadier-general of volunteers, and in 1865 was brevetted major-general U. S. army. He holds since 1867 the rank of colonel of engineers.

Be'ni, a river of South America, in Bolivia, rises on the E. slope of the Andes, and is formed by the junction of the Chuqueapo and Mapiri. It flows first northward and then north-eastward, and joins the Madeira or Mamore near the N. boundary of Bolivia, after a course of about 650 miles.

Beni, a department of Bolivia, is bounded on the N. and E. by Brazil, on the S. by La Paz, Cochabamba, and Santa Cruz, and on the W. by Peru. It comprises the whole northern part of the republic, and with the exception of a small part in the S. W. corner, and a part of the province of Menos in the E., consists entirely of an unknown region, inhabited only by wild Indians. Chief town, Trinidad. Pop. 53,900, exclusive of the Indians, whose number is estimated at 100,000.

Benicar'lo, a seaport-town of Spain, in the province of Valencia, on the Mediterranean, about 82 miles N. N. E. of Valencia. It is meanly built, and has a ruined castle and a fishing port. A strong wine is made here and exported to Bordeaux, where it is used in "cooking" or adulterating claret. Pop. 6989.

Benic'ia, a post-village of Solano co., Cal., is on the N. side of the Strait of Carquinez (which connects San Pablo and Suisun bays), about 33 miles by water N. E. of San Francisco. It was formerly the capital of the State. The strait is nearly two miles wide, and is navigable for large vessels. Benicia has a law school, a U. S. arsenal and barracks, a ladies' seminary, a convent, and important manufactures. It is the seat of St. Augustine College (Episcopalian). Here are quarries of limestone, producing good hydraulic cement, and the machine-shops and foundries of the Pacific Mail Steamship Company. Pop. of township, 1656.

Ben'i-Has'san, a village of Central Egypt, on the right bank of the Nile, 23 miles S. S. E. of Minieh. Here are twenty-two grottoes or catacombs excavated in a calcareous bank or hill. They are supposed to have been used as tombs by the people of Hermopolis, which stood on the opposite side of the river. Here are apartments sixty feet long and forty feet wide, in which are pillars of the native rock sixteen feet eight and a half inches in height, and five feet in diameter. The sides of the grottoes are covered with paintings, designed with skill and good taste. These tombs are among the most remarkable in Egypt. The

earliest bears the date of the forty-third year of Ositarsen I., not far from 1800 B. C. Says J. P. Thompson, "I found one tomb, some 200 feet above the level of the river, almost a Doric temple hewn from the solid rock. . . . This chamber was cut from the solid rock with perfect precision; no modern square or line or plummet could make it more true."

Be'ni Khaibir', a tribe in Arabia, supposed by some, but without sufficient reason, to be a remnant of the ancient ascetic Rechabites. They number about 60,000. (See RECHABITES.)

Benin', a kingdom of Western Africa, in Upper Guinea, is bounded on the N. E. and E. by the river Niger, on the S. W. by the Bay of Benin, and on the W. by Dahomey. Its limits in some directions are not well defined or ascertained. The interior is elevated and hilly, and mostly covered with forests. The soil is fertile, and supports a dense population. Sugar, rice, yams, palm oil, and cotton are the staple productions. Many human victims are sacrificed here. The religion of the country is gross fetishism.

Benin, a town of Africa, capital of the above, is on a river of the same name, which is one of the mouths of the Niger. It is about 55 miles from the ocean. The houses are built of clay. Pop. estimated at 15,000. Belzoni died in this town in 1823.

Beni-Sooef', or **Beni-Souef,** a town of Central Egypt, on the Nile, 68 miles S. S. W. of Cairo. It has cotton-mills and quarries of alabaster, and is the entrepôt of the produce of the fertile valley of Fayoom. Pop. 6000.

Ben'jamin, the youngest son of the patriarch Jacob and of Rachel (who called him BENONI). He was his father's favorite child, and the head of one of the twelve tribes of Israel. The territory of this tribe was bounded on the N. by that of Ephraim, on the E. by the Jordan, on the S. by the land of Judah, and on the W. by that of Dan. After the death of Solomon the tribes of Benjamin and Judah remained loyal to his dynasty when the other ten tribes revolted.

Benjamin (JUDAH PETER), an American politician of Jewish extraction, was born in Hayti in 1812. He practised law in New Orleans, was elected a Senator of the U. S. for Louisiana in 1852, and re-elected in 1859. He acted with the Democrats, and became a secessionist. He was secretary of state of the Confederate States from Feb., 1862, until the collapse of that power in 1865. Since the close of the civil war he has practised law in London, England.

Benjamin (PARK), an American poet, born at Demarara, in Guiana, Aug. 14, 1809. He graduated at Trinity College, Hartford, Conn., in 1829, and in 1840 became associated with R. W. Griswold as editor of the "New York World," a literary journal. He wrote, besides many lyrical poems, a "Poem on the Meditation of Nature." Mr. Benjamin, though physically strong, was never able to walk. Died Sept. 12, 1864.

Benjamin of Tudela, a Jewish rabbi and traveller, commenced about 1160 a journey through Palestine, Persia, and Egypt, in which he passed about twelve years. He wrote an account of his travels, which was translated into Latin, English, and French. Died in 1173. (See CARMOLY, "Notice sur B. de Tudéle et ses Voyages," 1837.)

Benkoelen, or **Bencoo'len,** a Dutch seaport-town on the S. W. coast of Sumatra: lat. 3° 48′ S., lon. 102° 19′ E. Pop. estimated at 5000. It was founded by the English in 1685, but was ceded to Holland in 1825, in exchange for Malacca. The climate of the city is exceedingly unhealthy. Pepper is the chief article of export.

Ben'ner, a township of Centre co., Pa. Pop. 1362.

Ben'net Spring, a township of Barnwell co., S. C. Pop. 1742.

Ben'nett (JAMES GORDON), a journalist, born in Banffshire, Scotland, Sept. 1, 1795, and educated for the Roman Catholic priesthood, emigrated to the U. S. in 1819, was connected with several journals published in the city of New York, and was chief editor in 1833 of the "Pennsylvanian," a daily paper of Philadelphia. In 1835 he founded the "New York Herald," which was very successful. He died June 1, 1872.

Bennett (JOHN HUGHES), M. D., an eminent physician and medical writer of Edinburgh, was born in London in 1812, took his degree at Edinburgh in 1837, and in 1848 was made professor of the institutes of medicine in that city. Dr. Bennett is especially distinguished for his studies in histology and therapeutics, and his advocacy of the expectant treatment of disease. Among his works are "Clinical Medicine" (1856), "Practice of Medicine," "Treatment of Pulmonary Consumption," etc.

Bennett (MILO LYMAN), LL.D., was born in Sharon, Conn., in 1790, graduated at Yale in 1811, and studied law at Litchfield. He resided at Burlington, Vt., and was a judge in the Vermont courts (1839–59). He published "Vermont Justice" and other legal works. Died July 7, 1868.

Bennett (Sir WILLIAM STERNDALE), MUS. DR., D. C. L., an English composer and pianist, born at Sheffield April 13, 1816. He visited Germany, and formed a friendship with Mendelssohn. He composed concertos, overtures, and pieces for the piano. He was knighted 1871. Died 1875.

Bennett's Bayou, a post-township of Fulton co., Ark. Pop. 427.

Ben'nettsville, a post-village, the capital of Marlborough co., S. C., 90 miles E. N. E. of Columbia. It has one weekly newspaper. Pop. of township, 1736.

Ben Ne'vis, a famous mountain of Scotland, and the highest point in Great Britain, is in the county of Inverness, about 5 miles E. of Loch Eil. It has an altitude of 4406 feet, and is very difficult of ascent. On the N. E. side is a tremendous precipice 1500 feet in height. Granite and gneiss form the base of this mountain, the upper part of which is porphyry. In clear weather most of the Western Islands and the mainland as far as Cairngorm and Ben Macdhui can be seen from the summit.

Bennezette, a township of Butler co., Ia. Pop. 206.

Bennezette, a township of Elk co., Pa. Pop. 902.

Ben'nigsen, von (RUDOLF), a prominent German statesman, born at Lüneburg in 1824, became in 1867 a member of the Hanoverian provincial diet and of the Prussian house of delegates, and second vice-president of the North German diet.

Ben'nington, a county which forms the S. W. extremity of Vermont. Area, 700 square miles. It is drained by the Battenkill River, which rises within its limits. The surface is mostly mountainous or hilly, and extensively covered with forests. Quarries of white and gray marble are worked in this county, which is intersected by the Harlem Extension R. R. or Western Vermont R. R. Oats, corn, wool, potatoes, and maple-sugar are important products. Capitals, Bennington and Manchester. P. 21,325.

Bennington, a township of Marshall co., Ill. Pop. 1020.

Bennington, a township of Black Hawk co., Ia. Pop. 654.

Bennington, a post-township of Shiawassee co., Mich. Pop. 1424.

Bennington, a township of Mower co., Minn. P. 257.

Bennington, a post-township of Hillsborough co., N. H. It has manufactures of boots, shoes, paper, cutlery, casks, hoes, etc. Pop. 401.

Bennington, a post-village and township of Wyoming co., N. Y., 26 miles E. S. E. of Buffalo. Pop. of the township, 2385.

Bennington, a township of Licking co., O. Pop. 907.

Bennington, a post-township of Morrow co., O. Pop. 899.

Bennington, the semi-capital of Bennington co., Vt., is on the Harlem extension division of the New York Boston and Montreal R. R., 55 miles S. by W. of Rutland, and 36 miles from the Hudson River at Troy. The town contains three villages—Bennington, North Bennington, and Bennington Centre—each of which has a separate post-office. Gen. Stark, at the head of a column of "Green Mountain Boys," defeated a British detachment in force, commanded by Col. Baum, sent from Gen. Burgoyne's army to capture the public stores at Bennington, Aug. 16, 1777; 600 British prisoners were captured. The town contains nine churches, two extensive graded schools, two national banks, five large manufactories of knit goods, and one of the largest shawl factories in the country. Bennington Village is the largest manufacturing village in the State. It has two weekly newspapers. Pop. 2501; total pop. of township, 5760.

J. HALSEY CUSHMAN, ED. "BANNER."

Beno'na, a post-township of Oceana co., Mich. P. 637.

Bensa'lem, a post-village and township of Bucks co., Pa., on the Philadelphia and Trenton R. R., 16 miles N. E. of Philadelphia. Pop. of township, 2353.

Ben'son, a post-village, capital of Swift co., Minn., is on the Chippewa River and on the St. Paul and Pacific R. R., 134 miles W. of St. Paul. Pop. of township, 628.

Benson, a post-township of Hamilton co., N. Y. P. 320.

Benson, a post-township of Rutland co., Vt. Pop. 1244.

Benson (EGBERT), LL.D., born in New York City June 21, 1746, graduated at Columbia College in 1795, was an eminent lawyer, a member of Congress (1784–88, 1789–93, and 1813–15), a regent of the university (1789–

1802), judge of the supreme court of New York (1791–1801), and of the U. S. circuit court. He published a "Vindication" of the captors of André (1817), and a "Memoir on Dutch Names" (1835). Died Aug. 24, 1833.

Benson (Henry C.), D. D., an eminent preacher and writer in the Methodist Episcopal Church, was born near Xenia, O., in 1815, joined the Indiana Conference in 1842, was elected professor of Greek in Indiana Asbury University in 1850, went to California in 1852, was editor of the "Pacific Christian Advocate" at Portland, Or., from 1864 to 1868, and elected editor of the "California Advocate" in 1868, in which office he still continues. He is author of "Life among the Choctaws," among whom he labored some time as a missionary.

Benson (Joseph), an English Methodist minister, born in Cumberland Jan. 25, 1748, acquired much influence in the Church. He was a popular preacher, and author of numerous works, among which are an "Apology for the Methodists" (1801), a "Life of the Rev. John Fletcher," and a "Commentary on the Holy Scriptures" (5 vols., 1811–18), which is highly esteemed. Died Feb. 16, 1821.

Bent, a county in the S. E. part of Colorado, bordering on Kansas. Area, 5040 square miles. It is intersected by the Arkansas River, and also drained by several creeks. The soil is adapted to grazing and tillage, and grain is successfully cultivated. Capital, Las Animas. Pop. 502.

Bent Grass (*Agrost'tis*), a genus of grasses comprising numerous species which are natives of Europe, the U. S., and many other countries. They have 1-flowered spikelets in a loose or open panicle, with glumes which are unequal, awnless, and longer than the palæ. The upper (inner) palea is often wanting. Stamens mostly three. Some of the species are cultivated for pasture and for hay, on account of their adaptation to certain soils. The *Agrostis vulgaris* forms a principal part of the pasture in the more elevated districts of England, and resists drought better than some other grasses. It is considered suitable for lawns. It is called "herd's grass" or "red top" in Pennsylvania. The *Agrostis alba*, sometimes called "marsh bent grass," is valuable for pasture, and is common in England. It is also naturalized in some of the U. S. The *Agrostis spica venti*, a native of Europe, is a beautiful grass, with very slender branches of its panicle, which, waving in the wind, presents a glossy and silky appearance.

Ben'tham (Jeremy), an English philosopher and reformer, eminent as a writer on ethics and jurisprudence, was born in London Feb. 15, 1748. He graduated at Queen's College, Oxford, in 1766, studied law, and was called to the bar in 1772, but he never practised that profession. He published in 1776 an acute and critical "Fragment on Government," which abounds in sound and original ideas, and in 1787 an exhaustive argument entitled a "Defence of Usury." His next important work was his "Introduction to the Principles of Morals and Legislation" (1789). He adopted the theory that "utility is the test and measure of virtue," and that laws should promote "the greatest happiness of the greatest number." He devoted his time and talents chiefly to the reform of legislation and government, and advocated universal suffrage, the vote by ballot, etc. He inherited from his father an easy fortune. About 1792 he formed a friendship and literary partnership with M. Dumont, who translated into French several of Bentham's works—namely, "Treatise on Civil and Penal Legislation" (3 vols., 1802), and "Theory of Penalties and Rewards" (1811). Among his other works are "Panopticon" (1791), which treats on prison discipline, and "The Rationale of Judicial Evidence" (5 vols., 1827). By habitual temperance, activity, and self-control he prolonged his life to the age of eighty-four. Died June 6, 1832. He has great merits in the English jurisprudence, "which," as Macaulay says, "he found a gibberish and left a science." But on the public in general his influence was small, on account of the unreadableness of his writings. He represents French ideas, especially those of the French Revolution, and he is the real founder of the utilitarian school of philosophy. His works were more admired on the Continent than in England. (See "Memoirs of Jeremy Bentham," prefixed to his works by Dr. Bowring; John Hill Burton, "Benthamiana;" Sir James Mackintosh, "View of the Progress of Ethical Philosophy;" "Edinburgh Review" for Oct., 1843.)

Bentinck (William George Frederick Cavendish), Lord, commonly called **Lord George Bentinck,** born Feb. 27, 1802, was a third son of the fourth duke of Portland. He became in 1826 private secretary to George Canning, who had married his aunt. He represented Lynn-Regis in Parliament from 1827 until his death, and in 1835 became a conservative and supporter of Sir Robert Peel. He was much addicted to field-sports and horse-races. After Peel adopted the policy of free trade in 1843, Lord George was recognized as the leader of the protectionist party, which opposed the repeal of the corn laws. He died suddenly Sept. 21, 1848. (See B. Disraeli, "Lord George Bentinck, a Political Biography," 1851.)

Bent'ley, a township of Perry co., Ark. Pop. 345.

Bentley (Richard), D. D., a celebrated English critic and classical scholar, born at Oulton, in Yorkshire, on the 27th of Jan., 1662. He entered St. John's College, Cambridge, in 1676, and having taken the degree of bachelor, became, in 1683, tutor to Dr. Stillingfleet's son, with whom he went to Oxford. He was ordained a priest in 1690. In 1692 he was appointed to deliver the Boyle lecture on the evidences of religion, and in 1694 became keeper of the Royal Library. He published in 1699 a celebrated "Dissertation on the Epistles of Phalaris," which procured for him a European reputation. He maintained that these Epistles were spurious, and was involved in a controversy with Atterbury, Charles Boyle, Pope, and other writers, who resorted to sarcasm and personality. Bentley defended himself in another "Dissertation on the Epistles of Phalaris" (1699). He was appointed master of Trinity College, Cambridge, in 1700, and married Joanna Bernard in 1701. In 1711 he published a good edition of Horace. His arrogance provoked a series of quarrels and litigations with the fellows of Trinity College. He was appointed regius professor of divinity in 1717, and was deprived of all his academic degrees and honors by the senate of the University in 1718, but he was reinstated by a mandamus of the court of king's bench in 1724. Among his productions was an edition of Homer, which he left unfinished. He proposed to revise and correct the text of the Greek Testament by comparing it with all the manuscripts. He failed to perform this task, but his principles of criticism have since been adopted, and have triumphed over all opposition. He died July 14, 1742. His daughter was the mother of Richard Cumberland, the dramatist. (See Monk, "Life of R. Bentley," 1830; Hartley Coleridge, "Lives of Distinguished Northerns;" "Edinburgh Review" for July, 1830.)

Ben'ton, a county which forms the N. W. extremity of Arkansas. Area, 900 square miles. It is drained by the Illinois and White rivers and several creeks, which afford water-power. It has great but undeveloped mineral wealth. Tobacco and corn are the chief crops. The soil is fertile. Capital, Bentonville. Pop. 13,831.

Benton, a county of Indiana, bordering on Illinois. Area, 414 square miles. It is drained by Pine and Sugar creeks. The greater part of the county is an undulating prairie, the soil of which is fertile. Grain and wool are the chief products. Capital, Oxford. Pop. 5615.

Benton, a county in E. Central Iowa. Area, 720 square miles. It is traversed by the Cedar River, and also drained by Prairie Creek. It contains extensive prairies, the land of which is fertile. Cattle, corn, wheat, and wool are largely raised. The Iowa division of the Chicago and North-western R. R. passes through this county. Capital, Vinton. Pop. 22,454.

Benton, a county in Central Minnesota. Area, 400 square miles. It is bounded on the W. by the Mississippi River, and also drained by the Elk River. The surface is undulating; the soil in some parts is fertile. Wheat, corn, and oats are the chief crops. A railroad has been opened from St. Paul to Sauk Rapids, which is the county-seat. Pop. 1558.

Benton, a county of Mississippi, bordering on Tennessee, was organized since the census of 1870. The Tallahatchee River bounds it on the S. W. The soil is fertile. Cotton is extensively raised. The Mississippi Central R. R. traverses the W. part. Capital, Ashland.

Benton, a county in W. Central Missouri. Area, 730 square miles. It is intersected by the Osage River, which flows eastward, and is also drained by the Grand River. The surface is moderately diversified; the soil is productive. Tobacco, grain, and wool are the chief products. Lead is found in this county. Capital, Warsaw. Pop. 11,322.

Benton, a county of Oregon. Area, 1556 square miles. It is bounded on the E. by the Willamette River, and on the W. by the Pacific Ocean. It is drained by the Alseya and Yaquina rivers. The Coast Range of mountains extends through the central part of the county. Wheat, oats, fruit, and wool are important products. Capital, Corvallis. Pop. 4584.

Benton, a county of Tennessee. Area, 400 square miles. It is bounded on the E. by the Tennessee River, navigable for steamboats, and on the N. W. by the Big Sandy River. The soil is productive. Corn, tobacco, and wool are the staple products. The county is intersected by

the Nashville and North-western R. R. Capital, Camden. Pop. 8234.

Benton, a post-village of Lowndes co., Ala., on the Alabama River, and on the railroad connecting Selma and Montgomery, 31 miles W. of Montgomery. Pop. of township, 2627.

Benton, a township of Conway co., Ark. Pop. 583.

Benton, a township of Fulton co., Ark. Pop. 461.

Benton, a post-village, capital of Saline co., Ark., is 25 miles S. W. of Little Rock.

Benton, a post-township of Mono co., Cal. Pop. 94.

Benton, the capital of Franklin co., Ill., 77 miles N. N. E. of Cairo, has 3 churches, 1 high school, 1 law library, 1 printing-office, 1 weekly paper, 1 manufactory of agricultural implements, 1 carriage-shop, 1 saddle and harness manufactory, 2 steam flouring mills, numerous stores, 2 hotels, an exchange bank, a county court-house, and a jail. Pop. 615. J. S. Barr, Pub. "Benton Standard."

Benton, a township of Lake co., Ill. Pop. 640.

Benton, a post-township of Elkhart co., Ind. P. 1188.

Benton, a township of Monroe co., Ind. Pop. 867.

Benton, a township of Benton co., Ia. Pop. 601.

Benton, a township of Des Moines co., Ia. Pop. 1192.

Benton, a township of Fremont co., Ia. Pop. 904.

Benton, a township of Keokuk co., Ia. Pop. 1309.

Benton, a township of Lucas co., Ia. Pop. 696.

Benton, a township of Ringgold co., Ia. Pop. 367.

Benton, a township of Taylor co., Ia. Pop. 1055.

Benton, a township of Wayne co., Ia. Pop. 852.

Benton, a post-village, capital of Marshall co., Ken., on Clark's River, about 270 miles W. S. W. of Frankfort.

Benton, a post-township of Kennebec co., Me. It has manufactures of lumber. Pop. 1180.

Benton, a township of Berrien co., Mich. Pop. 3116.

Benton, a township of Eaton co., Mich. Pop. 1355.

Benton, a post-township of Carver co., Minn. P. 1297.

Benton, a township of Adair co., Mo. Pop. 3369.

Benton, a township of Atchison co., Mo. Pop. 680.

Benton, a township of Cedar co., Mo. Pop. 1130.

Benton, a township of Christian co., Mo. Pop. 527.

Benton, a township of Crawford co., Mo. Pop. 1184.

Benton, a township of Dallas co., Mo. Pop. 2055.

Benton, a township of Daviess co., Mo. Pop. 1199.

Benton, a township of Douglas co., Mo. Pop. 379.

Benton, a township of Holt co., Mo. Pop. 2226.

Benton, a township of Howell co., Mo. Pop. 809.

Benton, a township of Knox co., Mo. Pop. 1602.

Benton, a township of Linn co., Mo. Pop. 696.

Benton, a township of Newton co., Mo. Pop. 968.

Benton, a township of Osage co., Mo. Pop. 2513.

Benton, a township of Polk co., Mo. Pop. 1650.

Benton, a township of Wayne co., Mo. Pop. 1291.

Benton, a township of Webster co., Mo. Pop. 768.

Benton, a township of Nemaha co., Neb. Pop. 456.

Benton, a post-township of Grafton co., N. H. It has manufactures of lumber, etc. Pop. 375.

Benton, a post-township of Yates co., N. Y., includes a part of the village of Penn Yan. Pop. 2422.

Benton, a township of Hocking co., O. Pop. 1448.

Benton, a township of Monroe co., O. Pop. 987.

Benton, a township of Ottawa co., O. Pop. 1152.

Benton, a township of Paulding co., O. Pop. 404.

Benton, a township of Pike co., O. Pop. 1119.

Benton, a post-township of Columbia co., Pa. P. 1053.

Benton, a township of Luzerne co., Pa. Pop. 1055.

Benton, a small post-village, capital of Polk co., Tenn., is about 75 miles S. S. W. of Knoxville. Pop. 250.

Benton, a post-village of Lafayette co., Wis., is 13 miles N. of Galena, and in Benton township. Rich mines of lead are worked here. Pop. of township, 1723.

Benton (James G.), an American officer, born in 1820 in New Hampshire, graduated at West Point in 1842; major of ordnance Sept. 15, 1863. He served at various arsenals and on special duties 1842–57, as member of the ordnance board 1854–56, at Military Academy as instructor of ordnance and gunnery 1857–61. In the civil war he was an assistant in the ordnance bureau at Washington 1861–63, in command of Washington Arsenal till June 14, 1864, and since of Springfield Armory, Mass. Brevet lieutenant-colonel and colonel Mar. 13, 1865, for faithful and meritorious services in the ordnance department. He is author of "A Course of Instruction in Ordnance and Gunnery for the use of the Cadets of the U. S. Military Academy" (1860).

George W. Cullum, *U. S. Army.*

Benton (Thomas Hart), an American Senator and statesman, born near Hillsborough, N. C., Mar. 14, 1782. He removed to Tennessee, studied law, and began to practise at Nashville about 1810. In the war of 1812 he served as colonel under Gen. Jackson. He became a resident of St. Louis, Mo., in 1815, and was elected a Senator of the U. S. for Missouri in 1820. Having been re-elected in 1826, he supported Gen. Jackson, opposed the U. S. Bank, and advocated a gold and silver currency, for which reason he was often called "Old Bullion." For many years he was the most prominent public man of Missouri. He was a member of the national Senate for 30 years, and opposed the extreme State Rights policy of Calhoun. In 1852 he was elected to the House of Representatives, in which he opposed the repeal of the Missouri Compromise. He was opposed by a powerful party of State Rights Democrats in Missouri, who defeated him as a candidate for governor in 1856. He published a "Thirty Years' View, or a History of the Working of the American Government for Thirty Years, 1820–50" (2 vols., 1854–56). Died April 10, 1858.

Ben'ton Har'bor, a post-village of Berrien co., Mich., is on the E. side of St. Joseph's River and the Benton Harbor ship canal, 1½ miles from Lake Michigan, in Benton township, and about 60 miles E. by N. from Chicago. It is on the Chicago and Michigan Lake Shore and Elkhart and Lake Michigan R. Rs. It has one weekly paper, a large trade in grain and lumber, and an immense one in fruit, large manufactories of fruit packages, washboards, and canned fruit, and an undeveloped water-power. Regular lines of steamers and sailing vessels connect it with Chicago and Milwaukee. Pop. 661; of Benton township, 3116.

Alvin Sturtevant,
Ed. of "Benton Harbor Palladium."

Ben'tonsville, a post-village of Johnston co., N. C., in a township of its own name, about 17 miles W. of Goldsboro'. After the battle of Averysboro' (Mar. 16, 1865) the army of Gen. Sherman marched towards Goldsboro', not anticipating any further contest before reaching that destination; but Gen. Johnston, who had been concentrating the Confederate forces from Georgia, South Carolina, and Tennessee at Smithfield, N. C. (now amounting to 40,000), slipped out at night in light marching order, expecting to fall upon the left wing of Sherman's army, under Gen. Slocum, and crush it before support could reach him. Gen. Slocum was at first driven back, but hastily throwing up rifle-pits, assumed the defensive, Kilpatrick with his cavalry supporting his left. Six assaults were made by Johnston, which failed to dislodge the veterans of Slocum from their position, while the artillery fire upon the Confederates was very damaging. Night caused a cessation, Gen. Slocum still holding his ground. By morning of the next day the right wing had arrived to Slocum's aid, and Johnston's army had intrenched itself in a strong position. An attempt was made to cut off the line of the Confederates' retreat, but Johnston hastily retreated during the night of Mar. 21 on Smithfield and Raleigh. The Federal loss was upwards of 1600, killed and wounded; the Confederate loss is not known: 267 dead, however, were left on the field, and 1600 prisoners were taken. Pop. of township, 922.

Ben'tonville, a post-village, the capital of Benton co., Ark., 170 miles N. W. of Little Rock. It has an active trade in tobacco, and has several manufactories.

Bentonville, a post-village of Sprigg township, Adams co., O. Pop. 310.

Bent Timber. Of late years much attention has been paid to the subject of bent timber on account of its strength and economy. This operation is effected either by bending the timber whole or by bending it in planks, which are then put together in pieces of any required thickness; both of them have been used for ship- and for bridge-building. When timber is bent whole, the requisite curvature is given by steaming the beam and weighing down the side intended to receive the curvature; but the objection to this plan is, that steaming is apt to impair the durability of the wood, and the radius of curvature must be always very flat. It was to avoid these objections that the system was introduced of cutting the logs into planks, and bending them to the required curvature, as is often done in railway-bridges and station-roofs. It has been found that the timber so bent remains sufficiently elastic to admit of considerable movement under the weight of a train, and consequently opens at the joints and allows water to act upon the interior. Many bridges where these beams have been

used have decayed: but in sheltered positions they have stood admirably. It is to be observed that bent planks retain a much greater degree of elasticity than the whole timber so managed, and that they are also more likely to retain the original strength of the wood itself. (See Emy, "Sur la Charpenterie.") Bent timber was formerly much used in shipbuilding in the form of natural-grown timber, but its use is becoming more and more rare, on account of the difficulty of obtaining natural-growth wood for that purpose.

Benu'e (*i. e.* "the mother of waters"), a large river of Central Africa, is the principal tributary of the Niger or Quorra. Its source has not been explored. It flows nearly westward through Sokoto, and enters the Niger at Lokoya, which is about 300 miles from the mouth of the Niger. Dr. Barth in 1851 crossed it near lon. 12° 30′ E., and found it there about 800 yards wide. Dr. Baikie in 1850 ascended the Benue to Dulti or Dolti, which is about 400 miles from its mouth. A second expedition to explore this river was undertaken by Dr. Baikie in 1861. In 1867, Gerhard Rohlfs travelled up this river from Dagbo to its entrance into the Niger at Lokoya, a distance of about 150 miles.

Ben Wade, a township of Pope co., Minn. Pop. 240.

Ben'zamide, $C_7H_7NO = N.C_7H_5O.H_2$, a primary amide obtained in beautiful white crystals by several different processes.

Benzene. See Benzole.

Ben'zidine, $C_{12}H_{12}N_2 = N_2.(C_{12}H_8)''.H_4$, an organic base, diamine, formed by the reduction of azobenzene or azoxybenzene.

Ben'zie, a county in North-west Michigan. Area, 440 square miles. It is bounded on the N. W. and W. by Lake Michigan, and drained by the Betsie River. Wheat, corn, potatoes, and maple-sugar are the staple crops. Capital, Benzonia. Pop. 2184.

Ben'zinger, a township of Elk co., Pa. Pop. 1630.

Benzine. See Benzole.

Benzo'ic Acid, or Flowers of Benzoin, a substance which exists in many balsams and is obtained from benzoin. It is artificially made on a large scale from naphthaline and the urine of animals. It occurs in the form of snow-white acicular or feathery crystals, and has a pleasant aromatic odor. It is readily soluble in alcohol and ether, and is one of the ingredients of elixir paregoric (*Tinctura camphoræ composita*). Combined with oxide of zinc, it is a most valuable application in many cases of eczema. It is also used in the arts for various purposes. The chemical formula of this acid is $H.C_7H_5O_2$.

Benzoin', or **Ben'jamin, Gum** [Lat. *benzoi'num*], a fragrant resinous substance, is the concrete juice of a tree called *Styrax benzoin*, which is a native of Sumatra, Siam, and Borneo, and belongs to the natural order Styracaceæ (which see). The resin is obtained by making incisions in the bark of trees which are cultivated for that purpose. It is extensively used as incense in Roman Catholic and Greek churches; is also used in perfumery, and in medicine as a stimulant, emetic, and styptic. A tincture of benzoin is sometimes applied to wounds, and is employed in making a cosmetic called virgin's milk.

Benzo'in Odorif'erum, a shrub more correctly called *Lindera Benzoin*, of the natural order Lauraceæ, a native of the U. S., popularly called Benjamin tree, spice bush, etc. Its bark is aromatic, stimulant, and tonic, and has been used as a remedy for intermittent fevers.

Ben'zole, Benzene, Hydride of Phenyl, or **Phene** (symbol C_6H_6), a compound of carbon and hydrogen, is a product obtained by the distillation of coal or coal-tar. It can also be obtained by subjecting oil-gas (carburetted hydrogen) to a pressure of thirty atmospheres, by passing the vapor of benzoic acid through a red-hot iron tube, by the dry distillation of kinic acid, or by distilling benzoic acid with lime. It is usually obtained from the light oil of coal-tar, coal-tar naphtha, by fractional distillation, and purification with nitric and sulphuric acids. Commercial benzole usually contains considerable quantities of the homologous hydrocarbons toluole, C_7H_8, xylol, C_8H_{10}, etc. It is prepared on a large scale for the manufacture of nitrobenzole, aniline, and aniline colors, and for "carbonizing" coal-gas. Benzole may be produced synthetically by heating acetylene, C_2H_2, to a temperature a little below redness. At ordinary temperatures benzole is a thin, limpid, colorless, and volatile liquid, emitting a characteristic ethereal odor. Its specific gravity is 0.85 at 60° F.; its boiling-point is 179.6° F. At 37° F. it becomes solid, or crystallizes into beautiful transparent crystals of fern-like forms. It is not soluble in water, but dissolves readily in alcohol, ether, and turpentine. It is valuable to the chemist as a powerful solvent of caoutchouc, gutta-percha, wax, and fatty substances. It is inflammable, and possesses great illuminating power, which it imparts to gases, and even to atmospheric air, when they are passed through it. With chlorine, bromine, nitric acid, etc., benzole forms interesting substitution products, the most important of which is nitrobenzole or essence of mirbane, $C_6H_5NO_2$. (See Tar.)

C. F. Chandler.

Benzo'nia, a post-village and capital of Benzie co., Mich., on Betsie River, 5 miles from Frankfort. It is the seat of Grand Traverse College, and has one weekly paper, one church, and a park. Pop. of Benzonia township, 214.

J. A. Pettit & Co., Eds. "Benzie County Journal."

Benzoyl', C_7H_5O, the hypothetical radical which is supposed to exist in benzoic acid and many kindred bodies. Oil of bitter almonds is supposed to be its hydride.

Ben'zyl, Tolyl, or **Toluenyl,** C_7H_7, a hypothetical radical, isomeric with cresyl, which is contained in benzylic alcohol, toluol ($C_7H_8 = C_7H_7.H$), etc.

Benzylamine, $C_7H_9N = N.C_7H_7.H_2$. (See Toluidine.)

Be'owulf', the title of a celebrated Anglo-Saxon poem, written not later than the eighth century, and having for its subject a semi-fabulous hero of Denmark. An English translation of it appeared in London in 1833.

Béranger, de (Jean Pierre), an eminent French lyric poet, born in Paris Aug. 19, 1780. He passed about three years as an apprentice to a printer, and never received a very liberal education. He was neglected by his father, and spent many of his early years with an aunt, who imbued his mind with virtuous and republican principles. His first essays in verse, which were written under the pressure of poverty, obtained for him in 1804 the patronage of Lucien Bonaparte. He was employed for nearly twelve years as a clerk or subordinate secretary in the University of Paris. He published in 1815 a volume of songs which became very popular. Some of his verses were political, and contained satirical passages which were offensive to the royalists, then the party in power. Having produced another volume of poems in 1821, he was prosecuted and sentenced to an imprisonment for three months. This increased the popularity of his songs, and failed to restrain the freedom of his satire or abate the ardor of his republicanism. He published in 1828 a fourth volume, for which he was sentenced to pay a fine of 10,000 francs and to be imprisoned for nine months. When his friends obtained power by the revolution of 1830, they offered him lucrative places, which he declined. He never published any poems after 1833, the date of his fifth volume. He rejected all the favors and overtures of Napoleon III. Died July 16, 1857. His character was noble and independent. In his poems gayety and pathos are combined with the happiest effect. "His style," says a French critic, "has a limpidity and purity which defy criticism." (See his autobiographic memoirs, "Ma Biographie," 1857; Savinien Lapointe, "Mémoires sur Béranger," 1857; Longfellow, "Poets and Poetry of Europe.")

Berard (Claudius), an eminent educator, born at Bordeaux, France, Mar. 21, 1786. In 1807 he emigrated to the U. S., and in 1812 was appointed a professor at Dickinson College, Carlisle, Pa. In 1815 he accepted an appointment as teacher in French at the U. S. Military Academy at West Point, which position he held till 1846, when under a law of Congress (1846) he was made professor, continuing in this capacity till his death, May 6, 1848.

Berat', a town of European Turkey, in Albania, on the river Ergent, here crossed by a bridge, 30 miles N. E. of Avlona. It contains a citadel, several Greek churches, and a number of mosques. It is the seat of a Greek archbishop. The population is estimated at 10,000, a majority of whom are Greeks.

Ber'ber, or **El Mesherif,** a town of Nubia, on the Nile. Roads lead from here to Egypt and Khartum. It has considerable trade. Pop., according to Heuglin, 45,000.

Ber'bera, a seaport station of Eastern Africa, in Somauli, is on the Gulf of Aden, 130 miles E. S. E. of Zeyla. Here is held an annual fair, which is attended by 100,000 persons from various foreign countries. They bring coffee, gold-dust, ivory, slaves, cattle, etc. to exchange for cotton, rice, and Indian piece-goods. It appears that Berbera has scarcely any permanent population. The fair begins in November, and continues nearly six months.

Berberida'ceæ, a natural order of exogenous plants, comprises more than 100 known species, one of which is the barberry (*Berberis*). They are natives of the temperate regions of both hemispheres. They have alternate leaves, and hypogynous stamens which are equal in number to the petals, with anthers opening curiously by valves or lids hinged at the top. The pistil is single; the fruit is a berry or a capsule. (See Barberry.)

Ber'berine, $C_{20}H_{17}NO_4$, an alkaloid contained in the roots of the barberry (*Berberis vulgaris*), of columbo (*Cocculus palmatus*), and *Menispermum fenestratum*, and in a yellow bark used as a dye in West Africa.

Ber'bers [supposed by some writers to be derived from the word *Barbari*, which the Greeks and Romans applied to all foreigners], a name given to the uncivilized, nomadic tribes of aborigines who inhabit the mountainous regions of Barbary and the northern part of the Desert of Sahara. They are sometimes called Kabyles, but they call themselves Amazeergh, Amazigh, or Amoshagh. They are the descendants of the aboriginal or ancient inhabitants of Northern Africa, who occupied the country before it was conquered by the Arabs, and they are the most numerous part of the present population. The Berbers vary in complexion with situation. Those who inhabit the high valleys of the Atlas have light hair and eyes, while those who occupy the oases of the Sahara are dark, approaching the negroes in complexion, though their features are entirely unlike theirs. Their language is allied to the Semitic in type, and has received from F. W. Newman the name of sub-Semitic. Language, customs, and physical type seem to indicate affiliation with the Semitic races of Asia and Eastern Africa. They are warlike, cruel, and very tenacious of their independence. In religion they are bigoted Mohammedans. They keep cattle and sheep, cultivate fruit trees, and practise agriculture in a rude manner. Many of them live in tents or in clay huts.

Ber'chem, a town of Belgium, in the province of Antwerp. It has factories of linen and tobacco. Pop. 5229.

Berdiansk', written also **Berdjansk,** a seaport-town of Russia, in the government of Taurida, is on the N. shore of the Sea of Azof, 184 miles N. E. of Simferopol. It has a good roadstead and an active trade, and has been remarkable for its rapid growth. It derives its prosperity partly from the coal-mines and salt-lakes of the vicinity. Pop. in 1867, 12,465.

Berditchef', or **Berditschev,** a town of Russia, in the province of Kiev, 194 miles N. W. of Elisabetgrad. It is meanly built, but is an important commercial town, having four annual fairs, held between Aug. 15 and Sept. 15. The value of the goods, cattle, corn, wine, etc. sold here annually is estimated at $3,000,000. Pop. in 1867, 52,786, mostly Jews.

Bere'a, an incorporated village in Cuyahoga co., O., on the Cleveland Columbus Cincinnati and Indianapolis and the Lake Shore and Michigan Southern R. Rs., 12 miles S. W. of Cleveland, noted for its extensive quarries of excellent sandstone, 18,000 car-loads having been shipped in a year; is the seat of Baldwin University and German Wallace College; has six churches, two newspapers, two banks, and a street railroad. Pop. 1628.

W. H. Pearce, Ed. "Grindstone City Advertiser."

Berea College is beautifully situated in the southern part of Madison co., Ky., 40 miles S. of Lexington and 140 from Cincinnati, very near the centre of the State. It originated in the labors of Rev. John G. Fee, a native of Kentucky, in the employment of the American Missionary Association. Mr. Fee was the son of a slaveholder, but earnestly embraced the anti-slavery cause while pursuing theology at Lane Seminary, and, disowned by his father and his Church, devoted his life to the salvation of his native State. The school, like its founder, was always noted for its abolitionism; yet, though its teachers were generally from Oberlin, its pupils were often the sons and daughters of slaveholders. Under the administration of Rev. J. A. R. Rogers the institution became widely known and popular, and its influence began to be feared. The John Brown raid gave occasion for its enemies to rally, and a county meeting sent a committee of sixty-five armed men to remove the school and its officers from the State. At the close of the war it was immediately revived, and for the last three years its annual average of students has been 270. These students represent thirty-eight towns and cities of Kentucky and eleven other States, as the last catalogue reports. Of these 18 are in the four college classes, 7 in the ladies' course, 16 in the normal course, and 43 in the preparatory department. The most are in lower departments. About three-fifths of the students are males, and nearly the same proportion colored. In the four higher departments the white and colored are almost equal—41 and 43. This impartial character of the school causes no collisions among the students, and only disturbs those who have no responsibility in regard to it. They generally acquiesce in silence. The commencement occurs on the first Wednesday of July. Its first senior class of three young men, all Kentuckians and all white, graduates this year (1873). A single lady finishes the ladies' course. The course of study is the same as in other regular colleges, and the grade of scholarship as high as in young colleges generally.

The present president, Rev. E. H. Fairchild, is the first. He commenced his labors in the spring of 1869. Rev. J. A. R. Rogers, professor of Greek; Henry F. Clark, A. M., professor of Latin; Albert A. Wright, A. M., professor of chemistry, etc.; Henry R. Chittenden, A. B., principal of the preparatory department; Mrs. Juliet C. Clark, principal ladies' department. Five other young ladies are employed as teachers, principally in the lower departments. There are fourteen trustees, and a ladies' board of six. The property of the college consists of 400 acres of land, estimated at $20,000; Howard Hall, a very nice dormitory building for young men, constructed of wood with tin roof, $18,000; the new ladies' hall, nearly completed, of brick, with rooms for 110 ladies, $50,000; other temporary buildings, $2500; and endowments to the amount of $23,000. Deduct from this the debts of the college, and the amount necessary to complete the ladies' hall, and the balance is about $95,000. Tuition is very low—$2.50 and $3.50 per quarter. The current expenses of the college, over $8000 per annum, are about half paid by benevolent friends. The American Missionary Association sustains the professor of Greek and three ladies in part. Future prospects are encouraging.

E. H. Fairchild.

Bere'ans, an obscure sect seceding from the Established Church in Scotland, founded by one Barclay in 1773. They take their name from Acts xviii. 11, deny natural theology, make all the Psalms Messianic, and hold assurance to be of the essence of faith. Their numbers are small and diminishing.

Beregh, a county of Hungary, is bounded on the N. E. by Galicia, on the E. by the county of Marmaras, on the S. by the counties of Ugocsa and Szatmar, on the W. by the county of Szabolcs, and on the N. W. by the county of Ungvear. Area, 1440 square miles. The country is mostly mountainous, and produces wine. Pop. in 1869, 159,223. Chief town, Munkacs.

Beregszasz, a town of Hungary, in the county of Beregh, has large vineyards and quarries. Pop. in 1870, 6272.

Beren'gelite, or **Berenge'la Resin,** a bituminous mineral found in a kind of pitch lake in Peru. (*Phil. Mag.* [3] xiii., 329; xiv., 87.)

Bérenger [Lat. *Berenga'rius*] **of Tours,** an eminent French scholastic theologian, born at Tours in 998. He studied under Fulbert of Chartres, and became archdeacon of Angers in 1040. He rejected the dogma of transubstantiation, and was excommunicated in 1050 for heresy by Pope Leo IX. He was compelled to recant or abjure his error, but afterwards relapsed, or continued to oppose the doctrines of the Church. Died in 1088. (See Heinrich Müller, "Berengarii veteris novique Historia," 1674; H. Sudendorf, "Berengarius Turonensis," etc., 1850.)

Bérenger (Alphonse Marie Marcellin Thomas, de la Drôme), a French jurist, born May 31, 1785, exposed the irregularities in the French courts in "De la justice criminelle" (1818). He has written various treatises on the reform of penal law, a "Rapport sur le système pententiare" (1836), and has labored to that end as magistrate and in the Chamber of Peers.

Berenice, a daughter of Magas, governor of Cyrene, was married to Ptolemy Euergetes, king of Egypt. During his absence on a military expedition she made a vow to sacrifice her hair to Venus for his safe return, which vow she performed. The astronomer Conon reported that Jupiter had transformed this hair into the constellation now called *Coma Berenices* ("Berenice's Hair"). She was put to death by her son, Ptolemy Philopator, in 222 B. C. (See Carl W. Ramler, "Ptolemäus und Berenice," 1765.)

Berenice (called **Bernice** in the New Testament), a daughter of Agrippa I., king of Judea, was born in 28 A. D. She was married to Herod, king of Chalcis, and after his death to Polemon, king of Cilicia. During a visit to Rome she captivated Titus, the son of the emperor Vespasian. She was a sister of King Agrippa, before whom Saint Paul spoke in his own defence. (See Acts xxv.)

Berenice, an ancient city of Egypt, on the Red Sea, 20 miles S. W. of Ras Bernass. It was founded by Ptolemy Philadelphus, who named it after his mother, and was a great emporium of the trade with India. The modern name is *Sakayt-el-Kublee*. Here are the ruins of a temple of Serapis and other interesting antiquities.

Ber'esford (James), an English surgeon, born in Barbados in 1783. He was employed for many years as surgeon in the British army, and settled at Hartford, Conn., about 1833. Died in 1843.

Beresford (William Carr), Viscount, a general, born

in Ireland Oct. 2, 1768, was a natural son of the first marquis of Waterford. He took command of the Portuguese army in Feb., 1809, and fought against the French in the Peninsula. In May, 1811, he defeated Soult at Albuera. He received the title of duke of Elvas in Spain, was created a viscount in 1823, and was master-general of the ordnance in 1828–30. Died Jan. 8, 1854.

Berettyo-Ujfalu, a market-town of Hungary, in the county of Behar, 20 miles S. of Debreczin. Pop. 5760.

Berezi'na, or **Beresi'na,** a river of Russia, rises in the government of Minsk, flows southward, and enters the Dnieper above Rechitza. Its length is about 325 miles. It is navigable, and is connected with the Düna by a canal which opens a communication between the Baltic and Black seas. The French army, retreating from Moscow in Nov., 1812, suffered a great disaster in the passage of this river. The French constructed hastily two bridges over the river, but while they were crossing they were attacked by the Russians, who took about 16,000 prisoners. The French loss, besides the prisoners, amounted to nearly 12,000, many of whom were drowned in the river.

Berez'na, a town of Russia, in the government of Tchernigov, 23 miles E. N. E. of Tchernigov. Pop. 9678.

Ber'ga, a town of Spain, in the province of Barcelona, 53 miles N. W. of Barcelona. Pop. 5590.

Ber'gama (anc. *Pergamum* or *Pergamus*), a ruined city of Asia Minor, in Anatolia, situated in a beautiful valley, on the river Caicus, 46 miles N. N. W. of Smyrna. Pop. about 14,000. The ancient city was the capital of the kingdom of Pergamus, and the seat of one of the seven churches of the Apocalypse. Here are extensive ruins of a palace, temple, amphitheatre, and other edifices.

Bérgamo, a province of Italy, in Lombardy, is bounded on the N. by Sondrino, on the E. by Brescia, on the S. by Cremona, and on the W. by Como and Milan. Area, 1027 square miles. The northern part is mountainous. The soil of the plains and valleys is fertile. Silk is among the products. Capital, Bergamo. Pop. 368,141.

Bergamo (anc. *Bergomum*), a fortified city of Italy, capital of the above province, is situated on several low hills, 52 miles by rail N. E. of Milan. It presents a very picturesque appearance, and is well built. It has a castle, a cathedral, a college, a library, a theatre, many convents and churches; also extensive manufactures of silk, cotton, linen, and woollen fabrics. *Bergomum* was destroyed by Attila in 452 A. D., after which it became an important city of the Lombard kings. Bergamo is connected by railways with Milan, Brescia, etc. Pop. 37,363.

Bergamot, the fruit of a tree which is a species or variety of the genus *Citrus*, is also called **Bergamot Orange,** or **Mellarosa.** According to some botanists, it is a variety of the orange (*Citrus aurantium*). It is cultivated in the south of Europe. The fruit is pear-shaped, of a pale yellow or green color, and has a green, sub-acid, and fragrant pulp. From its rind is obtained by distillation the oil of bergamot, which has a very agreeable odor, is extensively used in perfumery, and is an ingredient in eau-de-cologne and several fragrant essences.

Ber'gen, a fortified city and seaport of Norway, capital of the province of Bergen, is at the head of a deep bay (fiord) of the Atlantic, 184 miles W. N. W. of Christiania; lat. 60° 24′ N., lon. 5° 18′ E. It is picturesquely situated at the foot of a mountain, and enclosed on nearly all sides by water. The harbor is deep and safe, and is defended by several forts. Bergen is well built, has a cathedral, several hospitals, a theatre, a public library, a national museum, and a college. It is the seat of one of the three public treasuries, and is probably the most commercial town of Norway. A large portion of the population is employed in the fisheries, and fish and cod-liver oil form the chief articles of export. It is stated that in the spring 600 fishing-vessels may be seen at once in the harbor. These vessels bring cargoes of fish that were caught in the preceding winter on the northern shores. Bergen was founded in 1070, and was once a Hanse town. Pop. 29,210.

Bergen, a county of New Jersey, bordering on New York. Area, 350 square miles. It is bounded on the E. by the Hudson River, and intersected by the Hackensack and Ramapo. The Passaic River forms part of the S. W. boundary. The surface is partly hilly, and the Palisades of the Hudson extend along its eastern border. Dairy and garden products, corn, and potatoes are the chief crops. It is intersected by the Erie R. R. Magnetic iron ore is found here. It has various important manufactures. Capital, Hackensack. Pop. 30,122.

Bergen, a post-township of McLeod co., Minn. Pop. 588.

Bergen, a former village and township of Hudson co., N. J., on the top of Bergen Ridge, 3 miles W. of New York. It was merged into Jersey City in 1870.

Bergen, a post-township of Genesee co., N. Y. P. 1997.

Bergen, a township of Marathon co., Wis. Pop. 86.

Bergen, a township of Vernon co., Wis. Pop. 795.

Ber'gen-op-Zoom, or **Berg-op-Zoom,** a strongly-fortified town of Holland, in North Brabant, is on the river Zoom, at its junction with the East Scheldt, 27 miles by rail W. S. W. of Breda. It is important as a military position, and has often been besieged. The Spaniards made unsuccessful attempts to take it in 1588, in 1605, and in 1622. In the last-named year General Spinola lost about 10,000 men in the siege. It was taken by the French in 1747, and again in 1794. An English army attacked it without success in Mar., 1814. Pop. 9131.

Bergerac, a town of France, in Dordogne, is situated in a fertile plain on the right bank of the river Dordogne, here crossed by a fine bridge of five arches, 27 miles S. W. of Périgueux, and 51 miles E. of Bordeaux. It has a college, a public library, and manufactures of paper, hosiery, serges, and copper-ware. The Bergerac wine produced in this vicinity is highly esteemed. This town was formerly fortified, and sustained several sieges. Pop. 12,224.

Bergh (Henry), philanthropist, born in the city of New York in 1823, educated at Columbia College, is the author of "Love's Attractions," a drama; "Married Off," a poem; "The Portentous Telegram," "The "Ocean Paragon," "The Streets of New York," tales and sketches. In 1863, Mr. Bergh was made secretary of legation to Russia, and was afterwards a vice-consul there. He is known, not as a writer, diplomatist, or government official, but as the founder and president of the American Society for the Prevention of Cruelty to Animals. On his labors for the dumb creation rests his fame. Alone, in the face of indifference, opposition, and ridicule, he began the reform which is now recognized as one of the beneficent movements of the age. Through his exertions as a speaker and lecturer, but above all as a bold worker, in the street, in the court-room, before the legislature, the cause he adopted gained friends and rapidly increased in influence. The American society was incorporated April 10, 1866, by the legislature of New York, and, according to the seventh annual report (1873), similar societies had been then founded in twenty-five States and Territories and in Canada. The society has nine branches in the State of New York. There are 2 in California, 4 in Massachusetts, 2 in Maine, 4 in New Jersey, 4 in Ohio, 3 in Pennsylvania, 1 each in Virginia, Tennessee, Texas, Rhode Island, Oregon, North Carolina, New Hampshire, Mississippi, Michigan, Minnesota, Maryland, Kentucky, Indiana, Illinois, Georgia, Washington, D. C., Connecticut, and Colorado Territory. The work of the society covers all cases of cruelty to all sorts of animals, from the horse to the tortoise, employs every moral agency, social, legislative, personal, and touches points of vital concern to health as well as to humanity—the transportation of cattle intended for the shambles, the purity of milk, the times and manner of killing for the market. The total number of cases of all kinds prosecuted by the parent society, its branches and agents, since its foundation, is 2094. The membership is large and influential; the cause finds liberal benefactors, Mr. Lewis Bonard, a man who lived and died in extreme indigence and bequeathed a valuable estate to the society, being the greatest. Through this munificence handsome quarters were provided in the city, besides a considerable portion of the annual income of more than $30,000. The work takes on new features every year. Among the latest are an ambulance corps, and an ingenious invention for substituting artificial for live pigeons as marks for shooting. O. B. Frothingham.

Berg'isch-Glad'bach, a town of Prussia, in the Rhine province, 7 miles by rail E. N. E. of Müllheim. It has considerable manufactures of paper, linen, woollen, and silk goods, potash, percussion caps, etc. Pop. in 1871, 6195.

Berg'mann (Karl), b. at Ebersbach, Germany, April, 1821; removed to America 1849; became about 1855 director of the Philharmonic Society in New York; composed numerous pieces for orchestras. D. New York Aug. 10, 1876.

Berg'mann (Torbern Olof), Ph. D., a celebrated Swedish chemist, born at Catherinberg, in West Gothland, Mar. 20, 1735. He was educated at the University of Upsal, and devoted himself to natural history, physics, and mathematics. He obtained the chair of chemistry at Upsal in 1767. He discovered sulphuretted hydrogen, and first obtained important results from the use of the blowpipe. He laid the foundation of the science of crystallography. Among his works are an "Essay on Electric Affinities" (1775), and "Opuscula Physica et Chemica" (6 vols., 1779–90). Died July 8, 1784. (See P. F. Acrivillius,

"Aminnelse-Tal öfver T. O. Bergman," 1785; BIOT, article in the "Biographie Universelle.")

Berg'mehl, a German word signifying "mountain meal," is a name of an extremely fine powder found in geological strata of recent (eocene) formation, and composed of effete and indestructible silicious frustules of Diatomaceæ, which are microscopic plants of the class Algæ. Vast beds of these fossils occur in Germany, Lapland, Va., Md., Vt., N. H., and other regions. This powder is mixed with flour, and used as food by the people of Sweden and Norway in seasons of scarcity. It is used in making water-glass and the floating bricks of Southern Europe and as polishing-powder.

Berg'söe (WILHELM), PH. D., a Danish novelist, born Feb. 8, 1835, was in youth a zoologist, attaining distinction in that field. But in consequence of the failure of his eyesight, and of a long and severe illness, he was disqualified for his favorite study, and went to Italy for his health. He became a successful writer of romances. His first venture, "Fra Piazza del Popolo" (1866), had a great success. He has also published "I Sabinerbjergene" ("In the Sabine Hills," 1871), and "Bruden fra Rörvig" ("The Bride of Rörvig," 1872). His fame as a novelist is rapidly increasing.

Bergues, a fortified town of France, in the department of Nord, on the river Colne, 5 miles by rail S. S. E. of Dunkirk. It is connected by a canal with Dunkirk and the sea, and has an active trade, sugar-refineries, and manufactures of soap, tobacco, and earthenware. Pop. 5738.

Ber'gylt (*Sebas'tes Norveg'icus* or *Scorpæna Norvegica*),

The Bergylt.

a fish of the family Sclerogenidæ, resembles a perch in appearance so much that it has been called sea-perch. It is found in all the northern seas, is of a red color, and attains a length of two feet or more. It is used as food. It is found on both sides of the Atlantic.

Ber'hampoor', or **Berhampore,** a town of British India, in the presidency of Bengal, on the Bhagirathi River, 6 miles S. of Moorshedâbâd, and 118 miles by land N. of Calcutta. It is one of the principal British military stations in India, and has an appearance of grandeur and importance. Sanitary improvements have rendered it one of the most healthy places in Bengal.

Ber'i-ber'i, a disease almost peculiar to Ceylon and a part of Hindostan. It is attended by great weakness, often dropsy and paralysis, and is generally fatal in a few days or weeks. It especially attacks the intemperate, who are very numerous in Ceylon, and those who are exposed to the effects of bad air, impure water, and insufficient food.

Ber'ja, a town of Spain, in the province of Almería, on the S. slope of the Sierra de Gador, 22 miles W. S. W. of Almería. It is in the midst of lead-mines, and has manufactures of linen, hats, hardware, etc. Pop. 8000.

Ber'islav, a town of Russia, in the government of Cherson, on the Dnieper, 40 miles E. of Cherson. Pop. in 1867, 6023.

Berkeley, a county of the N. E. of West Virginia. Area, 250 square miles. It is bounded on the N. E. by the Potomac River, and on the S. E. by Opequan Creek. It is the most northern part of the Valley of Virginia. The surface is partly hilly; the soil of the valleys is fertile. Limestone and coal are found here. Wheat, corn, oats, and wool are staple products. It is intersected by the Baltimore and Ohio R. R. Capital, Martinsburg. Pop. 14,900.

Berkeley, a post-village of Alameda co., Cal., the seat of the University of California and the State Agricultural College, is 5 miles N. of Oakland and 9 from San Francisco.

Berkeley, a township of Spottsylvania co., Va. P. 1801.

Berkeley (GEORGE), an eminent philosopher and bishop, was born at Kilcrin, Ireland, on the 12th of Mar., 1684. He studied at Trinity College, Dublin, where he formed a friendship with Dean Swift, and became a fellow of that college in 1707. He published in 1709 his "Essay towards a New Theory of Vision," a work of wide reputation. He propounded his celebrated theory of idealism in a "Treatise concerning the Principles of Human Knowledge" (1710), in which he affirmed that there is no proof of the existence of a material world. The objects of which we are conscious in perception he called "ideas." Their presence he held to be due to the constant agency of the Almighty, who causes them to pass in a real and orderly succession before the mind. His views are the result of the application of rigid logic to the principles which Locke and his school had adopted from Descartes. His method was allied to that of Malebranche, though his conclusions were drawn with a boldness from which the French philosopher recoiled. As distinguished from the egoistic system of Fichte, Berkeley's views have been called theistic idealism. His object was to undermine materialism and counteract skepticism. In 1713 he removed to London, and wrote several essays for the "Guardian." He accompanied Lord Peterborough as chaplain to Italy, and returned to England about 1721. In 1724 he became dean of Derry, with an income of £1100. His abundant charity and zeal induced him to engage in an enterprise for the conversion of the American savages, for which purpose he proposed to found a college in America for the education of missionaries. Having received a promise of pecuniary aid from the government, he married Anna, a daughter of John Forster, in 1728, and sailed to Rhode Island. He preached at Newport two years, but he did not succeed in his enterprise, because the ministers failed to perform their promise. He returned home, and was appointed bishop of Cloyne in 1734. Among his works are "Alciphron, or the Minute Philosopher" (1732), "The Analyst" (1735), and a "Word to the Wise" (1749). He died at Oxford Jan. 23, 1753, leaving an excellent reputation as a model of virtue. "Ancient learning," says Sir J. Mackintosh, "exact science, polished society, modern literature, and the fine arts contributed to adorn and enrich the mind of this accomplished man. All his contemporaries agreed with the satirist [Pope] in ascribing 'to Berkeley every virtue under heaven.'" (*View of the Progress of Ethical Philosophy.*) (See DR. STOCK, "Life of Berkeley," prefixed to his works, 2 vols. 4to, 1784; G. N. WRIGHT, "Life of George Berkeley," prefixed to his works, 1843. Berkeley's works have recently been edited, with a life annexed, by Prof. Fraser, in 4 vols. 8vo, Oxford, 1871.)

Berkeley (Rev. MILES JOSEPH), F. L. S., one of the most eminent of English botanists of the present century, was born in 1803, and educated at Rugby and Christ's College, Cambridge, where he graduated with honors in 1825. He obtained several Church preferments, but his chief distinction has been won in science. As a botanist his attention has been principally directed to the lower Cryptogamia. He is honorary member of many of the scientific societies of Europe. His monographs are very numerous. He is the author of "Gleanings of British Algæ" (1833), the last volume of the "English Flora" (1836), "Handbook of Cryptogamic Botany" (1857), "British Fungology" (1860), "British Mosses" (1863), etc.

Berkeley (Sir WILLIAM) was born near London. He was appointed governor of Virginia in 1641, and held that office for many years. He was a royalist in the civil war, and was removed from power in 1651 by Cromwell, but became governor again in 1660. He rendered himself unpopular by his cruelty in putting to death the adherents of Nathaniel Bacon, and he once said, "I thank God there are no free schools or printing-presses in Virginia." Died in England July 13, 1677.

Berkeley, EARLS OF, and Viscounts Dursley (1679), Barons Berkeley (1416, in England), a prominent family of Great Britain.—THOMAS MORETON FITZ-HARDINGE BERKELEY, the sixth earl, born Oct. 19, 1796, succeeded his father in 1810.

Berkeley Springs, West Virginia. See BATH.

Ber'kenhout (JOHN), an English physician of Dutch descent, was born at Leeds in 1730. He was sent to America as an agent of the British government in 1788, and was imprisoned by Congress as a spy. He wrote "Biographia Literaria," "Outlines of the Natural History of Great Britain," and a "Botanical Lexicon." Died in 1791.

Berk'ley, a post-township of Bristol co., Mass. It contains the celebrated Dighton Rock. Pop. 744.

Berks, a county in the S. E. of Pennsylvania. Area, 920 square miles. It is intersected by the Schuylkill River, and also drained by Tulpehocken and other creeks. The Kittatinny or Blue Mountain forms the N. W. boundary of this county, the surface of which is finely diversified. The soil is fertile, especially in the large limestone valley between the Kittatinny and the ridge called South Mountain. Grain, cattle, dairy products, potatoes, and wool are extensively produced. It has rich iron-mines, which are

extensively worked. The county is intersected by the Philadelphia and Reading and the Reading and Columbia R. Rs. It was settled by Germans about 1734. It has important manufactures of many kinds of goods. Capital, Reading. Pop. 106,701.

Berk'shire, an inland county of England, bounded on the N. by Oxford and Bucks, on the E. by Surrey, on the S. by Hampshire, and on the W. by Wiltshire. Area, 705 square miles, or 451,210 acres. The river Thames forms its entire boundary on the N. and N. E. The surface is beautifully diversified by hills and valleys. In the S. E. is Windsor Forest and Park. This forest consists of oak, ash, beech, alder, and hazel trees. The county is drained by the river Kennet and other streams. The soil of the valleys is mostly a fertile loam, with a subsoil of chalk, gravel, or clay. Wheat, oats, horses, and swine are the staple products. The Great Western Railway passes through Berkshire. Capital, Reading. P. in 1871, 196,445.

Berkshire, a county which forms the W. extremity of Massachusetts, bordering on New York and Vermont, has an area of about 1000 square miles. It is drained by the Hoosic, Westfield, and Housatonic rivers, which rise within its limits, and afford abundant water-power. The surface is finely diversified by mountains, hills, and valleys, and presents very picturesque scenery. Saddle Mountain (Greylock), in the N. part, is the highest point in the State. The soil is generally productive, and adapted to grazing. Dairy products, corn, potatoes, wool, and tobacco are the chief products. The manufactures of cotton and woollen goods, paper, and glass are important. Marble, limestone, and iron ore abound here. The county is intersected by the Boston and Albany R. R. and the Housatonic R. R. Capital, Pittsfield. Pop. 64,827.

Berkshire, a post-twp. of Tioga co., N. Y. Pop. 1240.

Berkshire, a post-township of Delaware co., O. Pop. 1336.

Berkshire, a post-township of Franklin co., Vt. Pop. 1609.

Ber'lat, a town in Moldavia, on the Berlat, 63 miles S. of Jassy. It is an entrepôt for grain. Pop. 13,165.

Ber'liching'en, von (GÖTZ or GOTTFRIED), a famous German knight, surnamed OF THE IRON HAND, was born in 1480 at Berlichingen Castle, in Würtemberg. He lost a hand at the siege of Landshut, and supplied its place by an iron hand. He was a daring and turbulent subject, was involved in several feuds with neighboring barons, and fought for the insurgent peasants against the nobles in the Peasants' War, which closed in 1525. For this offence he was placed under the ban of the empire by Maximilian I. He died in 1562, and left an autobiography (1731). His exploits form the subject of Goethe's drama of "Götz von Berlichingen." (See CARL LANG, "Ritter G. von Berlichingen," 1825; BÜSCHING, "Leben Götz von Berlichingen," 1814.)

Ber'lin, the capital of the Prussian monarchy and the new German empire, residence of the German emperor, seat of the highest authorities of Prussia and Germany, is situated on the Spree; lat. 52° 30′ N., lon. 13° 24′ E. The city is of comparatively modern growth. The two oldest parts, Old Cologne and Old Berlin, are for the first time mentioned in 1237 and 1244. They were in 1307 consolidated into one city, which joined the Hanse, became the head of the confederation of the towns of *Mark*, and at the close of the fifteenth century became the residence of the electors of Brandenburg. Its rapid growth dates from the reign of "the great elector," at whose death it numbered about 20,000 inhabitants. Under Frederick the Great the population rose to 114,000; in 1817 its inhabitants numbered 188,000; in 1844, 311,000; in 1851, 436,000; in 1867, 702,000; and, according to the census of 1871, it had attained the number of 825,389 persons, who, with the exception of 50,000 Roman Catholics and 30,000 Jews, belong to the Protestant Church, and chiefly to the United Evangelical State Church. In 1867 the city had about 34,000 buildings, among which there were about 700 public buildings and sixty churches. Berlin consists of sixteen different parts, of which Old Berlin, on the right bank of the Spree, and Old Cologne, on an island, are the oldest. The others are New Cologne, settled about 1681; Friedrichswerder, 1658; Dorotheenstadt, Neustadt, 1673; Friedrichsstadt, 1694; Luisenstadt, 1669; Stralauer Viertel, 1705; Königsstadt, 1693; Spandauer Revier (Sophienstadt, 1691); and Friedrich-Wilhelmstadt, named since 1828. Inside of the wall, which formerly included the whole of these eleven parts, are situated Wedding (Oranienburger Vorstadt); Moabit (Voigtland, 1752); Äussere Friedrichsstadt (laid out in 1838); Äusseres Spandauer Revier, Schöneberger, and Tempelhofer Revier.

The principal streets are Unter den Linden, with four rows of lime trees and the stately Brandenburg Gate, the Wilhelmsstrasse, and Königsstrasse. Foremost among the public places are the Opera Place, with the equestrian statue of Frederick the Great by Rauch (erected in 1851); the Lustgarten (laid out in 1828), with the museums, the Gensdarmenplatz, with the new theatre; the Wilhelmplatz, with the statues of Schwerin, Winterfeld, Seidlitz, Keith, Ziethen, and Leopold of Dessau; the Belle Alliance Platz, with the Victoria Column (since 1843); the Leipziger Platz, with the monument of the count of Brandenburg; and the Pariser Platz. The most important bridges are the Kurfürstenbrücke, with a statue of "the great elector;" the Friedrichsbrücke, with eight iron arches; the Schlossbrücke, built in 1824, upon two massive arches and with eight allegorical marble groups; the iron Weidendammerbrücke, built in 1826; and the Alsenbrücke, built in 1867. Among the remarkable public buildings are the Königliche Schloss, with the Weisser Saal; the Königliche Palast, with which the palace of Prince Louis is incorporated; the palaces of the crown prince and the princes Charles and Albrecht; the Arsenal; the Artillery School, and the University (formerly palace of Prince Henry); the Singing Academy; the Exchange; the Old Museum, built in 1828 by Schinkel, and containing a celebrated picture-gallery, which is rich in paintings by the early Italian and German masters, and in collections of ancient sculpture and other antiquities. Connected with the Old Museum is the New Museum, begun in 1843, and chiefly formed of the Egyptian antiquities brought home by the expedition under Lepsius.

Berlin has no churches of importance in point of architecture. The university was established in 1810, and is in every respect one of the greatest literary institutions of the world. It had in 1868 about 3000 students, and from its beginning has counted among its professors many of the most celebrated scholars, such as Humboldt, Ritter, Fichte, Hegel, Schelling, Neander, Schleiermacher, and Virchow. The Royal Library numbered in 1870 about 700,000 volumes and more than 15,500 manuscripts. It rapidly increases, as Prussian publishers are bound to deposit in it a copy of every new work. The library of the university has about 100,000 volumes. Other important literary institutions are the Academy of Science, the Polytechnic Institute, the Building Academy, the Navy School, the Mining Academy, the Pharmaceutical School, institutions for the deaf and mute and for the blind, and ten gymnasia. The Charité, the greatest hospital of Berlin, has had as many as 10,000 patients in a year.

The trade and commerce of Berlin are extensive. The castings in iron and the china manufactures of Berlin have a world-wide reputation. The increase of railroad connection has of late given a powerful impulse to the development of industry, and the large numbers of the laboring classes have made Berlin one of the chief centres of the Internationale. The revenue and expenditure of Berlin amount to about five million thalers annually; the debt, to 8,000,000 thalers. The authorities of the city have established a statistical bureau specially devoted to the statistics and history of Berlin; an annual publication by the president of this bureau ("Berlin und seine Entwickelung," established in 1866) is the best source of information for everything relating to this great German city.

A. J. SCHEM.

Berlin, a town, the capital of Waterloo co., Ontario, Dominion of Canada, on the Grand Trunk Railway, 62 miles W. S. W. of Toronto, at the junction of the Doon branch. It has two weekly papers, fourteen churches, a large button-factory, and other important manufacturing interests. Its trade is extensive. Pop. 2743.

Berlin, a township of Chambers co., Ala. Pop. 2018.

Berlin, a post-village and township of Hartford co., Conn., on the New Haven Hartford and Springfield R. R., 25 miles N. N. E. of New Haven. Pop. of township, 2436.

Berlin, a township of Bureau co., Ill. Pop. 1469.

Berlin, a township of Clinton co., Ia. Pop. 805.

Berlin, a post-township of Worcester co., Mass., is on the Boston Clinton and Fitchburg R. R., 40 miles N. W. of Boston. Pop. 1016.

Berlin, a post-village of Worcester co., Md., at the eastern terminus of the Wicomico and Pocomoke R. R., and north-western terminus of the Worcester R. R., 14 miles from Snow Hill. Pop. 697; of township, 4330.

Berlin, a township of Ionia co., Mich. Pop. 1587.

Berlin, a township of Monroe co., Mich. Pop. 1844.

Berlin, a township of St. Clair co., Mich. Pop. 1231.

Berlin, a post-township of Steele co., Minn. Pop. 409.

Berlin, a township of Coos co., N. H. It has manufactures of lumber, etc. Pop. 529.

Berlin, a post-village and township of Rensselaer co.,

N. Y., on the New York and Harlem Extension R. R., 162 miles N. N. E. of New York City. Pop. of township, 2088.

Berlin, a township of Delaware co., O. Pop. 1330.

Berlin, a township of Erie co., O. Pop. 1741.

Berlin, a post-township of Holmes co., O. Pop. 1007.

Berlin, a township of Knox co., O. Pop. 887.

Berlin, a township of Mahoning co., O. Pop. 963.

Berlin, a post-borough of Somerset co., Pa., 70 miles S. E. of Pittsburg. Pop. 640.

Berlin, a township of Wayne co., Pa. Pop. 1295.

Berlin, a post-township of Washington co., Vt. Pop. 1474. It has manufactures of leather and lumber.

Berlin, a city and township of Green Lake co., Wis., on Fox River, at the termination of a branch of the Milwaukee and St. Paul R. R., 94 miles N. W. of Milwaukee. Steamboats ply between this point and Green Bay, etc. It has one bank, three grist and flouring mills, two sawmills, one foundry, and manufactures of turbine-wheels, whips, gloves, woollen goods, etc. It has two newspapers, a city park, and a high-school. Pop. of city, 2777; of township, 3800. ED. "BERLIN COURANT."

Berlin, a township of Marathon co., Wis. Pop. 879.

Berlin and Ivor, a post-township of Southampton co., Va. Pop. 2674.

Berlin Blue. See PRUSSIAN BLUE.

Berlin Heights, a post-village of Erie co., O., is the seat of a celebrated community of Spiritualists.

Berlioz (HECTOR LOUIS), a French musical composer, born Dec. 11, 1803, at Côte-Saint-André (Isère). The son of a physician sent to Paris to study medicine, he entered the Conservatory, following a passionate bent for music. He composed "Symphonie Fantastique," overtures to "Waverley" and "King Lear," "Harold" (1833), and "Romeo et Juliette" (1839), symphonies; "Benvenuto Cellini," an opera in two acts, "Symphonie Funèbre et Triumphale" (1840), "Damnation de Faust" (1846), a symphony, "Enfance de Christ," a trilogy (1854), and "Les Trogens," a grand five-act opera, played without success in 1863. M. Berlioz has been considered the chief of the romantic school. His works bespeak an ardent and independent genius, and have elicited diverse criticism. He was also a talented author and critic, and has published "Traité d'instrumentation et d'orchestration moderne" (1844), "Voyage musicale en Allemagne et en Italie," "Études sur Beethoven, Gluck, et Weber" (1845), "Soirées de l'orchestre" (1853), "Les Grotesques de la musique" (1859), and "Mémoires" (1870). Died Mar. 9, 1869.

Berme, in fortification, is a ledge or narrow level space, three or more feet wide, at the bottom of the outside of a rampart where it joins the scarp. It serves as a passageway for the garrison, and to prevent the earth and other materials from falling into the ditch when the rampart is battered by the enemy.

Bermu'da, a township of Chesterfield co., Va. P. 877.

Bermuda Grass, the *Cynodon Dactylon*, a grass which is extensively cultivated in India (where it is called *dhab*), and of late years introduced into the West Indies, Europe, the Southern U. S., and the Sandwich Islands. It is valuable both for pasture-grass and hay, and is especially prized in warm climates, where the grass crop is generally poor; but in light soils, especially northward, its perennial roots cause great trouble to the farmer.

Bermu'da Hun'dred, in Chesterfield co., Va., on the right bank of the James River, just above the mouth of the Appomattox, and 1½ miles above City Point. The tortuous course of the James River here encloses a neck of land which Gen. Butler occupied and fortified in May, 1864, and from which he was to co-operate with Gen. Grant by menacing Richmond and Petersburg. On the morning of the 16th of May, 1864, Gen. Butler, who had moved out of his works, was fiercely attacked by the Confederate force under Beauregard, and after a severe struggle, which lasted till noon, driven back into his intrenchments with severe loss. Beauregard, following slowly, erected a line of works across the peninsula in front of Butler's. Subsequent expeditions were made from these works, and the line finally formed a part of the investment lines of the combined armies against Petersburg.

Bermu'da Islands, or **Bermu'das** [Fr. *Bermudes*], or **Somers's Islands,** a group of small, low islands in the Atlantic Ocean, belonging to Great Britain. They take their name from Juan Bermudez, who discovered them in 1522. They are about 624 miles E. S.E. of Cape Hatteras, which is the nearest land, and are in lat. 32° 20′ N., and lon. 64° 50′ W. The extent of the group is only 19 miles by 6 miles, although the number of islets is nearly 400. Area, 24 square miles. They derive importance from the commanding position which they occupy between the West Indies and the other parts of British America. They are enclosed on several sides by formidable coral-reefs, which are said to be the only coral-reefs occurring in the central expanse of the Atlantic. The climate is so mild and delightful that these islands are covered with perpetual verdure. Between December and March the temperature ranges from 60° to 66° F. The chief articles of export are potatoes, onions, and arrow-root. The largest of these islands are Bermuda, 15 miles long; St. George's, 3½ miles; Somerset, 3 miles; and Ireland, 3 miles. Capital, Hamilton, on the isle of Bermuda. St. George's Isle has a good landlocked harbor, which is defended by strong batteries. These isles are separated by narrow and intricate channels, and have no streams, and but few pools of fresh water. Many of the inhabitants are employed in building cedar vessels, which are durable and swift. Pop. in 1863, 11,796.

Bern, a township of Athens co., O. Pop. 1014.

Bern, a township of Berks co., Pa. Pop. 2124.

Bernadotte, a post-township of Fulton co., Ill. P. 1253.

Bernadotte, a township of Nicollet co., Minn. P. 214.

Bernadotte (**Charles XIV.**), JOHN, king of Sweden, a French marshal, born at Pau Jan. 26, 1764. His original name was JEAN BAPTISTE JULES BERNADOTTE. He enlisted as a private in the army in 1780, served as general of division under Kleber and Jourdan in Flanders in 1794, and under Bonaparte in 1797. In 1798 he was French minister at Vienna, and married Mademoiselle Clary, a sister of Joseph Bonaparte's wife. He was minister of war for a short time in 1799. Napoleon created him a marshal of France in 1804, and in June, 1806, prince of Pontecorvo. He fought at Austerlitz in 1805, and defeated the Prussians at Halle in Oct., 1806. He quarrelled with Napoleon, who censured his conduct at Wagram (1809), and he resigned his command just after that battle. In Aug., 1810, the Swedish Diet elected Bernadotte as heir to the throne of Sweden, then occupied by Charles XIII., who had no son, and he was immediately associated with the old king in the exercise of royal power. Early in 1812, Bernadotte, who took the name of Charles John, negotiated with Russia a secret treaty of alliance against Napoleon. He openly joined the coalition of the allies in the spring of 1813, and led an army of about 28,000 men into Germany. His army defeated Oudinot at Gross-Beeren in Aug., 1813, but his conduct was considered equivocal and lukewarm by the allies. He forced Prince Christian of Denmark, who had proclaimed himself king of Norway, to resign, and on Nov. 4, 1814, Charles XIII. was proclaimed king, and Bernadotte crown prince. When the allies entered France in 1814, he led his army back to Sweden and conquered Norway. He began to reign alone on the death of Charles XIII., in Feb., 1818, after which a long peace ensued. He died in Mar., 1844, and left the throne to his son, Oscar I. (See ERIK G. GEIJER, "Konung Karls XIV. Johan Historia," 1844; W. G. MEREDITH, "Memorials of Charles (XIV.) John, King of Sweden," 1829.)

Bernal'da, a town of Italy, in the province of Potenza, 46 miles S. E. of Potenza. Pop. 5862.

Bernalil'lo, a large county in the W. part of New Mexico, is intersected by the Rio Grande and Rio Puerco. The surface is partly mountainous; the valley of the Rio Grande is productive. Hides, wool, corn, and wine are produced. Gold, silver, lead, iron, copper, and coal abound. Capital, Albuquerque. Pop. 7591.

Bernard (CLAUDE), an eminent French physiologist, born at Saint Julien, in Rhône, July 12, 1813. He wrote "Researches on the Uses of the Pancreas," which gained the grand prize of the Institute in 1849. He was admitted into the Institute in 1854, and became professor of physiology in the College of France in 1855. Bernard discovered the glycogenic function of the liver. He was created grand officer of the Legion of Honor in 1862. Among his best known works are "Leçons de Physiologie" (1855), and "Mémoire sur la Chaleur animale" (1856).

Bernard (Sir FRANCIS), an English lawyer, born in 1714, who became governor of New Jersey in 1758, and of Massachusetts in 1760. He was unpopular in Massachusetts because he brought troops into Boston and opposed liberal measures. He was accused of misconduct, but recalled and made a baronet in 1769. Died June 16, 1779.

Bernard, SAINT, abbot of Clairvaux, an eminent mediæval theologian, and a doctor of the Western Church, born at Fontaines, near Dijon, in 1091. He became an inmate of the monastery of Citeaux in 1113, and founded in 1115 a community of the Cistercian order at Clairvaux, in Champagne, of which he was the first abbot. His ascetic life and eloquence rendered him a very influential and powerful person in the Church. He was regarded as an oracle by all Christendom, founded a large number of monasteries,

and was an implacable adversary of Abelard. He zealously promoted the crusade of 1146, which was disastrous to those who joined it. He died Aug. 20, 1153, leaving many religious works, and was canonized in 1174. (See LEMAITRE, "Vie de Saint Bernard," 1649; A. NEANDER, "Der heilige Bernard und sein Zeitalter," 1813: translated into English by Wrench, 1843; C. MONTALEMBERT, "Histoire de S. Bernard;" J. O. ELLENDORF, "Der heilige Bernhard," 1837; EUGENIO DE CORRAL, "Vida de S. Bernardo," 1782.)

Bernard (SIMON), an officer of the French imperial corps du genie, born at Dôle April 28, 1779, was aide-de-camp to Napoleon I., and employed by him in many important and confidential duties incidental to his branch of the service. He was invited to this country by President Madison under a resolution approved April 29, 1816, "authorizing the President of the U. S. to employ a skilful assistant in the corps of engineers," instigated by the notion prevalent at that date, that only in Europe, and especially in France, could the high military science necessary to the organization of a system of sea-coast defence by fortification be found. The chief engineer, Gen. Swift, and subsequently another distinguished officer, Col. McRee, sent in their resignations in consequence. Gen. Swift was succeeded as chief engineer by Col. W. K. Armistead. As "Assistant Engineer" Gen. Bernard was associated with Col. (subsequently General and Chief Engineer) J. G. Totten, constituting a "permanent board," upon which the labor of working out the fundamental principles of the system, and of elaborating the projects of defence for the great seaports, devolved; and mainly upon these two officers, though naval officers of rank and experience were associated with them whenever their examinations included positions for dockyards, naval dépôts, or other objects which concerned the naval service; and the resident engineer officers had a voice in relation to their particular works. He also had a prominent part in the inauguration of some of our earlier works of civil engineering; *e. g.* the Chesapeake and Ohio Canal, the Delaware Breakwater, etc. He resigned in 1831, and returned to France, and became aide-de-camp to Louis Philippe, and subsequently minister of war of France. To high military and scientific acquirements and great experience in his professional duties, Gen. Bernard united the qualities of an amiable and accomplished gentleman, and the tact to adapt himself to his peculiar position without wounding the pride of those with whom he was thus associated. The prestige of his name aided powerfully in sustaining with the administration and with Congress the measures which the board found necessary to recommend, and in establishing firmly, as a part of our national policy, the system of sea-coast defence by fortifications. He died in Paris Nov. 5, 1839. J. G. BARNARD, *U. S. Army.*

Bernard of Cluny, not to be confounded with his more celebrated countryman and contemporary, Bernard of Clairvaux, was born at Morlaix, in Brittany, of English parents, probably not far from the year 1100. He was a monk at Cluny under Peter the Venerable, who was abbot there from 1122 to 1156. He wrote a poem, "De Contemptu Mundi," in about 3000 lines, portions of which were translated by the Rev. John Mason Neale (1818–66) in 1851 and 1862. Dr. Neale pronounces these verses of Bernard "the most lovely, in the same way that the 'Dies Iræ' is the most sublime, and the 'Stabat Mater' the most pathetic, of mediæval poems." Hymns taken from this poem, such as "The world is very evil," "Brief life is here our portion," and "Jerusalem the golden," are among the finest gems in recent English and American collections.

Bernard's, a township of Cherokee co., Ala. P. 135.

Bernard's, a township of Somerset co., N. J. P. 2369.

Ber'nardston, a post-township of Franklin co., Mass., on the Connecticut River R. R. It is the seat of Powers Institute. Pop. 961.

Bernard, the Great St., a famous mountain-pass of the Pennine Alps, upwards of 8000 feet in height, between the Swiss canton of Vaud and the valley of Aosta. Near the summit is the celebrated hospice, said to have been founded in 962 by Saint Bernard of Meuthon in Savoy for the succor of travellers crossing the mountain. In the humane efforts of the monks of this hospice the valuable dogs known as the St. Bernard breed, and noted for their size and sagacity, are valuable assistants. In 1800 Napoleon crossed the Alps here with an army of 30,000 men, with cavalry and artillery.

Ber'nau, a town of Prussia, in Brandenburg, on the Stettin Railway, 14 miles N. E. of Berlin. It has manufactures of silk stuffs, cotton, and woollen goods. Pop. in 1871, 5566.

Bernay, a town of France, in the department of Eure, on the railway from Paris to Caen, 25 miles W. N. W. of Evreux. It has a college, and manufactures of woollen cloths, linens, paper, and leather. A horse-fair, the largest in France, is held here annually. Pop. 7510.

Bern'burg, a town of Germany, formerly capital of the duchy of Anhalt Bernburg, is on the river Saale, here crossed by a bridge, 24 miles S. S. W. of Magdeburg. It is connected by railway with Berlin and Dresden. It has a gymnasium, a Realschule, a valuable library, a ducal castle, and manufactures of porcelain, paper, and starch. Pop. in 1871, 15,715.

Berne [Fr. *Berne;* Ger. *Bern;* Lat. *Ber'na*], the most populous canton of Switzerland, and the most extensive except the Grisons. It is bounded on the N. by Alsace and Soleure, on the E. by Aargau, Lucerne, Unterwalden, and Uri, on the S. by Valais, and on the N. by Vaud, Fribourg, Neufchâtel, and France. Area, 2660 English square miles. It is traversed by the river Aar, and also drained by the Emmen. The Aar expands into two lakes called Brienz and Thun. The surface is mountainous, and the northern part is occupied by the Jura Mountains. Several high peaks of the Alps—namely, the Finsteraarhorn, 14,032 feet, the Jungfrau, 13,514 feet, Schreckhorn, 13,393 feet—are in Berne. The valleys of the Simmenthal, Lauterbrunnen, and Grindelwald in the Bernese Oberland are celebrated for their beauty. The valleys of the Aar and Emmen are fertile and adapted to pasturage. Among its mineral resources are copper, lead, iron, marble, and granite. The canton has important manufactures of watches, paper, woollen goods, linens, etc. It is intersected by several railroads. Capital, Berne. Pop. in 1870, 506,465, of whom 66,015 were Roman Catholics.

Berne, or **Bern** [said to be derived from the Ger. *Bären,* "bears," figures of which are on the armorial bearings of the city], a city of Switzerland, capital of the canton of Berne, is situated on the river Aar, which encloses it on three sides, 65 miles by rail S. of Bâle and 92 miles by rail N. E. of Geneva. Berne is the seat of the federal government of the republic, and is considered to be the finest city in Switzerland. It is built of freestone, and the houses are massive structures, resting on arcades which form covered promenades on both sides of the streets. Magnificent Alpine scenery is visible from this point. Berne has a Gothic cathedral, a public library, a university, a museum of natural history, a mint, and an arsenal. One of the finest buildings is the new federal palace. The river is here crossed by four large bridges. Several railroads connect it with Geneva, Bâle, and other towns. Berne was founded in 1191, and became a free town of the empire in 1218. It joined the Swiss Confederation in 1352. In 1849 it became the permanent capital of the whole republic. Pop. in 1870, 36,002.

Berne, a post-township of Albany co., N. Y. It contains nine churches, several manufactories, and a number of small caves and mineral springs. Pop. 2562.

Berne, a township of Fairfield co., O. Pop. 3056.

Bern'hard, duke of Saxe-Weimar, a celebrated German general, born Aug. 6, 1604, was a younger son of John III. of Saxe-Weimar. He fought for the Protestant cause in the Thirty Years' war, distinguished himself at Wimpfen in 1622, and became a colonel in the army of Denmark, which he quitted in 1628. In 1631 he joined the standard of Gustavus Adolphus. The victory which the Swedes gained at Lützen in 1632 is attributed to the skill and energy of Bernhard, who in 1633 was appointed to the command of the Swedish army. Having made a personal treaty of alliance with France in 1635, he afterwards commanded a French army and defeated the imperialists. Died July 8, 1639. (See SCHILLER, "History of the Thirty Years' War;" J. A. C. VON HELLFELD, "Geschichte des Bernhard des Grossen," etc., 1797; BERNHARD ROESE, "Herzog Bernhard der Grosse von Sachsen-Weimar," 2 vols., 1828–29.)

Bernice. See BERENICE.

Berni'na, an imposing mountain-group in the Swiss canton of Grisons, rises 13,407 feet above the level of the sea, and has a remarkable glacier. The Pass of Bernina, the altitude of which is 6671 feet, affords a communication between the Upper Engadine and the Valtelline.

Berni'ni (GIOVANNI LORENZO), an Italian architect and sculptor, born at Naples in 1598, lived at Rome. His works, the best among which are the colonnade to St. Peter's church, the Scala Regia of the Vatican, and the Barberini Palace at Venice, possess some excellencies, but show the beginning of the decline of art into the *baroque* or Jesuit style, to which his influence greatly contributed.

Bernoulli, or **Bernouilli** (DANIEL), F. R. S., an eminent mathematician and philosopher, born at Groningen Feb. 9, 1700, was a son of Jean (1667–1748). He became in 1733 professor of anatomy and botany at Bâle, where he

afterwards obtained the chair of physics and speculative philosophy. He gained many prizes of the French Academy of Sciences, and wrote in Latin and French many scientific works. He was one of the three greatest members of this famous family. Died Mar. 17, 1782, at Bâle. (See CONDORCET, "Éloge de Daniel Bernouilli," 1782.)

Bernoulli (JACQUES), a Swiss mathematician, an uncle of the preceding, was born at Bâle Dec. 27, 1654. He became professor of mathematics in that city in 1687. He solved Leibnitz's problem of the isochronous curve, discovered the properties of the logarithmic spiral, and wrote several treatises on mathematics, etc. Died at Bâle Aug. 16, 1705. (See BATTIER, "Vita Jacobi Bernoulli," 1705.)

Bernoulli (JACQUES), a nephew and pupil of Daniel, was born at Bâle Oct. 17, 1759; he became professor of mathematics at St. Petersburg. He was drowned in the Neva July 13, 1789.

Bernoulli (JEAN or JOHN), one of the most eminent mathematicians of the Bernoulli family, was born at Bâle July 27, 1667. He was the father of Daniel and brother of Jacques (1654–1705). He discovered the exponential calculus, and ascertained the curve of swiftest descent. In 1705 he succeeded his brother Jacques as professor of mathematics at Bâle. His works were published in 4 vols., 1742. Died Jan. 1, 1748.

Bernoulli (JEAN), a son of the preceding, was born at Bâle May 18, 1710. He became professor of mathematics at Bâle in 1748, and wrote several treatises. Died July 11, 1790.—BERNOULLI (JEAN), born at Bâle Nov. 4, 1744, was a son of the preceding. He became astronomer-royal at Berlin in 1764, and wrote various works. Died July 13, 1807.—BERNOULLI (JÉROME), a Swiss naturalist, born at Bâle in 1745; died in 1829.—BERNOULLI (NICOLAS), a son of Jean and a brother of Daniel, noticed above, was born at Bâle Jan. 29, 1695. He was professor of mathematics at St. Petersburg, where he died July 26, 1726.—BERNOULLI (NICOLAS), LL.D., F. R. S., a cousin of the preceding, was born at Bâle Oct. 10, 1687. He made several discoveries in mathematics. Died Nov. 29, 1759.

Bern'storff (ALBRECHT), COUNT, a Prussian diplomatist and statesman, born Mar. 22, 1809, became in 1857 Prussian ambassador in London, was minister of foreign affairs from 1861 to 1862, returned to London in 1862, and represented the German empire in the London Conference of 1871. Died Mar. 26, 1873.

Bernstorff, von (JOHANN HARTWIG ERNST), COUNT, an eminent statesman, born at Hanover May 13, 1712. Having entered the civil service of Denmark, he was appointed minister of foreign affairs (prime minister) in 1761. He was a liberal patron of learning and the arts, and he promoted the commerce and manufactures of Denmark. He retained power till 1770. Died Feb. 19, 1772. (See G. H. AHLEMANN, "Ueber das Leben and den Charakter des Grafen von Bernstorff," 1777; G. NAVARRO, "Vie du Comte J. H. E. Bernstorff," 1822.)

Bern'ville, a post-borough of Berks co., Pa., 46 miles E. N. E. of Harrisburg. Pop. 457.

Ber'öe, a genus of Radiata of the class Acalepha, and of a division called Ciliograde (*i. e.* moving by means of cilia). They are phosphorescent marine animals. The genus is the type of a family characterized by an oval or nearly globular body, of a delicate jelly-like substance, with an alimentary canal passing through its axis, which is vertical as the animal floats in the water. The body is strengthened by bands of firmer texture, which are furnished with rows of cilia, the motion of which is very rapid.

Berœ'a, or **Berea,** a large and ancient city of Macedonia, situated at the foot of Mount Bermius, about 30 miles from Pella. It was attacked by the Athenians in the war which began about 430 B. C. Saint Paul visited Berœa, and preached there. (See Acts xvii. 10.) Its site is occupied by the modern town of *Veria*, 35 miles W. of Salonica. (See VERIA.)

Bero'sus [Gr. Βηρωσός], an eminent Chaldee historian, was a priest of Belus at Babylon, and lived about 300 B. C. He wrote in Greek a "History of Babylonia and Chaldæa," which was highly esteemed by the ancient Greeks and Romans, but it is lost except a few fragments. These were edited by Richter in 1825. Pliny states that the Athenians erected a statue to him.

Ber'rien, a county in S. Georgia. Area, 750 square miles. It is bounded on the E. by the Allapaha, and on the W. by Little River, and is drained by the Withlacoochee. The surface is nearly level; the soil is sandy. Rice, corn, cotton, tobacco, and wool are raised. It is intersected by the Brunswick and Albany R. R. Capital, Nashville. Pop. 4518.

Berrien, a county which forms the S. W. extremity of Michigan. Area, 600 square miles. It is bounded on the W. by Lake Michigan, and intersected by the St. Joseph River, navigable for keel-boats. The surface is undulating and mostly covered with forests. The soil is fertile. The county is intersected by the Michigan Central R. R. It sends large quantities of corn, wheat, wool, timber, and fruit to market. Capital, Berrien Springs. Pop. 35,104.

Berrien, a township of Berrien co., Mich. Pop. 1405.

Berrien (JOHN MCPHERSON), LL.D., a distinguished lawyer and politician, born in New Jersey in 1781. He removed to Georgia, and was elected a Senator of the U. S. in 1824. He was attorney-general under President Jackson in 1829–31, and was again chosen Senator in 1840 and 1846. Died Jan. 1, 1856.

Berrien's Island, in the East River, is a part of Newtown township, Queen's co., N. Y. Area, 12 acres.

Berrien Springs, a post-village, capital of Berrien co., Mich., on the St. Joseph River, about 15 miles from Lake Michigan and 160 miles W. S. W. of Lansing. Pop. 662.

Ber'ry [Anglo-Saxon *beria* or *berga*; Lat. *bac'ca*; Fr. *baie*], a botanical term used to designate a fruit which consists of a pulpy pericarp without valves, containing seeds, which have no covering except the pulp or rind, as the grape, gooseberry, currant, barberry, service-berry, and cranberry. Some of them have the calyx adherent to the ovary and the placenta parietal, as the gooseberry. Others have the ovary free and the placenta in the centre, as the grape. The term berry is popularly applied to several small fruits which are not berries in the scientific sense, as the strawberry, which bears seeds (*achenia*) on the external surface of an enlarged and pulpy receptacle. The orange is a berry with a leathery rind, and is also called a *hesperidium*.

Berry, or **Berri,** a former province of France, near its centre, now forms the departments of Cher and Indre. Capital, Bourges. Berry was erected into a duchy about 1360, after which it was held by many princes of the royal family of France. The last duke of Berry was the younger son of Charles X.

Berry, a township of Dane co., Wis. Pop. 1155.

Berry, or **Berri, de** (CHARLES FERDINAND), DUC, born at Versailles Jan. 24, 1778, was the second son of Charles X. He emigrated with his father in 1793, returned to France in 1814, and married in 1816 Caroline Ferdinande Louise, a daughter of the king of Naples. He was assassinated by Louvel Feb. 14, 1820. He was the father of the count de Chambord (Henry V.), who is recognized by the legitimist party as the heir to the French throne. (See CHATEAUBRIAND, "Mémoires touchant la Vie et la Mort du Duc de Berry," 1820.)

Berry (HIRAM G.), a major-general of U. S. volunteers, born at Rockland, Me., Aug. 27, 1824, killed at the battle of Chancellorsville, Va., May 2, 1863. He was member of the Maine legislature several times, mayor of his native city, and president of Lime Rock Bank. At the first call for troops to suppress the Confederate movement he raised three full companies, and himself entered the service as colonel of the Fourth Maine Volunteers. He was made a brigadier-general Mar. 17, 1862, and major-general Nov. 29, 1862. Killed at the head of his division by a shot while leading a bayonet charge on the morning of May 2, 1863.

G. C. SIMMONS, *Clerk Board of Eng'rs.*

Berryer (ANTOINE PIERRE), a celebrated French orator, lawyer, and legitimist, was born in Paris Jan. 4, 1790. He defended General Cambronne about 1815, gained distinction as an advocate of defendants in political trials, and was elected to the Chamber of Deputies in 1830. After Charles X. had been dethroned (July, 1830), he remained in the Chamber as the orator of the legitimist party, although the other members of that party all retired. He made an eloquent speech against the abolition of hereditary nobility in 1831. During the first years of the reign of Louis Philippe he was regarded as the foremost orator in the Chamber. In 1840 he defended Louis Napoleon, who was tried for his attempt to excite a revolution at Boulogne. He was elected to the Constituent Assembly in 1848, and the Legislative Assembly in 1849. In 1850 he went to Wiesbaden to offer homage to the count de Chambord. He opposed the republic, and protested against the *coup-d'état* of Dec., 1851, after which he retired from political life. In 1852 he was elected a member of the French Academy. Died Nov. 29, 1868. (See LOUIS MARIE DE LA HAYE DE CORMENIN, "Biographie parliamentaire de M. Berryer," 1837.)

Ber'ryhill's, a township of Mecklenburg co., N. C. Pop. 1414.

Ber'ryman, a township of Jo Daviess co., Ill. P. 559.

Ber'ry's, a township of Montgomery co., Md. P. 4700.

Ber'rysburg, a post-borough of Mifflin township, Dauphin co., Pa. Pop. 451.

Berry's Store, a township of Jackson co., Ala. P. 660.

Ber'ryville, a village of Mohawk tp., Montgomery co., N. Y., has a cotton factory, paper-mill, and grist-mill.

Berryville, the capital of Clarke co., Va., is situated 5 miles W. of the Shenandoah River and 10¼ E. of Winchester, and is on the line of the Shenandoah Valley R. R. It contains 6 churches, 1 academy, 1 steam saw and 1 sumac mill, and 1 newspaper. It is often called "Battletown," owing to the many contests of Gen. Morgan of Revolutionary fame. In this vicinity are many scenes of historic interest. Washington, in surveying the lands of this county when it was a part of Frederick, had his head-quarters at a beautiful spring just beyond the town. The small house which he occupied is still standing. Gen. Morgan lived near here. Pop. 580. JOHN O. CROWN, ED. "CLARKE COURIER."

Bersaglie'ri, the Italian name of the riflemen or sharpshooters who served in the army of Victor Emmanuel when he was king of Sardinia. They took part in the Crimean war, 1854–55, and fought against Austria in 1859. They wear a dark-green uniform.

Ber'serker [probably from the Scandinavian *berr-serkr*, "bear (-skin) shirt"], a hero of Scandinavian mythology, who fought without coat-of-mail. He was the grandson of Starkader, and overcame all opponents by his irresistible valor. The name has also been given to a class of warriors who fought naked and performed extraordinary feats under the influence of a kind of demoniac possession, and is perhaps never strictly a proper name.

Berthier, a county of Quebec (Dominion of Canada), has an area estimated at 1200 square miles. It is bounded on the S. E. by the St. Lawrence River. Its capital is Berthier-en-Haut, which is on the St. Lawrence, about 55 miles N. E. of Montreal. Pop. in 1871, 19,804.

Berthier-en-Bas, a post-village of Montgomery co., Ontario, on the St. Lawrence, 24 miles S. W. of Quebec.

Berthier-en-Haut, a post-village, capital of Berthier co., Quebec, on the left bank of the St. Lawrence, 55 miles N. E. of Montreal. It has extensive manufactures of leather and a good trade. It has also several saline chalybeate springs, and is in a fertile district. Pop. about 1700.

Berthier (LOUIS ALEXANDRE), prince of Wagram, a French general, born at Versailles Nov. 20, 1753. He served as captain under La Fayette in the U. S. 1778–82. In 1796 he became general of division, and chief of the staff of Bonaparte's army of Italy. He gained the confidence of the general-in-chief, retained for many years the position of chief of the staff, and accompanied Bonaparte to Egypt in 1798. About the end of 1799 he was appointed minister of war. He became a marshal of France in 1804, and rendered important services in the campaign against Austria, 1805. He usually rode in the carriage of Napoleon, whose plans he digested, and whose orders he despatched with remarkable rapidity and precision. He was admirably fitted for the duties of a staff officer by his strong constitution, his methodical habits, and his excellent memory, but he was not so competent to command an army. For his conduct at the battle of Wagram (1809) he received the title of prince of Wagram. He entered the service of Louis XVIII. in 1814, but when Napoleon returned from Elba, Berthier preferred neutrality and retired to Bamberg, where he was killed by a fall from a window Jan. 1, 1815. He left autobiographic "Mémoires d'A. Berthier," 1826.

Berthierite, or **Hardingerite,** a steel-gray, bronzy mineral containing $FeS + Sb_2S_3$.

Berthollet (CLAUDE LOUIS), M. D., COUNT, a French chemist, born in Savoy Nov. 9, 1748. He discovered the composition of ammonia, and invented the process of bleaching by chlorine, that of filtration through charcoal, and several fulminating powders. He published a valuable work, "The Elements of the Art of Dyeing" (1790), and "Essai de statique chimique" (2 vols., 1803). He was associated with Lavoisier in forming a new chemical nomenclature, and was one of the chief originators of modern chemistry. Died Nov. 6, 1822. (See CUVIER, "Éloge de Berthollet," 1824.)

Bertholle'tia, a genus of trees of the order Lecythidaceæ. The *Bertholletia excelsa*, a large South American tree, produces a hard-shelled fruit (about six inches in diameter), enclosing numerous elongated and triangular edible seeds, which are called Brazil nuts. Large quantities of them are exported from Pará.

Ber'tie, a county of North Carolina, having the Chowan River on the E. and the Roanoke on the S. Area, about 900 square miles. It contains extensive pine forests; its soil is quite level and fertile. Cotton and corn are the staple crops. Capital, Windsor. Pop. 12,950.

Bertin (LOUIS FRANÇOIS), called **Bertin l'Aîné,** a French journalist, was born in Paris Dec. 14, 1766. He founded in 1800, together with his brother (LOUIS FRANÇOIS, surnamed DE VEAUX), the daily "Journal des Débats," a literary and political journal, which obtained great influence and success. He was hostile to Napoleon, who banished him. Bertin revived his journal in 1814, and continued to edit it until his death, Sept. 13, 1841.—His son (LOUIS MARIE ARMAND), born Aug. 22, 1801, succeeded him as editor. Died Jan. 12, 1854.

Bertino'ro, a town in Central Italy, province of Forlì, on a mountain 7 miles S. E. of Forlì. It is the seat of a bishop. Pop. 6014.

Ber'tram, a post-township of Linn co., Ia. Pop. 827.

Ber'trand, a post-township of Berrien co., Mich. Pop. 1522.

Bertrand, de (HENRI GRATIEN), COUNT, a French general, was born at Châteauroux Mar. 28, 1773. He followed Napoleon to St. Helena in 1815. He died Jan. 31, 1844, leaving "Memoirs of the Campaigns of Egypt and Syria, dictated by Napoleon at St. Helena" (2 vols., 1847).

Ber'wick, a post-village of Cornwallis township, Kings co., Nova Scotia, on the Windsor and Annapolis Railway, 47 miles E. N. E. of Annapolis. It has manufactures of boots and shoes. Pop. about 350.

Berwick, a post-township of Warren co., Ill. P. 1066.

Berwick, a post-township of York co., Me. Pop. 2291. It has manufactures of lumber, shoes, carriages, doors, etc.

Berwick, a post-village in Seneca township, Seneca co., O., on the Cincinnati Sandusky and Cleveland R. R., 43 miles S. W. of Sandusky. Pop. 188.

Berwick, a borough and township of Adams co., Pa., 28 miles S. S. W. of Harrisburg. Pop. of township, 507; of borough, 325.

Berwick, a post-borough of Columbia co., Pa., on the North Branch of the Susquehanna and on the Lackawanna and Bloomsburg R. R., 28 miles S. W. of Wilkesbarre. It has a newspaper, one national bank, a car-shop, foundry, machine-shop, rolling-mill, and an academy. Pop. 923.
D. MORRIS KURTZ, ED. "INDEPENDENT."

Berwick (JAMES FITZ-JAMES), DUKE OF, an able general, a natural son of James II. of England and Arabella Churchill, was born in France Aug. 21, 1670. He had a high command in his father's army in Ireland in 1690, soon after which he entered the French service. He obtained the command of the French army in Spain in 1704, was created a marshal of France in 1706, and gained a decisive victory over the English and their allies at Almanza in 1707. Philip V. rewarded him with the title of duke of Liria and Xerica. He was killed at the siege of Philipsburg June 12, 1734. (See his own "Mémoires," published by his son in 2 vols., Paris, 1778.)

Berwick-on-Tweed, often called simply **Berwick,** a fortified seaport-town of England, in Northumberland, on the left (N.) bank of the Tweed, at its entrance into the North Sea, 58 miles by rail E. S. E. of Edinburgh; lat. 55° 46′ N., lon. 1° 59′ W. The river is here crossed by an old stone bridge of fifteen arches, 924 feet long, and by a magnificent viaduct, over which the trains of the North British Railway pass. It is crossed by the North-eastern, the Midland, and the Great Northern Railways. It has a Gothic church, a theatre, a public library, a town-hall, also large manufactures of steam-engines, mill-machinery, etc. Coal-mines are worked in the vicinity. Pop. in 1871, 13,231. The history of Berwick is full of interest. It was one of the chief seaports of Scotland in the Middle Ages, and in the border wars was often taken and retaken by the English and Scotch, who regarded it as an important military position. It was finally ceded to England in 1502, and became by treaty a free town, independent of both states. These privileges were confirmed on the accession of James I. to the English throne. Down to the time of George II. it was customary in Parliamentary statutes to mention specifically their application to "Berwick-on-the-Tweed."

Ber'wickshire, a county of Scotland, forming its S. E. extremity, is bounded on the N. by Haddington, on the N. E. by the German Ocean, and on the S. E. by the river Tweed, which separates it from England, on the S. by Roxburgh, and on the W. by Edinburgh. Area, 473 square miles. It is drained by the Blackadder, the Whiteadder, and the Eye. The surface is partly hilly in the northern part, occupied by the Lammermuir Hills. The Merse district in the S. part, and near the Tweed, is nearly level, and is one of the most fertile and well-cultivated tracts in the island. Carboniferous limestone, porphyry, and old red sandstone occur here. Capital, Greenlaw. Pop. in 1871, 36,474.

Ber'yl [Gr. βήρυλλος; Lat. *beryl'lus*], a mineral which occurs in the form of six-sided prisms, which are generally blue, yellow, or green, but are sometimes colorless. Those which display clear tints of sky-blue or sea-green are called *aquamarine* by jewellers. The deep green crystals constitute EMERALDS (which see). The sides of the prisms are often longitudinally striated, but the terminating or truncating planes are smooth. The beryl is one of the few minerals that contain *glucina*. It consists of 67 per cent. of silica, 19 of alumina, and 14 of glucina. Gigantic crystals of beryl are found at Acworth and Grafton in New Hampshire. One specimen found at Grafton was four feet long, and weighed more than 2500 pounds. Beryls of fine quality occur in Brazil, Siberia, and several parts of Europe. Emeralds are obtained from Peru, Siberia, and Upper Egypt. (See GEMS, by PROF. H. B. CORNWALL, E. M.)

Be'ryx, a genus of fishes of the family Percidæ, of which few species are living in the present seas, while a large number are found fossil. It begins with the first of the teleosts in the chalk. Three species are found in the chalk of England, and several in the tertiary, especially in the fish-beds of Monte Bolca, near Verona in Italy. This is therefore one of the oldest genera of living fishes.

Berze'lius (JOHAN JACOB), M. D., F. R. S., BARON, a distinguished Swedish chemist, was born in East Gothland, Aug. 20, 1779. He studied medicine and chemistry at the University of Upsal, and published in 1806 a "Treatise on Animal Chemistry" (2 vols.). He acquired great excellence as an analyst, and made important discoveries in chemistry. He was the author of the system of chemical symbols, and he discovered the elements selenium and thorium. His most important work is a "System of Chemistry" ("Lärebok i Kemien," 3 vols., 1808–18), which was translated into every European language. He was professor of medicine and pharmacy at Stockholm 1807–32. He contributed forty-seven articles to the "Memoirs of Physics, Chemistry, and Mineralogy" (6 vols., 1806–18), a work founded by Berzelius and Hisinger. Died Aug. 7, 1848. (See G. FORCHHAMMER, "J. J. Berzelius," 1849.)

Besançon (anc. *Vesontio*), a city of France, capital of the department of Doubs, on the river Doubs, 58 miles by rail E. of Dijon. It is connected with Paris and Lyons by several railways, is well built and strongly fortified, having a citadel which is considered impregnable. It was formerly the capital of Franche-Comté. The most remarkable edifices are a Gothic cathedral, a town-hall, a theatre, the palace of Cardinal Granvelle, and the prefecture. It has also a college, a public library, a museum, an academy of sciences and arts, and extensive manufactures of watches, jewelry, porcelain, carpets, etc. *Vesontio* was an important town in the time of Cæsar, who in 58 B. C. expelled the Sequani from it. Here are many Roman antiquities, and the remains of an amphitheatre and aqueduct. P. 46,961.

Bessara'bia, a province in the S. W. part of Russia, is bounded on the N. by Podolia, on the E. by Podolia, Cherson, and the Black Sea, on the S. by Moldavia, and on the W. by Moldavia and Bukovina. Area, 14,014 square miles. By the treaty of Paris (1856) part of Bessarabia adjacent to the Black Sea was ceded to Turkey. The surface is mostly low and flat; the soil is fertile, producing wheat, barley, maize, tobacco, etc. The chief articles of export are cattle, wool, tallow, and salt. The greater part of the land is in pasturage. The population is composed of Russians, Germans, Bulgarians, Moldavians, Greeks, Jews, Poles, etc. Capital, Kishinef. Pop. in 1867, 1,052,013.

Bessa'rion (JOHN), a learned Greek cardinal, born at Trebizond in 1395, was a disciple of Plato in philosophy. He favored the union of the Latin and Greek churches. He was appointed a cardinal by Pope Eugenius IV., and received in 1463 the title of patriarch of Constantinople. He wrote several works, translated the metaphysics of Aristotle into Latin, and was an efficient promoter of Greek learning. Died Nov. 19, 1472. (See A. BANDINI, "De Vita et Rebus gestis Bessarionis Cardinalis," 1777; AUBÉRY, "Histoire des Cardinaux.")

Bess'borough, EARLS OF (1739), Viscounts Duncannon (1723), barons of Bessborough (1723, in Ireland), Barons Ponsonby (1749, in Great Britain), Barons Duncannon (1834, in the United Kingdom), a prominent family of Great Britain.—JOHN GEORGE BRABAZON PONSONBY, the fifth earl, born Oct. 14, 1809, succeeded his father in 1847. He was member of Parliament for Bletchingley in 1831, for Higham Ferrers in 1831, and for Derby 1834–37.

Bes'sel (FRIEDRICH WILHELM), an eminent German astronomer, born at Minden July 22, 1784. He became assistant to Schröter at Lilienthal in 1806, and was appointed in 1810 director of a new observatory at Königsberg. In 1818 he published "Fundamenta Astronomiæ," an important and capital work, on which he had expended the labor of many years. After three years' observations he determined in 1840 the annual parallax of the star 61 Cygni, and published the result in his "Measure of the Distance of the Star 61 Cygni, etc." (1839). Having made a series of 75,011 observations, he formed a catalogue of stars within the zone from 15° N. to 15° S. declination, containing all stars to the ninth order. Among his works are "Astronomical Observations" (1841–42) and "Popular Lectures on Astronomy" (1848). Died Mar. 14, 1846. (See C. T. ANGER, "Erinnerung an F. W. Bessels Leben und Wirken," 1846.)

Bes'semer (HENRY), an English inventor of Breton descent, was born in Hertfordshire in 1818. He made various improvements in machinery, but is chiefly known as the inventor of the Bessemer process of refining steel—a process now largely employed in Europe and America. This invention has made Mr. Bessemer a very wealthy man.

Bessemer's Process for Refining Iron. See IRON, by J. B. PEARSE.

Bessières (JEAN BAPTISTE), duke of Istria, a French marshal, born near Cahors (Lot) Aug. 5, 1768. He entered the army as a private in 1792, served with distinction in Italy and Egypt, became a general of division in 1802, and marshal of France in 1804. He rendered important services at Austerlitz, Jena, Friedland, and Eylau. Having obtained in 1808 command of an army in Spain, he gained a victory at Medina del Rio Seco. He had the chief command of the cavalry of the grand army in 1813, and was killed on the day before the battle of Lützen, May 1, 1813. (See MIRAMONT, "Vie de J. B. Bessières;" "Victoires et Conquêtes des Français.")

Betan'zos (anc. *Fla'vium Brigan'tium*), a town of Spain, in the province of Corunna, is 12 miles S. E. of Corunna. It is said to be the oldest town in Galicia, and has remains of ancient fortifications. Here are manufactures of linen, leather, and pottery. Pop. 5832.

Be'tel, or **Pawn,** a narcotic stimulant extensively used as a masticatory by Oriental peoples, especially by tribes of the Malay race. It consists of a portion of the nut of the *Areca Catechu* (called betel-nut or *pinang*), rolled up with lime in the leaf of the *Piper Betel* or other species of pepper. The leaf is plucked green, and is smeared with moistened quicklime before the slice of areca-nut is wrapped in it. This mixture is chewed continually by men, women, and children, and the use of it is so general that a Malay presents his betel-box as a European offers his snuff-box. This practice appears to be very ancient, having prevailed before the Christian era. The betel causes giddiness in those who are not accustomed to chew it. The habitual use of it blackens the teeth, and perhaps destroys them. According to Sir James E. Tennent, the betel is beneficial, acting as a tonic, antacid, and carminative.

Beth, a Hebrew noun, meaning "house" or "habitation," employed some fifty times in the Scriptures as a prefix in naming places, such as Bethel, Bethlehem, and Bethany.

Bethab'ara, a place beyond the Jordan where John baptized (John i. 28), though some of the best manuscripts have Bethany.

Betha'nia, a post-township of Forsyth co., N. C. Pop. 1162.

Beth'any [Heb. "house of dates;" Gr. Βηθανία; Arab. *El-Azizeh* or *Lazarieh*], a village of Palestine, on the E. slope of the Mount of Olives, nearly 2 miles (15 stadia) E. of Jerusalem. As the home of Mary, Martha, and Lazarus, it was the scene of interesting events in sacred history. (See Matthew xxi. 17; xxvi. 6; John xi. and xii.; Luke xix. 29.) From some point near the village Christ ascended into heaven. (Luke xxiv. 50.) Here is a cave or excavation in a rock, which, according to a worthless tradition, is the grave of Lazarus. The descent into it is effected by twenty-six steps cut into the solid rock. The modern village contains about twenty families.

Bethany, a post-village of Manvers township, Durham co., Ontario, Canada, on the Midland Railway, 24 miles N. W. by N. of Port Hope. It has three churches and one weekly paper.

Bethany, a post-township of New Haven co., Conn. Pop. 1135.

Bethany, a post-township of Genesee co., N. Y. Pop. 1652.

Bethany, a township of Iredell co., N. C. Pop. 506.

Bethany, a township of Gratiot co., Mich. Pop. 1462.

Bethany, a post-village, capital of Harrison co., Mo., 62 miles N. E. of St. Joseph, 20 miles S. of the Iowa line,

has a good trade, and two weekly newspapers. Pop. of township, 2460. ED. OF "WATCHMAN."

Bethany, a post-village of Dyberry township, Wayne co., Pa. Pop. 202.

Bethany, a post-village of Brooke co., West Va., on Buffalo Creek, 7 miles from the Ohio River and 16 miles N. E. of Wheeling. It is situated in a beautiful and fertile region. It is the seat of Bethany College, established in 1841 by Alexander Campbell, the founder of the sect of "Disciples."

Beth'el [Arab. *Beitin* or *Beiteen*], an ancient town of Palestine, noted as the scene of the dream of the patriarch Jacob, was 10 or 12 miles N. of Jerusalem. It was near the boundary between Judea and Samaria. Here are ruins of ancient churches and other edifices.

Bethel, a village and township of Wilcox co., Ala., on the Alabama River, 50 miles S. W. of Selma. Pop. of the township, 2456.

Bethel, a borough of Fairfield co., Conn., on the Danbury and Norwalk R. R., 3 miles E. S. E. of Danbury and 25 miles W. N. W. of New Haven. It has manufactures of hats. Pop. of township, 2311.

Bethel, a township of McDonough co., Ill. Pop. 1040.

Bethel, a post-township of Morgan co., Ill. Pop. 1468.

Bethel, a township of Posey co., Ind. Pop. 581.

Bethel, a post-village and township of Oxford co., Me., on the Grand Trunk Railway, 70 miles N. N. W. of Portland. It has an academy, five churches, and manufactures of lumber, carriages, furniture, boxes, woollen goods, starch, etc. The scenery is here very fine. Pop. of the township, 2286.

Bethel, a post-township of Branch co., Mich. P. 1511.

Bethel, a post-township of Anoka co., Minn. Pop. 216.

Bethel, a small post-village of Shelby co., Mo., about 40 miles W. N. W. of Hannibal. It was settled about 1842 by a community of Germans, who built several mills and a glove-factory. Pop. of the township, 1224.

Bethel, a post-village and township of Sullivan co., N. Y., 39 miles N. W. of Goshen. It has manufactures of leather and lumber. Pop. of the township, 2737.

Bethel, a township of Cabarrus co., N. C. It is noted for its fine scenery. Pop. 1095.

Bethel, a township of Perquimans co., N. C. Pop. 1128.

Bethel, a township of Clark co., O. Pop. 3086.

Bethel, a post-village of Tate township, Clermont co., O. Pop. 634.

Bethel, a township of Miami co., O. Pop. 1801.

Bethel, a township of Monroe co., O. Pop. 1284.

Bethel, a post-township of Berks co., Pa. Pop. 2285.

Bethel, a township of Delaware co., Pa. Pop. 554.

Bethel, a township of Fulton co., Pa. Pop. 861.

Bethel, a township of Lebanon co., Pa. Pop. 2272.

Bethel, a township of York co., S. C. Pop. 2330.

Bethel, a township of Windsor co., Vt., has two post-offices, East Bethel and Bethel. It is on the Vermont Central R. R., 25 miles N. W. of White River Junction and 40 miles S. of Montpelier. It has manufactures of shoe-pegs, lumber, leather, etc., a national bank, one weekly newspaper, and seven churches. Pop. 1817.
ED. "WHITE RIVER STANDARD."

Bethel, a township of Pendleton co., West Va. P. 714.

Bethel College, in McKenzie, Tenn. This institution of learning was founded, with a liberal charter, in 1850. Its career of usefulness met the most sanguine expectations of its ardent friends. In an incredibly short time fine libraries of well-selected books were collected, an excellent apparatus was obtained, and praiseworthy efforts made by the board of trustees to secure a liberal endowment. The very moderate charges, as at present, have ever made it eminently the school of the people. The war of the States in 1861–65 closed its doors, and left its denuded walls all seathed and scarred, the endowment lost, libraries scattered, the apparatus destroyed, and its friends wasted and greatly disheartened. But since the dark clouds of despondency have partially passed away the reorganization of the college has been consummated. To secure better accessibility, the college has been moved from McLemoresville to McKenzie, Tenn. Her doors are again open, and she comes forward to resume her position among colleges, that she may bear her part in the education and elevation of the youth of our common country. A liberal patronage has been given since the reorganization. Successful efforts for endowment are being made, the refilling of the cases with valuable libraries has been undertaken with encouragement, and the furnishing of suitable apparatus is progressing. Thus dark hours are yielding to a brighter dawning. The college is under the control of the Synod of West Tennessee of the Cumberland Presbyterian Church. A liberal Christianity and a high standard of moral character are inculcated, yet no peculiar sectarian or political principles are allowed in the literary department. Candidates for the ministry of all denominations receive tuition free of charge. "Church schools differ from the schools of secular learning as differs the cold statue from the living man." Bethel College admits both sexes to her highest honors. The course of study is as thorough as that of any college of the country, and of an eminently practical character. This institution has had her bright as well as her dark hours. Many of the most useful in all the professions found in various parts of the country have obtained their education in this college. There have been many of the most powerful revivals of religion connected with its history. Her presidents have been in the following order: Rev. J. N. Roach, Rev. C. J. Bradley, Rev. A. Freeman, D. D., Rev. Felix Johnson, D. D., Rev. B. W. McDonnald, D. D., LL.D., Rev. J. S. Howard, A. M., Rev. M. Liles, A. M., Rev. W. W. Hendrix. McKenzie is in Carroll county, at the junction of the Nashville and North-western and Memphis Clarksville and Louisville R. Rs.
W. W. HENDRIX.

Bethes'da [Heb. "house of mercy" or "place of the flowing of water"], a pool or tank at Jerusalem where the lame man was miraculously healed (John v. 1–9). Some identify it with Birket Israil, a large reservoir inside the city walls, near St. Stephen's Gate; others with the Fountain of the Virgin (intermittent), about 300 yards S. of the Temple area; and others with the Pool of Siloam, about 300 yards farther S.

Bethesda, a township of York co., S. C. Pop. 2997.

Be'thia, a township of Marion co., S. C. Pop. 767.

Beth'lehem [Heb. *Beth lehem*, the "house of bread," so called from its fertile soil], a town frequently mentioned in both the Old and New Testaments, and especially distinguished as the birthplace of our Saviour, as well as of his ancestor, King David. Anciently it was called "Bethlehem Judah," to distinguish it from another Bethlehem in the northern part of Palestine (Josh. xix. 15). It is mentioned as existing in the time of Jacob, but was probably never very large or commercially important. It has at present about 3000 inhabitants, all Christians. The principal trade of the place is in crosses, beads, and relics. Here are Greek, Latin, and Armenian convents; and the monks show a cave which they claim to have been the stable where our Lord was born. (See ROBINSON'S "Biblical Researches;" HACKETT'S "Illustrations of Scripture;" RITTER'S "Geography of Palestine.")

Bethlehem, a township of Cass co., Ind. Pop. 993.

Bethlehem, a post-township of Clarke co., Ind. P. 763.

Bethlehem, a post-township of Grafton co., N. H., on the White Mountain R. R., 5 miles from Littleton. It has manufactures of lumber and starch. Pop. 998.

Bethlehem, a post-village and township of Hunterdon co., N. J., on the New Jersey Central R. R., 37 miles N. N. W. of Trenton. Pop. of the township, 2211.

Bethlehem, a post-township of Albany co., N. Y. Pop. 6950.

Bethlehem, a township of Coshocton co., O. P. 850.

Bethlehem, a village and township of Stark co., O., 58 miles S. S. E. of Cleveland. Pop. of township, 2148.

Bethlehem, a township and borough of Northampton co., Pa., on the left bank of the Lehigh River, and on the Lehigh Valley and Lehigh and Susquehanna R. Rs., 51 miles N. of Philadelphia and 5 miles E. of Allentown. It is the northern terminus of the North Pennsylvania R. R., and is pleasantly situated on the slopes of several hills. A bridge across the river connects it with South Bethlehem, the seat of Lehigh University, founded by Asa Packer in 1865, and richly endowed, having a fine stone edifice on a high and commanding position. Bethlehem was founded in 1741 by the Moravians, who have here a large stone church 142 feet long, a theological seminary, an ancient chapel, and several benevolent institutions. There are also a school for boys and a seminary for ladies, three newspapers, two national banks, one savings bank, and another banking-house. There are a large number of manufactories, chiefly in South Bethlehem, including the Lehigh Shovel-Works, several foundries, the Bethlehem Iron Company's rolling-mills, machine-shops, etc.—one of the largest establishments of the kind in the U. S.; Lehigh Zinc Company's rolling-mill, zinc, oxide, and spelter works; Lehigh Brass-Works, gas-works in both boroughs, etc. Pop. of Bethlehem township, 2230; of Bethlehem borough, 4512; of South Bethlehem borough, 3556.
D. J. GODSHALK, ED. "DAILY TIMES."

Beth'lehemites, an order of monks established at Cambridge, England, in 1257; also an order of monks and nuns founded at Guatemala about 1665. They are found in Central and South America and the Canary Islands.

Bethlem, a post-township of Litchfield co., Conn. Pop. 750.

Beth'mann-Holl'weg (Moritz August), a German jurist and statesman, born at Frankfort-on-the-Main April 8, 1795. He was professor of civil law at Berlin, and subsequently at Bonn, and was Prussian minister of public instruction from 1858 to 1862. He published several valuable legal works.

Beth'phage, a locality in Palestine, near Jerusalem, appears to have been on or near the Mount of Olives. The name occurs in Luke xix. 29 and Matthew xxi. 1. Its site has not been exactly ascertained.

Bethsa'ida [Heb. "house of fish"], an ancient town in Palestine, on the W. shore of the Lake of Galilee, the home of Andrew, Peter, and Philip (John i. 44). Dr. Robinson identifies it with Ain-et-Tabigbah, in a little bay or cove between Khan Minyeh (Capernaum?) and Tell Hum (Chorazin?). Another Bethsaida, afterwards called *Julias*, was situated near the head of the lake, on the E. side of the Jordan, about 2 miles from its mouth. It was near this Bethsaida that Christ fed the 5000. (Luke ix. 10–17.)

Beth'shemesh [Heb. "house of the sun"], the name of four places mentioned in the Scriptures, the most important of which was a sacerdotal city of Judah, about 15 miles W. S. W. of Jerusalem, and about 2 miles from the great Philistine plain. It was here the ark rested on its way home from Ekron (7 miles). It was here that Amaziah, king of Judah, was worsted and taken prisoner by Jehoash, king of Israel (2 Kings xiv. 11–13). In the reign of Ahaz it was captured by the Philistines (2 Chron. xxviii. 18), and is not again mentioned in sacred history. It stood on a low ridge. Only ruins now mark the spot, which bears the name of *Ain-Shems* ("fountain of the sun"). The greater part of Samson's exploits were in its immediate neighborhood.

Béthune, a fortified town of France, in the department of Pas de Calais, near the river Lave and the Canal of Aire, 23 miles by rail N. N. W. of Arras. It has a fine castle, a college, and a Gothic church; also manufactures of oil, soap, and woollen goods. It was taken from the Spaniards in 1645, retaken by Prince Eugène in 1710, and restored to France in 1713. Pop. 8178.

Bethune (George Washington), D. D., an American divine and poet, was born in the city of New York in 1805. He graduated at Dickinson College in 1822, and at the Princeton Theological Seminary in 1825. In 1828 he became pastor of a Dutch Reformed church in Rhinebeck, N. Y. He was afterwards settled in Utica, and still later in Philadelphia. In 1849 he removed to Brooklyn, N. Y. In 1861 he went to Europe for the benefit of his health, but died at Florence April 28, 1862. Dr. Bethune was distinguished for his fine taste, his varied culture, and his love of nature. Besides several literary and religious works, he published "A Commentary on the 130th Psalm" (1847), "Lectures on the Heidelberg Catechism" (1864), "Lays of Love and Faith" (1847). (See his life by Dr. Van Nest, New York, 1867.)

Beton. See Brick, Cement, and Stone, Artificial, by Gen. Q. A. Gillmore, U. S. Army.

Bet'terton (Thomas), a popular English actor, born in London in Aug., 1635. He performed with great success the parts of Hamlet, Macbeth, and Othello. He was the chief ornament of the English stage for nearly fifty years. His wife was a popular actress. He died April 28, 1710. (See Charles Gildon, "Life of T. Betterton," 1710.)

Bet'ting, or Wa'gering, a vicious practice which prevails more or less in all countries. The English are addicted to betting on horse-races to a ruinous extent. The British Parliament passed an act, 16 and 17 Vict. c. 119, to suppress the haunts of betters, called betting-houses, which it declares to be a common nuisance and contrary to law. But it provides that its enactments shall not extend to stakes or deposits due to the winner of any race or lawful sport. The laws of the U. S. prohibit betting on elections.

Betts (Samuel Rossiter), LL.D., one of the ablest of American jurists, was born at Richmond, Mass., June 8, 1787, and graduated at Williams College in 1806, practised law in Sullivan co., N. Y., served in the war of 1812, became judge advocate, and was a member of Congress (1815–17). He was a judge of the circuit court for the State (1823–26), and U. S. district judge (1826–67). Died Nov. 2, 1868. He published a treatise on "Admiralty Practice" (1838).

Bett's, a township of Sanford co., Ala. Pop. 1048.

Beudant (François Sulpice), an eminent French mineralogist, born in Paris Sept. 5, 1787, became professor of mineralogy in Paris in 1820. Among his writings is an "Elementary Treatise on Mineralogy" (2d ed. 1830). Died Dec. 9, 1850.

Beugnot, de (Arthur Auguste), Comte, a French writer and liberal statesman, was born at Bar-sur-Aube in 1797. He wrote an "Essay on the Institutions of Saint Louis" (Paris, 8vo, 1821), "The Jews of the West" (Paris, 8vo, 1824), and a "History of the Destruction of Paganism in the West" (2 vols., 1835). He became a peer of France in 1841. As a member of the Legislative Assembly of 1849 he promoted freedom in public instruction. Died in 1865.

Beu'lah, a township of Lee co., Ala. Pop. 1299.

Beulah, a village of Bolivar co., Miss., on the Mississippi River, 110 miles N. of Vicksburg.

Beulah, a post-township of Johnston co., N. C. Pop. 1105.

Beulé (Charles Ernest), a French archæologist, born June 29, 1826, took part in 1849–53 in the excavations of the Acropolis in Athens, and became in 1854 professor of archæology in the Imperial Library in Paris. He wrote, among other works, "L'Acropole d'Athènes" (2 vols., 1854), "Études sur le Peloponnèse" (1855), "Fouilles de Carthage" (the results of his excavations in Carthage in 1858), and "Auguste, sa Famille," etc. (1867). Died in 1874.

Beur'mann, von (Karl Moritz), a celebrated German explorer, was born in 1835. In 1860 he attempted to explore the country of the Bogos, but did not succeed in reaching it until Mar., 1861. In Dec., 1861, he was engaged to look for Vogel, who, it was supposed, had been murdered in Wadaï. Beurmann was to start from Tripoli, while at the same time Heuglin should attempt to reach Wadaï from Abyssinia. He reached Kuka in Bornu in Aug., 1862. As it was impossible to reach Wadaï at that time, he made a trip to Jacoba in Bautchi, from which he returned to Kuka Dec. 13. Soon after he attempted the voyage to Wadaï, and having succeeded in reaching Wadaï after several futile attempts, he was murdered in Feb., 1863, in Moa, in the most W. province of Wadaï, by the command of the governor.

Beusa'lem, a township of Moore co., N. C. Pop. 1032.

Beust, von (Friedrich Ferdinand), Count, an able German statesman, born at Dresden June 13, 1809. He was appointed minister of foreign affairs in Saxony in 1849. In Oct., 1866, he became minister of foreign affairs and prime minister of the Austrian empire. He received the additional title of chancellor of the empire in June, 1867, when Austria was apparently on the verge of ruin. He urged the emperor to adopt a liberal policy, and he effected important reforms which promoted civil and religious liberty. He insisted on the abolition of the concordat with the pope, and induced Francis Joseph to enter into friendly relations with the king of Prussia and emperor of united Germany. Never since the time of Metternich was the foreign policy of Austria so wisely directed as it was by Von Beust. He resigned in Nov., 1871, for reasons (as he announced) not political, but purely personal. He was then sent as ambassador to London.

Beu'then, a town of Prussia, in Silesia, 50 miles E. S. E. of Oppeln, has manufactures of woollen cloth, zinc-ware, and pottery. Pop. in 1871, 17,946.

Bev'el [Fr. *beveau* or *buveau*], an instrument used by masons and carpenters to take or measure angles. It is movable on a point or centre, and may be set to any angle. The term also denotes a slant or inclination of a surface which is not at right angles with the adjacent surface; a sloped or canted surface. It is nearly synonymous with splay.

Bevel Gear, or Bevelled Gear, in mechanics, a species of wheelwork in which the axes of two wheels working into each other are neither parallel nor perpendicular, but inclined to each other at a certain angle. Some wheels are also called conical wheels.

Beveren, a town of Belgium, in the province of East Flanders, 7 miles by rail W. of Antwerp. It has factories of laces, woollen, linen, and cotton goods. Pop. in 1866, 7151.

Bev'eridge (William), an English Orientalist and bishop, born at Barrow, in Leicestershire, in 1638. He was a man of great learning and of profoundly religious character. He published a "Treatise on Chronology" (1669), a work "On the Canons of the Greek Church" (1672), and several devotional treatises. In 1704 he was appointed bishop of St. Asaph. Died in 1708. (See Thomas H.

Horne, "Memoir of Bishop Beveridge," prefixed to an edition of his works, 9 vols. 8vo, 1824.)

Bev'erland (Adriaan), a Dutch classical scholar and heterodox writer, born at Middelburg about 1651, was a friend of Isaac Vossius. He wrote "Peccatum Originale" ("Original Sin," 1678), and other works which were censured for impiety. He was banished from Utrecht, and removed to England, where he died insane in 1712.

Bev'erley, a market-town of England, in Yorkshire, 1 mile W. of the river Hull, and 10 miles N. N. W. of the city of Hull. It is the chief town of the East Riding of Yorkshire, and is handsomely built. The origin of the name is said to be *Beverlac*, a "lake or dam of beavers." It has an ancient and beautiful Gothic minster, called the church of St. John, which exhibits several styles of Gothic architecture, and ranks next to York Minster among the ecclesiastical structures of England. The oldest part of this was erected in the thirteenth century. A priory was founded here about 700 A. D. Beverley has an active trade in corn, coals, and leather, and is on the railway from Hull to York. Pop. in 1871, 10,218.

Bev'erly, a post-township of Adams co., Ill. P. 1173.

Beverly, a thriving post-village of Essex co., Mass., is on a small inlet of the ocean, and on the Eastern R. R., 2 miles N. N. E. of Salem and 18 miles N. N. E. of Boston. A bridge across the inlet connects it with Salem. It derives its prosperity chiefly from commerce and fisheries, and has a national bank and manufactures of shoes, carriages, cotton and woollen goods. It has one weekly newspaper, ten churches, and an insurance company. Pop. of Beverly township, 6507.

Beverly, a city of Burlington co., N. J., on the Delaware River and the Camden and Amboy R. R., 15 miles above Philadelphia. It has five churches, a woollen mill, an oil-cloth factory, a very extensive ropewalk, and one weekly paper. It is a place of summer resort. Pop. 1418; of Beverly township, 2438. Geo. F. Clarke, Pub. "Visitor."

Beverly, a post-village, capital of Randolph co., West Va., is on the Tygart's Valley River, about 100 miles S. S. E. of Wheeling. Pop. of Beverly township, 847.

Beverly, a post-village of Washington co., O., on the Muskingum River, 20 miles above Marietta. It has a national bank. Pop. 814.

Beverly Manor, a township of Augusta co., Va. The town of Staunton is in this township. Pop. 8071.

Bevier', a post-village of Macon co., Mo., on the Hannibal and St. Joseph R. R., 5 miles W. of Macon City. Pop. 833; of Bevier township, 1531.

Bewd'ley (formerly **Beaulieu,** *i. e.* "fair place," so called from its situation), a market-town of England, in Worcestershire, on the river Severn, 14 miles N. N. W. of Worcester. It is pleasantly situated and neatly built, and has manufactures of combs, carpets, brass-ware, and leather. Pop. in 1871, 3018.

Bew'ick (Thomas), a celebrated English engraver, born near Newcastle-on-Tyne Aug. 12, 1753, was a pupil of Beilby. He was the founder of the modern English school of wood-engraving, and none of his numerous pupils have excelled him. He illustrated Gay's "Fables," 1779. Beilby and Bewick published in 1790 a "History of British Quadrupeds," with engravings, which procured for Bewick a high reputation. He was assisted by his brother John in the designs of Goldsmith's "Traveller" and "Deserted Village." Among his best works is a "History of British Birds" (2 vols., 1804). Died Nov. 8, 1828.

Bexar [Sp. pron. bà-har'], a county in the S. of Texas. Area, 1456 square miles. It is intersected by the Medina River, and bounded on the N. E. by the Cibolo, and also drained by Salada Creek. The soil is generally fertile, adapted to maize, cotton, wheat, and pasturage. Capital, San Antonio. Pop. 16,043.

Bexar Territory, an extensive portion of Western Texas, having an area of not less than 25,000 square miles. It has few inhabitants except Indians. The N. W. portion is an outlying part of the Llano Estacado, or "Staked Plain," a region having little wood, a few springs and "water-holes," some of them salt, and a very few insignificant streams and lakes. The Rio Pecos extends along the western border. In the E. central portion there are quite a number of streams, chiefly tributaries of the Colorado. The S. central part has an extensive table-land. Much of the region is mountainous and rocky. It has some cedar timber. The chief settlement is at Fort Concho. Its Indians are hostile and intractable. Pop. 1077.

Bey, or **Beg,** a title of the Turkish empire signifying "lord." The ruling officers of Tripoli and Tunis are beys; and the same title is given to some local magistrates, to colonels and generals of the army, and to the sons of pashas. In other cases it is a merely honorary title.

Beyle (Marie Henri), a French *littérateur*, who wrote under the assumed name of Stendhal, was born at Grenoble Jan. 23, 1783. He held several high civil offices under Napoleon. Among his chief works are a "History of Painting in Italy" (2 vols., 1817), "Le Rouge et le Noir," a novel, a "Life of Rossini" (1824), "Memoirs of a Tourist" (1838), "Rome, Naples, and Florence," and a novel called "The Carthusian Nun of Parma" (1839). He passed many years in Italy. Died in Paris in 1842. (See Honoré de Balzac, "Études sur M. Beyle.")

Bey'root', Beyrout, Beirut, or **Bairut** [supposed by some to be identical with the *Berothai* of 2 Sam. viii. 8, and the *Berothah* of Ezek. xlvii. 16; Gr. Βηρυτός; Lat. *Berytus*], a flourishing commercial town and seaport of Syria, is finely situated on the Mediterranean at the foot of Mount Lebanon, 58 miles W. N. W. of Damascus. The harbor admits only small vessels, but in the bay about 3 miles from the city there is good anchorage for large ships. This is the chief seaport of Damascus and Syria, and has an extensive commerce, which is increasing. French steamers ply weekly between Beyroot and Marseilles, and British steamers ply regularly between this city and Liverpool. The chief articles of export are madder, silk, wool, olive oil, and gums. Here are important manufactures of silk stuffs. Pop. in 1867, about 100,000. *Berytus* was besieged and taken by Baldwin, king of Jerusalem, about 1110, and retaken by the Saracens in 1187. American missionaries have been there since 1825. The Protestant Syrian college was opened in 1866.

Be'za [Fr. *De Bèze*], (Theodore), an eminent Calvinistic theologian, born at Vezelay, in Burgundy, June 24, 1519. In his youth he enjoyed two benefices in the Catholic Church, but in 1548 he went to Geneva with his wife, and avowed himself a Protestant. He became professor of Greek at Lausanne, and an intimate friend of Calvin. In 1554 he published a treatise, "De Hæreticis a Civili Magistratu Puniendis," in which he defended the burning of Servetus. He translated the New Testament into Latin (1556), removed to Geneva in 1559, and became Calvin's ablest coadjutor. He succeeded Calvin as professor of theology in 1564. He afterwards ruled the Genevan Church with energy for forty years. Among his works are a "Life of Calvin" and a "History of the Reformed Churches in France from 1521 to 1563" (3 vols., 1580). Died Oct. 13, 1605. (See Baum, "Th. Beza," 2 vols., 1843–51; Heppe, "Th. Beza," 1861.)

Bezant', or **Besant,** a gold coin struck at Byzantium, or a circular piece of gold or silver without any impression, supposed to be a part of the old coinage of Byzantium. Some of these were brought home by the Crusaders, and were current in England. Their value was 10*s.* sterling, but some gold bezants were worth £15 sterling. They occur in heraldic charges, especially Cornish coat-armor, and in the arms of banks or bankers (hence the "three balls" of the pawnbrokers' shops). *Bezant* in heraldry is a globe *or*, or a circle *argent*.

Bez'dan, a town of Hungary, in the county of Bacs. Pop. in 1870, 7573.

Béziers (anc. *Bæter'ræ*), a city of France, in the department of Hérault, on the river Orb and the Canal du Midi, 27 miles by rail E. S. E. of Cette. It is on the railway which connects Montpellier with Toulouse, and has a delightful situation, with a mild climate. Among its antique and interesting edifices are a noble Gothic cathedral and the church of La Madeleine. It has a college, a public library, a theatre; also manufactures of silk, hosiery, gloves, glass, soap, brandy, and leather. Béziers has some Roman remains. It was the scene of a massacre of the Albigenses in 1209. Pop. 27,722.

Be'zoar, a calculous concretion found in the stomachs or intestines of goats, deer, and other ruminant animals, was formerly prized for its supposed medicinal virtues and as an antidote to poisons. That of the antelope was especially prized. The bezoar is sometimes composed of the superphosphate of lime. It is quite worthless as a medicine.

Bhagavat (or **Bhagavad**) **Gîta,** modern Hindoo pron. bhŭg'a vŭt geet—*i. e.* "the divine song" [from the Sanscrit *bhagavat*, "adorable," "divine," and *gîta*, a "song"], a famous Hindoo poem usually regarded as an episode of the Mahabharata (which see), though it is not found in all the manuscripts of that great epic. The Bhagavat Gîta may be called a poetical treatise on the Hindoo philosophy, ethical and religious. The discourse on these subjects is represented as proceeding from the mouth of the god Krishna (one of the avatars of Vishnu). The poem is regarded with great reverence by the Hindoos, and it has been made the subject of numerous commentaries both in

India and in Europe. (See a translation by WILKINS, who first introduced the poem to the notice of Europe: W. VON HUMBOLDT, "Treatise on the Bhaghavat Gita," 1827.) The Sanscrit text, with a Latin translation, was edited by A. W. von Schlegel (2d ed., 1846).

Bhamo. See BAMO.

Bhar'tri-Ha'ri, a Hindoo poet celebrated as a writer of apothegms, is supposed to have been a brother of King Vikramâditya, who lived in the first century B. C. His name is attached to a collection of 300 apothegms which were published by Bohlen (Berlin, 1863). Bhartri-Hari was the first Hindoo poet whose works became known in Europe.

Bhawl'poor, a state of Northern India, bounded on the N. W. by the Ghara River and the Indus, and on the S. W. by Sindo. Area, about 22,000 square miles. The soil is mostly desert and sterile, except near the Ghara. Cattle, poultry, sheep, rice, and provisions are plentiful and cheap. The chief articles of export are cotton, sugar, indigo, hides, wool, and drugs. Capital, Bhawlpoor. This state is subject to a khan, and protected by the British. Pop. about 500,000.

Bhawlpoor, a town of India, the capital of the above state, is on a branch of the river Ghara, 210 miles S. W. of Lahore. It is situated in a fertile district, which produces abundance of oranges, apples, and other fruits, and has an extensive trade. Here are manufactures of scarfs, turbans, chintzes, and other cotton stuffs. Pop. about 20,000.

Bhil'sa, a town of Hindostan, 190 miles S. of Gwalior, on the Betwat River, is built on a trap rock, and is fortified. In the neighborhood are extensive ruins. Good tobacco is raised here. Pop. about 30,000.

Bhooj, a fortified town of Hindostan, capital of Cutch, 170 miles S. E. of Hyderâbâd. It has numerous temples or pagodas, mosques, and a beautiful mausoleum of Row Lakka, a former ruler of Cutch. Its manufactures of gold and silver are widely celebrated. Pop. estimated at 25,000.

Bho'pâl', or **Bhapaul,** a state of Hindostan under British protection, is bounded on the S. by the Nerbudda River. Area, estimated at 6764 square miles. It is traversed by the Vindhyan Mountains. Capital, Bhopal. Pop. about 664,000.

Bhurt'poor', or **Bhurtpore,** a "protected" state of British India, is between 26° 30′ and 27° 50′ N. lat., and between 77° and 78° E. lon. Area, estimated at 1978 square miles. Good crops of cotton, sugar, and grain are produced. The heat in summer is extreme. Pop. about 600,000.

Bhurtpoor, or **Bharatpura,** a large town of India, capital of the above state, in a plain 33 miles W. of Agra; lat. 27° 12′ N., lon. 77° 33′ E. Pop. estimated at 100,000. It was formerly fortified by a mud wall, and a ditch which could be filled with water from a lake. Lord Lake, having assaulted this town in 1805, lost 3000 men. It was besieged and taken by the British in 1826.

Bi [from the Lat. *bis*, "twice"], a prefix which occurs in many chemical and other scientific terms, and denotes duality or the number 2, as *bivalve*, "having two valves;" *bicarbonate*, a salt in which two equivalents of carbonic acid are combined with a base; *biceps*, "double-headed."

Biaf'ra, Bight of, a bay of the Atlantic Ocean, on the W. coast of Africa, is the eastern portion of the Gulf of Guinea, and lies between Cape Formosa and Cape Lopez. It encloses the island of Fernando Po and other smaller isles. The largest rivers which flow into the bight are the Niger (or Quorra), the Calabar, and the Cameroon.

Bia'la, an Austrian town, in Galicia, situated on the Biala, 42 miles S. W. of Cracow, has manufactures of cloth and linens. It is connected by rail with Bielitz. Pop. in 1869, 6558.

Biala, a town of Russia, in the government of Siedlce. It has several churches and a monastery. Pop. in 1867, 5662.

Bial'ystok, a fortified town of Russia, in the government of Grodno, on the river Bialy, 52 miles by rail S. W. of Grodno. It is well built and handsome, has several churches, and a palace with a park, which have been called the "Versailles of Poland." Here are a gymnasium and manufactures of woollen goods, hats, leather, and soap. It is on a railway from Warsaw to Grodno. Pop. in 1869, 16,985.

Biancavil'la (*i. e.* "white town"), a town of Sicily, in the province of Catania, on the S. W. declivity of Mount Etna, 13 miles N. W. of Catania. Grain, cotton, and silk are exported from it. Pop. 9083.

Bianchi'ni (FRANCESCO), an eminent Italian astronomer and antiquary, was born at Verona Dec. 13, 1662. He lived mostly at Rome, and enjoyed a rich benefice, the gift of Pope Alexander VIII. He published, besides other works, a "Universal History, proved by Monuments and illustrated with Symbols of the Antique" (1694). He spent several years in an effort to draw a meridian line from the Adriatic to the Mediterranean, but failed to complete it. He succeeded in drawing a meridian line through the church of Santa Maria degli Angeli. Died at Rome Mar. 2, 1729. (See FONTENELLE, "Éloge de Bianchini," 1757; A. MAZZOLENI, "Vita di F. Bianchini," 1735.)

Biard (AUGUSTE FRANÇOIS), an eminent French painter, born at Lyons June 27, 1800, travelled extensively in the Levant, Egypt, etc., collecting materials for his art. He excelled in several departments of painting, especially in *genre*. Among his works are a "Family of Beggars," "The Strolling Players," "The Wind of the Desert," "A Battle with Polar Bears," "The Slave-Trade," and the "Burning of a Hindoo Widow." (See L. BOIVIN, "Notice sur M. Biard.")

Biarritz, a village and fashionable watering-place of France, on the Bay of Biscay, in the department of Basses-Pyrénées, 5 miles S. W. of Bayonne. Here are several curious grottoes and mineral springs. The situation is pleasant and healthy. This was recently the summer residence of Napoleon III. Pop. 3652.

Bi'as [*Bias*], one of the Seven Sages of Greece, was a native of Priene, and a contemporary of Crœsus, king of Lydia. He lived about 570–550 B. C. He was distinguished for eloquence as well as wisdom, and was employed as a legal and political adviser or advocate. According to tradition, he said, "I carry all my goods (or riches) with me."

Bib, called also **Pout** or **Whiting Pout** (*Gadus luscus* or *Morrhua lusca*), a fish of the same genus as the cod and haddock, is found on many parts of the British coasts and farther N. It is seldom more than one foot long, and is remarkable for the depth of its body, which equals one-fourth of its length. It is esteemed for food.

The Bib.

Bibb, a county near the centre of Alabama. Area, 700 square miles. It is intersected by the Cahawba River. The surface is hilly; the soil in parts fertile. Cotton and corn are the chief crops. Iron ore and coal are found in it. Capital, Centreville. Pop. 7469.

Bibb, a county near the centre of Georgia. Area, 250 square miles. It is traversed by the Ocmulgee River, and also drained by the Tobesofka Creek. The surface is hilly; cotton and corn are the chief crops. The county is intersected by the Central, the Macon and Western, and the Macon and Brunswick R. Rs. Capital, Macon. P. 21,255.

Bibb (GEORGE M.), born in Virginia in 1772, graduated at Princeton in 1792, became a prominent lawyer of Kentucky, and was several times chosen chief-justice of that State, and once chancellor; was U. S. Senator (1811–14 and 1829–35), and secretary of the treasury under Tyler. He published four volumes of Kentucky "Law Reports" (1815–17). Died at Georgetown, D. C., April 14, 1859.

Bibb (WILLIAM WYATT), M. D., born in Virginia Oct. 1, 1780, was member of Congress from Georgia (1806–13), U. S. Senator (1813–14), governor of Alabama Territory (1817–19), and first governor of the State of Alabama (1819–20). Died July 9, 1820.

Bi'ber (GEORGE EDWARD), an English clergyman, born in 1801, was formerly associated with Pestalozzi in educational enterprises, and is author of several pedagogic works. He has taken an active part in recent church controversies in the High Church interest.

Bi'berach', a town of Würtemberg, is in a charming valley and on the river Riss, 23 miles by rail S. S. W. of Ulm. It has a realschule, a beautiful church, built in 1110,

manufactures of paper, linen goods, leather, etc. Pop. in 1871, 7091. The French general Moreau here defeated the Austrians under Latour in Oct., 1796, and the Austrian general Kray in 1800. The poet Wieland was born near Biberach.

Bi'berich, or **Bie'brich,** a village of Prussia, in the province of Hesse-Nassau, on the right bank of the Rhine, 3 miles S. of Wiesbaden. It has a ducal residence which is said to be the finest palace on the Rhine. The river-scenery here visible is almost unrivalled. Pop. including Mosbach, in 1871, 6642.

Bibes'co (GEORGE DEMETRIUS), PRINCE, ex-hospodar of Wallachia, born in 1804 in the banat of Crăiova, studied at Paris, and became under-secretary of state. In 1843 he led the movement which expelled Ghika, and succeeded him as hospodar. He instituted many reforms, but was forced to resign in 1848, on account of alleged Russian predilections. He kept aloof from politics until in 1857 he took part in the deliberations of the *divan* for the reorganization of Moldo-Wallachia. Died at Paris June, 1873.

Bible. See BIBLE, THE.

Bible Christians, called also **Bryanites,** from Rev. William Bryan of Cornwall, England, who left the Wesleyans in 1815. They have in England 368 chapels, 65 preachers, 957 local preachers, and 14,352 members; in Canada, 135 chapels, 16 preachers, and 4986 members; in Australasia, 100 chapels, 34 preachers, 147 local preachers, and 2045 members. In the U. S. the only congregation of "Bible Christians" is in Philadelphia, and they refer their origin to Rev. William Cowherd, who left the Church of England about 1800.

Bible Societies. While the sixteenth century is distinguished for the labor spent upon numerous translations of the Holy Scriptures into the languages of Christian nations, the nineteenth is no less memorable for the multiplication of Bible societies as a means of securing the widest diffusion of the Bible, not only in civilized lands and among Christian communities, but throughout the world. The British and Foreign Bible Society was established in London, Mar. 7, 1804. Previous to that time eight societies in Great Britain had been engaged in publishing or distributing Bibles, though only three, the Naval and Military Bible Society (1780), the Dublin Association (1792), and the French Bible Society (1792), had made this their principal work, and these, it is believed, did not long survive. The great destitution which was found to prevail in the principality of Wales in 1802, and the utter inability of existing societies to supply the demand for Bibles, led to the organization of the British and Foreign Bible Society, with the sole object of encouraging a wider dispersion of the Scriptures, first in the British dominions, and then, according to its ability, in other countries, Christian, Mohammedan, and Pagan. Three hundred persons of different religious denominations united in organizing it, and £700 were at once subscribed. Its entire receipts the first year fell a little short of £5600.

The American Bible Society was founded in the city of New York, May 11, 1816, with the sole object, as announced in its constitution, of encouraging "a wider circulation of the Holy Scriptures without note or comment." This society had, however, been preceded by fifty or sixty others, which had come into being at one point and another in the U. S. after the organization of the British and Foreign Bible Society. The first of these was founded at Philadelphia in 1808; the second at Hartford, Conn., in 1809. Next came the Massachusetts Bible Society at Boston, the New Jersey Bible Society at Princeton, and the New York Bible Society. Such local societies accomplished much good within their own bounds, but having no bond of union, their operations lacked efficiency and economy, and it soon became apparent that a combination of effort was essential for thorough work. Thirty-five local organizations sent delegates to the convention which founded the American Bible Society, and eighty-four became auxiliary to it during the first year of its existence. Among the delegates were representative men of the leading denominations—Baptist, Congregational, Reformed Dutch, Methodist Episcopal, Protestant Episcopal, Presbyterian, and the Society of Friends; but every sectarian jealousy and party prejudice being laid aside, all united with perfect harmony and cordiality in the single object of "disseminating the Scriptures in the received versions where they exist, and in the most faithful where they may be required." The announcement of this organization brought from the British and Foreign Bible Society the expression of their warmest congratulations, and the offer of a gift of £500. At an early date Bible societies were formed on the continent of Europe, as at Bâle (1804) and Berlin and Ratisbon (1805), and nearly fifty others, chiefly in the north of Europe, before 1816. At that time also two had been established in Africa, five in Asia, and others in Nova Scotia, Canada, and the West Indies. About seventy principal societies may be named as having been actually engaged in the manufacture and publication of Bibles. Auxiliary and branch Bible societies and associations have been very extensively formed with a view of enlisting local sympathies, collecting funds from churches and individuals, maintaining depositories, and looking after the circulation of the Scriptures among the needy. The American Bible Society has more than 2000 auxiliary societies, and with them are connected nearly 5000 branches. Such societies are expected to supply the wants of their field from their own resources, if possible, though receiving aid from the national society when necessary, and paying over their surplus funds annually into its treasury. The British and Foreign Bible Society has also not far from 1200 auxiliaries and branches, as well as 3134 Bible associations in the management of which ladies have a principal part. Besides these home institutions, it has many colonial auxiliaries, and also foreign agencies superintending its depositories of Bibles in the chief cities of Europe. Not far from 16,000 smaller organizations are thus connected with the two principal Bible societies of the world; and when it is remembered that many of the continental societies also have adopted the auxiliary system, it is very clear that this multiplication of associations for the distribution of the Scriptures is one of the phenomena of the age.

The American and Foreign Bible Society was founded in New York in 1836 by representatives of the Baptist denomination, owing to the refusal of the American Bible Society to apply its funds to print and circulate versions of the New Testament made by American Baptist missionaries, in which *βαπτίζειν* and its cognate terms were literally translated, not transferred. The American and Foreign Bible Society, thus inaugurated, instructed its translators "to endeavor to ascertain the exact meaning of the original text, to express that meaning as literally as the nature of the languages into which they should translate the Bible would permit, and to transfer no words which were capable of being literally translated." By vote of the representatives of the two societies this society was to have been consolidated with the American Baptist Publication Society, but legal obstacles have been thrown in the way, and the Bible Society still maintains an independent existence. Some of the members of this society were earnest advocates of the publication of a new version of the English Scriptures on the same principle as that which governed its translations into foreign tongues; and on the refusal of the society to authorize such a revision the American Bible Union was formed (1850)—a society which has published a revised version of the New Testament, Psalms, Job, and Genesis in conformity with the principle indicated—translating *βαπτίζειν* by "to immerse," etc. Although some of the most eminent scholars among the Baptists have been employed on the versions of this society, it has never received the support of the great body of American Baptists.

In general, several characteristics of Bible societies are to be noted. They are voluntary associations, being neither close corporations nor under ecclesiastical direction, and the privileges of membership are secured by the payment of money. They are unsectarian, inviting all men to common efforts on the simple basis of the Scriptures of the Old and New Testament without note or comment. They are Protestant organizations, however, because the rules of the Roman Catholic Church are opposed to the free circulation of the Scriptures without admixture of comment. They are strictly benevolent societies, publishing not for profit, but at prices as low as possible, and making large grants, as their receipts may allow, for the supply of the destitute. Their work is exceedingly helpful to Sunday-schools and to various forms of missionary effort at home and abroad; and their influence has been most happy in promoting Christian union, and presenting a form of religious activity in which all denominations might participate without the sacrifice of principle.

The work of Bible societies has constantly encountered difficulties of one sort and another. The circulation of the Bible in all lands creates a demand for new versions, the preparation of which involves many nice points, while the revision of existing versions can hardly fail to occasion complaint. Even the determination of the canon of the Scripture is not universally agreed on. The most violent controversy in the British and Foreign Bible Society turned upon the question whether the Apocrypha should be published and circulated. The controversy continued for years, and when in 1826 it was finally decided to withhold all aid from associations circulating the uncanonical books, fifty auxiliaries on the Continent withdrew from the parent society. The Edinburgh society, which had earnestly op-

posed the circulation of the Apocrypha, also withdrew and stood aloof. The proposal to combine men of different persuasions in Bible effort, and to circulate the Bible without the Book of Common Prayer, encountered some opposition in England at an early date, which after a few years died away. The Russian Bible Society at St. Petersburg (founded 1813) flourished until 1826, when its operations were summarily suspended by the emperor Nicholas, on the ground that it belonged to the Church, rather than to a secular society, to furnish the people with the word of God.

In the American Bible Society differences of opinion concerning the principles which should govern translations into foreign tongues led to the formation of the American and Foreign Bible Society in 1836; and at a later period (1858) its harmony was again imperilled for a time in consequence of dissatisfaction at some attempted modifications (numerous though generally slight) in the English editions of the society—a dissatisfaction which was allayed by abandoning the proposed changes.

The work accomplished by Bible societies in seventy years is vast in extent and of unspeakable usefulness. In 1872 the receipts of the American Bible Society for a year were $689,923, of which $361,274 came from sales. The same year it had issued 1,100,871 volumes, including Bibles, Testaments, and integral portions of Scripture. The British and Foreign Bible Society at the same time reported its receipts for a year to be £184,196, and its issues 2,584,357 volumes. Its total issues since 1804 are 65,884,095, and the total issues of the American Bible Society since 1816, 28,780,969. It is a low estimate to suppose that 113,000,000 volumes of the Bible or separate books of the Bible have been issued by Bible societies since the tears of a little girl in Wales in 1802 led Thomas Charles to ask what could be done to secure Welsh Bibles for his congregation. The aggregate number of volumes issued by no means measures the results of Bible society work. From motives of benevolence the prices of Bibles have been determined by the cost of materials and of manufacture, without regard to profit. The British and Foreign Bible Society has its work done by contract; the American Bible Society manufactures its publications on its own premises, and in so doing gives constant employment to about 400 persons. Besides the books which are sold at unremunerative prices, a large part of the publications each year are given away to destitute families and individuals, to charitable institutions, Sunday-schools, missionary societies, soldiers, seamen, immigrants, travellers, prisoners, and other classes of persons. The American Bible Society and its auxiliaries through the U. S. are engaged for the third time in an effort to reach every destitute family in the land with the offer of a Bible. It has printed the Bible or parts of it in fifty different languages, twenty-seven of these being new translations; 205 new versions have been prepared since 1804. The British and Foreign Bible Society has directly or indirectly promoted the publication and distribution of the Scriptures in at least 200 languages and dialects. (For further information respecting Bible societies reference may be had to the following works: Owen's "History of the British and Foreign Bible Society," 1817; Browne's "History" of same, 1859; Dudley's "Analysis of the System of Bible Societies," 1821; "Jubilee Memorial of British and Foreign Bible Society," 1854; "Jubilee Commemoration at Bombay," 1854; Strickland's "History of American Bible Society," 1856; "Manual of American Bible Society," 1871; "Jubilee Memorial," 1866; Memoirs of S. H. Turner, Gardiner Spring, and John C. Brigham; numerous controversial pamphlets; "Bible Society Record," and "Annual Reports" of each Bible society.)

E. W. Gilman.

Bible, The [Lat. *Bib'lia;* Gr. τὰ Βιβλία (*i. e.* "the books"); Fr. *la Bible;* Ger. *die Bibel;* It. *la Bibbia*], popularly known also as the **Holy Bible** and **Holy Scriptures,** a collection of ancient writings, divided into two parts, the Old and New Testaments, of which the first is regarded by the Jewish Church, and both are regarded by the Christian Church, as a divine revelation. With respect to the more precise definition and character of the Bible, the views are very diverse in the different churches. The Roman Catholic Church, in consistency with the monarchical theory which it inherited from the Roman civil law, denies any such character to the Bible as would make it a constitutional limitation on the sovereign power. The supreme authority of revelation does not, on this theory, inhere in the codex, but in the personal representative, for the time being, of the Church catholic. The Greek Church lays chief stress on orthodoxy—that is, on inflexible adhesion to the dogmatic symbols in which the faith of Christianity was codified in the early centuries. The Scriptures must therefore be interpreted in accordance with these creeds, but as this elevates the creeds into the position of supreme authority, the labor of interpreting Scripture becomes a superfluous trouble. The Scriptures have in consequence fallen into neglect, and this neglect has become so absolute, under a rigid traditional orthodoxy, that it is impossible to state any positive attitude towards the Scriptures as characteristic of this Church. The Protestants of the sixteenth century, in reviving reverence for the authority of the Scriptures, developed various schools of opinion. Luther and his followers adopted a comparatively free but subjective position. They saw divine revelation in the Bible, but not in all parts of it equally. Calvin's position was different and more scientific. Among his followers in Switzerland, however, there sprang up a great zeal for the doctrine of inspiration. The sacred writers were compared to trumpets or to pens, in order to express their absolute instrumentality in the hands of the Holy Spirit. The Anglican Church at first held a less definite theory of the Scriptures, and there was great diversity of opinion, but it has gradually adopted the general theory of the Swiss Reformers, modified only so far as sober reflection has forced the over-credulous or over-zealous to relinquish the theory of verbal inspiration. Finally, the scientific and critical school of biblical scholars, represented chiefly by modern Germans, regards the Bible as the human record of a divine revelation; not absolutely infallible, since there is no book written in any human language but must partake in a measure of the imperfections of that language. Many of this school, while admitting the Bible to contain the record of a true supernatural revelation, do not consider it to be without positive errors of historical fact, not without false coloring from popular legend and tradition, but nevertheless a record as good as human hands could make of a truly divine revelation. Thus diverse are the conceptions of the book which are held by different parties. Scarcely any of these conceptions rely on an unbiassed examination of the book, to see what it is; many of them are invented to obtain the support of the Bible for some form of Christianity which is first settled, independently of the Scriptures, on the basis of religious or philosophical prepossessions. The Protestant churches, however, are generally united in regarding the Scriptures—1, as of divine authority; 2, as containing all knowledge necessary to salvation; 3, as the appropriate form of a divine revelation (as opposed to tradition or the inner light); 4, as the heritage of all Christians—*i. e.* it is the right of all to read and become acquainted with the teachings of the Bible.

A. *The Old Testament.*—The Old Testament was originally written in Hebrew, but of course the Hebrew manuscripts which we possess are separated by a long interval and many vicissitudes from the original handiwork of the authors.

The History of the Hebrew text is briefly as follows: I. *First Period* (536–180 B. C.)—The Babylonian captivity (from 586, the chief deportation, to 536, the first return) forms an epoch in the history of the Jews. It is a gulf dividing the independent from the subject position of the nation. It was under the former that they had original and productive power and a living revelation, and while they had them they were indifferent to them. After the captivity, when the Jewish nation had been purified by adversity, they turned back to them with new interest. They were able to see that Isaiah and Jeremiah had been the only men of their times who had truly had "the mind of the Spirit." They desired to restore the ancient law, worship, and traditions. To this end the collection and preservation of the ancient writings, which served as the authority for, or bore witness to, the former observances, became an object of great interest and importance. With this movement, however, the nation entered on a new stage. Its work was not original and creative, but preservative and reconstructive. It did not look to the future, to an ideal, but to the past, to a memory. Its spring was not in thought, communion with God, foresight, and purpose, but in tradition, reflection, and application. It had to make the most of its inherited wealth, without adding to it.

In the work which now began Ezra had a prominent part. He collected and arranged the ancient writings, and so laid the foundation of the canon (see below, section on the *Canon*); and from this point the history of the written codex begins. The books were at this time written in the ancient Phœnician characters which appear on some ancient Phœnician inscriptions, on the Moabite Stone, on some coins of the Asmoneans, and in the Samaritan Pentateuch. The letters had no variation of form or shape for capitals and small letters, and neither words, verses, nor chapters were marked off in any way. Some of the books which now appear separately were then united, and a few which are now found in the canon had not yet been written. The work, however, which was now to be done extended beyond the collection, arrangement, and preservation of the ancient Scriptures. The Hebrew language was already a dead language. The popular dialect was the Chaldee, and the Hebrew of Moses, David, and the prophets had become a sort of classical and sacred language, known only to the

oldest and to the learned. It was an object of academical acquisition. It was, therefore, necessary to explain and translate or expound the writings. This task naturally devolved upon such as possessed the requisite knowledge, and they constituted an informal body for this purpose. So much is no doubt true, and it forms the historical basis of the rabbinical tradition about the "Great Synagogue" which was said to have done this work.

When this much is said of the commencement of this period, we have in fact told nearly all which is known about it. We can only infer, from what we know of its beginning and what we find at its close, that the following movements were in progress: 1. The college of interpreters, though not a formally or legally constituted body, and though their business was primarily literary or academical, were gaining in authority and dignity, and acquiring a certain official character from general consent. The "elders" came to have civil and judicial authority from the lack of others to fill these functions. Possibly the Sanhedrim was an outgrowth of this body. 2. The canon (see below) was being formed; the idea of *Holy* Scripture was being elaborated and formulated; the respect for the traditional writings, and the disposition to set them by themselves, were gaining ground; the doctrine of inspiration took its rise. At the close of this period the canon is formed and these doctrines are established dogmas. 3. The form of the letters in use was undergoing a change. At the period referred to, the square letters which are represented in our printed texts had become established in use.

II. *Second Period* (180 B.C. to 500 A. D.).—The "schools" begin with Simon the Just, in 180 B. C. These schools produced the Talmud, an immense work in a dozen folio volumes, containing a commentary on the Mishna, which is itself a "repetition" of the "Law." The schools developed intense zeal for the text of the Scriptures—a zeal which, though frivolous and fanatical in many of its manifestations, has been of immense value to biblical scholarship. The scribes and Talmudists spent unwearying labor in the establishment of the consonant text; they separated the words by spaces (but characteristically ordained just how great the space should be). They probably also introduced the verse-mark (:), and therefore the division into verses. The preservation of the text from corruption in copying was secured by counting the letters or by other devices, and by crabbed, rigid, and minute rules. This work exercised its legitimate influence on the characters of those who did it; it made them punctilious about trifles and negligent of "the weightier matters;" but it preserved the Old Testament text from corruption, and handed it down to us in a comparatively pure and reliable form. In their exegesis the Talmudists were generally guided by arbitrary rules, by dogmatic prepossessions, by a view of the Bible which made it a storehouse of occult wisdom, only to be unlocked by cabalistic and allegorical treatment. It is asserted by some who are well acquainted with the Talmud that it contains valuable geographical, ethnological, historical, and exegetical information for the elucidation of the Bible, but the commentaries of Jews and Christians alike fail to bear witness to the truth of the assertion.

The Targums.—One result of the zeal of the Jews for the original Hebrew was the publication of paraphrases in the Aramaic or popular dialect, which were called *Targumim* (from a root signifying to "interpret"). They present the rabbinical and traditional interpretation of the Scriptures. Their origin is very obscure.

III. *Third Period* (500–1488 A.D.).—The Talmud, having grown by the work of successive generations for three or four centuries, closed about the year 500—*i. e.*, the last of the commentators whose sayings are included in it lived at that time. Then a new work began. The Jewish nation had long been broken up and dispersed. Christianity had grown into a powerful opponent. The latter fact had led the Jews to abandon the Septuagint Greek version of the Old Testament (see below, on the *Versions of the Old Testament*), and the former fact made it necessary to provide still further for the preservation of the Hebrew text. The pronunciation of a language written only with consonants must, of course, be very uncertain; that of the Hebrew had been preserved in the rabbinical schools by tradition. There seemed to be danger that it would now be lost if no means of recording it were devised. The Syriac language had shortly before been provided with points to designate the vowel sounds, and to make the written language a complete representation of the spoken. The chief seats of rabbinical learning at this period were Tiberias in Galilee and Sbra in the Euphrates valley, and the scholars are known as the Massoretes. The Massorah was a mass of notes, comments, emendations, and corrections of various kinds, which the Talmudists had adopted, committed to memory, and handed down by tradition, but which they had not ventured to mark in any way upon the pages of the sacred text. The Massoretes now undertook to do this. They marked in the text—1, the vowels, the shades of pronunciation of the consonants, and the diacritical points which distinguish two sounds expressed by one character; 2, the accents, which are partly marks of pronunciation, and partly serve the purpose of musical notes, marking the intonations of the chant; 3, the emendations and corrections which the Talmudists had adopted. These they mark on the margin by a peculiar device, which leaves the consonants as they were, but suggests those which should be read. Here, again, the superstitious reverence of the rabbis for the text served the purpose of a true biblical science, since their proposed amendments are still open to criticism and review. It is difficult to pass a summary judgment on their emendations, but perhaps in a majority of cases modern scholars retain the original reading and reject the Massorah.

The work of the Massoretes did not begin before the sixth century, and it was finished before 1106, the date of the oldest manuscript now known to exist. This manuscript presents the Massoretic text. The work certainly covered a long period, and was done by many different hands. It was not possible, even with the minute and stringent rules which were adopted, to prevent errors in copying, and our manuscripts, all of which belong to the period between 1106 and 1488, offer many variants. The Jews continued to use in the synagogues copies of the Scriptures containing only the consonant text.

IV. *After the art of printing* was invented some books of the Old Testament were printed separately. In 1488 the first edition of the whole Hebrew Bible was printed at Soncino. The second, based on the first, was published at Brescia in 1494. This was the one used by Luther. An independent version appeared in the Complutensian Polyglot, 1517. A collection of variants was made from 615 manuscripts by Kennicott, Oxford, 1780, and a better one by De Rossi, 1788. The Hebrew Bibles in use are scarcely more than reproductions of the two first printed editions. They possess some critical advantages, but generally the excellence of a subsequent edition over the former consists in typographical accuracy and neatness. A satisfactory critical edition, with a full account taken of the variants, is yet to be prepared.

V. *The Old Testament in the Christian Church.*—The Church of the first and second centuries based the authority and truth of its doctrines on the Old Testament, just as it is used in the New Testament. The Church of the third and fourth centuries wavered between acquiescence in the authority ascribed to the Old Testament by our Lord and his apostles, and hatred and suspicion of all things Jewish. No Christians save converted Jews knew Hebrew, and of these very few were of the class which "knew the Law." No man was converted who brought into the infant Church a knowledge of the Hebrew. The Septuagint Greek version (see below) was the form in which the Christians became acquainted with the Old Testament. The first Christian scholar who undertook to learn Hebrew was Origen (254 A. D.). He prepared a Hexapla, containing the Hebrew and five versions, which unfortunately is lost. We possess, however, his commentaries, which show that he had borrowed from the rabbis their allegorical mystical methods of interpretation. He is counted among the Fathers of the Eastern Church, and is the only biblical scholar of whom that Church can boast.

Jerome (430 A. D.) endeavored to learn Hebrew of a Jew, and did learn as much as his teacher could or would teach him. His method of treating the Old Testament shows the influence of his teacher. Through him the rabbinical ideas of inspiration, etc. found their way into the Western Church. His translation of the Scriptures (see *Vulgate*, in the section below on the *Versions*) was regarded as a finality, and all interest in the original text died out. In 1311, Clement V. ordered that Hebrew should be studied at the universities, but no results followed. Nicholas de Lyra (1340) was a converted Jew. His commentaries carried great authority among Christians, and influenced Luther so much that a popular saying arose: "If Lyra had not played the lyre, Luther would not have danced." The Reformers returned with zeal to the study of the Hebrew. That pursuit participated in the general revival of learning, and in the most recent times it has been wonderfully advanced by the development of philological and historical science. It is probably not too much to say that the Hebrew language is more at the command of this generation than of any other since the Babylonian captivity.

It follows from the above—1, That the only text we can hope to establish on manuscript authority is that of the Massoretes. 2, We have no manuscript, even of this text, older than 1106. We shall see below, under *Versions*, what means we have of learning what the text was at an earlier date.

3. The vowel-points, accents, word, verse, and chapter divisions are all many centuries more recent than the original writings. Even the consonant text has been transliterated. The chapter divisions were made in the thirteenth century, and applied to the Vulgate. In the sixteenth century it was asserted that the vowels, etc. were of later origin than the text. This assertion was considered heterodox, as it was inconsistent with the prevailing theory of inspiration. It is only in the most recent times that this fact has been admitted, and it is now undisputed. 4, The crude and superstitious theories of inspiration which have prevailed to some extent in the Christian Church are of rabbinical manufacture. They were introduced into the Christian Church first as attaching to the Old Testament, and then extended over both in their purest and most original form.

VI. *The Canon and the Apocryphal Books.*—As we said above (A, I.), when the period of creation and production was ended, and the period of conservation and reflection and application began, one of the first ideas which was elaborated from the crude into the dogmatic form was that of the Scriptures in their sacred character and divine authority. Hence the terms Holy Scripture, Word of God, etc. When this doctrine was established, the necessity of defining and limiting its application at once made itself felt. What books come under this designation? What is the standard by which they must be tested in order to answer this question? It is certain that these questions never received any authoritative answer. Ezra made a collection of books, but he did not include those books which were not yet written. The Hebrew Bible as we now possess it is divided into three parts: 1, the Torah (*i. e.*, Law—Pentateuch); 2, the Nebiim (Prophets, including Joshua, Judges, First and Second Samuel, and First and Second Kings); 3, the Chetubim ("Writings," including all the other books in the English Version of the Old Testament). Ezra and Nehemiah probably collected a book. The addition of the third part cannot be historically accounted for. The form of the collection, as a whole, bears witness to successive collections and successive gradations of authority. This gradation may be traced still farther. Besides and beyond the Chetubim were a number of books which were on the line, not accepted and not definitely rejected. Still again, beyond these were others which were positively set aside. The translators of the Septuagint included in their collection a number which do not appear in the Hebrew collection (they form the Apocrypha of the English Bible). The Ethiopic version contains others which belong even to the class of the totally rejected. Thus, one who knew only the Septuagint version would find the book of Exodus and the book of Tobit side by side, presented to him as of equal authority. Ethiopian Christianity would give the same authority to the book of Adam as to the book of Genesis. Thus it is certain that when these versions were made, the strict definition of the books to which standard authority belonged was not yet established. Fürst has even shown from the Talmud (*Kanon des Alten Testament*, s. 25) that this idea of the canon was not so definitely established at the time of our Lord but that the rabbis ventured to propose to exclude the book of Ezekiel from the canon, on account of its contradiction to the Pentateuch. Here, then, we have the idea of the canon. It is the limited collection to which, and to which only, authority as the inspired word of God appertains. The works which were in circulation, and to which this authority was denied, were called apocryphal, from a Greek word meaning "to withdraw," because they were withdrawn from use for public instruction. The third class, the pseudepigraphs, were so called because many of them bore names which were forged. In 2 Maccabees ii. 13 we read: "The same things are narrated in the writings and memoirs of Nehemiah, and how he collected the books about the kings and prophets, and those of David, and the letters of the kings in regard to offerings." The Pentateuch had been restored to authority and use by Ezra in 444 B. C. (Nehemiah viii.). Nehemiah added the "Nebiim," which are distinctly described in this passage ("kings and prophets"), and the Psalms, which are the nucleus of the Chetubim. The "letters" are those of the Persian kings, such as we find in the books of Ezra and Daniel. The subsequent omission of these letters from the canon bears witness to the soundness of the standard by which its formation was governed. The Massoretes were finally called upon to decide what books they would recognize as canonical, but in this, as in other things, they no doubt confined themselves to the establishment of the tradition which they had received. In the Christian Church the influence of the Septuagint secured the introduction of the Apocrypha with full canonical authority. Jerome translated all into the Latin Vulgate. They thus remain in authority in the Greek and Roman churches. Luther adopted the Hebrew canon, but translated the apocryphal books, setting them by themselves, and giving them a heading which recommended them for edification, though not for dogmatic definition. The English translators followed the same policy. Of late, however, the Apocrypha has been omitted from the popular editions of the English Bible, because the presence in the volume of works which formed a grade between it and ordinary works seemed to detract from the supreme and isolated position of Holy Scripture.

The Apocrypha and Pseudepigrapha are both quoted in the New Testament. See Jude 9 ("Translation of Moses"); 14 (Book of Enoch); 1 Corinthians ii. 9 (said by Origen to be from a lost apocryphal writing under the name of Elijah). Compare also James iv. 5, John vii. 38, and Luke xi. 40—citations which we cannot identify with passages in any known book.

It appears from the above—1, That the Canon was fixed only after long experience, and by the general consent of successive generations, who bore testimony, by their esteem and veneration for particular books, to their intrinsic authority and profitableness. 2, There is no broad and distinct line of demarcation between the Canon and the Apocrypha. If we allow ourselves to form estimates of the comparative value of various books, we shall find that the first book of Maccabees compares very favorably, as an edifying religious history, with the book of Esther, and that the book of Jesus the son of Sirach compares favorably with Ecclesiastes as a book of religious instruction.

VII. *The Order of the Books of the Old Testament.*—In the arrangement which has been adopted there appears to have been an effort to conform as far as possible to chronology, not only in regard to the historical, but also the legal and prophetic portions. The following are the principal divisions:

1. Law (in Hebrew, תורה, *Torah;* Gr. *νόμος*) or Pentateuch (Gr. *πεντάτευχος*), because it consisted of five parts.

2. Prophets (Heb. נביאים; Gr. Προφῆται).

3. Holy Writings or Hagiog'rapha (Gr. *ἁγιόγραφα*), called in Heb. כתובים, *Chetubim—i. e.*, the "writings," *par excellence*).

The Law included—1, Genesis, or "origin;" 2, Exodus, or the "going out;" 3, Leviticus, or the book relating to the Levites; 4, Numbers, so called because Moses was commanded to "take the sum of all the congregation of the children of Israel" (Numbers i. 2); 5, Deuteronomy (from the Gr. *δεύτερος*, "second," and *νόμος*, "law"), because it was the second laying down (or the repetition) of the Law.

The Prophets were divided into the Former or Earlier (*Priores*), including Joshua, Judges, First and Second Samuel, First and Second Kings; and Later (*Posteriores*), comprising the greater prophets, viz., Isaiah, Jeremiah, and Ezekiel, and the minor prophets, Hosea, Joel, Amos, etc.

The Holy Writings, or Hagiographa, included the Psalms, Proverbs, Job, The Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, First and Second Chronicles. (For a more particular notice of the different books the reader is referred to their respective heads.)

VIII. *Versions of the Old Testament.*—As we saw above, the oldest manuscript of the Hebrew Scriptures which we possess dates from 1106 A. D., and presents the Massoretic text. If we wish to go back of this to reach something nearer to the original work of the authors, and to eliminate errors which may have crept in, we have one means of doing so—viz., the ancient translations which were made from the text at a remote date.

1. The first and most important of these is the Greek version, called *the Septuagint* (LXX.).—Passing over the fables of the Jews and early Christians in regard to this version (such as that it was made on a set occasion by seventy-two men (six from a tribe) chosen by the high priest, and sent to Egypt for the purpose—that they each separately translated the whole, but that, by virtue of divine inspiration, the seventy-two translations were identical), we state only the best-assured facts in regard to it. The Pentateuch was translated by Alexandrian (not Palestinian) Jews, but by how many is unknown. It was a result of the enlightened interest of the Ptolemies (Lagus and Philadelphus) in all literary and scientific progress. It was made in 285 B. C. The work thus begun was carried on by various persons at various times until all the canonical and apocryphal books were translated. Some originally written in Greek were added. The parts vary in fidelity to the original and in literary excellence. Job and Isaiah are so poorly translated that one must know Hebrew to see the sense of the Greek; Ecclesiastes is faithfully and correctly rendered. At this time Greek was the language of popular intercourse. The Jews of the time of Christ neglected the Hebrew, and generally relied on the Septuagint version. It is the form in which the Old Testament is quoted by Mark, Luke, Peter, and, for the most part, by Paul. Matthew, John, and Paul show acquaintance with the Hebrew, but they also use the Septuagint. Its influence was at this time para-

mount. It passed into the Christian Church as *the* authoritative form of the Old Testament. It soon began to be asserted, however, by the Jews, when the Septuagint was quoted in controversy by the Christians, that it was not a faithful rendering of the original. Hence the Jews abandoned it and returned to the Hebrew, and the most scholarly of the Christians attempted to acquire that language. Nevertheless, the Septuagint remains the authority of the Greek Church to this day. Other Greek versions, which need only be mentioned, are those of Aquila, Theodotion, and Symmachus.

2. *The Peshito* is a Syriac version, whose name signifies "simple" or "faithful," because it is a literal translation, not a paraphrase. It includes the New Testament. Its origin is obscure. It was in use in the time of Ephraim Syrus (378 A. D.).

3. *The Vulgate.*—Augustine says ("De Doctr. Chris." ii. 11), in regard to the early Latin versions, that "in the first days of the faith, if any one obtained a copy of the Greek Scriptures, and gave himself credit for any knowledge of the two languages, he ventured to translate." He recommends only one of the versions existing at the time—viz., the Itala. This is now lost, but seems to have been made from the Septuagint. Jerome (390 A. D.) undertook to learn Hebrew, in order to make a new translation from the original. History repeats itself with regard to all new translations of the Bible. This one was made avowedly in order to meet the wants of the common people, and it was called the "Vulgate" because written in the popular Latin. It was met by the most violent opposition, by all the arguments of tradition and prescription, and by all the considerations of policy and expediency, which suggest themselves in such a case. It was finally adopted, and now it has itself become sacred in the Latin Church. The text of the Vulgate became so corrupt by repeated copyings that, on the invention of printing, the true text seemed lost in a chaos of variants. An attempt to revise it resulted in an arbitrary decree of Sixtus V. (1598), deciding what it should be, and this text is now the "received text" in the Roman Church. A text having critical and scientific authority is still a desideratum.

B. *The New Testament.*—With the advent of our Lord the fountain of divine revelation once more began to flow. Mankind once more received an original and creative revelation, not whimsical traditions or weary reflections on the record of past thought and life. The Greek language, which, as we saw above, was at this time the medium of popular intercourse, became the vehicle of the new revelation. The Gospel of Matthew was probably originally written in Aramaic, but the remainder of the New Testament was certainly Greek from the very hands of the authors.

I. *History of the Greek Text.*—The original handiwork of the writers soon perished. We have no record or tradition of the original manuscripts, and no tradition to bear witness to any care for them. Copies were made from them, and by the middle of the second century the interest in them had become so great as to lead to extensive multiplication of copies. The oldest manuscripts which we possess date from the fourth century. (See article on the Codices of the New Testament.) From that time on, the number of manuscripts which we possess increases as we come down, but as the copies increase in number, so also do the variants. When printing was invented one of the first uses to which it was put was the printing of the Greek Testament. This art gave ground to hope that the text-copies might be multiplied for the future without the errors inseparable from manual copying. The first printed text was contained in the Complutensian Polyglot, prepared under the patronage of Cardinal Ximenes, at Alcalá (the ancient Complutum), in Spain, in 1514. It is not known what manuscript served as copy for this edition. Erasmus prepared a very faulty text, published at Bâle in 1516. These two editions from manuscripts taken at hazard, no doubt fresh ones, served as the basis of succeeding ones (Stephanus, Paris, 1546; Beza, 1565; Elzevir, 1641). The last of these (chiefly on account of its convenience of form and typographical beauty) became the "received text." The doubt between various authorities was settled in this case, as in so many others, not by thoroughly investigating the matter, but by giving arbitrary sanction to one. The Elzevir remained supreme until the time of Griesbach (1812). Here again we come to a department in which the credit for what has been done belongs entirely to German scholars. Griesbach, and after him Lachmann (1851), and at present Tischendorf, have prosecuted the tedious labor of comparing the variants and weighing the authorities. The effort cannot be defined as one to re-establish the text of the apostles, for that may be pronounced hopeless, but to recover the text to which the oldest and best manuscripts bear witness. The three scholars mentioned form a succession in which this aim has been prosecuted with intelligence and zeal and consistency. Some other editions, based on limited authorities and imperfect grasp of the task and its method, have only confused the labor (Bloomfield, Wordsworth, Alford).

The dialect of Greek in which the New Testament is written is what is called the Hellenistic. This was not a good dialect in point of grammatical accuracy, etc., and the influence of the Septuagint makes the New Testament even a sad specimen of it. This assertion was made in the sixteenth century, and it was generally declared that the New Testament was written in "bad Greek." Such an assertion was considered, in some quarters, derogatory to the Bible, and a controversy arose as to whether the New Testament was good Greek or bad. It ended in the general and very sensible conclusion that any dialect is "good" as soon as it contains a literature of any value. Nevertheless, the lack of grammatical accuracy, of precision in the use of words and particles, and of adherence to the rules of style, adds greatly to the difficulty of interpreting the New Testament.

The order of the books in the Greek differs from that in the English Version, in that the catholic Epistles follow the Acts.

II. *Respecting the Separate Books of the New Testament.*—The following account includes such facts as can be relied on, omitting questions which are involved in controversy.

The Gospels.—We possess a fourfold record of the life and teachings of our Lord. It strikes the attention of the reader at once, that the first three contain many passages which are almost identical. On the other hand, each differs from each in a manner equally remarkable. From the earliest times efforts have been made, without much success, to harmonize them into one consistent narrative. Within a century these phenomena have again been examined with great zeal. The question is raised: Do not these resemblances point to an interdependence between the synoptical Gospels? If so, which is the original? If one served as the original, how is it that the authors of the others, in using it, failed to transfer passages of high interest? In fact, the phenomena of identity and difference are so perplexing that these questions seem unsolvable. The prevailing opinion of scholars at the present time appears to be that the Gospel of Mark presents the nearest approach to the original of the synoptical Gospels; that Matthew was originally written in Aramaic, and translated with the assistance of Mark. That Luke is a subsequent compilation of the gospel-material is certain. It was written about the year 70. Before the historic interest in the Gospels arose, and before the movement towards a New Testament canon began, the Gospels no doubt exerted great influence on each other. Passages appear to have been copied from one into another, either inadvertently or at the pleasure or will of the copyist, and hence our science is baffled when it attempts to trace the intricacies of the movement.

The Gospel of John is clearly independent of the others in its material, scope, and purpose. It takes up the life of our Lord not so much pragmatically as philosophically and mystically—in its religious rather than its historical aspect. It has been vigorously attacked by the negative and rationalistic school of critics, and is held by many of them to be falsely attributed to John, but to date from the latter half of the second century. These opinions, however, rest chiefly on philosophical and historical dogmas which are set up as postulates; and one who refuses to admit the necessary *a priori* truth of these postulates, finds that the true critical grounds on which this opinion rests are meagre and insufficient. Conservative scholars of every grade admit the authenticity of the book, and even many who doubt if John were the author, admit its evangelical authority.

III. *The Canon.*—The first century of the Christian era produced a large number of literary works beyond those contained in the New Testament. The idea of the canon therefore came to be applied here once more (see above, *Canon of the Old Testament*). Such of these works as were of genuine apostolic origin, or were faithful representatives of Christian truth, must be separated and recognized apart from all others. Here once more the same phenomenon appeared as in the Old Testament. There was no distinct dividing line to be drawn. The division did not make or suggest itself. The whole body of works might be graded from the Gospel of Matthew down to the most gross and contemptible product of superstition, but the stages were gradual all the way. Different persons differed in their comparative estimate of two (*e. g.*, the Epistle of Barnabas and the Epistle of Jude, the Shepherd of Hermas and the Epistle to the Hebrews), though they agreed in the general range of estimate. Down to the middle of the second century the Christians used the Old Testament for their apologetics and their polemics. Moreover, the tradition was still so fresh that literary authority was not needed. We do not find in any writers earlier than Irenæus (202) references to

the New Testament writings as authoritative, or as inspired in any such sense as the Old Testament was believed to be inspired. From this time on, the chief interest of the Christian Church is rapidly transferred to the New Testament. The books are collected and studied and compared. Their respective authority is determined. The informal verdict of the Church accepted certain books and rejected others, but there were a number which were on the line or in doubt. These were the Epistle of Jude, the Second of Peter, the Second and Third of John, the Epistle to the Hebrews, the Shepherd of Hermas, and the Epistle of Barnabas. In the third century considerable disfavor to the book of Revelation was manifested in the Western Church, though earlier it had been very popular. To go into details of various authorities would lead us too far. Eusebius (340 A. D.) bears witness that the matter stood, in his time, in just about the position above described. Not only the above-mentioned doubtful books, but others also which had become familiar and gained a footing in popular affection, were retained, as the Apocrypha is still sometimes retained in our Bibles. The Synod of Laodicea (360) made the first official list (omitting the Apocalypse), and forbade the public reading of uncanonical books. Pope Innocent I. (405) fixed the canon by decree as it now stands.

IV. *Modern Translations of the Bible.*—1. *German.* In the fifteenth century numerous attempts were made to translate the Bible into German, but it remained for Luther to present the German people with a national version. His safety-imprisonment in the Wartburg gave him an opportunity. He there translated the New Testament (published in 1522). He then undertook, with others, the task of translating the Old Testament, and if he had no other claim to rank among the Fathers of the Christian Church, without regard to time or country, this work would establish it. He had all the enlightened zeal for the popularization of the Bible which animated Jerome (see under *Vulgate*), though he resembled him in nothing else. He had to make his own tools for the work, for he and his age inherited no science and little knowledge from the scholasticism of the Middle Ages. Heine's saying of him and his critics still remains true, that many a dwarf has sneered at the giant for not being able to see as far as himself after climbing upon his shoulders.

2. *French.* A French version by Le Fevre was published first in parts, then as a whole, at Antwerp in 1530. Another by Olivetan, improved by Calvin, was published in Switzerland in 1536. Neither, and no other, has ever won the position of a national version in France.

3. *English.* John Wickliffe (1384) made the first translation into the English language. He translated literally from the Vulgate. His work in this respect, as in others, was a pioneer of the Reformation. William Tyndale is the true father of the English national version, founded on the original languages. He conceived and undertook the work when he risked his life if a proof-sheet of it were found on him, and his work was the basis of all subsequent ones. He published the New Testament (from Erasmus's text—see above, *History of the Greek Text*) at Wittenberg in 1526. He and Coverdale commenced to translate the Old Testament at Antwerp, but they were discovered; Tyndale was captured, and burnt near Brussels in 1536. His merits, obscured by those who afterwards used his work when it was safe and popular to do so, have never met with the recognition they deserved. Coverdale finished the translation of the Old Testament in 1535. "Matthew's Bible" (1537) was approved by royal authority. It contained notes. A new edition (1539)—the "Great Bible"—and another in 1540 with Cranmer's preface—"Cranmer's Bible"—which omitted the notes, supplanted the former. The "Geneva Bible" followed in 1560, with Calvinistic notes. This won great popularity. Archbishop Parker went back to the "Great Bible," and appointed a commission (mostly bishops) to revise it. This produced the "Bishops' Bible" (1568). It also had explanatory notes. It was the "Authorized Version," and was read in the churches. It represented the Church party, while the Geneva Bible retained its place amongst the Puritans, and, in fact, with the popular majority. In 1610 the Roman Catholics also produced a representative version, translated strictly and solely from the Vulgate, and known as the "Douay Bible." In 1604, at the "Hampton Court Conference," it was proposed to supersede the two Protestant versions by a new one satisfactory to both parties. James I. appointed a commission of fifty-four learned men of all parties to do the work, and fixed the rules under which they were to act. The "Bishops' Bible" was to be made the basis, and only altered where necessary. This version was published in 1611, and it gradually displaced the others by virtue of its intrinsic merits. Under the Commonwealth the question of a new version was raised, but the committee of Parliament reported that the English version was "the best in the world." It certainly is one of the very best modern national versions. In 1870 the convocation of Canterbury proposed a revision, which is now in progress. W. G. Sumner.

Bib'lia Pau'perum [a Latin term signifying "the Bible of the poor"]. The work known to bibliographers under this name is one of the earliest "block books" printed before the use of movable type. The printing has been attributed to Lawrence Coster of Haarlem, and was probably printed somewhere between 1410 and 1420. The work consists of a series of cuts illustrating the history of our Lord, as set forth in the New Testament and as predicted in the Old. The descriptive text is in the abbreviated Latin of the time. It has different titles, but Heineken gave it the name which he found attached to a copy which he described. It would seem ill adapted to the wants of the ignorant laity of that time, when few among them were equal to the task of deciphering the letter-press, and without this the engravings would have been meaningless. There seems good reason for the opinion of Jackson and Chatto (*History of Wood-Engraving*), that the work was prepared to aid the mendicant friars of the time in their preaching—the text forming the topic for their sermons, and the pictures an excitement for their imaginations. (See Jackson and Chatto, and Humphreys's "History of Printing.")

Bib'lical Archæol'ogy, the science which treats of those things which illustrate the public and private life of the people and places mentioned in the Bible. Our knowledge of these subjects is obtained from the ancient literature both of the Jews and Gentiles, and from the monumental and other remains of ancient nations, such as inscriptions, ruins, coins, etc. The principal literary sources of archæological knowledge of this kind are the Bible, Josephus, Philo, the rabbinical and Arabian writers, Herodotus, and a great number of modern works of travel and literary research. The monumental sources of knowledge may not improperly include the interesting literary and other remains of ancient Egypt, the coins of the Phœnicians, of the Maccabees, and of the Syrians, the cuneiform inscriptions of Babylon, Assyria, and Persia, the Moabite Stone, and the remains of the ancient cities of Palestine and the neighboring countries. The archæology of the early Christian Church receives light also from the writings of the Fathers, from the later classical authors, and from the catacombs of Rome.

Among the immense numbers of treatises upon this subject we may mention Jahn's "Biblical Archæology" (1796–1805); Robinson's "Researches" (1856); Rheinwald's "Kirchliche Archaeologie" (1830); Kitto's "Cyclopædia" (1845–50); Michælis's "Mosaisches Recht" (1770; 2d ed. 1775); Saalschütz, "Das Mosaische Recht" (1846–48); Raumer's "Palestina" (1650).

Bibliog'raphy [from the Gr. βιβλίον, a "book," and γράφω, to "write"], that science which has for its object the knowledge and description of the literary productions of all ages and races. It is one of the most important auxiliaries in studying the history of science and art. Distinction is often made between pure and applied bibliography. The former considers the books by themselves, and aims merely to show what has been written, while the latter considers the books according to their character and contents. Bibliography is also useful as facilitating the buying and selling of books, while classified catalogues are often valuable to the student of special subjects. Almost every nation, as well as every science, has its own bibliography, and there are also separate lists of scarce and peculiar books, valuable to bibliomaniacs. The German books published since 1700 are given in the "Allgemeine Bücherlexicon" of Heinsius in alphabetical order (vol. i.–xvi., 1812–69). Ersch gave a list of those published since 1750 in his handbook of German literature (1845–49). In Leipsic a trade catalogue is published semi-annually, as well as Hinrich's "Verzeichniss" and the monthly "Allgemeine Bibliographie" of Brockhaus, comprising the most important works of every nation. The French literature has been catalogued since 1811 in the "Bibliographie de la France;" the Dutch in the "Nederlandsche Bibliographie" since 1854; the Belgian in the "Bibliographie de la Belgique" since 1838; the English in Longman's "History of New Books" since 1844; the Italian in the "Bibliographia italiana" since 1861; the Spanish in the "Boletin bibliografico español" since 1860. Danish, Swedish, Hebrew, Greek, and Polish catalogues are also annually published; while the Russian literature is given in the monthly magazine "Russkaja Bibliografija." The new books published in the U. S. are given in the "Literary Gazette" (Philadelphia). Trübner's "American and Oriental Literary Record" (London, monthly since 1865) gives a list of the most important works published in America, China, and India. (For the earlier literature of all nations see Ebert, "Allgemeines bibliographisches Lexicon," 2 vols., 1821–50.)

The oldest known work with this title is De Bure's "Bibliographie Instructive" (1763–68), but there were older and very valuable bibliographies, such, for example, as Conrad Gesner's "Bibliotheca Universalis" (1545). The works of Robert Watt, Dibdin, Horne, and Lowndes in Great Britain, of Peignot, Brunet, Bourquelot, Louandre, and Quérard in France, of Gambia in Italy, of Foppens in Belgium, of Nyerup and Kraft in Denmark, and of Hain and Panzer in Germany, are all of value to the student of general literature. The American works of Allibone, Duyckinck, Rich, Bartlett, and Sabin also deserve mention.

REVISED BY C. W. GREENE.

Bib'liomancy [Gr. *βιβλία*, the "Bible," and *μαντεία*, "divination"], a mode of divination used in both ancient and modern times, by opening the Bible and observing the first passage which occurred, or by entering a church and taking note of the first words of the Bible heard after entering. It seems to have originated with the Jews, and to have been adopted from them by the Eastern Christians. The application either depended upon the sound of the words or upon the signification of the passage. Prayer and fasting were used as a preparation for consulting the divine oracles. Bibliomancy was prohibited, under pain of excommunication, by the Council of Vannes, 465 A. D. It continued, however, to prevail for many centuries thereafter. It came into use in the Roman Catholic Church in the choice of bishops, and prevailed in some places for centuries. Many eminent Protestant Christians have made use of this practice in times of perplexity, as Bunyan and John Wesley.

Biblioma'nia [from the Gr. *βιβλίον*, a "book," and *μανία*, "madness"], a taste for collecting books, not for their intrinsic value, but for their age or rarity, or on account of their publisher's, printer's, or binder's fame, or even, in some instances, for the mere caprice of fashion. For example, a few years since the works of some of the Elzevirs brought fabulous prices, while at present they are sold at a comparatively low rate. First editions usually bring high prices. The works of such ancient printers as Caxton must always be sold high on account of their age; so also the books of Aldus Manutius, joining great textual beauty and accuracy to extreme age; while the productions of much later date are often sought for their beauty alone; such, for instance, are the works of Foulis and Baskerville, printers of the last century.

Bibliothe'ca [from the Gr. *βιβλίον*, a "book," and *θήκη*, a "case"], the Latin word signifying library, a collection of books; often used, like our word "library," as a name for publications of various kinds, as "Bibliotheca Hispana," "Bibliotheca Sacra," etc.

Bice [Ger. *Beis*, possibly from a root cognate with the Sanscrit *bisha* or *bisa*, "poison"], the name of two blue and green pigments which are native carbonates of copper, and have been used by painters from very early times. The blue bice is sometimes called mountain blue and ongaro. The synonyms of green bice are Hungarian green, verdetto, malachite green, mountain green, etc.

Bi'ceps [from the Lat. *bis*, "twice" or "two," and *ca'put*, a "head"], ("double headed"), is the large round muscle lying upon the front of the arm. Above, it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the shallow socket of the head of the humerus. The former is the short, the latter the long, head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon inserted into the tubercle of the radius. The action of the biceps is to bend the fore arm. Another biceps is found on the outer and posterior aspect of the thigh. Its long head arises from the tuberosity of the ischium; its short head, from the *linea aspera* of the thigh-bone. Its tendon is the outer hamstring.

Bicêtre,* the name of an old castle, a hospital, and a fort in the department of Seine, in the southern environs of Paris. The castle, which is very large, has been converted into a hospital for old men and for lunatics. Here the prisoners sentenced to death or to the galleys were formerly kept until the sentence was executed. But in 1837 this prison was transferred to La Roquette. Situated on an eminence, it commands a fine view of Paris and the Seine. Here are accommodations for about 900 male lunatics, who receive gentle treatment.

Bichat (MARIE FRANÇOIS XAVIER), an illustrious French anatomist and physiologist, born at Thoirette, in Jura, Nov. 11, 1771. In 1797 he began to lecture on anatomy, surgery, etc. in Paris. He published "Researches on Life and Death" (1800), and an excellent and profound work entitled "General Anatomy applied to Physiology and Medicine" (4 vols., 1801). He simplified anatomy and physiology by reducing the complex structures of the organs to the simple or elementary tissues, and he was the first who recognized the importance of the distinction between the organic functions and the animal or vital functions. Having impaired his health by close application, he died before the age of thirty-one, July 22, 1802.

Bickanir', a native state of India, under British protection, situated between lat. 27° 30′ and 29° 55′ N., and between lon. 72° 30′ and 75° 40′ E. Area, 17,750 square miles. The soil is poor, consisting almost entirely of deserts. The inhabitants are mostly Rajpoots. Pop. 539,520.

Bickanir, a fortified town, capital of the above state, is in an arid and desolate tract 240 miles W. S. W. of Delhi; lat. 28° N., lon. 73° 22′ E. It is surrounded by a battlemented wall three and a half miles in circuit, and has a citadel, several temples, and lofty buildings, but the streets are dirty and most of the houses mean. Pop. estimated at 60,000.

Bick'erstaff (ISAAC), an Irish dramatist, born about 1735, was in his early life an officer of marines. He produced several popular comedies and comic operas, among which are "The Maid of the Mill," "The Padlock," "Love in a Village" (1763), and "The Captive." Died after 1787. Steele's "Tatler" was published under the assumed name of Isaac Bickerstaff, which often occurs in the papers of that work.

Bick'ersteth (EDWARD), an English theologian, born in Westmoreland in 1786. He took orders in the Anglican Church, and was sent by the Missionary Society to Africa in 1816 to reorganize their mission stations. On his return he was chosen secretary to that society. He became rector of Watton, in Hertfordshire, in 1830, and was one of the founders of the Evangelical Alliance. Among his works, which are highly esteemed, are a "Help to the Study of the Scriptures" (1814), "The Christian Student," "A Treatise on Baptism," and "The Promised Glory of the Church of Christ." Died in 1850. His collected works were published in 16 vols., 1853. (See T. R. BIRKS, "Memoir of the Rev. E. Bickersteth," 2 vols., 1851.)

Bickersteth (EDWARD HENRY), a poet and clergyman of the Church of England, son of the above, was born Jan. 25, 1825, and was educated at Cambridge. He has published, besides numerous other works, "Poems" (1849), "The Rock of Ages" (1859), and "Yesterday, To-day, and For Ever" (1866), which has had a great success. His poetry, chiefly upon sacred themes, has many admirers.

Bick'more (ALBERT SMITH), PH. D., naturalist, was born in St. George's, Me., Mar. 1, 1839, and graduated at Dartmouth in 1860. He studied under Agassiz at Cambridge, and in 1865 sailed for the Dutch East Indies for the purpose of collecting shells. He also travelled in China, Japan, Manchooria, Siberia, and Russia. He became in 1870 professor of natural history in Madison University, and has devoted much time to the Museum of Natural History founded by him at the Central Park, N. Y. He has published "Travels in the East Indian Archipelago" (1869).

Bidasso'a, a small river forming part of the boundary between France and Spain. It rises in Spain, and enters the Bay of Biscay at Fuentarabia. On the Isle of Pheasants, in this river, the treaty of the Pyrenees was concluded in 1659. In Aug., 1813, Wellington defeated the French marshal Soult at San Marcial on the Bidassoa.

Bid'deford, a city of York co., Me., situated on the Saco River, 9 miles from its mouth, on the Boston and Maine and the Portsmouth Saco and Portland R. Rs., 15 miles S. W. of Portland. The city limits measure 12 by 4 miles. It was named from the city of Bideford, England. The first settlement was made at the "Pool" (at the mouth of the river) by Richard Vines, in 1616–17. It was settled by a patent to John Oldham and Vines in 1630. York county originally embraced all of the province of Maine, and while settlements were made at a very early date along the seacoast (none earlier than this) to the Piscataqua River, Bideford or Biddeford for a long series of years was the chief settlement and centre. Here are inexhaustible ledges of granite, which ranks among the best in the world, and is largely exported. The business of the place is manufacturing: among the chief corporations are the Pepperell (capital $1,000,000, three extensive mills, 75,000 spindles, average monthly product 1,200,000 yards of cotton cloth, employs 1600 hands); Laconia (capital $1,200,000, four extensive mills, one in process of erection, about 80,000 spindles, cotton cloth, monthly pay over $20,000); Water-Power Machine Company, largest in Maine or New Hampshire (cotton and woollen machinery, capital $300,000, employs 500 men); Harding Machine Company (capital $75,000); Gas Company (capital $71,600); Paper Collar

*This name is said to be a corruption of *Winchester*. Its castle was founded in 1290 by John, bishop of Winchester.

Company (capital $15,000). A large amount of lumber is also manufactured; valuation, $5,682,402. Assessment, $25 per $1000; annual tax-list, about $83,000; debt, $142,589.76; sinking fund amounts to $20,000. It has two national banks. Biddeford has eight churches and one chapel, and is noted for its church architecture. The average seating capacity, 800; average cost, $20,000. It has one daily and two weekly papers. Pop. in 1850, 6095; in 1860, 9349; in 1870, 10,282.

J. E. Butler, Ed. "Union and Journal."

Bid'dle (Charles John), a son of Nicholas Biddle, was born in Philadelphia in 1819, and graduated at Princeton in 1837. He became a lawyer, served with distinction in the Mexican war, winning a major's brevet, and served also in the late civil war; became editor of the "Age," a leading Democratic journal of Philadelphia, which he conducted with great ability. He published a masterly vindication of Washington's conduct with regard to the execution of André. Died Sept. 28, 1873.

Biddle (Clement), an American officer and merchant, born in Philadelphia May 10, 1740. He fought with the rank of colonel at the battles of Trenton, Princeton, Brandywine, and Monmouth, and quitted the army in 1780. He was a friend and correspondent of Gen. Washington, who appointed him marshal of Pennsylvania. Died July 14, 1814.

Biddle (Clement Cornell), a lawyer, a son of the preceding, was born in Philadelphia in 1784. He served as colonel in the war against the British, 1812–15, and afterwards applied himself to political economy. He produced in 1821 a translation of J. B. Say's "Treatise on Political Economy," with notes. Died in 1855.

Biddle (James), a naval officer, born in Philadelphia Feb. 28, 1783, educated at the University of Pennsylvania, and entered the navy in 1800. He served against Tripoli, where he was a prisoner nineteen months. In the war of 1812 he served with distinction in several engagements, and while commanding the Hornet captured the brig Penguin, receiving a wound in the action (Mar. 23, 1814). For his services he received a gold medal from Congress, besides other honors. He became a captain in 1815. He was afterwards commissioner to Turkey, China, etc., and held other important positions. Died Oct. 1, 1848.

Biddle (John), the founder of English Unitarianism, was born at Wotton-under-Edge, in Gloucestershire, in 1615, and graduated at Oxford. He was prosecuted about 1645 for the expression of heterodox opinions respecting the personality of the Holy Spirit, and after a formal trial by Parliament was condemned to imprisonment for five years. While in prison he published in 1648 a "Confession of Faith concerning the Holy Trinity." He was liberated about 1650, after the death of Charles I., and gathered a congregation of his fellow-believers. He was subsequently persecuted and imprisoned twice during the Commonwealth. It is stated that Cromwell once banished him in order to save his life. He died in prison Sept. 22, 1662. (See J. Toulmin, "Life of John Biddle," 1815.)

Biddle (John). See Appendix.

Biddle (Nicholas), a American naval officer, born in Philadelphia Sept. 10, 1750. He entered the royal navy in 1770, and once served in a ship of which the famous Nelson was mate. He obtained the rank of captain in the U. S. navy in 1776, and took several prizes from the British. Early in 1777 he took command of the Randolph, a frigate, which encountered the Yarmouth, a 64-gun ship, Mar. 7, 1778. During the action that ensued the magazine of the Randolph exploded and killed Captain Biddle, with nearly all his crew.

Biddle (Nicholas), LL.D., an American financier, a nephew of the preceding, was born in Philadelphia Jan. 8, 1786. He was a son of Charles Biddle, who was vice-president of Pennsylvania in 1786–87. He graduated at Princeton in 1801, was elected to the legislature of Pennsylvania in 1810, and appointed a director of the U. S. Bank by President Monroe in 1819. In 1823 he became president of that bank, the affairs of which he managed with great ability and success for many years, so that it supplied the country with a sound and uniform currency. The bill to recharter the bank having been vetoed by President Jackson in 1832, the bank was closed in 1836 by the limitation of its charter. He was soon elected president of a new State bank, called "The United States Bank," which was chartered by the legislature of Pennsylvania. This bank became insolvent in the financial crisis of 1841. He was president of the trustees of the fund ($2,000,000) which Stephen Girard left to found a college for orphans. "To his exertions alone," says Judge R. T. Conrad, "the country owes one of the most beautiful structures of modern times, the Girard College. He proposed the present plan, and in the midst of wild political excitement and opposition persisted firmly, and secured a building which every citizen now not only approves, but applauds." Died Feb. 27, 1844. (See a "Memoir of N. Biddle," by R. T. Conrad, in the "National Portrait Gallery," vol. iv., 1839.)

Biddle (Richard), a lawyer and writer, a brother of the preceding, was born in Philadelphia Mar. 25, 1796. He practised law at Pittsburg, was a member of Congress (1837–41), and wrote a "Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery" (1831). Died July 7, 1847.

Bid'eford, a seaport-town of England, in Devonshire, on the river Torridge, 1½ miles from its entrance into the estuary of the Taw, 30 miles N. W. of Exeter. It has a stone bridge of twenty-four arches, about 680 feet long, a town-hall, a hospital, and manufactures of ropes, sails, earthenware, and leather. Among the articles of export are linen and woollen goods, iron, sails, and naval stores. Vessels of 500 tons can come up to the centre of the town. Pop. in 1871, 6953.

Bidsch'ow, or **Bydcow,** New, a town of Bohemia, is 41 miles E. N. E. of Prague. Pop. in 1869, 5957.

Bid'well, a township of Butte co., Cal. Pop. 337.

Bidwell (Daniel D.), an American general of volunteers, born at Black Rock, now part of Buffalo, N. Y., Aug. 12, 1816. He held various important local offices, and was actively identified with the militia organizations of the city for many years. On the outbreak of the civil war he enlisted as a private soldier, and was promoted to be captain in the Sixty-fifth, and subsequently colonel of the Forty-ninth, New York volunteers. He was engaged in the various actions of the Peninsula campaign, in the battles of South Mountain and Antietam, Fredericksburg, and Chancellorsville, and before Richmond and Petersburg, being most of the time in command of a brigade. In July, 1864, he was commissioned a brigadier-general of volunteers, and assigned to a command under Gen. Sheridan in the Shenandoah Valley, participating in the engagements of that campaign, including the battle of Cedar Creek, Oct. 19, 1864, where he was mortally wounded while gallantly leading his brigade.

G. C. Simmons, *Clerk Board of Eng'rs.*

Biel (Gabriel), "the last of the Schoolmen," was born at Spire, in Germany, after 1442, was professor at Tübingen from the establishment of the university there in 1477, and died in 1495. Although a devout and earnest Catholic, he sided with the Council of Bâle against the pope, and deplored the corruptions and abuses of his time. He is worthy of note as having rejected the doctrine of sensible and intelligible species so widely prevalent among the Schoolmen.

Bie'dermann (Alois Emanuel), a German rationalistic theologian, was born Mar. 2, 1819. He wrote "Die Freie Theologie" (1844), founded the "Kirche der Gegenwart," 1845, and published in 1869 his "Christliche Dogmatik," one of the most important emanations of recent rationalistic theology.

Biedermann (Friedrich Karl), a German journalist and author, born in Leipsic in 1812. He became professor of philosophy and public law at that city, and took part in the political movement of 1848. He has written numerous philosophical and historical works, and conducted various liberal journals.

Bièfve (Édouard de), a Flemish historical painter, born in 1808, studied in Paris with Von Paelink, and lives at Brussels. His chief work is "Compromise of the Burgundian Nobles."

Biela, von (Wilhelm), Baron, a German astronomer, born at Rosla, in Prussia, in 1782, discovered in 1826 the comet noticed below. Died in 1856.

Biela's Comet is a comet remarkable for its short period, of about six and a half years, and for the near approach of its orbit to that of the earth. In 1846 and in 1852 it appeared as if broken into two distinct comets. It has not been observed since 1852, and astronomers are unable to explain its apparent disappearance from the solar system. A shower of shooting stars which occurred Nov. 27, 1872, as the earth was crossing the orbit of this comet, is supposed by astronomers to have been derived from the débris of the lost body.

Bie'lefeld, a walled town of Prussia, in Westphalia, is finely situated on the Minden and Cologne Railway, 20 miles S. W. of Minden. It has a large linen trade, and manufactures of woollen stuffs, leather, soap, and meerschaum pipes. Here is the old castle of Sparrenberg, now used as a prison. Pop. in 1871, 21,803.

Bielef', an old town of Russia, in the government of Toola, and on the river Oka, 70 miles S. W. of Toola. It has a large trade, and manufactures of hardware, leather, and soap. Pop. 8123.

Bielgorai, a town of Russian Poland, in the government of Lublin. Pop. 6168.

Bielgorod, a Russian town, in the government of Koorsk, on the Donitz, 80 miles S. of Koursk. Pop. 8190.

Bie'litz, a town of Austrian Silesia, on the river Biala, 48 miles S. W. of Cracow, with which it is connected by rail. It has an active trade in woollen cloth and cassimeres. Here is a castle of Prince Sulkowsky. A bridge across the river connects Bielitz with Bialia, in Galicia. Pop. in 1869, 10,721.

Biel'la, a town of Italy, in the province of Novara, is on the Cervo, 50 miles by rail N. E. of Turin. It has manufactures of paper, hats, and woollen goods. Pop. 8362.

Bielo'pol, a town of Russia, in the government of Kharkof, on the Vira, 118 miles N. W. of Kharkof. It is on the railway from Orel to Kiev. It has a considerable trade and several distilleries. Pop. 12,178.

Bielzy, a town of Russia, in the province of Bessarabia, 145 miles N. W. of Odessa, has several factories. An annual fair is held here. Pop. in 1867, 6070.

Bienne [Ger. *Biel*], a town of Switzerland, in the canton of Berne, at the N. E. extremity of the Lake of Bienne, 13 miles W. S. W. of Soleure. It is beautifully situated at the foot of the Jura, is enclosed by old walls, and is connected by railways with Berne and Lausanne. Here are manufactures of watches, cotton goods, etc. Many Roman coins have been found at Bienne, which is a place of great antiquity. Pop. in 1870, 8113.

Bienne, Lake of, is in the Swiss canton of Berne. It is 10 miles long, 3 miles wide, and 250 feet deep, is near the base of the Jura Mountains, and has an elevation of 1419 feet above the sea. The Thiele passes through it before joining the Aar. It encloses the island of St. Pierre, which was the residence of J. J. Rousseau in 1765. In digging peat, which is extensively procured from its marshy border, the remains of a pre-historic village of lake-dwellings has been found on the S. E. side of the lake.

Biennial Plants, a term including all plants which live longer than annuals, and not so long as perennials. They grow the first season without flowering, and produce flowers in the second season, at the end of which they die. Such are the turnip, parsnip, beet, and many other plants which are cultivated. Many biennials, if sown early in the spring, will flower in the summer or autumn of that year, and become annuals. In botanical books, biennial plants are often designated by the symbol of the planet Mars, ♂.

Bien'ville, a parish in the N. W. of Louisiana. Area, 680 square miles. It is bounded on the W. by Lake Bistineau (navigable by steamers), and drained by Saline Bayou and other streams. The soil produces cotton and maize. Capital, Sparta. Pop. 10,636.

Bienville, de (JEAN BAPTISTE LEMOINE), a French officer and pioneer, born in Montreal Feb. 23, 1680, was a brother of Lemoine d'Iberville. He accompanied the latter in an expedition to the mouth of the Mississippi in 1699, and was three times appointed colonial governor of Louisiana. He founded New Orleans in 1718. Died in France in 1768.

Bier'stadt (ALBERT), an eminent painter, born at Düsseldorf in 1829, was brought to the U. S. by his parents in 1831. He studied at Düsseldorf, visited Rome, and returned to the U. S. in 1857. He took part in General Lander's expedition to the Rocky Mountains in 1858. Among his works are a magnificent "View of the Rocky Mountains—Lander's Peak" (1863), "A Storm in the Rocky Mountains," and "The Domes of the Yosemite."

Bi'ga (or **Bi'gæ,** a plural form with the same signification), a term applied by the ancient Romans to a vehicle drawn by two horses abreast; a two-horse chariot used in processions and games. Like the Greek war-chariot, it had two wheels, was low and open behind, and higher and closed in front. Figures of the bigæ are often found upon ancient coins.

Big'amy [Lat. *bigamia*], the offence of contracting a second marriage while a former marriage is still subsisting. The more proper term for this offence is polygamy. It is governed by statute. It is usual to provide that if a husband or wife shall remain absent for a specified number of years (seven) without being heard from or being known to be living, and the other party shall marry again, no crime will be committed, though the absent party be alive. The same rule extends to the case of a party divorced from the bonds of matrimony. In some of the States a person divorced for his or her own adultery cannot marry again during the life of the other party. A violation of this rule is not a case of bigamy, but rather a breach of the prohibitory statute. A sentence to imprisonment for life is in New York a dissolution of a marriage, so that the parties may lawfully marry other persons. The offence consists in the act of marrying; so that if the parties marry in one State and cohabit in another, the crime is committed solely in the place of the marriage, and can only be prosecuted there. In a prosecution for bigamy an *actual* marriage must be established. Evidence of reputation, or even of cohabitation, will not suffice. It does not follow that proof of a ceremonial marriage is necessary. The law of the States differs upon that point, some holding that a case of bigamy may be established by proof of consent before witnesses, without any ceremony. Such is the law in New York.

Big Beaver, a township of Beaver co., Pa. P. 1559.

Big Beaver, a township of Lawrence co., Pa. P. 1406.

Big Bethel, the name given to the action of June 10, 1861. Gen. Butler, who had taken possession of and fortified Newport News a few days previously, found the Confederates under Gen. Magruder in possession of all the commanding points in his front; he accordingly directed a reconnoissance in force to be made, with the object of surprising and capturing the position called Little Bethel; and to make the expedition more certain of success two regiments, Duryea's Zouaves and the Third New York under Col. Townsend, were to start about midnight of the 9th, and gain the rear of the position to prevent retreat, while a battalion of Vermont troops, Col. Phelps, and a New York regiment, Col. Bendix, were to be ready to attack in front by daybreak of the 10th. Though various precautions had been taken against mistake, the commands of Cols. Bendix and Townsend approaching each other near daybreak, Col. Bendix's command opened fire on the Third New York, killing two men and wounding a considerable number, and throwing the whole command into confusion before the mistake was discovered. The Confederates, being thus notified, retreated to Big Bethel, where they hastily threw up breastworks behind a deep creek. Gen. Pierce, who was in command of the Federal expedition, after being reinforced, and finding Little Bethel deserted, advanced towards Big Bethel, a few miles to the N., where he found a Confederate force, estimated at 1800, under the command of Col. J. B. Magruder, a graduate of West Point, protected by the hastily constructed earthworks. Gen. Pierce ordered an attack, which was continued nearly four hours, during which time the Federal troops were exposed to a deadly fire, while the Confederates were almost entirely protected. Later in the day a more general assault was made, led by Major Theodore Winthrop, in which he was instantly killed while encouraging his men to the assault. Gen. Pierce finally ordered a retreat, which was effected in good order, the Confederates following at some distance with cavalry. Lieut. John T. Greble of the Second U. S. Artillery was killed while covering the defeated troops. The Confederates, fearing reinforcements of the Federals from Fortress Monroe, fell back that night to Yorktown. The Federal loss in killed and wounded was about 100 men; the Confederate loss was said to be only 1 killed and 7 wounded.

Big Black, a river of Mississippi, rises in Choctaw co., flows south-westward, and enters the Mississippi at Grand Gulf. Length, about 200 miles. It is navigable for steamboats for 50 miles. General Grant's army, moving to the siege of Vicksburg, defeated the Confederates on the Big Black, nearly 15 miles E. of that town, May 12, 1863. The morning after the battle of Champion Hills, May 17, 1863, found the Confederate forces under Pemberton strongly posted on both banks of the Big Black River. The works were successfully assaulted, and all the troops on the E. bank, with seventeen pieces of artillery, captured, the remainder of Pemberton's army retreating to the fortifications of Vicksburg.

Big Bone Lick, a salt "lick" or spring in Boone co., Ky. It takes its name from the fossil bones found here of the mastodon and other animals, which are thought to have resorted to this place to "lick" the salt earth, and to have perished in the marshy soil.

Big Bottom, a township of Independence co., Ark. Pop. 938.

Big Creek, a township of Limestone co., Ala. P. 1140.

Big Creek, a township of Craighead co., Ark. P. 487.

Big Creek, a township of Fulton co., Ark. Pop. 535.

Big Creek, a township of Hot Springs co., Ark. Pop. 158.

Big Creek, a township of Phillips co., Ark. Pop. 1699.

Big Creek, a township of Sebastian co., Ark. P. 1062.

Big Creek, a township of Sharpe co., Ark. Pop. 414.

Big Creek, a township of White co., Ind. Pop. 584.

Big Creek, a township of Black Hawk co., Ia. Pop. 1394.

Big Creek, a township of Ellis co., Kan. Pop. 6.

Big Creek, a township of Neosho co., Kan. P. 1077.

Big Creek, a township of Cass co., Mo. Pop. 1097.

Big Creek, a township of Henry co., Mo. Pop. 1390.

Big Creek, a township of Taney co., Mo. Pop. 267.

Big Creek, a township of McDowell co., West Va. Pop. 688.

Bigelow (Erastus Brigham), LL.D., an eminent inventor, born in West Boylston, Mass., April, 1814. While a mere boy, he invented a loom for suspender-weaving and other machines, and wrote a book on short-hand writing. He subsequently invented looms for counterpanes (1838–40), another for coach-lace, and in 1839 brought out his well-known carpet loom. He is one of the principal manufacturers of Clinton, Mass. He published "The Tariff Question" (1862) and other works.

Bigelow (George Tyler), LL.D., was born at Watertown, Mass., Oct. 6, 1810, and graduated at Harvard in 1829. He was a State senator of Massachusetts (1847–48), a justice of the State supreme court (1850–61), and chief-justice (1861–68).

Bigelow (Jacob), M. D., LL.D., an eminent American physician and botanist, born in Sudbury, Mass., in 1787, graduated at Harvard in 1806. He became professor of materia medica and clinic medicine at Harvard, and president of the Massachusetts Medical Society. He practised medicine in Boston many years, founded the Mount Auburn Cemetery, and laid out the grounds with much taste. Among his works are "American Medical Botany" (3 vols. 8vo, 1817–21), an able "Discourse on Self-limited Diseases" (1835), "Nature in Disease" (1854), and "History of Mount Auburn" (1860).

Bigelow (John), an author and diplomatist, born in Malden, N. Y., Nov. 25, 1817, graduated at Union College in 1835. He contributed numerous articles to the "Democratic Review," and in 1850 became managing editor of William C. Bryant's journal, the "New York Evening Post." Having visited Jamaica in that year, he published "Jamaica in 1850, or the Effects of Sixteen Years of Freedom on a Slave Colony." He was appointed American consul at Paris in 1861, and minister plenipotentiary at that court in April, 1865. He resigned this position in 1866. He published in Paris "Les États Unis d'Amérique en 1863," and in 1871 a work on the French monarchy. He has also edited the "Autobiography of Franklin" (1868).

Bigelow (Timothy), born in Worcester, Mass., Aug. 12, 1739, was a blacksmith who became a member of the provincial Congress of 1774–75, entered the Revolutionary army as captain of minute-men in 1775, was captured at Quebec, became a colonel of Massachusetts troops, serving at Stillwater, Valley Forge, etc. Died Mar. 31, 1790.

Bigelow (Timothy), a son of Col. Timothy Bigelow, was born in Worcester, Mass., April 30, 1767, graduated at Harvard in 1786, practised law in Groton and Boston, Mass., where he long stood at the head of his profession, performing an immense amount of legal work. He was also long a prominent Federalist leader. Died May 18, 1821. His daughter became the wife of Abbott Lawrence.

Big Flat, a township of Searcy co., Ark. Pop. 472.

Big Flats, a post-township of Chemung co., N. Y. Pop. 1902.

Big Flats, a post-township of Adams co., Wis. P. 89.

Big Fork, a township of Montgomery co., Ark. P. 206.

Big Fork, a post-township of Polk co., Ark. P. 274.

Big'ger, a township of Jennings co., Ind. Pop. 945.

Big Grove, a township of Kendall co., Ill. Pop. 1726.

Big Grove, a township of Benton co., Ia. Pop. 856.

Big Grove, a township of Johnson co., Ia. Pop. 1358.

Biggs'ville, a post-village of Henderson co., Ill. Pop. 353.

Big Horn, or **Rocky Mountain Sheep** (*Ovis montana*, Cuvier), is regarded by Cuvier as identical with the argali of the Old World. It also resembles the wild sheep (*moufion*) of the Mediterranean Islands and of the Atlas Mountains. It is very large and extremely wild, and is found in the western and north-western mountains of North America. Its flesh is highly prized, but its hair can hardly be called wool.

Big Horn, a county in the S. E. part of Montana. Area, 25,862 square miles. It is drained by the Yellowstone and its branches. Lignite and other minerals are found here. Pop. 38.

Big Horn, a river of the U. S., is the largest affluent of the Yellowstone. It rises in Wyoming Territory, among the Wind River Mountains, and, flowing in a generally northward direction, crosses the southern boundary of Montana, and enters the Yellowstone at Big Horn City, in Montana. Entire length, estimated at 450 or 500 miles. The upper part or head-stream of it is called Wind River.

Big Island, a township of Marion co., O. Pop. 940.

Big Ivey, a township of Buncombe co., N. C. Pop. 1270.

Big Lake, a township of Mississippi co., Ark. Pop. 211.

Big Lake, a township of Sherburne co., Minn. Pop. 57.

Big'ler (John), born in Cumberland co., Pa., Jan. 8, 1804, was a brother of Gov. William Bigler of Pennsylvania, became a printer, a journalist, and subsequently a lawyer. He removed to Illinois in 1846, and to California in 1849, where he was a prominent Democratic politician, and was known as "Honest John Bigler." He was governor of California (1852–56). Died Nov. 30, 1871.

Bigler (William), governor of Pennsylvania, born Dec., 1813, was of German descent. He received a common-school education, and entered a printing-office. He was connected with the press many years, and afterwards engaged in mercantile pursuits. He was elected by the Democratic party speaker of the State senate 1843, governor 1851 and 1854, and U. S. Senator 1855 and 1858.

Big Level, a township of Greenbrier co., West Va. Pop. 1589.

Big Lick, a post-township of Stanley co., N. C. Pop. 1354.

Big Lick, a township of Hancock co., O. Pop. 1179.

Big Lick, a post-village and township of Roanoke co., Va., on the Virginia and Tennessee R. R., 54 miles W. S. W. of Lynchburg. Pop. of the township, 2592.

Big'low (William), an American teacher and poet, born at Natick, Mass., Sept. 22, 1773. He graduated at Harvard in 1794, and became principal of the Latin School of Boston, for which he prepared several text-books. He contributed to different periodicals, and wrote poems, among which is "The Cheerful Parson." Died Jan. 19, 1844.

Big Mound, a township of Wayne co., Ill. Pop. 1168.

Bignon (Louis Pierre Édouard), a French statesman and historian, born at La Meilleraye Jan. 3, 1771. He was elected to the Chamber of Deputies in 1817, and became a peer of France in 1837. He wrote a "History of France from the 18th Brumaire to the Peace of Tilsit" (7 vols., 1827–38), and other works. Napoleon I. bequeathed him 100,000 francs. Died Jan. 5, 1841.

Bigno'nia [named by Tournefort in honor of the Abbé Bignon, the librarian of Louis XIV.], a genus of plants, the type of the natural order Bignoniaceæ, natives of the tropical and sub-tropical parts of America. Many of them are climbing plants, with compound leaves terminating in a tendril, and handsome trumpet-shaped or bell-shaped flowers, which are 5-lobed, or rather 2-lipped. The *Bignonias* are probably the handsomest twining plants known." The trumpet-creeper or trumpet-flower of the U. S. is the *Bignonia radicans* (or *Tecoma radicans*). It has a large and showy orange and scarlet corolla, funnel-shaped and 5-lobed, with four stamens.

Bignonia'ceæ (so called from *Bignonia*, the principal genus), a natural order of exogenous plants, natives of the U. S. and of tropical climates. They are mostly trees or shrubs, with compound leaves and showy flowers. The corolla is monopetalous, tubular, or campanulate, and irregular; the stamens are five, or four with the rudiment of a fifth; the fruit is a capsule or a drupe. The order comprises about 500 species or more, including those which some botanists have placed in the separate orders of Crescentiaceæ and Pedaliaceæ. Some of them are noble trees which are valuable for timber, as the *Bignonia Leucoxylon* of Jamaica, and the ipe-una of Brazil, which is said to be the hardest timber of that empire. The red coloring-matter called chica is obtained from the leaves of the *Bignonia Chica*, which grows near the Orinoco River. Among the North American species of this order is the *Catalpa Bignonioides*, a well-known ornamental tree of the U. S., which has simple cordate leaves.

Big North Fork, a township of Fulton co., Ark. Pop. 473.

Big Oak Flat, a post-township of Tuolumne co., Cal. Pop. 1249.

Big Piney, a township of Pulaski co., Mo. Pop. 541.

Big Prairie, a post-township of Newaygo co., Mich. Pop. 403.

Big Prairie, a township of New Madrid co., Mo. Pop. 1089.

Big Rapids, a township of Clare co., Mich. Pop. 132.

Big Rapids, a city, capital of Mecosta co., Mich., on

the Muskegon River and Grand Rapids and Indiana R. R., also the terminus of the Big Rapids division of the Chicago and Michigan Lake Shore R. R., 56 miles N. of Grand Rapids and 55 miles N. of Muskegon. It has two banks, one national and one under State law, two newspapers, Holly Waterworks, extensive water-power, the river being dammed in two places, a heavy lumber trade, and large manufacturing interests. Pop. 1237; of the township, 1702.
E. O. Rose, Ed. "Magnet."

Big River, a tp. of Mendocino co., Cal. Pop. 1911.

Big River, a township of Jefferson co., Mo. Pop. 2033.

Big River, a township of St. Francois co., Mo. Pop. 436.

Big Rock, a township of Pulaski co., Ark. Pop. 3990.

Big Rock, a post-township of Kane co., Ill. Pop. 829.

Big Sandy, a township of Jefferson co., Neb. Pop. 693.

Big Sandy, a tp. of Kanawha co., West Va. Pop. 876.

Big Sandy River, an affluent of the Ohio, is the boundary between West Virginia and Kentucky. It is navigable for more than 100 miles for steamboats. Its main stream, or Tug Fork, rises in the S. of West Virginia. Its West Fork flows through Eastern Kentucky. Its valley abounds in coal, timber, and mineral wealth.

Big Spring, a township of Fulton co., Ark. Pop. 228.

Big Spring, a post-tp. of Shelby co., Ill. Pop. 1755.

Big Spring, a post-village of Breckinridge co., Ky., lying partly in Hardin and Meade cos. A large spring rises here which sinks into the ground and disappears after flowing a few hundred feet. Pop. 134.

Big Spring, a township of Seneca co., O. Pop. 2084.

Big Stone, a county of Minnesota, bordering on Dakota, from which it is partly separated by Big Stone Lake. Area, 325 square miles. It is intersected by the Minnesota River. Pop. 24.

Big Valley, a township of Siskiyou co., Cal. P. 246.

Big Vermilion River. See Vermilion River.

Big Wood (Boisé, or Boisée) River, of Idaho, rises in or near the Salmon Mountains, flows westward, and enters the Lewis or Snake River on the line between Idaho and Oregon. Gold is found near this river.

Bihar, a county of Hungary, is bounded on the N. by the county of Szabolcs, on the E. by the county of Middle Szolnok and Transylvania, on the S. by Arad, and on the W. by Bekes. Area, 4279 square miles. The eastern part is mountainous, while the western is a plain, consisting alternately of swamps, sandy plains, and fertile ground, traversed by numerous small rivers. All kinds of grain abound, especially wheat of an excellent quality. Wine and tobacco are also raised in great quantities. Pop. in 1869, 555,337. Chief town, Debreczin.

Biisk, a town of Siberia, in the government of Tomsk, 300 miles S. of Tomsk. Pop. in 1867, 5952.

Bij'anagur', Bijnagur, or **Bijanaghur,** a decayed but once famous city of Southern India, in the presidency of Madras, on the Tumbuddra, about 40 miles N. W. of Bellary. It stands in a plain containing numerous granite rocks, many of which have been rudely sculptured into various forms. It was founded in 1336, and was the capital of a powerful Hindoo kingdom. It was sacked and ruined by the Mohammedans of the Deccan in 1564, but still presents traces of its former grandeur in a number of granite temples and palaces.

Bij'nee, a rajahship of British India, in Bengal, having on the S. the Garrows Mountains, and crossed by the river Bramapootra. It is level and fertile, producing rice, wheat, sugar, and betel. The people are divided between the Bhakat worshippers of Krishna, and the Gorami, who eat meat and drink liquors.

Bilba'o, often written in English **Bilbo'a,** a seaport-town of Spain, capital of the province of Biscay, is situated on the river Nervion, near the Bay of Biscay, and 28 miles N. W. of Vitoria; lat. 43° 15′ N., lon. 2° 54′ W. It is partly enclosed by high mountains, and is well built. Small vessels can ascend the river to this point, which is here crossed by several bridges. Bilbao has a cathedral and a number of convents; also manufactures of hardware, hats, leather, paper, and earthenware. The chief articles of export are wool, iron, oil, and fruits. This town was founded in 1300, and was first called *Belcao*, and about 1500 was the seat of a famous commercial tribunal. Pop. in 1860, 17,969.

Bil'berry, or **Whortleberry,** the fruit of various small shrubs, of the genera *Vaccinium* and *Gaylussacia*, and of the natural order Ericaceæ, natives of North America and Northern Europe. These fruits, under the name of huckleberries and blueberries, are extensively used in the Northern U. S. and Canada.

Bil'derdijk' (Willem), an eminent Dutch poet and philologist, born in Amsterdam Sept. 7, 1756, was a man of great erudition and versed in many languages and sciences. He studied law, and practised as an advocate at The Hague. About 1808, Louis Bonaparte appointed him president of the Institute of Holland. He was the author of many poems, tragedies, and prose works, which had a high reputation, and display a vigorous imagination. Among his important works are "Elius" (1778), "Miscellaneous Poems" (1799), "Rural Life," and an epic poem called "The Destruction of the First World." Died at Haarlem Dec. 18, 1831.

Bildt, a town of Holland in Friesland. Pop. 8362.

Bile [Lat. *bilis*], the secretion of the liver in animals. In all vertebrates it is formed chiefly from the blood of the portal vein, which is mingled, however, to some extent with that of the hepatic artery. It is secreted slowly during the intervals of digestion, attaining its maximum (according to Dalton) about an hour after eating. It is in man a yellowish-green, viscid fluid, with a bitter taste and a peculiar smell. In carnivorous animals it is brownish-yellow; in herbivorous, greenish. From twenty to fifty ounces of it are secreted daily in a man. A portion of bile is commonly detained in the gall-bladder, where it becomes more dense by the loss of water and the addition of mucus.

Bile contains certain resinous, coloring, and saline constituents. The biliary resin, or *bilin*, consists of cholic (glycocholic) and taurocholic acids, combined in man with soda; also with a little cholesterin, a fatty body. These acids are formed in the liver, not being present in the blood, unless from absorption after their elaboration in the liver. Cholesterin and the coloring-matter of the bile are probably present in the blood. Arrest of their removal causes unpleasant, sometimes serious, symptoms, recognized under the term "biliousness."

Entering by the common biliary duct into the duodenum, the bile aids in the digestion of food, especially of fat; and the greater part of it is then reabsorbed from the small intestine. A portion, however, is excreted with the fæcal discharge. Bile stimulates the peristaltic muscular action of the bowels, being the natural laxative. It acts also as an antiseptic to the almost putrescent contents of the large intestine. Solidification of the components of the bile (especially of cholesterin) causes gall-stones, the passage of which through the duct often produces extreme pain.

The gall-bladder is not always present, even in the higher animals. Oxen, sheep, and antelopes have it, but not deer or camels. It is absent in the elephant and horse, but present in the hog. All carnivora have it. Among birds, the ostrich, pigeon, and many parrots are without it. Some species of the same genus have it, and others not. (See Digestion.) It is interesting to observe that the bile of salt-water fishes contains potash in place of soda, although from their being surrounded by much common salt (chloride of sodium) in the sea-water, we should naturally expect to find soda in abundance; and the bile of land and fresh-water animals contains soda, while, considering diet and habitat, potash might more naturally be looked for.
Henry Hartshorne.

Bilin' [Lat. *Belina*], a town of Bohemia, beautifully situated in the valley of the Bila, 17 miles W. of Leitmeritz. It has celebrated mineral springs which are much frequented, and two castles. Near Bilin is a remarkable isolated clinkstone rock called *Bilíner Stein*, or Borzenberg. The well-known polishing-powder of Bilin is bergmehl. Pop. 3862.

Bilious Fever. See Fever.

Bill, or **Beak** [Lat. *rostrum*; Fr. *bec*], the hard, horny mouth of birds, consists of two parts called the upper and lower mandibles, which may be regarded as mere extensions of the upper and lower jaws. It is not furnished with teeth, but the bills of the tribe Dentirostres have notches like teeth, and Prof. Marsh has discovered a fossil bird at Fort Harker, Kan., with true teeth. The bill is the principal weapon of offence and defence of many birds, and is an important character on which the distinctions of the orders are founded, the various forms of the bill being intimately connected with the peculiar habits of birds. These forms are especially adapted to the nature of the food on which the bird subsists, and to the operations by which that food must be procured. In birds of prey (Raptores), the upper mandible is hooked and sharp, and the whole bill is adapted for seizing animals and tearing their flesh; birds that feed on seeds have short, strong, and conical bills; while humming-birds have long, straight, and slender bills, fitted to insert into long, tubular corollas. Many aquatic birds have broad, obtuse, and comparatively soft and sensitive bills, with laminæ on the inner margin in order to strain the mud in which they find their food. At the base of the upper mandible is a membrane called the *cere*, which in many birds is naked, in others feathered.

Bill, in law, a formal statement or declaration in writing. It is commonly used in connection with some descriptive word. The principal cases will be considered separately. Bills may be conveniently arranged under the following classes:

1. Contracts and commercial instruments—bill of exchange, bill of lading, bill of credit, bill of sale, single or penal bill.

2. A project of law pending before a legislature, as in the U. S. Constitution. Article I., section 7, "bills for raising revenue." After such a bill becomes a law, it is usually termed an "act."

3. Laws actually passed by the legislature, as a bill of indemnity, a bill of attainder or of pains and penalties.

4. Constitutional instruments or provisions—"bill of rights."

5. In mercantile and ordinary usage—bill of goods, bill of health, bill of mortality, bill of parcels, bills payable and receivable.

6. In pleadings, criminal and civil—original bill, bill of Middlesex, bill of indictment, bill of privilege, bill in equity.

7. In legal practice—bill of costs, bill of exceptions, bill of particulars.

Bill, Brown-bill, or **Gisarme,** an ancient weapon of the English infantry for fighting at close quarters. It differed from the battle-axe in its sickle-shaped blade, to which a drawing stroke was given. The bill was used by the English at the battle of Hastings, and finally went out of use in consequence of the introduction of firearms. Similar weapons were used by mounted troops, as well as infantry, both in England and on the Continent. The partisans with which the yeomen of the Guard in England are armed, and the halberd, are derived from the ancient bill.

Bil'lerica, a beautiful post-village of Middlesex co., Mass., on the Boston and Lowell R. R., 18 miles N. by W. of Boston. It has five churches, an academy, and important manufactures. Pop. of Billerica township, 1833.

Bil'leting, a mode of feeding and lodging soldiers when they are not in camp or barrack. It is a compulsory process by which soldiers obtain food and lodging in taverns, inns, or private houses. In 1745 all persons in England were exempt from this burden except certain traders. The persons liable to have soldiers billeted on them in England at present are the keepers of hotels, inns, public-houses, ale-houses, beer-shops, wine-shops, livery-stables, and such-like licensed places. Those who supply food and lodging receive tenpence per day for each soldier.

Bil'liards [Fr. *billard*], a game played with ivory balls upon a rectangular table having resilient sides. The balls are put in motion by means of rods called *cues* held by the players. The place of the origin of this game is variously given as in the East, in France, and in Italy, and the date is entirely uncertain. Shakspeare alludes to this game in "Antony and Cleopatra," but this is undoubtedly an anachronism. The rules of the game vary somewhat in different countries. Various games are played at present in the U. S., the French three-ball game being considered the best. This game requires great skill and quickness of hand and accuracy of sight, and is one of the most popular of games. (See PHELAN, "The Game of Billiards.")

Bill in Eq'uity. This is a statement of the plaintiff's case in a suit in court of equity. A bill is either original or not original. An original bill initiates the suit; a bill not original is used to controvert or suspend or revise a proceeding in the cause, as a decree or order, or for cross-litigation. Particular suits receive special names, with which the word *bill* is connected, such as "bill of peace," "bill of interpleader," "bill of discovery," "cross bill," etc., etc.

Billings, a post-village of Christian co., Mo., 261 miles S. W. of St. Louis, on the Atlantic and Pacific R. R., is the seat of South-western Christian College and the Christian Colony. It is beautifully situated, and has one monthly newspaper, a steam flouring-mill, wagon and plough factory, several stores, etc. Chalybeate springs are within 10 miles.

W. H. GOODLOE, ED. "CHRISTIAN MONTHLY."

Bil'lings (ELKANAH), geologist, was born in Canada May 5, 1820. His father was a native of Massachusetts. In 1845 he was called to the bar, but since 1856 has acted as palæontologist to the Canadian geological survey. He has published valuable scientific memoirs and other important contributions to the geology and natural history of Canada.

Billings (JOSEPH), an English navigator who entered the service of Catherine II. of Russia in 1785. He commanded an exploring expedition sent out by that sovereign in 1787. He explored the coast of Alaska, discovered several islands in the Arctic Ocean, and returned in 1791.

Billings, Josh, the pseudonym of Mr. A. W. Shaw of Poughkeepsie, N. Y., an American humorist, who is known by his "Allminax" and other works.

Billings (LUTHER G.), U. S. N., born in New York in 1840, entered the navy as an acting assistant paymaster Oct. 24, 1862, became an assistant paymaster in 1865, and a paymaster in 1866. He served in the steamer Waterwitch when she was captured by Confederates on the morning of June 3, 1864, and fought gallantly in her defence. Lieutenant-Commander Austin Pendergrast, in his detailed report of Oct. 22, 1864, says: "Notwithstanding the defeat I have sustained, I cannot close this report without recommending to the kind consideration of the department the gallant conduct of those officers and men who so bravely defended their ship. To C. W. Buck, acting master, Acting Ensigns Charles Hill and A. D. Storer, Acting Assistant Paymaster L. G. Billings, Acting Master's Mate C. P. Weston, Coast-pilot R. B. K. Murphy, Henry Williams, captain of the hold, John Williams, captain of the afterguard, John Parker, gunner's mate, and John Y. Hazelton, cockswain, I am indebted for a cordial support in the defence of the ship; and though every one of them was wounded, and many of them threatened with instant death unless they would say that they surrendered, I am proud to say that not one of them disgraced himself by doing so."

FOXHALL A. PARKER, U. S. N.

Billings (WILLIAM), an American musical composer, was born in Boston, Mass., Oct. 7, 1746. He introduced a new style of church-music, which became very popular in New England. Died Sept. 26, 1800.

Bil'lingsgate, a wharf and fish-market of London, below London Bridge, which was made a "free and open market for all sorts of fish" in 1699. It is the only wholesale fish-market in London, and all fish, fresh or cured, if imported in British vessels, are admitted free of duty. All fish are sold here by tale, except salmon and eels, which are sold by weight; oysters are sold by measure. No fish are sold on Sunday except mackerel. The women who vended fish here were formerly notorious for ribaldry and vituperative personalities, so that "Billingsgate" became a synonym of vulgar and foul expressions.

Bill'ion, in the French system of numeration, is a thousand millions, but it is used by the English to denote a million millions—1,000,000,000,000.

Bil'liton, or **Billeton,** a Dutch island in the East Indies, is situated between Borneo and the S. E. end of Sumatra, and is separated from Banca by Clement's (or Gaspar) Strait. It is about 3° S. lat., and 108° E. lon. Area, estimated at 1150 square miles. Iron ore and good timber abound here. Trepang, tin, birds' nests, and tortoise-shells are exported from it.

Bill of Attain'der is a legislative enactment declaring the attainder of one or more persons. (See ATTAINDER.) Formerly, persons were often attained of high treason in England by act of Parliament, and during the war of the Revolution bills of attainder were frequently passed in this country. The Constitution of the U. S. provides that neither a State nor Congress shall pass bills of attainder. Such a bill is usually opposed to sound legislation in four principal respects: It is adopted by the legislature, instead of being a sentence by the judiciary; it departs from judicial rules in establishing the commission of the alleged criminal act, having no regular methods of trial or rules of evidence; it may declare an act to be a crime which was not so when committed; and it admits of the infliction of cruel and unusual punishments. (An instance of such a bill is found in FROUDE'S "History of England," i., 286.)

Bill of Credit, in law. (1), in mercantile law, a letter written by one person to another authorizing or requesting him to give credit to a third or his order, or to bearer. Such a letter is either general or special. It is general when addressed to any one who may see fit to give the proposed credit, and who on giving credit may have recourse to the writer of the letter. On such a letter several persons may successively give credit. The letter is said to be special when addressed to specified persons in such a way that no other persons but those specified can give the credit.

2. Under the U. S. Constitution. That instrument provides that no State shall "emit bills of credit." This expression is construed by the courts to mean instruments issued for the payment of money—issued on the credit of the States as such, payable at a future day, and intended to circulate as money. The clause does not prevent a State from issuing bonds for the payment of its indebtedness, payable at a future day; nor is it supposed to prohibit the creation of banks, which issue currency. The provision aims at the use of the credit of the State in its corporate character.

Bill of Excep'tions, a formal statement in writing

of exceptions taken to the opinion, decision, or direction of a judge during a trial. It sets forth the proceedings at such trial, the decision or ruling made, and the exception thereto, signed and sealed by the judge in testimony of its correctness. The object of a bill of exceptions is to bring the alleged error of the judge before the proper court for review, and it usually contains only such portion of the proceedings and evidence taken at the trial as is necessary for that purpose. (The details of the subject will be found in TIDD and other works on legal practice.)

Bill of Exchange, an open letter of request, whereby one person requests another to pay a third or his order or bearer a sum of money, absolutely and at all events. The person who writes the letter is called the *drawer;* the one to whom it is addressed is termed the *drawee;* and the person who is to receive the money is the *payee*. A bill of exchange is either inland or foreign. Where the parties are in the same State, it is inland; where the drawee resides in a State or country different from that of the drawer, or in any case where the bill is drawn in one State upon a person in another, it is foreign. A bill may be considered under the following heads – 1, its nature; 2, endorsement; 3, acceptance; 4, presentment for payment, and steps to be taken to charge drawer and endorsers.

1. A bill of exchange having all the requisites referred to in the definition as above given is *negotiable*. By this word is meant that a transfer of it in good faith before maturity will give the purchaser a right of action in his own name in a court of law, as distinguished from a court of equity; and he accordingly takes a title free from defences that may have existed between the original parties. But if any of the qualities referred to in the definition are wanting, *negotiability* does not exist. The paper becomes assignable, and the defences between the original parties are let in. Negotiability, however, assumes that the instrument has a legal existence as to its outward form, and is accordingly executed by a person competent to contract. A bill of exchange drawn by or upon a married woman or an infant would not create a valid obligation even as to a purchaser in good faith. So if the instrument were declared void by statute, as is sometimes the case when infected with usury or given for a gaming consideration. Under these rules, if an instrument otherwise in the form of a bill of exchange were payable in something other than money, or upon a contingency, or from a special fund, or to a particular person, without the addition of the words "order" or "bearer," it would not be negotiable. The law presumes that a bill is given for a valuable consideration. Evidence may be offered as between the original parties, and as to all who cannot insist upon the protection of negotiability, that there is no consideration. An important distinction thus arises between what may be called business paper and accommodation paper. The former is given for a valuable consideration as between the original parties, such as for money lent or goods sold. In accommodation paper there is no such consideration, but the person who makes it intends to lend his credit to some person. Every party to a bill may hold this relation to it. Thus, there may be an accommodation acceptor, drawer, or endorser. This kind of paper must be distinguished from that which is simply without consideration, in which there is no *intent* to have the credit of the party who makes it used. A single illustration will show the distinction. If a friend should draw a bill in favor of his friend on account of his affection, it would be simply without consideration: if under the same circumstances it was drawn with intent to have it discounted by a bank, it would be "accommodation paper." In the one case, if a purchaser should acquire it with knowledge of all the circumstances, he could not enforce it, while in the other case he could, by reason of the intent. When accommodation paper has been acquired for value, it is substantially equivalent, as far as the holder is concerned, to business paper. Between the original parties it would have no validity, and could not supply the basis of an action. On the contrary, if an accommodation party to the bill is obliged to pay, he has his remedy against the party in whose favor he acted, either on the bill or on an implied contract, as the case may be. Thus, an accommodation acceptor could not bring an action *upon the bill* against the drawer whom he had accommodated, but would be driven to an action on an implied contract on the part of the drawer to repay money which had been paid for the drawer's use and benefit. When one party gives his acceptance to another in return for the other's acceptance, it is not a true case of an accommodation acceptance, though sometimes so called. These "cross" acceptances are based upon a consideration, the one promise being a consideration for the other. They are certainly dangerous contracts, as either party may be called on to pay to a holder not only his own acceptance, but that of the other party. Without further pursuing this distinction, attention should be called to a peculiarity in this branch of the law which shows its close connection with the subject of currency. It is a well-settled general rule of the common law that a person having no title to goods can transfer none, even to a purchaser in good faith. A thief or a finder, for example, can create no better title than he possesses. There is a marked exception to this rule in the case of money. One who has stolen money may give a perfect title to one who takes it in good faith and for value. This exception is demanded by the necessities of commerce. The rule is extended to negotiable paper, payable to bearer, or even to order, when so endorsed as to pass from hand to hand without further endorsement.

It is plain that a bill when drawn imposes no obligation upon the drawee. It is necessary that he should assent to it in some legal form before he becomes liable. This act is termed "acceptance." Before acceptance the only person liable to the payee is the drawer. His liability is a contingent one, and implied by law. There is thus a marked distinction between the liability of a drawer and acceptor—one is implied, and the other is express and created by express contract. The implied obligation of the drawer is created by the custom of merchants, and is conditional. It requires certain acts to be performed as a condition precedent to recovery of the amount of the bill, such as presentment either for acceptance or payment, and due notice to be given of a failure to accept or pay, as the case may be. This distinction between the *implied* liability of the drawer and the *express* contract of an acceptor is of great consequence, and must be carefully attended to. The same remark may be made as to the liability of an endorser. This is also implied and conditional. The nature of a check upon a bank should be referred to. It resembles a bill of exchange, though it is not precisely equivalent to it. The check, according to the better opinion, creates no obligation against the bank in favor of the holder without acceptance. In mercantile phrase, a check when accepted by the act of an officer, such as a teller, is said to be "certified." The bank after such an act is liable to the holder. The drawer of a check having funds on deposit has an action against the bank for damages for a refusal to honor his check, on the ground of an implied obligation to pay checks according to the usual course of business. While checks are usually drawn payable immediately, they may be made payable at a future day, when their resemblance to a bill of exchange is still more close.

2. *Endorsement.*—The payee of a bill may transfer it by writing his name upon the back of it. He is then termed an endorser. When the name is simply written the endorsement is said to be "in blank;" when some person is pointed out to whom payment is to be made, it is said to be "in full." When a bill is endorsed in blank, it will pass from hand to hand, as though payable to bearer; when endorsed in full, an endorsement by the person to whom it is transferred will be necessary to its further transfer. There may be a series of endorsers, called first, second, third, etc. endorsers. Under these rules no holder can claim a title to a bill payable to order except through an endorsement made by the very person to whom it is payable, or some one holding under him, such as his executor, administrator, or assignee in bankruptcy. Accordingly, if it should come into the possession of another person of the same name as the owner, but acting without authority, he could give no title to one acting in good faith. When an owner of a bill endorses it for value, he can impose upon the purchaser no valid restriction preventing its further transfer. The right of sale is an inseparable incident to ownership. On the other hand, if a person endorse a bill to an agent, he may place valid restrictions upon the agent's authority to sell. These, if incorporated in the endorsement, will bind all purchasers. Where a bill is payable to several persons, all must, in general, unite in an endorsement. The regular effect of an endorsement is twofold: one consequence is to transfer the endorser's interest, and the other is to create an implied obligation on his part to pay the bill in case that the drawee does not accept or pay at maturity, and proper steps are taken to charge him. In an accommodation endorsement, as there would be no ownership, the sole effect would be to create an obligation to pay. This obligation closely resembles that of suretyship. Thus, when a bill is accepted the acceptor is primarily liable, and the endorser is, as it were, a surety. The rules governing suretyship may in the main be invoked in his favor. An endorser may avoid this liability by making use of suitable words in his endorsement, such as "without recourse." The endorsement would then simply operate as a transfer of such interest as he might have. Endorsers are commonly liable in the order of time of their endorsements. Thus, if there were three endorsers, if the third

(or last) was compelled to pay, he would be entitled to sue the second or first, and recover in full. A holder need not pursue any prescribed order as between the endorsers. He may select any one, who, if he pays, will be entitled to proceed in the same way as to any one preceding him. If, however, the bill is made payable to several payees, who endorse, they are liable jointly and not successively, and each, as between themselves, would be liable only for their respective shares. Every endorsement is a new contract. One of the consequences of this rule is, that though the original bill may be void, the endorser will still be liable, as if the bill be void for usury or be made by a married woman. Another consequence is, that the rules of private international law may cause a different effect to be given to the respective endorsements. Thus, if A should endorse in one country, and B should endorse the same bill in another, each endorsement would be governed as to its effect by the law of the state where it was made. The mere act of writing one's name is not an endorsement; there must also be a delivery. Accordingly, if one should write his name and die before delivery, an executor could not deliver the bill so as to make a valid "endorsement." The proper course would be for the executor to endorse it in his representative character.

3. *Acceptance.*—The object of acceptance is to show the assent of the drawee of the bill to pay it according to its terms. Without such assent he would not be liable. The regular and formal method of acceptance is to write the name of the drawee upon the front of the bill. But no particular mode of acceptance is necessary. It may be made by writing separate from the bill or orally. It may sometimes be implied, as, for example, by a detention on the part of the drawee beyond a reasonable time. It may be either absolute or conditional. A conditional acceptance may be illustrated by one purporting to be made "on the consignment of goods to the drawee." A holder could not collect in such a case if there was no such consignment. An acceptance should not differ from the terms of the bill. A holder may decline to take such an acceptance, and treat the case as though there was no acceptance. Should he assent to it, he would thereby discharge the drawer and existing endorsers. It is not always necessary that there should be presentment for acceptance as distinct from one for payment, though in some cases it is requisite. Where a bill is payable a fixed number of days "after sight," the word "sight" means acceptance, and it would be necessary to present it once for acceptance, and, if that act took place, again for payment. If, on the other hand, the bill were payable a certain number of days "after date," it would only be necessary to present it once for all for payment, though it would usually be an act of prudence to present it for acceptance, as the holder would in case of acceptance have an additional person to whom he could have recourse, and in case of non-acceptance he could take immediate steps to charge the other parties to the bill. There has been great controversy on the question whether bills payable "at sight" must be presented for acceptance as well as payment. In some of the States the doubt is settled by legislation. The effect of acceptance is to make the drawer the principal debtor. The other parties stand in the relation of sureties, and if they are compelled to pay, they have their remedy over against the acceptors. This is clearly the case in business paper: in the case of an accommodation bill the position of the parties is of course reversed, so that the acceptor, as already explained, has his remedy on an implied contract against the person to whom he lent his credit, though as to the holder of the bill he holds the place of a principal debtor. Under these rules an acceptor is bound to know the handwriting of the drawer, and if that be forged he is still liable to the original holder. If acceptance is refused, the proper course, in the case of foreign bills, is to have a protest made, and prompt notice sent to the drawer and endorsers. In case of inland bills, protest is not essential, though presentment and notice are. Statutes usually allow protest in case of inland bills as a convenient medium of proof that the necessary steps have been taken to charge the parties to the bill. The term "protest" is applied to an official act by an authorized person (notary public), whereby he affirms in a formal or prescribed manner, in writing, that the bill has been regularly presented for acceptance or payment, as the case may be, and that it has been refused. It is used as presumptive evidence at a trial to establish the facts in question. The office of a "notice" is to give immediate information to the drawer or endorsers of failure of acceptance, so that they may take such steps as they deem necessary for their protection. The protest and notice are thus entirely distinct acts for different purposes, and must not be confounded. Assuming that acceptance has been refused and due protest made, mercantile law allows any person to intervene and accept a bill "for the honor" of a drawer or endorser. A holder is not bound to take such an acceptance, though it is valid if assented to. It takes place before a notary public, and is termed an acceptance "*supra protest.*" The person thus intervening states for whose honor he accepts. In case he pays, he becomes the creditor of that party, and may also have recourse to all who precede him on the bill, in opposition to the general rule of law that one cannot become the creditor of another without his consent. When the bill matures it is again presented to the original drawee for payment, who may in the mean time have been placed in funds, and may now be willing to take up the bill. Should he again refuse, it is protested, and presented to the acceptor *supra protest* for payment, which, if he refuses to make another and final protest, will be necessary to charge drawer or endorsers.

4. *Presentment for Payment.*—It is a general rule that as between debtor and creditor no presentment for payment is necessary. It is the duty of the debtor to seek the creditor, and if the day for payment elapses without it, there is an immediate remedy by action. The better opinion in this country is, that this rule applies to an acceptor of a bill of exchange, even where it is made payable at a particular place, such as a specified bank. On this view it would not be necessary for the holder to prove a presentment, but the acceptor might show in his defence any facts that would relieve him or diminish liability, such as that he had left funds with the bank, which had failed. But to charge drawer and endorsers the case is entirely different. These enter into no absolute engagement, but only into an obligation implied by law. It is a part of the implied contract that presentment for payment shall be made, and protest, where that is necessary, and notice given. These acts must be alleged in the pleadings, and proved at the trial as conditions precedent to a right of recovery. The modes of performing these various acts branch out into much detail, and only the leading ones can be brought within the compass of this article. The general rule is, that the bill, when payable without designation of place, must be presented, when it matures, to the acceptor, either at his residence or place of business, and, if at the place of business, within business hours. If a particular place, as a bank, is designated, presentment must be made there within the usual hours devoted to banking business. This duty continues, though the place of business be closed or the acceptor be notoriously insolvent. In the case of an accommodation acceptance no presentment is necessary in behalf of the person to whom the accommodation is given, since he could have no action against such an acceptor. The duty of presentment, as well as of the performance of the succeeding acts, may be waived by a party to the bill by appropriate acts. This waiver may take place either before or after maturity of the bill. An instance would be a writing on the bill, "I hereby waive demand of the within bill," or "I hereby waive notice of demand." The latter expression would be imperfect, since a waiver of notice does not dispense with the necessity of presentment, while a waiver of demand is, from the nature of the case, a waiver of notice.

A bill does not ordinarily actually mature on the day on which it apparently falls due. Three days are allowed, termed "days of grace." These have become so fully a part of the contract that a presentment before the last day of grace is nugatory. Should the last day fall on Sunday or a public holiday, the bill matures on the preceding day. This matter is sometimes regulated by statute. If presentment is made and refused, protest should take place in the case of foreign bills, as already explained in reference to non-acceptance, and notice given to the parties to be charged. The subject of notice requires a more full explanation than has been given in connection with non-acceptance. The object of notice is to give information to the respective parties, to the end that they may protect themselves from loss. The test of its sufficiency is whether it gives the requisite information. No particular form is necessary. It may be either oral or written. It is a common practice to reduce it to writing, and either to give it to a party personally or to send it to him by mail. By the general rule of law the mail can only be used for the purpose of transmission, and accordingly cannot be resorted to where the holder and the person to be notified obtain their letters from the same post-office, though it is in some instances otherwise by statute. The law requires extreme diligence in despatching the notice. It should be sent as early as the next day, and some authorities require by the first convenient mail on the next day. If the notice is properly sent by the mail, it will suffice, though never received. Any endorser receiving notice has a day to send it to one preceding him. After notice the rights of the holder are fixed, and it is not necessary for him to bring his action any earlier than he would be required to do by the statute of

limitations. Delay to collect the bill from the acceptor does not of itself discharge the drawer and endorsers. If, however, a bargain (based upon a consideration) is made between the holder and acceptor, whereby the time of payment is extended, the drawer and endorsers are discharged, unless their consent is obtained. The drawer is not only liable for the face of the bill, but for damages incidental to non payment. These damages are in some cases fixed by statute. It is sometimes necessary to take into account the difference in exchange between two countries; as, if a bill drawn in New York were payable in London, exchange being in its favor, and the action on the bill were brought in New York, and it cost a certain per cent. to place the funds in London, that amount should be included in the recovery. The article on promissory notes may be referred to. (See PROMISSORY NOTES.) T. W. DWIGHT.

Bill of Lading, the written evidence of a contract for the carriage of goods by water. It is usually signed by the master of the vessel, either in duplicate or triplicate, acknowledges the receipt of the goods from a person (named the consignor), and undertakes to deliver them to a designated person (the consignee) or his assigns at a specified place, for the compensation and on the conditions therein specified. An endorsement of the bill of lading transfers the title to the goods, and, if made in good faith and for a valuable consideration, cuts off the right of stoppage *in transitu*. For most purposes, a bill of lading is assignable, and an assignee takes it subject to any defence existing between the original parties. For the single purpose of shutting out the right of stoppage *in transitu* it is negotiable. (See STOPPAGE IN TRANSITU.) This instrument consists of two parts—a receipt and a contract. That portion of it which is a receipt can be contradicted, as between the original parties, by parol evidence. For example, if it were stated that the goods were in good order, evidence may be adduced to show the contrary. This proposition would not extend to a person who had made advances on the faith of the statement, as he could invoke the doctrine of estoppel. (See ESTOPPEL.) The part of the bill which is a contract cannot be contradicted by parol evidence, even as between the original parties. Although the term was originally applied only to a memorandum of a contract for transportation by water, it is now frequently used to denote the memorandum given by *any* carrier of the terms on which he agrees to carry the goods received by him. T. W. DWIGHT.

Bill of Pains and Penalties, a special act of the legislature declaring a person guilty of some offence, without any conviction in the regular course of judicial proceedings, and inflicting upon him some punishment less than death. It differs from a strict bill of attainder in that the punishment inflicted by the latter is death. Bills of pains and penalties are within the provision of the U. S. Constitution that neither Congress nor a State shall pass a bill of attainder or an *ex post facto* law. Thus, a law of Congress requiring all attorneys of the Supreme Court to take an oath that they had not been engaged in rebellion, or else to be disqualified from practice, was held to be in the nature of "a bill of pains and penalties" as to those who had thus participated, and accordingly void. (*Ex parte Garland*, 4 Wallace R., 333.)

Bill of Rights, an English statute enacted at the time of the accession of William and Mary to the throne. It declared, among other things, the right of the subject to petition the king, freedom of election of members of Parliament, and freedom of speech in Parliament. It affirmed that standing armies without the consent of Parliament are illegal, and that the king had no power of suspending or dispensing with laws. It provided that excessive bail should not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted. The provisions of this act have had great influence in this country, and are deemed of high consequence, as securing liberty to the individual. A number of them are literally inserted among the amendments to the U. S. Constitution, and are also found in State constitutions. The phrase "bill of rights" is frequently employed in this country to designate all those portions of a constitution, State or national, designed to secure liberty to the individual.

Bill of Sale, a writing under seal conveying the title to goods and chattels. The seal by the common law is conclusive evidence of consideration. Accordingly, a bill of sale formally executed passes the title without any consideration or delivery of the property. Where there is no seal, there must be a consideration or delivery. A delivery without consideration would amount to a gift. A bill of sale may pass a title which would be valid as between the parties, and yet not of force as to creditors or purchasers, as if one who was indebted should make a bill of sale without actual consideration, or should sell, even with consideration, and still retain possession of the goods. The transaction might be regarded as infected with fraud, even though there were no fraudulent intent. (See FRAUD and CONSTRUCTIVE FRAUD. As to the general law concerning sales of chattels and the requisites to their validity, see SALES.)

The phrase "bill of sale" is frequently used in a more popular sense to indicate any written instrument, though not under seal, executed as evidence of a sale. In sales of ships the term "grand bill of sale" is sometimes employed. The word "grand" indicates that the sale is made by the builder. All subsequent transfers would be indicated by the ordinary phrase "bill of sale."

Biloxi, a post-village of Harrison co., Miss., on the Mobile New Orleans and Texas R. R., 79 miles E. N. E. of New Orleans, and on Biloxi Bay: lat. 30° 23.8′ N., lon. 88° 53.1′ W. It has an iron lighthouse, with a fixed white light 62 feet above the level of the sea. Biloxi is a place of summer resort. Pop. 954.

Bilson (THOMAS), an eminent English prelate, born at Winchester in 1536, became bishop of Worcester in 1596, and bishop of Winchester the year following. Bilson was a man of great learning, and a zealous enemy of Puritanism. He assisted in the translation of King James's Bible. He wrote, among other works, "The True Difference between Christian Subjection and Unchristian Rebellion" (1585), and "The Perpetual Government of Christ's Church" (1593), which is considered an able defence of the doctrine of apostolic succession. Died in 1616.

Bilston, a market-town of England, in the county of Staffordshire, 2 miles by rail S. E. of Wolverhampton. It forms part of the parliamentary borough of Wolverhampton, and is an important centre of the hardware trade. It is situated between numerous iron and coal mines, and has large manufactures of japanned ware. Pop. in 1871, 24,192.

Bimana [from the Lat. *bis*, "twice," "double," and *manus*, a "hand"], a Latin term applied by some zoologists to the first or highest order of Mammalia, of which man is the type and sole genus. Some persons have urged an absurd objection to this classification, because it ignores the spiritual and essential part of man, and does not make a sufficiently wide distinction between men and brutes; while others, again, object to the term on the ground that man in his anatomy is not sufficiently distinct from the higher Quadrumana to require to be placed in a separate order. (See QUADRUMANA, and also MAN.)

Binary Stars. See DOUBLE STARS.

Binary Theory, in chemistry, is the name given to an hypothesis proposed by Davy, and once supported by Liebig, which assumes that all salts are compounds of a metallic and a non-metallic element. A large class of compounds (like common salt, or sodium-chloride) readily come under this rule. But in order to bring most salts into such a class, it is necessary to suppose all the non-metallic elements in any given salt to be combined into one compound element. But, according to the later theories, it is not considered at all necessary to try to represent the probable arrangement of chemical atoms in compound bodies. (See CHEMISTRY.)

Binche, a town of Belgium, province of Hainaut, well built on the river Haine, 6 miles E. S. E. of Mons. It has manufactures of cutlery, glass, pottery, etc.; also a trade in marble, coal, paper, and lace. Pop. 6678.

Bindrabund', or **Bindraban'** (anc. *Vrindavana*), a town of British India, in the North-western Provinces, on the river Jumna, about 40 miles N. N. W. of Agra. It has several temples of Krishna, one of which is a remarkably massive structure. This town is visited by multitudes of pilgrims from distant parts of India, and their munificence is the chief support of the place. Pop. about 20,000.

Bingen (anc. *Vin'cum* or *Bin'gium*), a town of Germany, in Hesse, is finely situated on the left bank of the Rhine, at the mouth of the Nahe, 20 miles by rail W. of Mentz. The Nahe is here crossed by an old bridge supposed to have been built by the Romans. Wine of superior quality is produced in the vicinity. Near Bingen the Rhine passes through a narrow channel called *Bingerloch* (*i. e.* the "hole of Bingen"), in which the rocks and rapid current once rendered the navigation dangerous, but in 1834 the obstruction was chiefly removed. Bingen is opposite Rüdesheim, from which it is separated by the Rhine. It has manufactures of flannel, fustian, and leather. Here are interesting ruins of an old castle and convent. Pop. in 1871, 5936.

Bingham, a post-township of Somerset co., Me. Pop. 826.

Bingham, a township of Clinton co., Mich. Pop. 2910.

Bingham, a township of Huron co., Mich. Pop. 441.

Bingham, a township of Leelenau co., Mich. Pop. 637.

Bingham, a township of Orange co., N. C. Pop. 1604.

Bingham, a township of Potter co., Pa. Pop. 773.

Bingham (Rev. Hiram), born in Bennington, Vt., about 1790, graduated at Middlebury College in 1816, at Andover in 1819, and was one of the first Congregational missionaries sent to the Sandwich Islands, where he long exercised a powerful and salutary influence. He returned to the U. S. in 1841. Died at New Haven, Conn., Nov. 11, 1869.

Bingham (John A.), an American legislator, born in Pennsylvania in 1815, removed to Ohio. He was elected a member of Congress by the Republicans of the Western Reserve in 1854, and was often re-elected. He was chairman of the managers who conducted the impeachment of Andrew Johnson in April and May, 1868. He was again elected to Congress in 1870.

Bingham (Kinsley S.), born at Camillus, Onondaga co., N. Y., Dec. 16, 1808, studied law, went to Michigan in 1833, held many public offices, was a judge of probate, speaker of the house of representatives, member of Congress (1849–51), governor (1855–59), and U. S. Senator (1859–61). Died at Green Oak, Livingston co., Mich., Oct. 5, 1861.

Bingham (William), born in Philadelphia in 1751, graduated at Philadelphia College in 1768, was consul at St. Pierre, West Indies, in 1771, and afterwards American agent at Martinique. In 1787–88 he was a delegate to Congress, and was U. S. Senator from Pennsylvania (1795–1801). He was a man of wealth and of strong aristocratic feelings. Died in England Feb. 7, 1804.

Bing'hamton, the county-seat of Broome co., N. Y., was incorporated a city in 1867. It is pleasantly situated at the junction of the Susquehanna and Chenango rivers, 216 miles N. W. of New York and 142 miles S. W. of Albany. The Erie R. R. passes through it, and it is the terminus of the Albany and Susquehanna, the Delaware Lackawanna and Western, the Syracuse Binghamton and New York, and the Utica Chenango and Susquehanna Valley R. Rs. It is also the southern terminus of the Chenango Canal. The State inebriate asylum is situated here, and also a State home for orphan and indigent children of Broome, Tioga, Tompkins, Cortland, Delaware, and Sullivan counties.

The public schools are under a separate management from the State schools, and are controlled by a board of education consisting of ten commissioners, two from each ward. The average annual number of pupils who attend the public schools are 120 in the high school or academic department, and 2200 at the seven ward school-houses. Five teachers are employed in the high school and forty in the ward schools, to whom $27,000 are annually paid in salaries. The school library contains 2587 volumes, valued at $3600, and provision is made for an increase annually of 400 volumes; philosophical apparatus and cabinet worth $2000; total value of public school property, $260,000. Dean College, for females, a school conducted with private capital, employs 13 teachers and is attended by about 150 pupils. Board and tuition, $200 a year; property valued at $50,000. St. Joseph's (Catholic) Female Academy, conducted by Sisters of St. Joseph, has an average of 85 pupils. Tuition and board, $175 a year; library 300 volumes; property valued at $15,000. St. James's (parochial) school for Catholic boys and girls has an average attendance of 350 pupils; salary of principal, $700. Lowell's Commercial College and Telegraphic Institute is a flourishing and important school of its class.

The churches are—3 Presbyterian, 3 Methodist Episcopal, 2 Protestant Episcopal, 1 Baptist, 1 Catholic, and 2 colored Methodist. Together they have a capacity of seating 10,000 persons; value of church property, $700,000; church membership, about 5500.

The city is supplied by Holly Waterworks, owned by the corporation. The gasworks are owned by a private company. Three miles of street railway have been constructed and equipped at a cost of $7500 per mile. A mile and a half of street are paved with wood pavement. The principal business streets are sewered.

Much of the business capital of the city is invested in mercantile establishments, and the wholesale and retail transactions amount to not far from $6,000,000 a year. About $1,800,000 are invested in manufactories, which employ 1400 hands of all grades, to whom about $800,000 are paid annually. The value of manufactured articles is about $3,500,000 annually. The leading articles are boots and shoes, tobacco and cigars, scales, combs, sewing-machines, machinery, and building materials, carriages, furniture, tools, and children's sleighs and carriages. The banking institutions are three national banks, one private banking-house, and two savings banks. There are four weekly, one semi-weekly, and three daily newspapers. The city has an area of 972 acres. The assessors' valuation (on a basis of a quarter of the real value) is $2,180,035 for real estate, and $430,985 for personal property. About $110,000 are raised annually for city and school purposes. The public debt for which the city is bonded, for and in the construction of railroads, and for the construction of the high-school building, waterworks, and bridges, is nearly $400,000. Pop. of city, 12,692; city and township, 14,758.

Malette & Reid, Eds. "Binghamton Republican."

Bing'ley, a town of England, in the West Riding of Yorkshire, is situated on an eminence on the river Aire, 15 miles W. N. W. of Leeds. The Leeds and Liverpool Canal passes by it. Here are manufactures of worsted goods, paper, etc. Pop. 5019.

Bin'ney (Amos), M. D., an American naturalist, born at Boston Oct. 18, 1803, graduated at Brown University in 1821, was the owner of an ample fortune. He was a liberal patron of artists and men of science, and was president of the Boston Society of Natural History. He wrote "Terrestrial and Air-Breathing Mollusks of the United States" (3 vols., 1851, finely illustrated). Died at Rome Feb. 18, 1847.—His son, W. G. Binney, is also a distinguished conchologist.

Binney (Hibbert), D. D., born in Nova Scotia in 1819, was educated in London and Oxford, graduating at the latter university in 1842. In 1851 he was consecrated lord bishop (Anglican) of Nova Scotia and Prince Edward's Island.

Binney (Horace), LL.D., an eminent American lawyer, born in Philadelphia Jan. 4, 1780. He graduated at Harvard College in 1797, and divided the first honors with his classmate, the late Judge White of Salem, Mass. Having studied law with Jared Ingersoll in Philadelphia, he was admitted to the bar in 1800, and rose in a few years to the highest rank in his profession. He declined high judicial positions which were offered him, but as a lawyer he took a prominent part in important cases in the higher courts of Pennsylvania, and was several times called to the Supreme Court of the U. S. Elected to Congress in the latter part of Jackson's first administration, he distinguished himself by his eloquence and ability. In 1843 he made his celebrated argument in the Supreme Court of the U. S. in the case of Vidal *versus* the mayor of Philadelphia. This admirable argument is often cited by the bench and bar of the U. S. as authority on questions involving the law of charitable uses, and has been referred to by eminent English jurists in the highest terms of praise. Mr. Binney appeared for the last time before his legal brethren on the occasion of the death of his friend, the Hon. John Sergeant, whose character he delineated in terms of deep feeling and eloquence. Mr. Binney's principal works, besides the argument in the Vidal case, are "An Inquiry into the Formation of Washington's Farewell Address" (1859), eulogiums on Chief-Justice Tilghman (1827) and Chief-Justice Marshall (1836), and "Reports of Cases in the Supreme Court of Pennsylvania" (6 vols.). D. Aug. 12, 1875.

Binney (Horace, Jr.), a son of the foregoing, born in Philadelphia Jan. 21, 1809, graduated at Yale in 1828, and was admitted to the bar in 1831. He was eminent for his literary knowledge, and was for a time president of the Union League of Philadelphia. Died Feb. 23, 1870. A memoir of his life by Dr. C. J. Stillé was published in 1870.

Binney (Thomas), born in 1798, an English dissenting minister, pastor of King's Weigh-house Chapel in London (1829–69). He wrote many controversial papers, "Conscientious Clerical Nonconformity," "Service of Song," and several books for young men, besides several volumes the products of a controversy with the Australian bishop of Adelaide. Died Feb., 1874.

Binoc'ular Tel'escope [from the Lat. *binus*, "double," and *oculus*, an "eye"], a telescope to which both eyes may be applied at once, and by which an object may be observed with both eyes at the same time. There are also binocular microscopes, having two tubes, one for each eye. In some kinds of work they possess superior defining power.

Bino'mial [from the Lat. *bis*, "twice" and *nomen*, a "name"], in algebra, an expression having two terms joined by the sign + or −. The "binomial theorem" has for its object the expression of the law for the formation of any power of a binomial. By means of this theorem any power of $x+a$ can be at once written down without going through the actual multiplication. The older mathematicians were acquainted with this method of finding such powers, but Newton first demonstrated the universality of its application. This is considered one of his greatest discoveries, and the formula was placed upon his tomb. It is usually written thus:

$$(x+a)^m = x^m + max^{m-1} + m\frac{m-1}{2}a^2x^{m-2} + m\frac{(m-1)(m-2)}{2\quad 3}a^3x^{m-3}, \text{ etc.}$$

Binturong' (*Ictides* or *Arctictis*), a genus of quadrupeds nearly allied to raccoons, comprises two species, natives of Java, Sumatra, and Malacca.

The Black Binturong.

Bi'obi'o, the largest river of Chili, rises in the Andes, and enters the sea at Concepcion, after a course of 200 miles.

Biogen'esis, the origin of life from life by parentage or descent; a term recently used in opposition to *abiogenesis*, or the origination of life in matter before not living. (See Spontaneous Generation.)

Biog'raphy [from the Gr. βίος, "life," and γραφή, a "writing"] is the term applied to the literature which treats of the lives of individual persons. Anciently, the leading incidents of a man's life were narrated in their historical sequence, without elaborate attempts to analyze character. Ancient biography was possessed of a stately dignity, colored but sparingly with eulogy or censure. Modern biography, on the other hand, like modern history, is often full of criticism and disquisition. Of strictly biographical works, the most valuable that has come to us from the ancient Greeks is the "Lives" of Plutarch. Roman literature also possesses an admirable "Life of Agricola," by his son-in-law, Tacitus. Besides these may be mentioned the "Lives" ascribed to Cornelius Nepos, the writings of Suetonius, the "Life of Alexander the Great" by Curtius, "Lives of the Sophists" by Philostratus, and a "Life of Plato" by Olympiodorus. Later, we encounter the "Lives of the Fathers" by Saint Jerome and others, while biographies of saints, martyrs, etc. are scattered profusely through ecclesiastical literature. The monks of the Middle Ages worked at the manufacture of biographies in which the hunger for the marvellous was gratified. Modern biographical literature may be said to date from the seventeenth century. Among the most celebrated works written since the Reformation may be mentioned Vasari's "Lives of the Painters" (Florence, 1550); Tillemont's "Mémoires pour servir à l'Histoire Ecclésiastique des six Premières Siècles de l'Église," in 16 vols. 4to (Paris, 1693); Bayle's "Dictionnaire Historique et Critique" (Rotterdam, 1697); the "Acta Sanctorum" of the Bollandist Fathers; the "Lives of the Saints" by Alban Butler; the "Biographie Universelle" (1810–28); Charles Knight's "English Cyclopædia," Biographical Section, 1856–57. The "Nouvelle Biographie Générale" (42 vols., 1857–63) is of great value. Among individual Lives a high place is given to Boswell's "Life of Johnson" (1793), "The Life of Charles XII." by Voltaire, that of Voltaire by Condorcet, and that of Molière and Corneille by Taschereau. The biographical writings of Carlyle are of the first importance. In American literature we may mention in general biography the works of Sparks, Sprague, Allen, and Drake, and the special biographical writings of Irving and the Abbotts.

Revised by C. W. Greene.

Biol'ogy [from the Gr. βίος, "life," and λόγος, "discourse"] is that branch of the study of nature which treats of organized beings, under their diverse relations, in contradistinction to mineralogy, which relates to the inorganic or mineral substances: its subjects are therefore animals (zoology) and plants (botany or phytology), living and extinct. These agree with each other, and differ from minerals in (1) the physical and chemical characteristics of their primitive constituents or cells, and the concomitant phenomena of life exhibited under certain conditions; (2) the perpetual change during life in the organism by loss of substance proportioned to the demands on the system of exertion or existence, and the renewal of substance by derivation and assimilation of nutriment from without; (3) the segregation and specialization, when the demand for rapid growth has been fulfilled, of certain portions of the organism as reproductive organs, differentiated as receptive and procreative (female), and impregnating and vivifying (male); from the former of which (after the conjunction of the two under certain conditions) an organism originates essentially like that from which it proceeds; and (4) the existence, for a vaguely determinate period, of the organism, and finally a disturbance of the equilibrium or conditions of existence, death and dissolution; (5) originating as above indicated, the offspring repeats the same cycle of phenomena as the parent, and in turn contributes to the perpetuation of the race. Our limits will only allow us to briefly consider, in the order indicated, these characteristic features of the great empire of organic nature.

(1) The animal or vegetable organism is in the main constituted of four elements, three of which are separately known only in a gaseous state—*oxygen*, *hydrogen*, and *nitrogen*—and one —*carbon*—in a simple condition is only known in a solid form. From this predominance of gaseous elements results the degree of molecular mobility of the constituents of the organism, and, according to Herbert Spencer, "that comparative readiness displayed by organic matters to undergo those changes in the arrangement of parts which we call development, and those transformations of motion which we call function." The same author has also insisted on facts that (1) the elements in question (except oxygen) have affinities which are narrow in their range, but low in their intensity; (2) that in all allotropism (or the ability to assume different states) is inherent; and (3) that they all present certain extreme antitheses (as, for example, between oxygen and nitrogen as to chemical affinity, and between carbon and the gases as to molecular mobility); and that these extreme contrasts "fulfil, in the highest degree, a certain further condition to facility of differentiation and integration." The primary form into which these elements enter is a fluid substance called protoplasm, which may or may not be nucleated, but in most organisms assumes the nucleated condition (that is, of cells); of such elements, more or less modified and disguised according to circumstances (*i. e.* specialization and complexity of parts), the entire organism is built up.

(2) By the absorption or ingestion of extraneous substances the organism derives a nutriment which is assimilated and converted into its own substance, and supplies the material (1) for the power for work, (2) the repair of the system, and (3) for direct growth. Every action and exertion is attended with a loss of substance, and hence exists the necessity for a corresponding supply of nutriment. For a certain length of time (according to the species or race), in addition to the preservation of an unstable equilibrium, there is also a demand for supply for increase of bulk, or growth, of the organism. The period and extent to which this is carried is, within certain limits, constant for each species.

(3) When the full stature or phase of development has been more or less nearly attained, the organs of reproduction become functionally developed, and provision for the perpetuation of the race is made. In plants, the female element is termed a seed; in animals, an ovum or egg. The male and female elements may be united in the same individual, as in most plants and many animals, but in the highest animals the sexes are always differentiated in distinct individuals. In molluska, hermaphroditism is almost of ordinal value, but not more, and in at least one case (Valvatidæ) hermaphroditism occurs in an order of which the other members are diœcious. Among vertebrates, true hermaphroditism is only known (as an exceptional development) in certain fishes (Serranidæ); it is entirely unknown in the higher forms (mammals, etc.), all the reported cases to the contrary being referable to males with the genitalia in an embryonic condition, or females with the clitoris hypertrophied. The homologies of the male and female organs render it impossible that there shall be a union of the sexes in the same individual in the mammals. Actual fecundation of individual germs (seeds or eggs) by the male element is necessary, in most cases, for their development, but in exceptional cases (*e. g.* certain insects, crus-

taceous mollusks), females produce broods of young without having had direct previous intercourse with the male. This peculiar capability has been designated *parthenogenesis:* the unimpregnated eggs (in some forms) produce only females. The question of the determination of sex is still involved in obscurity.

(4) After a certain period, if the individual has escaped all the liabilities to death that occur from enemies, accidents, and disease, there is a decline in the activity of the functions, the system becomes disordered, and death ensues. This period, like those of growth and development of the reproductive power, is also, within certain limits, a constant term, and all reports of extreme longevity—such as the reputed ages of H. Jenkins (169 years), T. Parr (150 years), the countess Desmond (140 years), and others—are either based on very unsatisfactory evidence or demonstrably false.

(5) The offspring, although as a rule very similar to the parent, is never exactly alike, being always distinguishable by some more or less obvious difference or *individuality* of character. Occasionally, however, the offspring differs very markedly in some one character, which may or may not be co-ordinated with other correspondingly important differences. The newly developed peculiarity is apt to be transmitted either to the immediate offspring or to a succeeding generation, and sometimes in an exaggerated degree. But such peculiarities, if the individuals so distinguished pair with those not exhibiting them, generally disappear in their descendants after a longer or shorter course. If, however, the individuals thus characterized are set aside, and their immediate and remote descendants selected in ratio to their possession of some peculiarity, that peculiarity will be indefinitely perpetuated, and a new race distinguished thereby will be thus originated. By means of such *artificial selection*, unintentional or studied, the various races of domesticated animals have been produced. And as, in most cases, there is an obvious fitness of organized beings to the conditions under which they are found, it has been assumed that such relations are the result of the survival of beings possessing characteristics which may have spontaneously arisen, and which have gradually become (relatively) perpetuated in the "struggle for existence;" and hence the hypothesis of *natural selection* has originated. Inasmuch, also, as no offspring is exactly like the parents, it follows that no generation is exactly like the preceding; and although there must be a certain unstable equilibrium, resulting from constant interbreeding, in the incessant surge of variations, the descendants must necessarily depart more and more from their progenitors. While in an historical epoch no very obvious changes may be perceptible, eventually (unless by the interposition of miraculous agency) there must be a contrast between the extremes of a lineage, and the exhibition of such must be merely a question of time, determined to a greater or less degree by the changes of condition. The assumption of this hypothesis, and the inductive evidence furnished by various departments of science, have culminated in the theory of *evolution*, and for an explanation of the *modus operandi* of evolution, natural selection (or Darwinism) has been evoked. The evidence relied upon is chiefly derived from morphology (and the contrast between it and teleology), embryology, the geological succession and the geographical distribution of organisms.

While animals and plants differ from minerals, and agree with each other in all the characters thus specified, there are no such salient differences between themselves. It is, indeed, easy to distinguish the higher animals and plants, and they are, to a certain extent, antetypes and complementary to each other. On the one hand, plants derive their nourishment by absorption from the inorganic world through the external surfaces of their roots and leaves, and (under most conditions) decompose carbonic acid gas, assimilate carbon (and nitrogen), and eliminate oxygen. On the other hand, animals derive their nutriment, immediately or mediately, from plants, and ingest it either through a provisional or specialized alimentary cavity, imbibe oxygen, and exhale carbonic acid gas. The mode of taking nutriment is the most characteristic feature, and specialization especially tends to that end, but supplemented, in the animal, by a specialization of other systems to guide it in the selection and pursuit of its food. Some rather high animals (*e. g.* certain Entozoa) take their nutriment through their external surfaces, but this is rather a teleological modification co-ordinated with atrophy of the intestinal tube, superinduced by peculiar conditions of life. In view of the slight differences between animals and plants, and their contrast with minerals, it is evident that the ternary division of natural objects into animals, plants, and minerals does not express the degree of the relations between them; and hence the animal and plant kingdoms have been combined in an *organic empire* or realm on the one hand, and on the other minerals have been denominated an *inorganic empire*. The impossibility or great difficulty of discriminating the lowest plants and animals has also led some naturalists to separate them from the animal and vegetable kingdoms, and combine them in a peculiar one, which has received, with some varying limits, numerous names; *e. g.* Infusory world (Infusorienwelt), règne de Zoophytes, règnes Psychodaire, règne chaotique, règne Plantanimal, regnum Amphorganicorum, règne organique Primitive, kingdom of Protozoa, regnum Primigenium, kingdom of Primalia, and Protistenreichs. Such propositions, however, do not remove the difficulty, but only shift and complicate the questions, and obscure the recognition of the tendencies of the two antitypically functional divisions of nature. It need only be added that there is also, to some extent, a contrast in respect to individuality in the respective kingdoms, numerous individuals (flowers) being developed from the outgrowth of the contents of a single seed, while in all except some of the lower animals a single individual only originates from one egg. The subject of individuality, however, is a somewhat obscure one, and has provoked much discussion; and the question has been involved by the confusion of potential and actual individuality. (For more detailed information respecting the various subjects of biology, consult Evolution, Hermaphroditism, Longevity, Morphology, Palæontology, Parthenogenesis, Taxonomy, Teleology, Zoological Geography, and Zoology and Botany, and their respective subdivisions.)

Theo. Gill, *Smithsonian Inst.*

Bi'on of Smyrna, a Greek pastoral poet, was a friend and contemporary of Moschus, and lived about 250 B. C. His style is graceful and polished. He composed bucolic and erotic poems, fragments of which are extant. Among his extant works is a lament for Adonis.

Biot (Jean Baptiste), an eminent French natural philosopher and astronomer, was born in Paris April 21, 1774. He became in 1800 professor of physics in the College of France. In 1803 he was admitted into the Institute, and in 1805 published "An Elementary Treatise on Physical Astronomy" (2 vols.). An enlarged edition of this appeared in 5 vols., 1841–57. Having been appointed a member of the bureau of longitudes, he was sent to Spain with Arago to measure the arc of the meridian. He contributed many able articles to the "Biographie Universelle" and the "Annales de Chimie et de Physique," and published, besides other works, a "Treatise on Experimental Physics and Mathematics" (4 vols., 1816), which is highly esteemed, and "Researches in Ancient Astronomy" (1829). In 1840 he received the Rumford medal of the Royal Society of London for his researches on the circular polarization of light. He was admitted into the French Academy in 1856. Died Feb. 3, 1862.

Bi'otite, called also Uniax'ial, or Magne'sian Mi'ca, occurs in six-sided tubular prisms, having a perfect basal cleavage, and generally dark green, brown, or nearly black. It has a vitreous lustre, varies from transparent to opaque, is sectile, flexible, and elastic when reduced to thin laminæ. It consists chiefly of silica, alumina, magnesia, and oxide of iron, with some potassa.

Bi'ped [from the Lat. *bis,* "twice," "double," and *pes, pedis,* a "foot"], an animal which has two feet. Men and birds are almost the only animals to which the term is applicable. The two-footed saurians are thought to furnish a link between reptiles and serpents; certain two-footed batrachians seem to approach the character of fishes; while there are fossil biped reptiles which appear to have resembled birds.

Bi'pont Edi'tions, the name of certain editions of the Latin classics, the publication of which was commenced in 1779 at the German town of Zweibrücken (Deux-Ponts), called in Latin *Bipontium.*

Bir, or Beer [anc. *Bir'tha;* Turk. *Bireh-jik*], a town of Asiatic Turkey, on the left (E.) bank of the Euphrates, 74 miles N. E. of Aleppo. It has about 2000 houses, a citadel or castle on a steep rock, and several mosques. Caravans from Aleppo to Diarbekir and Bagdad cross the Euphrates at this point. Pop. about 6000.

Birch (*Bet'ula*), a genus of trees or shrubs of the order Betulaceæ, natives of temperate and cold regions in Asia, Europe, and America (several species are found among the Himalayas). The genus *Betula* is distinguished by ten to twelve stamens and winged seeds (achenia), has alternate, simple leaves, and flowers in scaly catkins. The common birch of Europe and Asia (*Betula alba*) is a handsome tree with triangular or deltoid leaves, which are doubly serrate. The bark is smooth and chalky white, and separable in thin sheets or layers. This bark is very durable, and is used for tanning, dyeing yellow, and other purposes. In some countries hats, shoes, and boots are made of it. The

wood is firm, tough, and valuable, and is much used by coopers, turners, and wheelwrights. The sap is esteemed as a beverage in Scotland, both in a fresh state and fermented. Europe produces a graceful variety called weeping birch (*Betula pendula* of some botanists), which attains a height of sixty feet, and has very slender and pendulous branches. The American white birch, which, according to Gray, is a variety of the above, is a small, graceful tree with tremulous, deltoid, and shining leaves, but is not valuable for timber. Among the other species indigenous in the U. S. are the *Betula lenta* (sweet or black birch), *Betula excelsa* (yellow birch), and *Betula papyracea* (canoe or paper birch). The *Betula lenta* is a rather large tree, the bark of which is aromatic, yielding an essential oil identical with that of *Gaultheria*, and the timber is fine-grained and valuable for cabinet-work. The *Betula papyracea* grows in the Northern States to the height of about seventy feet, has a fine grained wood, and a very tough, durable white bark, splitting freely into thin layers, which have been used as paper. The Indians make canoes of this bark. The *Betula lutea* (or *excelsa*) sometimes attains a height of nearly eighty feet, and is remarkable for the brilliant yellow tint of its bark or epidermis. The leaves are from three to five inches long. Besides the above and several less important species, the U. S. have the *Betula nigra*, or river birch, which grows on the banks of streams and has remarkably tough wood. Russia leather is tanned with birch bark. "Russian oil" is a tar-like, empyreumatic substance obtained from birch-wood in Russia, and is useful in certain skin diseases.

Birch (Samuel), LL.D., born in London Nov. 3, 1813, one of the best modern Egyptologists, is the author of nearly all the last volume of Bunsen's work on Egypt, and has published a treatise on "Hieroglyphics" (1857), the "Rhind Papyri" (1866), and numerous other treatises on archæology, etc. His studies embrace Chinese literature and all departments of antiquities and ethnology.

Birch (Thomas), D. D., F. R. S., an English biographer and historian, born in London Nov. 23, 1705. He took orders in the Anglican Church, and became rector of a parish in London. Among his numerous works are "The General Dictionary, Historical and Critical" (10 vols., 1734–41), a "Life of Archbishop Tillotson" (1752), "Memoirs of the Reign of Queen Elizabeth" (2 vols., 1754), and a "History of the Royal Society" (4 vols., 1757). Died Jan. 9, 1766.

Birch Coo'ley, a post-township of Renville co., Minn. Pop. 503.

Birch-Pfeif'fer (Charlotte), a German actress and dramatic writer, born at Stuttgart June 2, 1800, was married to Dr. Birch of Copenhagen in 1825. She attained success as a performer and a writer. Among her dramas are "Die Günstlinge," "Hinko," "Dorf and Stadt" (1848), and "Anna of Austria" ("Anna von Oestreich," 1850). Died Aug. 25, 1868.

Birch Point Plantation, a township of Somerset co., Me. Pop. 2.

Birch Run, a post-township of Saginaw co., Mich., 15 miles S. E. of Saginaw. Pop. 925.

Birch Tree, a post-township of Shannon co., Mo. Pop. 312.

Bird. See Birds.

Bird, a township of Jackson co., Ark. Pop. 1313.

Bird (Edward), an English painter of genre and rural scenes, was born at Wolverhampton in 1772. His "Field of Chevy Chase the Day after the Battle" is called his masterpiece. Died in 1819.

Bird (Frederick Mayer), son of Robert Montgomery Bird, noticed below, was born in Philadelphia June 28, 1838, graduated at the University of Pennsylvania in 1857, and at the Union Theological Seminary in New York City in 1860. For several years he was a minister in the Lutheran Church, serving as chaplain in the Union army during the winter of 1862–63. In 1868 he entered the Protestant Episcopal Church, and in 1870 became rector of St. Peter's church in Spottswood, N. J. He owns the largest hymnological library, and is the best-informed hymnologist, in the U. S. He was main editor of the Lutheran Hymn-Book (1865), published "Charles Wesley seen in his Finer and less Familiar Poems" (1867), assisted Bishop Odenheimer in compiling "Hymns of the Spirit" (1872), and has contributed many articles to reviews and newspapers.

Bird (Golding), M. D., an English physician and writer, born in Norfolk in 1815, practised in London, where he also lectured on medical botany. He published a valuable work on the urine. Died in 1854.

Bird (Robert Montgomery), M. D., an American author, born at New Castle, Del., in 1803. He practised medicine in Philadelphia, and wrote, besides other works, "The Gladiator," a tragedy which was successful; "Calavar, a Romance of Mexico" (1834), and the "Infidel," a novel (1835). He became in 1847 one of the chief editors of "The North American and United States Gazette," a daily paper of Philadelphia. Died Jan. 22, 1854.

Bird-Catching Spider (*Mygale avicularia*), a spider of Cayenne and Surinam. Its body is nearly two inches long, but its legs when stretched out occupy a space almost

Bird-Catching Spider.

a foot in diameter. The hooks of its mandibles are black and very strong. It does not construct a net or web for the capture of its prey, but it obtains it by the chase, and hunts only in the night. This spider and other species of *Mygale* will attack and kill small birds. It is asserted that in some tropical countries there are spiders which feed upon birds caught in their webs.

Bird Cherry, a name given in England to the *Prunus Padus*, which is a small tree growing wild in Europe, and called *hagberry* in Scotland. It bears racemes of small drupes of a sweetish and bitterish taste, which are used in the north of Europe to make spirituous liquors. Nearly allied to this is the wild cherry or choke cherry of the U. S. (See Prunus Virginiana.)

Birde, or **Byrd** (William), a distinguished English composer of church music, born in 1540. In conjunction with Thomas Tallis he became organist to Queen Elizabeth in 1575. He produced, among other works, "Sacred Songs," and a magnificent canon entitled "Non Nobis Domine." Died in 1623.

Bird Lime [Lat. *vis'cus*], a viscous adhesive substance placed on the branches of trees to catch birds which may perch there. It is prepared by boiling the middle bark of the holly (*Ilex*), the mistletoe (*Viscum album*), or other glutinous plants, and concentrating the decoction by evaporation. The gluten of wheat flour is sometimes used as a substitute for bird lime. A tame bird in a cage is sometimes employed to decoy the birds to the tree on which the bird lime is smeared.

Bird of Paradise, the name of several species of birds of the genus *Paradisea* and kindred genera, of the order Insessores, and of the tribe Conirostres, natives of Papua and the neighboring islands, remarkable for the beautiful form and splendor of their plumage. The name was originally applied to the *Paradisea apoda*, which was supposed to be destitute of feet, because the skins, which are exported to Europe, are usually deprived of wings and feet. The older naturalists imagined that they passed all their lives floating in the air and feeding on ethereal food or nectar. For these fabulous and fanciful ideas science substitutes the prosaic truth that they are

nearly allied to the Corvidæ (crow family), and are omnivorous. The value of these birds arises chiefly from the extraordinary development and light and beautiful struc-

Bird of Paradise.

ture of the plumes which grow from the scapular and lateral portions of the body. The plumage of the males is

Red Bird of Paradise.

remarkable not only for brightness of tints, but also for a velvety texture and brilliant metallic reflections. Tufts of feathers growing from the shoulders are so prolonged that they extend even beyond the tail, and they constitute the most beautiful part of the plumes of the bird of paradise, which are a highly prized article of commerce for female ornament. The principal species of this genus are the common bird of paradise (*Paradisea apoda*), the royal bird of paradise (*Paradisea regia*), the red bird of paradise (*Paradisea rubra*), the magnificent bird of paradise (*Paradisea magnifica* or *speciosa*), and the six-threaded (or golden) bird of paradise (*Paradisea sexnetacea*), from the head of which grow six long and threadlike feathers, three on each side. The common bird of paradise is about as large as a jay, and is mostly of a cinnamon color, with a throat of emerald green, whence it is sometimes called "the emerald bird of paradise." The royal bird of paradise has two long feathers or filaments, which extend behind the tail and terminate in disks, like the tail-feathers of a peacock. The red bird of paradise has two very long filaments, extending far beyond its rich and beautiful tail-feathers. They are generally gregarious, and they sometimes fly in flocks from one island to another. It is stated that they can fly more easily against than with the wind. In confinement they are lively and bold, and bestow great care on their plumage. Eighteen species are described by Wallace, whose list does not include all the known species.

A recent writer, referring to what he calls "the supremely glorious members of the feathered tribe which have by common consent been termed BIRDS OF PARADISE," observes that "The plumage of these birds is wonderfully rich and varied, and not even the humming-birds themselves present such an inexhaustible treasury of form and color as is found among the comparatively few species of the birds of paradise." (See WALLACE, "Malay Archipelago.")

REVISED BY J. S. NEWBERRY.

Birds [Lat. *aves;* Fr. *oiseau*, plu. *oiseaux;* Ger. *Vögel*], a class of oviparous vertebrate animals, which in several respects are peculiar, and separated from other animals by a very distinct line of demarcation. They are all bipeds, and are all covered with feathers, which nature has given to no animals of other classes. Nearly all birds have the power of flight, which is enjoyed by few other vertebrate animals. The most conspicuous external characteristic of birds is the plumage, which invests their bodies and wings, serves as clothing, and assists in motion through the air. The feathers entangle among their fibres a considerable quantity of air, and are well adapted to protect the bird from extremes of cold and heat. The internal temperature of birds is from 105° to 112° F., much higher than that of men and beasts. Their buoyancy and muscular energy are increased by numerous air-cells which are connected with the lungs, penetrate the substance of the bones, insinuate themselves between the skin and subjacent muscles, and enter the quills, so that the whole organism is permeated by air. The general form of birds is adapted to aërial navigation, and the body is somewhat boat-shaped. The number of vertebræ in the neck varies from ten to twenty-three, and is always greater than is found in any mammal. Among their peculiar organs is the hard, horny, toothless mouth, called a beak or bill. (See BILL.) The head is so articulated to the neck by a single condyle or pivot that a bird can turn its head round in a manner impossible to Mammalia. The number of toes of each foot is generally four, of which three extend forward and one backward; but the Scansores (climbers) have two before and two behind. The various forms of the toes are the characters which distinguish the five primary orders. (See ORNITHOLOGY.) The sternum or breast-bone is very large and strong, serving for the attachment of the powerful muscles which move the expanded wings. In eagles and other rapacious birds the ridge or keel of the sternum is very prominent. The wing of a bird is the homologue of the arm of a man, and is composed of bones which correspond to those of a human arm or the fore leg of a quadruped. The wing is furnished with feathers called quills, which are larger and stronger than those of the other parts of the bird, and which display an admirable combination of strength and lightness. The names of the several varieties of wing-feathers are *primaries, secondaries, tertiaries,* and *coverts.* The primaries are quill-feathers arising from the first or terminal joint—*i. e.* the part of the wing which corresponds to the hand and fingers of a man. The form of these indicates the bird's capacity of flight, and birds of powerful flight have long and firm primaries. Next to these are the secondaries, which are attached to the middle bone, the homologue of man's fore arm. The tertiaries grow from the part of the wing between the elbow and the shoulder. The leg of a bird is formed of bones which are homologous to those of Mammalia, but are subject to modifications. The thigh-bone is very short, and is so concealed within the body or under the feathers that it is not apparent as a part of the leg on a superficial view. The next division, often mis-

taken for the thigh, is the *tibia* or proper leg-bone, which is always the largest bone of the limb. The feet vary according to the habits of the birds, some of which have strong, hooked, and retractile claws fitted for seizing prey, and others are adapted for swimming by a membrane which unites their toes.

The digestive apparatus is modified in accordance with the nature of their food. A large majority of birds do not masticate their food, which passes from the mouth into the crop or craw, an enlargement of the gullet. The *crop*, or first stomach, is large in birds that feed on grain and seeds, and is wanting in those that eat fish. The second stomach, or *proventriculus*, is largest in those birds in which the crop is small or wanting. The third and principal stomach is the *gizzard*, which is a powerful grinding apparatus, especially in those birds which feed on grain and swallow gravel and pebbles, as the common domestic fowl. Birds sleep generally with the head under their wing, and some prefer to stand on one foot while asleep. Others pass the night on branches of trees, which without effort they clasp with their claws, for the tendons of the muscles which close the claws pass over the joints of the leg in such a manner as to be stretched by the mere pressure when the weight of the bird rests on the legs. The sense of sight in this class is exceedingly keen, and is remarkable for its perfect adaptation to near or distant objects. The swallow, when darting through the air with a swiftness which has become proverbial, is capable of accommodating its sight to the insect which it pursues, even in the short time which is occupied by its swoop at its victim. Some birds of prey have an acute sense of smell, and nocturnal birds, such as owls, have sensitive organs of hearing. Birds are distinguished among all dumb animals for their musical powers, and song-birds are doubtless sensitive to sound and differences of pitch. All the best singing-birds belong to the order Insessores.

Among the most interesting subjects connected with the birds are their migrations and the vastly diversified instincts and ingenuity which they exhibit in building nests. The number of eggs in a state of nature varies from one to twenty, and birds generally breed only once a year, which is in spring. Many species of birds are gregarious, but large rapacious birds are quite solitary in their mode of life. They all moult—*i. e.* change their feathers once a year—and the summer plumage of many birds is very different from the winter dress. The plumage of the males is generally richer and more brilliant than that of the females. Birds perform an important part in the economy of nature. Their flesh and eggs are valuable as food for man, and many species render him great service by checking the increase of insects. "There are few objects," says J. G. Wood, "which will better repay investigation than the young bird in its various stages of development. It is so wonderful to see the manner in which a living creature is gradually evolved from the apparently lifeless substances that are contained within an egg. The being seems to grow under our very gaze, and we arise from the wondrous spectacle with an involuntary feeling that we have been present at a veritable act of creation." (For the classification of birds, see ORNITHOLOGY.)

The earliest traces of the existence of birds on the globe have been supposed to be the so-called birds' tracks in the triassic sandstones of the Connecticut Valley; but it is now generally conceded that most if not all these tracks were made by reptiles and amphibians. Feathers, supposed to have belonged to birds, have been found in the Jurassic rocks of England, and in the lithographic slates of Solenhofen (Jurassic) a nearly complete bird has been recently discovered. This has been described by Prof. Owen, and called *Archæopteryx*. It exhibits some remarkable anatomical features, and is supposed to form a kind of connecting link between birds and reptiles. (See ARCHÆOPTERYX.) The remains of birds have been found in the greensand of England, the eocene of the island of Sheppy, and the Paris basin, as well as in the more recent tertiaries at various European localities. In America fossil birds were unknown until quite recently: they have now been found, however, in the greensand of New Jersey, the cretaceous beds of Kansas, and the tertiary deposits of Wyoming and Idaho. Nearly all these remains have been discovered by Prof. O. C. Marsh, who has made them objects of special search. The most important of Prof. Marsh's discoveries in this branch of palæontology is that of a bird with teeth in the cretaceous beds at Fort Harker, Kan. In the superficial deposits of New Zealand and Madagascar the remains of several kinds of extinct birds have been met with, some of which far exceed in dimensions the largest now living. The great bird of Madagascar is called *Æpiornis maximus*. It is supposed to have been at least twelve feet in height, and very massive. The egg of this bird was over a foot in length. The contents of one of these eggs were equal to those of six ostriches' eggs or 148 hens' eggs. The largest extinct birds of New Zealand have been described under the name of *Dinornis* by Prof. Owen. They were from six to ten feet in height; and one species, *Dinornis elephantopus*, had legs and feet nearly as massive as those of the elephant. REVISED BY J. S. NEWBERRY.

Bird'sall, a post-township of Allegany co., N. Y. Pop. 759.

Birds'borough, a post-village of Berks co., Pa. It has one weekly newspaper.

Bird's-Eye Limestone, a compact, dove-colored stone, with whitish crystalline points, belonging to the lower division of the Trenton group of the lower Silurian strata of North America, apparently corresponding to the Llandeilo flags. It contains many orthoceratites of enormous size, and fossil brachiopods.

Bird's-Eye View, a term used in the fine arts to denote a picture or view arranged according to the laws of perspective, in which the point of sight or situation of the eye is placed at a considerable height above the object. This is a convenient method of representing battles, or of delineating a large city or a small tract of country. In sketching a locality for military purposes this kind of perspective is used. A common kind of bird's-eye view differs from ordinary perspective only in that the horizontal line is placed considerably above the picture.

Bird's Foot (*Ornith'opus*), a genus of plants of the order Leguminosæ, sub-order Papilionaceæ, derives its name from the resemblance of the curved pods to birds' claws. One species, the *Ornithopus sativus*, an annual plant, a native of Portugal, is cultivated in that country, and affords a nutritious green fodder for cattle. Its Portuguese name is *serradilla*.

Bird's Foot Trefoil (*Lotus*), a genus of plants of the order Leguminosæ, sub-order Papilionaceæ, comprises numerous species, natives of the temperate and cold regions of the Old World. They are so called because a cluster of their pods resembles a bird's foot. The *Lotus corniculatus* is common in the pastures of Great Britain, and is eaten with avidity by cattle. It bears yellow flowers, which have a honey-like smell, and leaves which are trifoliate, like those of clover. A larger species or variety, called *Lotus major*, is also a native of England.

Birds' Nests, Edible, the nest of the sea-swallow (*Hirundo esculenta*) of the Malay Archipelago, a bird of the size of a common martin. It builds its nest of a glutinous substance which it is said to derive from a sea-weed. This weed is swallowed and partly digested, and then disgorged and fashioned into a nest as large as a common coffee-cup. When fresh these nests are of a waxy white color, and are said to be worth twice their weight in silver in the markets of China, where alone they are sold. The poorer sorts bring $5 or more a pound, according to the age of the nests. The taste of dishes prepared from these nests is said to be insipid, but the Chinese prize them, not perhaps so much for their taste as for their supposed tonic and aphrodisiac powers.

Birds of Passage are birds which are migratory, passing instinctively and habitually from one country or latitude to another on account of the change of the season. The migration of birds is generally from north to south, or from south to north, in the temperate zones. They migrate twice in a year, moving northward in the spring, and southward in the autumn, directed by a sagacious instinct to the regions in which their proper food is then most abundant. Migratory birds which breed in the U. S. are called summer birds of passage with reference to those States. They return in autumn to the tropical regions, and are winter birds of passage in the countries where they pass the winter. Wild-geese and other waterfowl that breed in the Arctic regions in summer annually visit the U. S. and Great Britain in autumn, and return northward in the spring. Several other species that are not aquatic, as the woodcock, fieldfare, and snow-bird, pass the winter in the temperate parts of Europe or the U. S., and spend the summer in a more northern latitude. On the approach of cold weather the swallows of Europe pass across the Mediterranean into Africa. "Before the time of migration," says Wood, "they may be seen assembled in great numbers, chattering eagerly and appearing to be holding a great parliament for the settlement of affairs before starting on their long journey. They do not migrate in flocks, but pass in little families of two or three in number across the vast space that separates them from the end of their journey. Although such powerful and swift fliers, they become fatigued in passing the sea, and will flock in great numbers to rest upon the rigging of some ship that may happen to pass their course. It is rather curious that the birds almost invariably fly in a line directly north and south."

Bi'ren, Biron, or **Bu'ren** (Ernest John), duke of Courland, was born in 1687. He gained the favor of Anna (a niece of Peter the Great), who became empress of Russia in 1730, and gave him the title of duke. He was a powerful favorite during her reign, and abused his power by the execution of many innocent persons. On the death of Anna in 1740 he became regent, but he was exiled to Siberia in 1741. When Elizabeth ascended the throne in 1741 she permitted him to return to Russia, and in 1763 the duchy of Courland was restored to him. Died Dec. 28, 1772. (See Rühl, "Geschichte E. J. von Biron," 2 vols., 1764.)

Birk'enhead, a seaport-town of England, in Cheshire, is on the left bank and near the mouth of the Mersey, opposite Liverpool, and 15 miles N. N. W. of Chester, with which it is connected by railway. It is about 1½ miles S. W. of Liverpool, and is the residence of many merchants who do business in that city. Steamers cross the river between these places once in fifteen minutes, or oftener. Birkenhead was only a small fishing-village as recently as 1824, since which it has increased rapidly in consequence of the construction of extensive docks and important public works. It has wide streets, a fine public park, a college called St. Aidan's (designed for the education of young men for the Anglican ministry), and many handsome villas. One of the docks occupies 120 acres. Pop. in 1871, 65,980.

Bir'mingham, one of the greatest manufacturing cities of England, is situated in the county of Warwick, on the river Rea, 79 miles by rail S. E. of Liverpool, and 130 miles by rail N. W. of London. It is built on the eastern slope of three undulating hills, and has a gravelly foundation. Its suburbs extend into Staffordshire and Worcestershire. It returns three members to Parliament. Birmingham is the chief town of Great Britain for the manufacture of hardware and metallic products made of gold, silver, brass, iron, steel, and mixed metal, including firearms, swords, jewelry, buttons, tools, steel pens, locks, steam-engines, and all sorts of machinery. The value of the goods manufactured here in a year is estimated at more than £4,500,000. Here are also extensive manufactures of glass and papier-maché. Several railways extend from this city to London, Liverpool, Manchester, etc. Birmingham contains about 100 churches; Queen's College, connected with the London University; a free public library; a botanic garden; a Roman Catholic cathedral; and a town-hall, which is a handsome edifice of the classic style, with a very fine organ. A musical festival is held in this hall once in three years. In the vicinity of Birmingham are the famous Soho and Smethwick Works, founded by Watt and Boulton, who there manufactured their first steam-engines. Among the charitable institutions are an asylum for the deaf and dumb, and an asylum for the blind. Pop. in 1871, 343,676.

Birmingham, a new city in Jefferson co., Ala., at the crossing of the South and North Alabama and Alabama and Chattanooga R. Rs. Other railroads are being constructed to the same point. This will doubtless soon be a great railroad centre. It already (1873) claims several thousand inhabitants. Extensive beds of coal and iron ore lie in its vicinity, and contribute essentially to the prosperity of the place. It has one national bank and one weekly newspaper.

Birmingham, a manufacturing borough of New Haven co., Conn., on the Housatonic River, at the mouth of the Naugatuck, 9 miles W. of New Haven. A bridge across the Naugatuck connects it with the village of Old Derby, which is on the Naugatuck R. R. A new railroad, the Derby and New Haven, connects it with New Haven. It has one national bank, several rolling-mills, manufactures of augers, chains, pins, and carriage-axles and springs, and one newspaper. Steamboats ply daily between this place and New York. Here is the first pin-factory established in the U. S. Pop. 2103, or, including Derby Narrows, 3364.
Ed. "Derby Transcript."

Birmingham, a post-twp. of Schuyler co., Ill. P. 1253.

Birmingham, a post-village of Union township, Van Buren co., Ia. It has one weekly newspaper. Pop. 626.

Birmingham, a post-village of Marshall co., Ky. Pop. 322.

Birmingham, a former borough of Alleghany co., Pa., on the left (W.) bank of the Monongahela River, 1 mile S. of Pittsburg, with which it is connected by a bridge 1500 feet long. It derives its prosperity chiefly from manufactures of glass and iron, and has a national bank. The name of its post-office is Buchanan. Pop. 8603. In 1872 it was united to Pittsburg.

Birmingham, a township of Chester co., Pa. Pop. 450.

Birmingham, a township of Delaware co., Pa. P. 765.

Birmingham, a post-borough of Huntingdon co., Pa., 77 miles N. W. of Harrisburg. Pop. 263.

Birmingham Falls, a village of Au Sable township, Clinton co., and Chesterfield township, Essex co., N. Y., at the head of the rapids of the Au Sable River, has a paper-mill, two starch-factories, etc.

Bir'nam, a hill of Scotland, in Perthshire, 12 miles N. W. of Perth, is 1580 feet high, and commands a fine view of the valley of the Tay. It was formerly covered by part of a royal forest, to which Shakspeare has given celebrity in his tragedy of "Macbeth."

Bir'ney (David Bell), an American general, born at Huntsville, Ala., May 29, 1825, practised law in Philadelphia. He became a brigadier-general of Union volunteers in 1861, and as such served at Fredericksburg, Dec., 1862. He was raised to the rank of major-general, and commanded a division at Gettysburg in July, 1863, and in several battles in Virginia in 1864. Died Oct. 18, 1864.

Birney (James G.), a distinguished opponent of slavery, the father of the preceding, was born at Danville, Ky., Feb. 4, 1792, graduated at Princeton in 1812, and became a lawyer. He was the owner of about twenty slaves, whom he liberated, and he founded at Cincinnati an anti-slavery paper called "The Philanthropist." His office was soon attacked by a mob, which threw his press into the river. Having become secretary of the American Anti-Slavery Society, he removed to New York City about 1836. He was nominated in 1840 for the presidency of the U. S. by the Liberty party, which also supported him in the election of 1844. Died Nov. 24, 1857.

Biron, de (Charles de Gontaut), Duke, a French general, born in 1562, was a son of Armand (died 1592). He served with distinction at Ivry, 1590, became a favorite of Henry IV., marshal of France in 1595, and was appointed governor of Burgundy. He was ambitious, and was convicted of forming a treasonable plot with the duke of Savoy, for which he was put to death July 31, 1602. (See De Thou, "Historia sui Temporis;" Martir-Rizo, "Historia de la Vida del Duque de Biron," 1629.)

Bisa'ccia (anc. *Romulea*), a town of Italy, in the province of Avellino, on a hill 32 miles E. N. E. of Avellino. Here is a much-frequented sulphur spring. Pop. 4977.

Bisaqui'no, Busaqui'no, or **Busacchi'no,** a town of Sicily, in Palermo, 30 miles S. S. E. of Palermo, has an extensive trade in grain and oil. Pop. 8585.

Bis'cay, or **Bisca'ya** [Sp. *Vizca'ya*], one of the four Basque provinces of Spain, is bounded on the N. by the Bay of Biscay, on the E. by Guipúzcoa, on the S. by Alava, and on the W. by Santander. Area, 834 square miles. It consists partly of mountains and partly of level plains. The chief products are wine, fruit, walnuts, chestnuts, figs, and grain. Capital, Bilbao. Pop. 778,229.

Biscay, Bay of [Fr. *Golfe de Gascogne;* anc. *Gal'licus Oce'anus,* or *Aquitan'icus Si'nus*], a portion of the Atlantic Ocean bordering on France and Spain, extends from the French island of Ushant to Cape Ortegal. The depth, which is greatest near the coast of Spain, varies from 20 to 200 fathoms. The southern or Spanish coast is bold and rocky, but the E. coast, from the Adour to the mouth of the Gironde, is low and sandy. The largest rivers that flow into this bay are the Loire and the Gironde. The principal ports on it are Nantes, Bordeaux, Bayonne, La Rochelle, and Rochefort in France, and Bilbao and Santander in Spain. Violent currents and winds render the navigation of this bay difficult.

Biscayne, formerly **Miam'i,** a post-village, capital of Dade co., Fla., on Biscayne Bay. It is celebrated for its healthfulness and delightful climate. It has been proposed to establish here a tropical botanic garden. On Key Biscayne there is a lighthouse with a fixed white light 100 feet above the sea; lat. 25° 39′ 51″ N., lon. 80° 09′ 24″ W. It has important sponge-fisheries.

Bisce'glia [Lat. *Vigilia*], or **Bise'glie,** a fortified seaport-town of Italy, in Bari, on the Adriatic, 25 miles W. N. W. of Bari. It has a cathedral, a college, and several churches and convents. Excellent currants and olives are raised in the vicinity. It is connected by rail with Foggia and all the points along the coast S. of Barletta to Brindisi. Pop. in 1872, 21,371.

Bisch'of (Karl Gustav), a German chemist, born at Wörd, near Nuremberg, Jan. 18, 1792. He became professor of chemistry at Bonn in 1822. His chief work is a "Manual of Chemical and Physical Geology" (2 vols., 1847–54; 2d ed., Bonn, 1863–66). Died Nov. 30, 1870.

Bischoff (Theodor Ludwig Wilhelm), a German physiologist and anatomist, born at Hanover Oct. 28, 1807. He became professor of anatomy at Heidelberg in 1836, at Giessen in 1843, and obtained a chair at Munich in 1854.

He gained distinction by his researches in embryology, on which he wrote several treatises.

Bisch'weiler, a town of Alsace, on the river Moder, 14 miles by rail E. N. E. of Strasburg. It has manufactures of linens, coarse woollen cloths, gloves, and earthenware. It is the centre of the hop-trade in Lower Alsace. Near it is a rich mine of iron. It was formerly fortified. Pop. in 1871, 9231.

Bis'cuit [Fr. *bis*, "twice," and *cuit*, passive part., from *cuire*, to "cook" or "bake"], a hard kind of unfermented bread formed into small cakes or flat pieces, and sometimes called ship-bread or sea-biscuit. It is composed of wheat flour, water, and salt, and is rendered hard and dry by baking, in order that it may be preserved for a long time. Biscuits are exposed to the heat of an oven for about twelve minutes, and afterwards dried in a warm room for two or three days. "Captain's biscuit" is prepared with butter, in addition to the ingredients mentioned above, and sometimes contains milk. Water or hard biscuits are made of flour, water, with variable quantities of butter, eggs, and sugar. Soft biscuits contain increased proportions of butter and sugar. Several varieties of fermented biscuits are manufactured. Meat biscuit consists of wheat flour, combined with the essential or soluble part of beef, so that the nutritive qualities of the meat may be preserved for a long time. To prepare this biscuit large pieces of beef, with water sufficient to cover them, are subjected to slow ebullition. The fat is skimmed off, the liquor is reduced by evaporation to the consistency of syrup, and is then mixed with wheat flour, rolled out to the thickness of ordinary ship biscuit, and cut, baked, and dried in the same manner as common biscuits. One pound of meat biscuit contains about one half pound of flour and the soluble part of five pounds of meat. It is used in the form of soup, which is made by boiling the biscuit in twenty times its weight of water for half an hour. (See PEMMICAN.)

BISCUIT, in pottery, is applied to porcelain and earthenware after it has been hardened in the fire, and before it has received the glaze. In this state it is porous and permeable to water. Biscuit in sculpture is a species of porcelain, of which groups and figures in miniature are formed, which are twice passed through the furnace or oven.

Bish'areen', a name given to several nomadic tribes who live in the desert between the Red Sea and the valley of the Nile. Their most valuable possessions are camels, horses, sheep, and goats. They have no firearms, but are armed with bows and arrows, and are addicted to robbery. They profess the Mohammedan religion. One tribe of Bishareen is the largest Arab tribe of Nubia. Like all the Arabs of Upper Egypt, they pay taxes to the khedive.

Bish'op [Gr. *ἐπίσκοπος* (*i. e.* "overseer"); Lat. *epis'copus;* Fr. *évêque;* Ger. *Bish'of;* Dutch, *bis'cop*], the name applied to an ecclesiastic of the highest rank in the Christian Church—all archbishops, patriarchs, and the pope himself belonging to the order of bishops. In many Protestant denominations the order of bishops is held to be identical with that of presbyters or elders; and in such sects these names are used in preference to that of bishop. Other churches claim for their bishops, by direct succession, an authority derived from the twelve apostles. The principal churches recognizing the superior rank of bishops are the Greek, the Roman Catholic, the Armenian, Coptic, Abyssinian, Nestorian, and Jacobite, the various parts of the Anglican, the Moravian, the Mormon, the Catholic Apostolic (Irvingite), and a part of the Lutheran churches. The Methodist Episcopal churches and some others give their bishops a superiority of office, but not of order. In the Roman Catholic and Anglican churches bishops have the title of "right reverend." In the former, bishops are of six classes: 1st, the pope; 2d, patriarchs; 3d, primates, who are archbishops of the principal sees of some countries; 4th, metropolitans, who are bishops of the large cities, and have a certain authority over smaller sees; 5th, simple bishops; 6th, inferior bishops, as *episcopi vacui*, bishops without cures; bishops *in partibus infidelium*, who are titular bishops, either without office or coadjutors to diocesan bishops. The assistants of metropolitans are called suffragans, but the bishops under a metropolitan are also termed his suffragans. The insignia of bishops in the Greek and Roman Catholic churches are the ring, staff, mitre, gloves, pallium (now worn only by superior bishops), and pectoral. In Great Britain and its dependencies bishops are called lord bishops; and all English bishops, except the bishop of Sodor and Man, and the junior bishop in England proper, have votes in the House of Lords. (See VICAR APOSTOLIC.)

Bishop, a township of Effingham co., Ill. Pop. 564.

Bishop (ANNA), born in London in 1814, was the daughter of Mr. Rivière, an artist. In 1831 she married Sir H. R. Bishop. Her *début* was made in 1837. She has won the highest distinction as a singer, both in classical music and modern opera. Her second husband is Mr. M. Schults of New York, whom she married in 1858.

Bishop (Sir HENRY ROWLEY), MUS. DR., an eminent English composer of music, born in London in 1780. He produced numerous popular operas, which are commended for their long flowing melodies and animated style. Among them are "Guy Mannering," "Maid Marian," "Native Land," and "The Virgin of the Sun." His glees are very fine. He was knighted in 1842, and was appointed professor of music in the University of Oxford in 1848. Died April 30, 1855. His second wife was Anna Bishop, noticed above.

Bishop Creek, a township of Inyo co., Cal. Pop. 624.

Bish'op's Auck'land, an English market-town, county of Durham, 10 miles S. W. of Durham. It is well built and growing. The fine large castle of the bishop of Durham is here. Pop. 6480.

Bish'op's Stort'ford, a town of England, in Hertfordshire, on the river Stort, 32 miles by rail N. N. E. of London. It is also connected by rail with Cambridge and Colchester. It has a corn and malt trade. In Saxon times it was owned by the bishop of London. Pop. 5280.

Bish'opville, a post-township of Sumter co., S. C. Pop. 1701.

Bis'marck-Schön'hausen, von (OTTO EDWARD LEOPOLD), PRINCE, Prussian statesman, born at Schönhausen on the 1st of April, 1815. He was educated at the universities of Göttingen and Berlin. After he had studied law, he resided for some years on his paternal estate in Pomerania, and married Johanna von Putkammer in 1847. He was chosen the same year a member of the united Diet or parliament, in which he distinguished himself as a Junker and an advocate of ultra-royalist principles. In 1851 he began his diplomatic career as Prussian secretary of legation at the Federal Diet in Frankfort. Here he manifested his hostility to Austria, and his determination to aggrandize the Prussian monarchy. He was sent to Vienna in 1852. In 1857 he had a conference with Napoleon III. in Paris. He was sent as ambassador to St. Petersburg in 1859. In a letter dated St. Petersburg, May 12, 1859, he says: "I see in our position in the Diet a defect of Prussia which we shall have sooner or later to heal *ferro et igni*" (with iron and fire). He had acquired the confidence of the king, who sent him early in 1862 on a mission to Paris, and in the autumn of that year he was appointed minister of foreign affairs and prime minister. His reactionary policy being resisted with success by the liberals, he closed or dissolved the chamber in Oct., 1862, and announced that he would enforce his measures without the sanction of the deputies. He rendered himself very unpopular, especially with the party of progress and the friends of constitutional government. Austria and Prussia co-operated in the spoliation of Denmark and the conquest of Sleswick and Holstein in 1864.

The rivalry of Austria and Prussia was for a long time a great obstacle to the reunion or reconstruction of Germany as a nation. Bismarck adopted the axiom that Austria must be excluded from the German federation, and that a new union of German states must be formed under the leadership of Prussia. Both of these rivals prepared for war, and as Austria was supported by a majority of the Federal Diet, Prussia seceded from the confederation and appealed to arms in June, 1866. The Prussian armies, assuming the offensive, marched rapidly into Bohemia, and defeated the Austrians at the decisive battle of Sadowa, July 3, 1866. The war was ended by a treaty signed in August of that year, by which Austria was excluded from the German federation. Among the results of this victory was the annexation of Hanover, Electoral Hesse, Holstein, and other states to Prussia, and the formation of the North German Confederation, including all the states N. of the river Maine. Bismarck negotiated in 1866 secret treaties of alliance with Bavaria, Baden, and Würtemberg, which powers agreed that the king of Prussia should command their armies in time of war. The great and sudden increase in the power of Prussia which followed the victory at Sadowa is ascribed chiefly to the energy and diplomatic genius of Bismarck, who was appointed chancellor of the North German Confederation in 1867.

The prestige of Napoleon was much impaired by the great step which had been made in 1866 towards the unity of Germany, and the rise of a new military power so alarming to the French. It is generally admitted that Napoleon III. was not an equal match for Bismarck in the diplomatic intrigues and contests that ensued after the war of 1866. The "Edinburgh Review" (Oct., 1869) has the following estimate of Bismarck: "We cannot consider him a really great statesman, though he has certainly gifts of the high-

est order. He is a first-rate diplomatist and negotiator. No man can captivate more adroitly those he wants to win; nobody knows better to strike at the right moment, or to wait when the tide is running in his favor. His personal courage is great, physically as well as morally; he shrinks from nothing conducive to his end. He is not naturally eloquent, but his speeches are generally impressive and full of terse argument. He is a capital companion in society—witty, genial, sparkling in his conversation. . . . But by the side of these virtues the darker shades are not wanting. He can tell the very reverse of the truth with an amazing coolness; still oftener will he tell the plain truth when he knows he will not be believed."

In July, 1870, Napoleon declared war against Prussia, which was ready for the contest after a few days' notice, and was aided by all the German states except those of Austria. Bismarck accompanied the German army which invaded France, and which gained a series of decisive victories. He was present at the capture of Napoleon at Sedan, and followed King William to the siege of Paris. At an interview with Jules Favre, the French minister of foreign affairs, who made overtures of peace in September, Bismarck demanded the cession of Alsace and part of Lorraine. He spoke contemptuously of the ministers of the new régime as "the gentlemen of the pavement." After the surrender of Paris in Feb., 1871, he negotiated the treaty of peace by which France ceded to the victors Alsace and a part of Lorraine, including the important fortress of Metz, and agreed to pay in money an indemnity of five milliards of francs, equal to $1,000,000,000. The definitive treaty was signed at Frankfort in May. Bismarck received the title of prince and became chancellor of the new empire in 1871. In 1873 he resigned his position as prime minister of Prussia. By his recent course in opposition to the ultramontane and conservative party he has gained great popularity with the liberals. (See "Graf Bismarck, ein Lebensbild," 1867; Bamberger, "Herr von Bismarck," 1868, also in French and English; "Fürst Bismarck," in vol. vii., part 1, 1871, of "Unsere Zeit.")

Revised by A. J. Schem.

Bis'mark, a post-village of St. François co., Mo., on the St. Louis and Iron Mountain R. R., 76 miles S. of St. Louis. A branch railroad extends from this point 11 miles to Pilot Knob and to Piermont, 40 miles beyond.

Bis'muth (symbol Bi; specific gravity about 9.8; equivalent 208), a brittle metal of a crystalline texture and of a yellowish-white color, occurs native in Germany, France, Cornwall, California, Texas, and Sweden. It is also found in combination with oxygen, sulphur, and arsenic. Rich deposits of bismuth ore have recently been found in Utah. It fuses at about 500° F. When strongly heated it burns with a bluish-white flame, and is rapidly oxidized. This metal is not often used in the arts in a pure state, but its alloys are of considerable importance. Some of them are extremely fusible. A compound of eight parts of bismuth, five of lead, and three of tin melts in boiling water, and is called *fusible metal.* Other alloys are even more fusible. Bismuth is an ingredient of some kinds of stereotype metal. The most important of several compounds it forms with oxygen is the tri-oxide (Bi_2O_3), which is employed in the manufacture of porcelain as an agent for fixing the gilding and for increasing the fusibility of fluxes. The sub-nitrate is a tasteless, heavy powder of pure white color, called pearl white, pearl powder, blanc de fard, etc. This is used as a cosmetic. As a medicine it acts as a tonic and antispasmodic. Other medicinal preparations are the sub-carbonate, the sub-oxide, the citrate, the tannate, and the valerianate.

Bis'muthine, a tri-sulphide of bismuth, is composed of 81.6 per cent. of bismuth and 18.4 of sulphur. It occurs in lodes and beds in the older rocks with ores of arsenic, copper, iron, and lead, either crystallized in acicular prisms or massive with a foliated structure. It is a rare mineral.

Bi'son, a genus of animals of the order Ruminantia and family Bovidæ, nearly allied to the ox, natives of Europe and North America. The bisons have short horns, which are curved inward at the point. They are distinguished from the ox by an additional pair of ribs (having fourteen pairs), and by long woolly or shaggy hair, which covers the neck and shoulders of the males. At least three species of fossil bison have been discovered. (For the European bison, see Aurochs.) The American bison (*Bison Americanus*) is known in the U. S. by the incorrect name of buffalo. This is the only species of the ox family indigenous to America, except the musk ox. It is similar to the European bison, but the fore parts are more shaggy, and it is a powerful and ferocious-looking animal, which no American beast can overcome or resist except the grizzly bear. The color of its hair is mostly brown. Vast herds of bisons roam over the plains and prairies between the Mississippi River and the Rocky Mountains, feeding on grass and brushwood. They are generally inoffensive, and will not attack men, but prefer to run rather than to fight. During their migration they move in enormous herds, which are innumerable and irresistible. Great numbers of them are killed by Indians, who pursue them on horseback and subsist on their flesh. Their hides are also valuable, and under the name of buffalo robes are an important article of commerce. The flesh of the cows is highly esteemed, and is similar to beef, being very juicy and savory. The bisons are swift in running, and have so keen a sense of smell that the hunter cannot easily approach near enough to shoot them. The Indians sometimes circumvent them by setting fire to the prairie grass on several sides, and thus driving them in confusion towards a central position. They also drive them over precipices in large herds, the momentum of which is such that the leaders cannot stop or retreat, being forced forward by the mass behind them. The chase of bisons is attended with some danger, as they sometimes turn upon an assailant, who is liable to be trampled under the feet of the herd. Numerous tribes of aborigines are mainly dependent on the bison for their food and clothing. Their skins, which are covered with soft hair or fur, are much used for blankets, and their flesh and fat are converted into *pemmican,* the favorite food of the fur-hunters and *voyageurs* of North America. The bison differs from the true buffaloes in having a hump upon the back, and in the absence of the dewlap, which is small in the buffaloes. The buffaloes have cavities in their horns communicating with the nasal passages—the bison has not; the horns turn outward in the true buffaloes, and inward in the bisons. (See Buffalo.)

Bison.

Revised by C. W. Greene.

Bissa'gos, or Bijoo'ja Islands, a group of numerous small volcanic islands in the Atlantic, near the W. coast of Africa, between lat. 10° and 12° N., and between lon. 15° and 17° W. They have several good ports. Some of them are densely peopled with a savage negro race who cultivate maize, bananas, etc., and raise cattle. Bissão, an island of the above group, is a settlement of Portuguese, who formerly traded in slaves, and who export hides, wax, and rice; it has about 8000 inhabitants.

Bis'sell (William H.), M. D., born in Cooperstown, N. Y., April 1, 1811, removed to Illinois in 1837. He practised law for several years, served as a colonel in the Mexican war (1846–47), and was elected a member of Congress by the Democrats in 1848, and served six years. In 1856 he was chosen governor of Illinois by the Republicans. Died Mar. 18, 1860.

Bissex'tile [Lat. *bissextilis,* from *bis,* "twice," and *sextilis,* "sixth"], called in English **Leap-Year,** a name given to the year which contains 366 days. In the Julian calendar the length of the year was fixed at 365¼ days, about 11 minutes more than the actual length. In order that the year should always begin with the beginning of a day, it was directed that every fourth year should contain 366 days, and the other years 365. The additional day was given to February, and was inserted next after the 24th, which the Romans called *Sexto Kalendas Martii.* This was reckoned twice, and the repeated day was *Bis Sexto Kalendas;* hence the name *bissextile.*

Bistineau, bis'te-nō', a lake in the N. W. part of Louisiana, forms the boundary between Bienville and Bossier parishes. It is about 25 miles long, and has a mean width of nearly 2 miles. Its water is discharged through a short outlet into Red River. It is navigable by steamboats.

Bis'tort (*Polygonum Bistorta*), a perennial herbaceous plant of the order Polygonaceæ, is a native of Europe and Asia. It bears flowers in a dense terminal spike. The whole plant is astringent, containing much tannin. The tortuous root is one of the most powerful vegetable astringents, and is used both internally and externally.

Bis'tre, or Bis'ter, a pigment of a warm brown color or reddish brown, used by painters in water-colors. It is prepared from the soot of wood, especially the beech.

Bistric'za, a town of Austria, in Croatia, 14 miles N. E. of Agram. Pop. in 1869, 6117.

Bis'tritz, a fortified town of Transylvania, is situated in a beautiful valley on the Bistritz River, 52 miles N. E. of Klausenburg. It has two monasteries, a gymnasium, and several large cattle-fairs every year. Near it are the

ruins of an ancient castle, the former residence of the family of Hunniades. Pop. in 1869, 7212.

Bit, in ships, is a frame composed of two short but strong vertical timbers fixed upon the deck in the fore part of the vessel. Its main purpose is for fastening the cable when the ship rides at anchor, and for "leading" the principal ropes of the rigging. To "bit the cable" is to fasten it round the bit. Various kinds are called "riding-bits," "paul-bits," "jeer-bits," "topsail-sheet-bits," etc. To resist strains, the bits are strongly bolted to the beams that support the deck.

Bitsch [Fr. *Bitche;* Lat. *Bicina*], a small fortified town of Lorraine, in a pass of the Vosges, about 36 miles N. N. W. of Strasburg and 64 miles E. of Metz. Here is a citadel on a steep isolated rock that is nearly impregnable. It was in the French department of Moselle until 1870, when possession was taken of it by the Germans at the general cession of the country; for, in spite of a long siege and bombardment, it was not surrendered. Pop. in 1866, 2740.

Bit'hoor', or **Bittoor,** a town of India, in the Northwestern Provinces, and on the right bank of the Ganges, about 12 miles N. W. of Cawnpore. It has numerous pagodas, and is visited by multitudes of pilgrims. During the mutiny of 1857 it was a stronghold of Nana Sahib, and was taken by Gen. Havelock in Aug., 1857. Pop. about 8000.

Bithyn'ia, an ancient country of Asia Minor, was bounded on the N. by the Pontus Euxinus (Black Sea), on the E. by Paphlagonia, on the S. by Galatia and Phrygia, and on the W. by the Propontis (Sea of Mármora), which separated it from Europe. The chief towns were Nicomedia, Chalcedon, Nicæa, Prusa, and Heraclea. Bithynia was annexed to the Persian empire in 543 B. C., and afterwards became an independent kingdom. Nicomedes I. began to reign over it in 278 B. C., and died in 246. Prusias II. was king of Bithynia in the time of Hannibal, who sought refuge at his court. In 74 B. C., Bithynia became a province of the Roman empire. Nicomedia was for a long time the capital of the kingdom. In 1298 the Turks conquered the country, and in 1328 made Prusa the capital of their whole empire.

Bit'lis, Betlis, or **Bedlis,** a town of Asiatic Turkey, 60 miles W. S. W. of Van. It is built in a wide ravine between limestone ridges or hills which rise about 2000 feet higher than the town. It contains three mosques, several convents, and an ancient castle, and has manufactures of firearms, and cotton cloths of a bright-red dye. Pop. from 10,000 to 12,000, of which about one-third are Armenians. The Persians defeated the army of Solyman the Magnificent near Bitlis in 1554.

Biton'to (anc. *Butuntum* or *Bituntum*), a town of Italy, in the province of Bari, 11 miles W. of Bari. It is well built, and has a fine cathedral and several monasteries. Good wine is made in the vicinity. The Spaniards gained a decisive victory over the Austrians here May 25, 1734. Pop. in 1872, 24,978.

Bitter Almond Oil. See ALMONDS, OIL OF.

Bitter Creek, a station on the Union Pacific R. R., in Sweetwater co., Wy., 785 miles W. of Omaha. The railroad company has repair-shops at this point. Remarkably imposing scenery abounds in the neighborhood. P. 48.

Bit'terfeld, a town of Prussia, in the province of Saxony, on the Mulde River, 20 miles by rail N. of Leipsic. It is on the railway from Berlin to Leipsic, with branches to Halle and other places. It has important manufactures of cloth, iron, machines, etc. Pop. in 1870, 4972.

Bitter King (*Soulamea amara*), a shrub or small tree of the order Polygalaceæ, derives its name from its intense bitterness. It is a native of the East Indian Islands, has large oval leaves and axillary racemes of regular flowers. It is used as a remedy for fevers and other diseases.

Bit'tern (*Ardea* or *Botaurus*), a bird of the order Grallatores or waders, is regarded by some naturalists as a species of heron (*Ardea*). It has a long, straight, and sharp bill, long legs, and a long neck. The neck is furnished with a loose plumage or fringe of feathers which it can erect at pleasure. This handsome bird frequents marshy fens and reedy shores of rivers and lakes, where it lies hid during the day, and feeds by night on frogs, fish, etc. The *Ardea stellaris* (common bittern of England) is widely diffused in Europe, Asia, and Africa. It utters a peculiar hollow and booming sound, which is noticed in Goldsmith's line, "The hollow-sounding bittern guards its nest." When assailed it defends itself bravely with its sharp bill, which is about four inches long. In the U. S. are found two bitterns similar in habits to the *Ardea stellaris*—viz. *Botaurus minor* ("bittern" or "bog bull") and *Ardea exilis* ("least bittern").

Bittern.

Bittern, the mother-liquid remaining after the removal of common salt from brines which have been partially evaporated. The bitter taste is due to the magnesium salts present. Sea-water and many salt wells yield a bittern which is valuable in the production of Epsom salts (sulphate of magnesia), and especially of bromine.

Bitter Principle, a term applied to a great variety of bitter substances of vegetable origin, most of which are alkaloids or glucosides. Welter applies this name to carbazotic or picric acid, a crystallizable bitter substance composed of carbon, nitrogen, and oxygen, obtained by the action of nitric acid on indigo, etc.

Bitter Root River of Montana Territory rises in the Rocky Mountains, flows northward, and enters Clark's River in Missoula co. Length, estimated at 110 miles. Gold is found near it.

Bit'ters, the name applied to certain medicines, simple or compound, chiefly of vegetable origin, characterized by a bitter taste, and for the most part having tonic virtues. The simple bitter medicines are *aromatic,* if they have a fragrant odor; *pure,* if bitterness is their principal characteristic to the taste; and *styptic,* if they have an astringent effect upon the tongue. "Bitters," as popularly used, are generally compounds of dilute alcohol with various bitter drugs, as aloes if a cathartic effect be desired; if a tonic effect is sought, the bitters used are calisaya bark, gentian, quassia, columbo, and others. An aromatic is often added.

Bitter Spar, a name given to an easily cleavable variety of DOLOMITE (which see). It usually occurs in obtuse rhombohedrons, and consists of about 55 per cent. of carbonate of lime and 45 of carbonate of magnesia. Fine transparent crystals of it are found at Gap in France and Traversella in Piedmont.

Bitter-Sweet, or **Woody Nightshade** (*Solanum Dulcamara*), a perennial plant with a shrubby stem, nearly allied to the potato, is a native of Europe and Asia, and is naturalized in the U. S. It has ovate, heart-shaped leaves, the upper ones halberd-shaped or with two ear-like lobes at the base, and purple flowers. The fruit is a poisonous red berry. The stems or twigs gathered in autumn are sometimes used in medicine in chorea and some cutaneous disorders.

The name bitter-sweet is frequently given in this country to a climbing woody vine, the *Celastrus scandens,* of the natural order Celastraceæ, which grows wild in the Northern and Atlantic States. This vine is also called WAX-WORK and STAFF TREE. It has been used in medicine, and is popularly believed to have great virtues as an alterative.

Bitter Wood, a name given to several trees and shrubs of the genus *Xylopia* and the order Anonaceæ, natives of Brazil and the West Indies. They are remarkable for the bitterness of their wood. The fruit of *Xylopia sericea* is aromatic and pungent like pepper. The term is also applied to the *Picræna excelsa* and *Quassia excelsa,* the wood of which is used in medicine as a tonic. (See QUASSIA.)

Bitu'men [perhaps from the Gr. πίτυς, a "pitch-pine tree"]. This term applies to those mineral substances, both solid and liquid, of an oily or resinous nature, composed principally of hydrogen and carbon, sometimes united with oxygen, for which the general formula is $n(C^xH^y) + m(C^{x'}H^{y'}O^{w'})$. In general terms, therefore, the bitumens are mixtures in sundry proportions of many simple carbonated hydrogens, accompanied in the solid and viscous varieties by many oxygenated carburets of hydrogen.

In general, the whole series of bitumens arrange themselves between two extremes, represented by pit-coal and naphtha as types, as follows:

Pit-coal.		Naphtha.	
Carbon	89.31	Carbon	88.20
Hydrogen	4.92	Hydrogen	11.80
Oxygen and azote	5.77		
	100.00		100.00

Bitumen is employed as the binding substance in a variety of bituminous mastics and cements, which, though principally used as a surface-coating for timber to protect it from decay, and for roofs, arches, walls, area and cellar floors, etc., to render them watertight, is also quite often employed in masonry constructions, both as a matrix for concrete and as a cement between bricks and stone, instead of lime and calcareous cements. It is also used extensively for street and other pavements, and in some of its forms for fuel and for making illuminating gas and varnish.

A knowledge of bitumen dates back to a remote period, but its extensive and varied application in the builder's art is of quite recent origin. It is found in numerous localities and in a variety of forms, principally in the secondary, tertiary, and alluvial formations, seldom in the primitive or older strata. The several varieties pass into each other, from *naphtha*, the most fluid, to *petroleum* and *mineral tar*, which are less so, thence to *maltha*, which is more or less cohesive, to *asphaltum* and *elastic bitumen*, which are solid. They are insoluble in water or alcohol, but combine with the fixed and essential oils. They are most commonly soluble in ether, and generally the more solid varieties are soluble, to a greater or less extent, in those that are more fluid.

Naphtha is a carburet of hydrogen (H_5C_8), is fluid and transparent, exhales a strong odor, burns on the approach of a lighted taper, and will unite with pure ammonia and the fluid caustic alkalies. The principal use of naphtha as an ingredient of cements and mastics is its power of dissolving the more solid bitumens. It also possesses the remarkable property of dissolving india-rubber, which gelatinizes when digested in it with gentle heat, and in this pulpy state is used to render fabrics waterproof. Naphtha is found near Baku, on the western shore of the Caspian Sea, and various parts of Persia; also at Monte Cain, near Piacenza in Italy, and near Amiano in the duchy of Parma. It is also found in Calabria, in Sicily, and in America.

Petroleum is less limpid than naphtha, is unctuous to the touch, blackish or brownish in color, more or less translucid, has a strong odor and a pungent, acrid taste, and is very inflammable, though less so than naphtha. When warm it is as fluid as common tar, but at the freezing-point of water it becomes very viscid. It is much more abundant than naphtha, being found in the secondary rocks, particularly in the coal-strata and in the vicinity of beds of coal. It rises in a spring on the base of Mount Vesuvius, and is found in a stream at Gobian, France. At Beckelbronn in Alsace it is found mixed with about 10 per cent. of sand, from which it is extracted by boiling in water. It is viscous, of a brown color, and is much used as a lubricator for machinery and carriage axles. At Amiano, Italy, it is extracted from a compact, greenish clay, and near Modena it is found on the surface of certain springs. In Transylvania it occurs in most of the salt-mines. The most remarkable and abundant sources of petroleum are found in the U. S., in the vicinity of the coal-beds of Pennsylvania, West Virginia, Ohio, and Kentucky, where it is procured by means of artesian wells, and gives employment to immense capital. The aggregate yield of the oil-wells of Pennsylvania alone has reached as high as 18,000 barrels per day.

Petroleum is a more or less perfect solvent of the more solid bitumens, and when rectified will dissolve india-rubber; and it is in this way that it is useful for cements and mastics. The residuum of refined petroleum will dissolve solid asphaltum.

The viscous bitumens generally, when submitted to distillation, yield a more or less pale-yellow, oily liquid, called by Boussingault *petrolene*, because it is an essential ingredient of petroleum. When pure, this oil, light yellow in color, has a bituminous odor, little taste, boils at 536° F., yielding a vapor of the density of 9.415. It is therefore isomeric with the essential oils of lemon and turpentine. Petroleum at $69\frac{8}{10}$° F. has a specific gravity of .891, and contains 1 equivalent of hydrogen and 1 of carbon, and dissolves sparingly in alcohol. Its composition by analysis is—

Carbon	88. — 1 equivalent.
Hydrogen	12. — 1 equivalent.
	100.

If the petroleum of Beckelbronn and other similar varieties be heated in an oil-bath at a temperature of 482° F., the petrolene is separated and passes off as vapor, and there remains a brilliantly black body, heavier than water, with a conchoidal fracture, and which burns like the resins in general, leaving an abundant coke. As this body possesses the character of asphaltum, and forms an essential part of that bitumen, it is called *asphaltene*. It is oxidized *petroleum*, containing by analysis—

Carbon	75.
Hydrogen	9.9
Oxygen	15.1
	100.00

Mineral tar is regarded as asphaltum containing a larger proportion of bituminous oil than the solid asphaltum. It is more viscid than petroleum, and of a glossy, black color. The principal sources of the mineral tar of commerce are, in France, at Bastenne (Landes) and at Pyrimont-Seyssel (Ain), and in Switzerland at Val-de-Travers in the canton of Neufchâtel, where it is found in the Jurassic limestone formation. At Bastenne, and also at Gaujac, the bitumen flows out from several openings or springs mixed with water, and is also found richly impregnating a quartzy sandstone, from which it is separated by the process of boiling. The Bastenne mines are nearly exhausted. At Seyssel the bitumen is found impregnating both sandstones and limestones. It is procured from the sandstone (called *molasse*) by boiling in water. The tar rises to the surface or adheres to the sides of the vessels in brown lumps, or in a semi-transparent brownish coating. Thus purified it is called *graisse*. A specimen of this sandstone, considerably richer than the average, gave by analysis—

Bituminous oil	8.6	
Carbon	2.	Bitumen 10.60
Quartzy grains		69.00
Calcareous grains		20.40
		100.00

Taken in bulk, the product of the mine is much less rich than this specimen.

The bituminous limestone called asphalt rock is found both at Seyssel and at Val-de-Travers. That from Seyssel contains on an average about 90 per cent. of carbonate of lime and 10 per cent. of bitumen. The Val-de-Travers asphaltic rock is richer, containing about 80 per cent. of carbonate of lime and 20 per cent. of bitumen. The stone is massive, of irregular fracture, and of a liver-brown color. Though easily scratched with the finger nail, it is difficult to break up with a hammer, showing malleable properties under the blows. Its specific gravity is 2.114, water being 1000.

Asphaltum is a dry and solid variety of bitumen, usually very brittle, and at ordinary temperatures too hard to be easily impressed with the finger nail. It is opaque, smooth, slightly translucent at the edges, of black or brownish color, and has little odor unless rubbed or heated. It is very inflammable, melts easily, and if pure burns with little or no residue. It is soluble in alcohol, and not readily so in the fixed and essential oils or ether, but naphtha dissolves one-fifth of its weight of asphaltum at ordinary temperatures, and forms a saturated solution of a deep-black color.

Asphaltum is found floating in the Dead Sea, and in veins with calcareous spar and brown iron ore at Karmsdorf in Saxony. In Cornwall it occurs with sulphurets of lead and copper; near Syrsan on the Wolga in compact limestone; in embedded veins in the secondary limestone in Fifeshire; in clay iron-stone at East Lothian; in veins in Shropshire, England; and in the Hartz Mountains, Germany, along with sparry iron, heavy spar, and brown iron ore. It is also found in the Ural and Caucasus Mountains. It is found in many places in Mexico, and abounds in the islands of Barbadoes and Trinidad. In Trinidad there is a remarkable lake about three miles in circuit, covered almost entirely with a stratum of asphaltum, traversed by fissures and crevices filled with water. The color is ashy or gray, approaching to black, and in portions of the lake quite black. Near the shore it is generally hard, giving a dull conchoidal fracture. Towards the centre it is softer, and at some points fluid petroleum is formed, which gradually indurates on exposure to the air. A gentle heat renders the Trinidad asphaltum ductile, but it is quite brittle at the freezing-point of water. It is employed on the island in making roads and in paving courtyard areas, etc., and for covering roofs, terraces, etc. Within the last few years it has been imported into the U. S. to a considerable extent, where it is used in the fabrication of various road and roof coverings, and for other kindred purposes. The products of its distillation are inflammable gas resembling that obtained from pit-coal, a species of bituminous oil, a tarry substance resembling coal-tar, and a substance resembling coke.

The other forms of solid bitumen (cohesive mineral pitch, elastic bitumen, retinite or retin asphaltum, fossil copal, and hatchetine or mineral adipocere) have little or no useful application in the industrial arts, and require no extended notice. The elastic bitumen, known also as mineral caoutchouc, possesses the property, like india-rubber, of effacing pencil-marks from paper, but is little used for that purpose, as it soils the paper.

The bitumen employed by the ancient Babylonians was a semi-fluid variety, obtained from the fountains of Is (the modern *Hit*), on the right bank of the Euphrates. These thermal fountains still flow copiously, yielding large quantities of petroleum, mixed with intensely saline sulphureous water. It was used to unite the sun-dried bricks with which the Babylonians constructed their public and private buildings, and the state in which the ruins of many colossal structures are still found indicates the imperishable character of the cement used. It was probably applied in the plastic state, and indurated gradually by the evaporation, and absorption of a portion of the bituminous oils.

In the fabrication of bituminous mastics and cements the

forms of bitumen employed are principally petroleum, mineral tar, asphaltum, and, to a limited extent, naphtha. Of petroleum, it is the residuum only (known as "still bottoms"), obtained in the refining process, that is used for this purpose. This is a suitable solvent for solid asphaltum.

Bituminous mastic (sometimes called asphaltic mastic or asphaltic cement) is generally composed of mineral tar and some calcareous, silicious, or earthy substances in powder. Instead of the mineral tar, solid asphaltum, that has been softened by a liquid bitumen or other suitable solvent, may be used. The bituminous masties of Seyssel and Val-de-Travers are generally made by mixing the bituminous limestones of these localities, previously pulverized, with a suitable proportion of the mineral tar extracted from the bituminous sandstone or *molasse*. Seven to eight per cent. of mineral tar will be required for the Seyssel mastic, while 4½ to 5 per cent. will answer for that of Val-de-Travers. The tar is first heated in cast- or wrought-iron boilers over a brisk fire, until the boiling liquid begins to emit a thin whitish vapor. The heat is then moderated, and maintained at a uniform state, while the powdered stone is added gradually, care being taken to avoid lowering the temperature suddenly by adding too much at once. A yellowish or brownish vapor indicates a degree of heat calculated to scorch and injure the mastic. In such case the material should be stirred rapidly and the fire drawn or reduced. For convenience of transportation the mastic is moulded into blocks about twenty inches long, twelve inches wide, and five or six inches deep. When remelted for use it is necessary to add 2 to 3 per cent. of mineral tar, to compensate for loss of oil by evaporation in reheating.

The bituminous limestone may be reduced to powder by either grinding or roasting. For grinding, the stone is first broken up into pieces not much larger than a hen's egg, and is then passed through some suitable mill. The cast-iron mill, consisting of two horizontal iron plates, one revolving eccentrically upon the face of the other, answers very well. Cold, dry weather is the best season for this operation, which should be conducted under cover. If the weather be too warm the stone is apt to cake. For roasting, the stone is first broken up as for grinding; the fragments are then gently heated in a closed iron vessel. They gradually lose their coherence, and are reduced to powder by stirring with an iron instrument. This process is not only less economical than grinding when large operations are carried on, but there is a loss of tar by evaporation, and there is also danger of injury by too high heat.

Instead of the bituminous limestone, powdered limestone, marl, or chalk has sometimes been used with the mineral tar, giving very good results, the proportion of the tar being of course increased to compensate for its absence in the powdered mineral.

Trinidad Bituminous Mastic.—A good mastic may be made from the Trinidad asphaltum, provided a suitable solvent for it be employed. This asphaltum melts readily at a gentle heat, and is very brittle when cold. When mixed up, without a solvent, with any pulverized material, whether silicious, calcareous, or argillaceous, the mastic produced is not, as it should be, hard, firm, and in some degree malleable through the wide range of temperature peculiar to the U. S. If the proportion of mineral ingredient be so much increased as to give a hard and firm mastic at 100° F., it will be quite brittle at the freezing-point of water; while, on the contrary, if the proportions be adjusted with a view to firmness and tenacity in cold weather, it will be much too soft at a summer heat. The residuum produced in refining crude petroleum is so far a solvent for solid Trinidad asphaltum that when the two are thoroughly mixed together by stirring in an iron boiler over a gentle heat, in the proportion, by weight, of 3 of residuum to 7½ or 8 of asphaltum, a mineral tar is produced much resembling that of Bastennes or Seyssel, and which, like the latter, may be employed for making mastic, in combination with the bituminous limestone or other mineral substance.

The following formulæ give a good mastic for covering pavements, cellars, areas, and arches, and for other similar purposes:

1.	Solid Trinidad asphaltum	21½ lbs.	= tar 30 lbs.
	Residuum of refined petroleum	8½ "	
	Powdered marl or other amorphous limestone	70 "	
		100 "	
2.	Solid Trinidad asphaltum	17½ lbs.	= tar 24 lbs.
	Residuum of refined petroleum	6½ "	
	Powdered amorphous limestone	76 "	
		100 "	

From the trials that have been made there appears no reason to doubt that the Trinidad asphaltum, suitably softened with some of the liquid bitumens, or with substances derived from them possessing the properties of a solvent, is quite as good as the natural mineral tar in the fabrication of masties. But it must be conceded that nothing has yet been discovered which can replace, with entire satisfaction, the bituminous limestone of Seyssel and Val-de-Travers. An amorphous carbonate of lime, and even well-slacked quicklime, have both been used with very good results; but in the natural asphaltic rock the calcareous matter is so intimately and impalpably combined with the bitumen, resists so thoroughly the action of air and water, and even muriatic acid, and is so entirely free from moisture—properties due perhaps to the vast pressure and intense heat under which the ingredients have been incorporated by nature—that we are forced to attribute the excellence of this material to the existence of certain natural conditions which the most skilful artificial methods fail to reproduce.

The North American Neufchâtel Rock Paving Company use for their pavement and other coverings in the U. S. the Val-de-Travers asphalt rock, Trinidad bitumen, and "still bottoms" or residuum of petroleum. They manufacture by the following processes:

1. *Mineral tar* is produced by mixing together in an iron boiler, with constant stirring, at a temperature of 470° F.,

Trinidad asphaltum	85 lbs.
Still bottoms	15 "
	100 "

2. *Bituminous mastic* is produced by mixing together, at 400° F.,

Pulverized Val-de-Travers asphalt rock	98¾ lbs.
Mineral tar (No. 1, as above)	1¼ "

3. The *pavement covering* for sidewalks, roadways for light traffic, areas, cellars, warehouses, and for similar purposes, is made by mixing together at 400° F. the following:

Bituminous mastic (No. 2, as above)	98¾ lbs.	= 100.
Mineral tar (No. 1, as above)	1¼ "	
Grits or pulverized limestone	35 "	

This is laid one-half to three-quarters of an inch thick on a concrete foundation four and a half to six inches thick, and then rubbed down smooth with a dry mixture of hydraulic cement and fine sand. The thickness of the foundation should vary to suit the kind and quantity of traffic to which the pavement is to be subjected. This mixture (No. 3) is also suitable for covering roofs, arches, and for watersheds generally. For pavements subjected to traffic with heavy vehicles the covering should be Val-de-Travers asphalt rock alone, and the pavement is laid as follows: 1, prepare a concrete foundation seven to nine inches thick; 2, pulverize the Val-de-Travers rock at a temperature of 260° F.; 3, spread it over the foundation with a rake, and ram it with red-hot rammers in a layer one and a half to two inches thick; 4, smooth it off with a hot smoothing-iron; 5, roll it with a heavy roller, to remove marks of rammer and compress it more solidly.

Q. A. Gillmore, *U. S. Army.*

Bitu'minous Coal, a variety of coal which is valuable for fuel and burns with a smoky flame. It is softer than anthracite, and ignites more easily, but is less durable in combustion. It is composed of carbon, with a small proportion of hydrogen. Bituminous coal-fields of great extent occur in Western Pennsylvania, Ohio, Indiana, Illinois, Iowa, Kansas, Kentucky, Missouri, etc. This substance is also found in several parts of Europe, especially in Great Britain. It is extensively used in the manufacture of illuminating gas, and is burned as fuel in steamboats, manufactories, etc. (See Coal, Coke, and Gas.)

Bituminous Limestone, carbonate of lime impregnated with bituminous matter, derived from decayed vegetables or from the decomposed remains of those animals the hard parts of which form a large portion of the rock, which is sometimes very extensive. Within a few miles of Chicago, Ill., it has been estimated by Prof. T. S. Hunt that the limestone rocks contain as much petroleum as the oil-wells of Pennsylvania yield in ten years. It is not, however, believed to be separable for use. (For the uses of this stone, see Bitumen, by Gen. Q. A. Gillmore, U. S. A.)

Bituminous Shale, an indurated bed of clay, or a tough clayey substance which occurs in many coal-fields, and contains portions of carbon and volatile matter. These shales have a slaty fracture, are often repeated like other beds of clay, and occupy a definite position with regard to coal. Oil, gas, and paraffine are obtained from them by distillation.

Bi'valve [from the Lat. *bis*, "twice," "double," and *valva*, plu. *valvæ*, "folding doors"], a term applied in conchology to a shell which consists of two concave calcareous plates or valves joined together by a hinge and an elastic ligament, as the oyster.

Bivalve Shells, or Bivalves, are those coverings of mollusks which consist of two concave plates or valves, united by a hinge. (See Conchology.) A majority of

recent bivalve shells belong to the acephalous or lamellibranchiate Mollusca. There are also mollusks of the class Brachiopoda which possess bivalve shells. The structure and chemical composition of the shell, however, is different in the two classes. A very large proportion of the bivalve shells of the older fossiliferous rocks belong to the class Brachiopoda. In the Brachiopoda one valve is ventral and the other dorsal; in the Lamellibranchiata both are lateral.

Bivouac, biv'wăk [from the Ger. *bei*, "near," and *Wache*, "watch"], a French word signifying an encampment of soldiers by night in the open air, without tents, or the system by which soldiers on a march, or in expectation of a battle, remain all night in the open air, resting with their arms by their side and ready for action. This practice is said to have been common among the crusaders. The generals of the French republic or the First Empire introduced the plan of dispensing with the use of tents and passing the night *en bivouac*. The same system was adopted by the other great powers on the continent of Europe. In recent times it is common for soldiers on the march to use the *tente d'abri* or shelter-tent.

Bix'in, the coloring principle of annotto, the paste obtained by bruising the seeds of *Bixa Orellana*.

Bizer'ta, or Benzer'ta (anc. *Hippo Zarytus*), a fortified seaport of Tunis, and the most northern town of Africa, about 38 miles N. W. of Tunis. The port, which was formerly good, has been filled up, so that it will now admit only small vessels. It is surrounded by walls and defended by two castles, but is commanded by the adjacent heights. This place was fortified by Agathocles about 308 B. C. Pop. about 10,000.

Björne'borg, or Biornborg, a seaport of Finland, at the mouth of the Kumo, 115 miles S. of Vasa; lat. 61° 29′ N., lon. 39° 23′ E. It has various manufactures and a considerable trade. Pop. 7270.

Björn'son (Björnstjerne) was born Dec. 8, 1832, in a lonesome and dreary parsonage in North-western Norway, where his father was a minister. He was educated in the Latin school at Molde, from which he went to the University of Christiania in 1851. But already in the next year he broke off his scientific education and commenced a literary life, in which there, as yet, have been no failures and only a few mistakes, while its beneficial consequences will reach far into the future, for with him begins the Norwegian Literature. (See that article.) His first book, published in 1856, was a little novel, "Synnöve Solbakken," descriptive of peasant life in Norway. It made a very deep impression. The plot was simple, but at every movement it touched the deepest laws of life, and nowhere smacked of any narrow tendency. The characters were pure psychological developments, never marred by explanations or remarks from a merely individual moral standpoint. The style was the short, pithy sentence from the Saga, with all its power of signification, all its strength of passion, and all its sweetness of feeling. The effect of this book was truly wonderful, and the impression it made was both deepened and widened by the novels which followed, "Arne," "En glad gut," "Fiskerjenten," etc. In spite of the great variety of characters and situations which they depict, they are all so singularly alike that in the reader's mind they melt together into one book, into one picture of life in Norway; and so touching and charming is this picture that more than one reader exclaimed in delight, "I wish I had been born in Norway!" Alternating with the novels he wrote dramas, and in this field he experienced some opposition. When his first tragedy, "Halte-Hulda," was published in 1858, there were people who felt that a new dramatic genius had arisen, greater perhaps than any since the days of Shakspeare; but the great public was, and will always be, incapable of appreciating a drama by reading it only. Actual representation on the stage is necessary, and the Scandinavian theatres were, at first, singularly unwilling to try the new author. Moreover, the expressions are, in "Halte-Hulda," often forced and obscure. The young poet had not yet learnt to say unimportant things in an unassuming manner, which alone can set off the important in due relief. His next drama, "Kong Sverre," was better in this respect, but it was not until he published his great tragedy, "Sigurd Slembe" (1862), that the public thoroughly felt the eminent greatness of his dramatical powers. "Sigurd Slembe" is a grand conception, masterly executed; and when in 1866 the Royal Theatre in Copenhagen represented his lovely little comedy, "The Newly Married," and next year his tragedy, "Marie Stuart," the impression was irresistible. Meanwhile, he worked alternately as a stage-manager and as an editor, and in practical life he not only experienced hard opposition, but he deserved it. He has ideas, and they are both sound and vigorous, but they are unsupported by that experience or knowledge which alone can make ideas fit for actual life. He has enthusiasm and energy, but he lacks that patience with actual circumstances, and that respect for other people's opinions, which constitute true wisdom. In practical life he is apt to make everything a question of party, and liable to forget that the other party also may comprise honest people; and this circumstance has now and then caused some passing troubles in his life, otherwise so rich and happy and blessed in every respect. Clemens Petersen.

Björn'stjer'na (Magnus Fredrik Ferdinand), Count, a Swedish general and author, born at Dresden Oct. 10, 1779. He fought against the French in 1809–13, and negotiated the treaty by which Sweden and Norway were united. He was ambassador at London for many years (1828–46). Among his works is "The Theogony, Philosophy, and Cosmogony of the Hindoos" (1843). Died Oct., 1847.

Blacas (Pierre Louis Jean Casimir), Duke of, a French statesman, born at Aups, in the department of Var, Jan. 12, 1771, was a faithful adherent of the Bourbons. He negotiated the concordat of 1817, and was employed on various important embassies. He founded the Egyptian Museum in Paris, and became a member of the Institute. Died Nov. 17, 1839.

Black [Lat. *ni'ger*], a term applied to things that absorb all the rays of light. It is considered the privation or negation of color, and a symbol of evil, darkness, and mourning. In blazonry, black (sable) denotes constancy, wisdom, and prudence. Black dyes are produced by logwood, catechu, galls, or other substance containing tannic acid, used with iron; or by various aniline compounds. Black pigments are usually carbonaceous.

Black, a township of Posey co., Ind. Pop. 6291. It contains the town of Mount Vernon.

Black (Jeremiah S.), an American jurist and Democratic politician, born in Somerset co., Pa., Jan. 10, 1810, became a judge of the supreme court of Pennsylvania in 1851, attorney-general in the Cabinet of Buchanan in 1857, and secretary of state in 1860.

Black (Joseph), an eminent chemist of Scottish extraction, was born at Bordeaux in 1728. He graduated as doctor of medicine at Edinburgh in 1754, and became professor of anatomy at Glasgow in 1756. His reputation is founded chiefly on the theory of latent heat, which he propounded between 1759 and 1763. He obtained in 1766 the chair of chemistry in the University of Edinburgh, where he lectured for thirty years, and acquired great popularity. Died Nov. 26, 1799. His "Lectures on Chemistry" were published by Dr. Robison (2 vols. 4to, 1803). He was a friend of James Watt.

Black (William), a Wesleyan divine, born in England in 1760, removed to Nova Scotia in 1775, and founded there the Wesleyan Church. He was subsequently general superintendent of the Wesleyan missions in British America. His purity of life and eminent services to his denomination have made him one of its most memorable characters. He died Sept. 8, 1834.

Black Acts, the acts of the Scottish Parliaments passed between 1425 and 1586—so called because they were printed in the characters known as *black letter*. In English lawbooks the term "black act" is applied to the 9 Geo. I. c. 22 (1722), because it was occasioned by the outrages committed by persons whose faces were blackened. They destroyed the deer in Epping Forest and committed other offences. The act was repealed in 1827.

Black Art. See Magic.

Black'ball. In the elections of clubs and other associations a black ball is deposited in the ballot-box or urn by each person who votes in the negative, or votes against a candidate for admission. Those candidates who are thus rejected are said to be blackballed.

Black Band, a variety of clay iron-stone or compact carbonate of iron, containing 25 or 30 per cent. of carbonaceous matter. It occurs abundantly in the coal-fields of Scotland, and is the ore almost exclusively used for the production of iron in that country. It is not very rich, and does not yield iron ore of the first quality when smelted by itself, but it is easily reduced. Black band also occurs in the coal-measures of Ohio, and is extensively used for the production of iron. Many black bands are so filled with fossil bone and other phosphatic matter that they cannot be profitably wrought.

Black Bass, a highly esteemed game fish of the lakes and rivers of the U. S., of which there are two or more species—*Grystes nigricans* and *Grystes megastoma*. The name is locally applied to various other fishes.

Black'berry, the common name of several species of

Rubus, natives of the U. S. They are shrubby plants called brambles, armed with stout, curved prickles. The fruit (which is not a berry in the botanical sense, but a collection of drupes) is edible and pleasant. The common or high blackberry (the *Rubus villosus*) has compound leaves, with leaflets ovate, pointed, and unequally serrate. Several valuable varieties have been extensively introduced into cultivation. Among these are the sorts known as the Dorchester, the Lawton (or New Rochelle), the Kittatinny, and the Wilson. A leading requisite for success in their management is to keep the bushes "pinched in" during summer, so as to prevent a loose, straggling growth, and to give them a neat, small, compact shape, by which their productiveness is greatly increased. The low blackberry, or dewberry, is *Rubus Canadensis*. Similar fruits are common in Asia and Europe.

Blackberry, a post-township of Kane co., Ill. P. 1173.

Black'bird, or **Merle,** a popular name given in England to the *Turdus merula* or *Merula vulgaris*, a species of thrush which abounds in Europe. In size it is intermediate between the song-thrush or mavis and the missel thrush. The plumage of the male is all deep black, but that of the female is brown. It has a powerful voice, and its song is more mellow than that of the song-thrush, but inferior in compass and variety. The blackbird is often kept in cages, and is very susceptible of being trained. It feeds on worms, insects, and fruits, and frequents hedges, woods, and thickets. Quite distinct from this bird is the blackbird of the U. S. (*Quiscalus versicolor*), sometimes called "crow blackbird" or purple grakle. The "rusty crow-blackbird" (*Quiscalus ferruginous*) is a rather less common bird of the U. S. It is a great depredator of corn-fields. The swamps and meadows of the U. S. are frequented by the *Agelaius Phœniceus*, or red-winged blackbird. It is gregarious, and feeds on insects and grain.

The Rusty Crow-Blackbird.

Blackbird, a county in Nebraska, bounded on the E. by the Missouri River, which separates it from Iowa. Area, about 522 square miles. It is largely occupied by the reservation for the Omaha Indians. The surface is undulating; the soil is fertile. Pop. 31.

Black Bluff, a township of Sumter co., Ala. Pop. 640.

Black'brook, a post-village and township of Clinton co., N. Y. It contains extensive beds of iron ore, and has large manufactures of excellent iron. Charcoal and lumber are also manufactured. Pop. of township, 3561.

Black Brook, a post-township of Polk co., Wis. Pop. 323.

Black'burn, a manufacturing town of England, in Lancashire, is situated in a barren district on a small stream called "The Brook," 24 miles by rail N. N. W. of Manchester. It has a beautiful Gothic parish church, a fine new exchange, also in the Gothic style, and numerous chapels of the dissenters, a grammar school founded by Queen Elizabeth, a hospital, a theological academy, and a theatre. The principal business of the town is the manufacture of cotton stuffs, chiefly coarse calicoes and muslins, in which 10,000 persons or more are employed. Coal and lime are abundant in the vicinity. James Hargreaves, who invented the spinning-jenny in 1767, was born here. Railways extend from this point in various directions. Blackburn sends two members to Parliament. It has a public park which is 709 feet above the level of the sea. Pop. in 1871, 76,337.

Blackburn (William Maxwell), D. D., born at Carlisle, Ind., in 1828, graduated at Hanover College, Ind., in 1850, and studied theology at Princeton. He has been professor of biblical and ecclesiastical history in the Presbyterian Theological Seminary at Chicago since 1868, and been for many years an active contributor to religious literature in church history and books for the young. He has also contributed largely to the "Princeton" and "American Presbyterian" Reviews.

Black'burn's, a township of Lauderdale co., Ala. Pop. 672.

Black Buttes, a station of the Union Pacific R. R., in Sweetwater co., Wy., 794 miles from Omaha. Mines of excellent lignitic coal abound in this region, and are extensively wrought. Pop. in 1870, 18.

Black Cap, Black Cap Warbler, or **Fauvette** (*Curruca atracapilla*), a bird of the family Sylviadæ or warblers, is nearly allied to the nightingale. It is regarded as the sweetest song-bird in Great Britain, except the nightingale, to which it is somewhat inferior in size. The back, wings, and tail are of an ash-brown color, the belly is white, and the top of the head is jet black (in the male). Its note is rich in tone, and has a great variety of sweet and gentle modulations. It is a summer bird of passage in England, which it enters in early spring, and from which it migrates in September. It is highly prized as a cage-bird, not only for its song, but for its pleasant manners and temper.

Black Cap is also the name applied to a species of raspberry (the *Rubus occidentalis*), of which several varieties have recently been introduced for cultivation into gardens in the U. S.

Black Chalk, a variety of shale, containing a large proportion of carbon, is found in France, Spain, Scotland, Wales, etc. It is made into artists' crayons and used for drawing, and is ground to powder for paint.

Black Cock, Heath Fowl, or **Black Grouse,**

Black Grouse.

(*Tetrao tetrix*), a bird of the order Rasores, is abundant in Scotland and the north of England. It also occurs in the mountains and marshy parts of the continent of Europe, and abounds in Scandinavia and Russia. Its favorite haunts are moors, bogs, and morasses covered with rank herbage. The male, which weighs nearly four pounds, is of a shining bluish-black color, with a conspicuous white bar on the wings below the ends of the great wing-covers. The outer tail-feathers on each side are elongated and curved outward. The female is of a rust color, and is called the "gray hen." This species of grouse is gregarious, but in winter the males and females form separate flocks. They build nests of very simple construction on the ground, and lay in each six or eight eggs, which are about two inches long. Their food consists of seeds, berries, insects, and the young shoots of the pine, fir, and birch. Their flesh is highly esteemed for food.

Black Creek, a township of Perry co., Miss. Pop. 492.

Black Creek, a township of Shelby co., Mo. Pop. 1418.

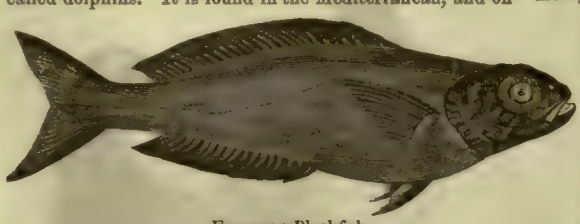
Black Creek, a township of Mercer co., O. Pop. 1087.

Black Creek, a township of Lexington co., S. C. Pop. 474.

Black Creek, a post-township of Luzerne co., Pa. Pop. 569.

Black Creek, a township of New Kent co., Va. P. 998.

Black Creek, a township of Outagamie co., Wis. P. 528.



Black Death. See PLAGUE, by E. D. HUDSON, JR., M. D.

Black Duck (*Anas obscura*), one of the best known and most highly prized of American wild ducks, breeds abundantly throughout the continent from Mexico to Labrador and from the Atlantic to the Pacific. It might be readily domesticated. It is of a generally blackish-brown color, with bright tints about the bill, neck, wings, etc.

Black Earth, a post-township of Dane co., Wis. It has one weekly newspaper. Pop. 966.

Black'feet, a tribe of American Indians who infest the Territory of Montana and Wyoming on the E. side of the Rocky Mountains, and between the Yellowstone and the Missouri Rivers. They are divided into the true Blackfeet, the Bloods, the Piegans, and the Small Robes. They were once a powerful and ferocious tribe, very hostile to the white people, and addicted to robbery. They are distinct from the "Blackfeet Sioux," who belong to the Dakota confederacy. The Blackfeet are also found in British America, and are of Algonquin stock. A small vocabulary of their language was published by George Catlin in the second volume of his "Letters and Notes on the Manners, etc. of the North American Indians" (1841).

Black'fish (*Centrolophus Moris*), a fish of the family Scomberidæ, is nearly allied to the Coryphenes, which are called dolphins. It is found in the Mediterranean, and on

European Blackfish.

the western coasts of Europe, but is not abundant anywhere, at least in shallow water. It sometimes measures thirty inches long and weighs fourteen pounds. Its body is covered with minute scales and a tough skin. The term blackfish or tautog is applied in the U. S. to the *Tautoga Americana*, which is esteemed for the table.

BLACKFISH (*Physeter tursio*) is also the name of a whale closely akin to the spermaceti whale. It is sometimes nearly sixty feet long, but usually much smaller. This huge animal has an eye about the size of that of a common haddock. It yields oil and spermaceti, and is found in the Atlantic. Quite recently the existence of the *Physeter tursio* has been denied. Several other whales are known by this name.

Black Flux, a mixture of carbonate of potash and finely-divided carbon or powdered charcoal. It is prepared by mixing in a crucible one part of nitre with two or three parts of crude cream of tartar, and deflagrating the mixture by ignited charcoal; or by heating in a covered crucible crude cream of tartar or bitartrate of potash, when the tartaric acid is decomposed and charred, forming carbonic acid, which remains in combination with the potash. It is a valuable flux in reducing ores. The metal potassium can be obtained by heating this flux in iron vessels.

Black'ford, a county in the E. N. E. of Indiana. Area, 180 square miles. It is drained by the Salamonie River. The surface is undulating or nearly level; the soil is productive. Corn, wheat, and wool are important products. The county is intersected by the Fort Wayne Muncie and Cincinnati and by the Pittsburg Cincinnati and St. Louis R. Rs. Capital, Hartford. Pop. 6272.

Black Forest [Ger. *Schwarzwald;* anc. *Hyrcinia Sylva*], a mountainous and wooded region in Baden and Würtemberg, with a chain of mountains which extends about 85 miles, and separates the basin of the Rhine from that of the Neckar. It was a part of the ancient Hercynian Forest. This region is remarkable for its extensive forests and its mines of silver, copper, zinc, lead, and iron. The highest point of this chain is the Feldberg, which rises 4903 feet above the level of the sea. The Danube, Neckar, Kinzig, Murg, and Elz rise in the Black Forest. A number of small lakes are found here at elevations of 2500–3500 feet. Granite and gneiss form the foundations of these mountains, and porphyry occurs on their sides, which are also covered with abundance of fir trees. The descent is precipitous on the western side, but the eastern slope is very gentle. A valley called Murgthal, situated in this forest, is famous for its beautiful scenery. In the vicinity of Neustadt is the mountain-pass of Hölle, which was celebrated in connection with Moreau's retreat in 1796. The soil of these highlands is not adapted to tillage. The inhabitants are extensively employed in the manufacture of wooden clocks and toys.

Black Fork, a township of Scott co., Ark. Pop. 160.

Black Fork, a post-township of Tucker co., West Va. Pop. 610.

Black'friars, a term applied, on account of the color of their garments, to the Dominican order of monks, who first came to England about A. D. 1220, and settled at Oxford. Their second house was the Blackfriars in London, and from it the district still bears the name of the order, which had nearly sixty houses in England and Wales at the time of the abolition of monasteries. (See DOMINICAN.)

Black'guard. It is said that when the kings of England made a progress with the court from one royal residence to another, it was customary for the scullions and other menials to follow with loads of kitchen utensils, and even coals; and from their dirty appearance they received the derisive name of *black guard*, which has come to be applied to any person of a vile character, or one who uses vulgar or ruffianly language. (See TRENCH, "English, Past and Present.")

Black Gum, a popular name of the *Nyssa multiflora*, an American tree, sometimes called pepperidge, hornpipe, tupelo, and sour gum. It has oval or obovate leaves, commonly acuminate, which turn bright crimson in autumn. The fruit is a bluish-black drupe, the wood close-grained, tough, and very difficult to split. It is used for cog-wheels, hatters' blocks, and wheel-naves. It belongs to the order Cornaceæ.

Black'hammer, a township of Houston co., Minn. Pop. 709.

Black Hawk, a county in N. E. Central Iowa. Area, 576 miles. It is traversed and nearly bisected by the Cedar River, which flows south-eastward. It is also drained by Black Hawk Creek. Extensive prairies occur in this county, which has a fertile soil. Cattle, corn, wheat, oats, and wool are important products. It is intersected by the Illinois Central R. R. (Iowa division) and the Burlington Cedar Rapids and Minnesota R. R. Capital, Waterloo. Pop. 21,706.

Black Hawk is a mining town of Gilpin co., Col., located about 40 miles W. of Denver, the terminus of the Colorado Central R. R. (narrow gauge through Clear Creek Cañon). It contains, and is adjacent to, rich mines of gold and silver. It has within its limits twenty quartz-mills and the Boston and Colorado Smelting-Works, and is the principal ore-reducing point in Colorado. It has two churches, three hotels, forty stores, one foundry, a fine public school, and a daily and weekly paper. Pop. 1068.

S. CUSHMAN, ED. "JOURNAL."

Black Hawk, a township of Rock Island co., Ill. Pop. 1723.

Black Hawk, a township of Black Hawk co., Ia. Pop. 716.

Black Hawk, a township of Grundy co., Ia. Pop. 396.

Black Hawk, a township of Jefferson co., Ia. Pop. 1019.

Black Hawk, an American Indian, chief of the Sac tribe, born in 1767. He waged war against the U. S. in 1832 for the recovery of lands which certain chiefs of the Sacs and Foxes had ceded to the whites. Died Oct. 3, 1838.

Black'heath, an elevated open common in the county of Kent, England, 5 miles S. E. of London, adjoining Greenwich Park, is a favorite holiday resort for Londoners. It commands an extensive view, and is bordered by numerous handsome villas. The Roman Watling Street crosses this heath, which is the site of Morden College. This heath was the scene of the insurrections of Wat Tyler and Jack Cade, and was formerly infested by highway robbers.

Black Hills, a mountain-range in the S. W. part of Dakota and the eastern part of Wyoming Territory. The highest point of this range, Laramie Peak, in Wyoming, rises about 8000 feet above the sea. It is in about lat. 42° 10′ N., and 60 miles W. of Fort Laramie.

Black Hole, the name of a small dungeon or cell in Calcutta which was the scene of a nefarious crime committed by the nabob Suraja Dowlah in June, 1756. Having captured the English garrison of a fort at Calcutta, he confined the prisoners, 146 in number, in a cell twenty feet square, with only two windows. They suffered great agonies from thirst, heat, and foul air, and 123 died from suffocation in the first night. The twenty-three survivors were taken out the next morning. One of them, John Z. Holwell, published a narrative of their sufferings.

Blackie (John, Sr.). See Appendix.

Black'ie (John Stuart), a Scottish classical scholar, born in Glasgow in 1809, studied at Edinburgh and Göttingen. He translated Goethe's "Faust" into English verse, and produced in 1850 an able translation of the works of Æschylus. In 1852 he became professor of Greek in the University of Edinburgh. He contributed articles to the "Encyclopædia Britannica" and the "Imperial Dictionary of Biography." Among his numerous other works are "Lays and Legends of Ancient Greece" (1857), "Lyrical Poems" (1860), and "Homer and the Iliad" (4 vols., 1866).

Black'ing, a compound of bone-black, oil, sulphuric acid, and sugar or molasses, employed in polishing boots, shoes, or leather, on which it produces a black-glazed and shining surface. The ingredients in Day & Martin's blacking are finely powdered bone-black ground with sperm oil, raw sugar or molasses, a little vinegar, and concentrated sulphuric acid, which unites with the lime of the bone-black to form sulphate of lime.

Black Jack, the name given by miners to blende (sulphide of zinc). It is also a popular name of a small species of American oak (*Quercus nigra*), sometimes called barren oak and iron oak. Its wood is very hard and makes a good firewood, but is rather perishable, and is not very valuable for timber. There are several varieties.

Black Jack, a tp. of Richmond co., N. C. Pop. 799.

Black Lead. See Graphite.

Black Letter, a term applied to the Gothic or Old English types or letters, which were used in the typography of the first books ever printed in England. Books printed before 1500 are generally in this character, which was commonly used in manuscripts by Europeans long before the invention of the art of printing. A form of type similar to this is still used by the Germans.

Blacklick, a township of Cambria co., Pa. Pop. 646.

Black Lick, a township of Indiana co., Pa. P. 1016.

Black Lick, a township of Wythe co., Va. P. 3489.

Black List, the name applied in Great Britain to printed lists connected with insolvency, bankruptcy, and other matters affecting the credit of firms and individuals, and which are circulated for the guidance of the mercantile community. These lists, which serve an important purpose, are well known by commercial men in the United Kingdom. The lists are extracts from public registers, as are the ordinary lists of bankruptcies in the newspapers. Similar information is furnished in America by commercial agencies.

Black Mail was an impost formerly submitted to in parts of Scotland and the north of England as a compromise with robbers. A class of men, often belonging to families in good standing, levied a tax upon their neighbors (generally about 4 per cent. of the rental of their property), on the pretext of protecting them from cattle-thieves. The celebrated Rob Roy was one of these black-mailers. The practice ceased in Scotland after the rebellion of 1745. It had already been long extinct in England. In modern usage, black mail signifies money extorted from a person by threats of accusation or exposure in the public prints. Those who practise this extortion are said to "levy black mail."

Black'man, a township of Jackson co., Mich. Pop. 1470.

Blackman (George Curtis), M. D., one of the first of American surgeons, was born at Newtown, Conn., April 20, 1819, and graduated in medicine at the College of Physicians and Surgeons, N. Y., in 1840. He afterwards studied in the London hospitals, "studying covered with bedclothes to avoid the expense of a fire, and subsisting on two penny rolls a day." His excellent attainments and enthusiasm for his profession won him many eminent friends, and he became a member of the Royal Medical and Chirurgical Society, an honor rarely given to foreigners. He became a resident of Cincinnati in 1851, and was appointed professor of the principles and practice of surgery in the Medical College of Ohio. He served as an army surgeon throughout the late civil war. He was an able writer, a brilliant lecturer, and a bold and skilful operator. He crossed the Atlantic more than thirty-six times on account of his feeble health. He published numerous contributions to professional journals, and several valuable translations. Died July 21, 1871.

Black'more (Sir Richard), a court-physician of William III. and of Queen Anne, a voluminous writer of prose and verse, was born about 1650. He was the object of the satire of Pope and of the ridicule of the wits of his time, but deserves mention as an honest man and a steady friend of virtue at a time when virtue had but few influential friends. His chief works are "Prince Arthur" (1696) and "The Creation" (1712). Died Oct. 8, 1729.

Black Mountain, of North Carolina, is in Yancey co., a few miles W. of the Blue Ridge. This group of mountains derives its name from the forests of dark balsam firs which crown its summits. It has the shape of a horse-shoe. The highest of its peaks rises to 6707 feet, and is called the Black Dome, or Mitchell's High Peak in honor of Dr. Mitchell of the University of North Carolina, who perished while exploring this inhospitable region, and was buried on its top. This is the highest point of the U. S. east of the Rocky Mountains. Arnold Guyot.

Black Oak, a large tree of the U. S., common eastward of the Mississippi, generally considered a distinct species (*Quercus tinctoria*), but regarded by Gray as a variety of *Quercus coccinea*. It is a handsome tree, affording useful timber, but is best known for its thick yellow bark, prized for tanning purposes, and yielding quercitron, a valuable yellow dye. It is also called yellow oak and dyers' oak.

Black Oak, a township of Mahaska co., Ia. P. 936.

Black Quarter, Quarter Evil, or **Black Leg,** a disease which attacks animals, especially thrifty young neat cattle, which are kept on fertile but undrained land. It is characterized by swelling of a joint, leg, or quarter, diarrhœa, extravasation of blood, and formation of abscesses. It is usually fatal. It is probably the same disease which is known in man as malignant pustule. Its causes are not well understood. It is a hard disease to cure, but stimulants, free incision in the affected part, with the application of weak solutions of chloride of zinc and carbolic acid, may prove useful. The best preventive is thorough underdrainage of pastures.

Black River, or **Big Black River,** of Missouri and Arkansas, rises in Iron co., Mo., and flows nearly southward to the N. line of Arkansas. It afterwards runs south-westward, and enters the White River (of which it is the largest affluent) at Jacksonport, Ark. Length, estimated at 350 miles. It is navigable by steamboats about 100 miles from its mouth, except when the water is low.

Black River of New York rises in Herkimer co., flows in a general N. W. direction through Oneida, Lewis, and Jefferson cos., and enters Lake Ontario about 6 miles below Watertown. The whole length is about 125 miles. It falls 63 feet near Turin, in Lewis co.

Black River of Wisconsin rises in Marathon co., flows southward and south-westward through Clarke and Jackson cos., and enters the Mississippi about 15 miles above La Crosse. Its length is about 225 miles. Its Indian name is *Sappah*.

Black River of Vermont [Indian name *Kaskatuac*] rises in ponds in the town of Plymouth, Windsor co., and flows S. by E. through Ludlow, Cavendish, Weathersfield, and Springfield, and empties into the Connecticut River. It furnishes abundant water-power, which is employed in numerous manufactories.

Black River, a township of Greene co., Ark. P. 131.

Black River, a twp. of Independence co., Ark. P. 1358.

Black River, a township of Lawrence co., Ark. P. 1189.

Black River, a township of Butler co., Mo. P. 492.

Black River, a township of Reynolds co., Mo. Pop. 1280.

Black River, a township of Wayne co., Mo. P. 743.

Black River, or **Lockport,** a post-village of Rutland and Le Ray townships, Jefferson co., N. Y., on the Car-

thage Watertown and Sacketts Harbor R. R., 6 miles E. by N. of Watertown. Pop. 181.

Black River, a township of Cumberland co., N. C. Pop. 760.

Black River, a post-village and township of Lorain co., O., the northern terminus of the Lake Shore and Tuscarawas Valley R. R., on the S. shore of Lake Erie, 8 miles N. of Elyria. Pop. 838.

Black River, a township of Georgetown co., S. C. Pop. 960.

Black River Falls, an incorporated village, the county-seat of Jackson co., Wis., on Black River and the West Wisconsin R. R., 50 miles N. of La Crosse. It has numerous saw-mills and flouring-mills, a graded high school with ten departments, iron in unlimited quantities, and one weekly newspaper. Pop. 1101.

COOPER & SON, PUBS. "BADGER STATE BANNER."

Black Rock, a former post-town of Erie co., N. Y., on the Niagara River, at its S. end, about 1 mile N. of Buffalo, of which it is now a part. The river here affords abundant water-power.

Black Rood (OF SCOTLAND), a cross of gold which was alleged to contain a piece of the true cross, was brought into Scotland in 1067 by Margaret, sister of Edgar Atheling, queen of Malcolm III. It was regarded as a national palladium. It was taken twice, at least, by the English, who after 1346 kept it in Durham Cathedral. It disappeared at the Reformation.

Black's Bluff, a tp. of Wilcox co., Ala. Pop. 1586.

Blacks'burg, a post-township of Montgomery co., Va. It is the seat of the Virginia Agricultural and Mechanical College. Pop. 3565.

Black Sea, or Eux'ine [anc. *Pontus Euxinus;* Turk. *Kara Dengis*], a large inland sea between Europe and Asia. It extends from lat. 40° 45′ to 46° 45′ N., and from lon. 27° 30′ to 41° 50′ E. The extreme length is about 700 miles, and its greatest breadth about 380 miles. Area, estimated at 185,000 square miles. It communicates with the Sea of Mármora by the Bosphorus, and with the Sea of Azof by the Strait of Kertch. The shores of this sea are high and bold on all sides except the N. W., between the Crimea and the mouth of the Danube. In the middle of it no soundings were obtained at 160 fathoms. It encloses no islands except a few small ones at the mouth of the Danube, and the Symplegades, near the Bosphorus. The largest rivers that flow into it are the Danube, Dniester, Bug, Don, Dnieper, Kooban, and Kizil Irmâk. This sea has no tide, but strong currents are produced by the influx of the large rivers, in consequence of which the water is fresher than that of the Mediterranean. The navigation of the Euxine is not dangerous except during violent storms. It is supposed that this sea once extended much farther E. than it does now. In ancient times it was an important highway of commerce. The Turks excluded the ships of all foreign powers from it until 1774, when the Russians obtained the right to navigate its waters. By the treaty of Paris, 1856, this sea was neutralized—that is, the Russians and Turks were not permitted to keep ships of war in it. In 1871 the Russians again were permitted to have men-of-war on this sea.

Black'shear, a post-village, capital of Pierce co., Ga., on Hurricane Creek and on the Atlantic and Gulf R. R., 86 miles S. W. of Savannah. It has one weekly newspaper. Pop. 490.

Black Snake (*Bascanion constrictor*), a species of snake which is common in nearly all parts of the U. S. Its length varies from four to six or seven feet. It is remarkable for agility, climbs trees with ease, and moves along the ground very swiftly. It feeds on frogs, mice, lizards, eggs, birds, etc. Although it is harmless and has no poison-fangs, it will sometimes attack or resist its human enemies. The *Bascanion Alleghaniensis* is another large black snake of the same regions, easily distinguished by the keeled scales on its back.

Black'stock, a post-township of Chester co., S. C. Pop. 479.

Black'stone, a post-village and township of Worcester co., Mass., on the Boston Hartford and Erie R. R., 36 miles S. W. of Boston, and on the Providence and Worcester R. R. It has extensive manufactures, one national bank, seven churches, and a public library. Pop. 5421.

Blackstone River of Massachusetts rises in Worcester co., flows south-eastward into Rhode Island, and enters through Providence River into Narraganset Bay. The name Pawtucket River is given to that part of it which is below the town of Pawtucket. It affords abundant water-power, and flows through several manufacturing villages.

Blackstone (Sir WILLIAM), an English jurist and eminent commentator on law, was born in London July 10, 1723. He was admitted to the bar in 1746, but obtained little practice. In 1758 he became Vinerian professor of law at Oxford, of which he was a graduate, and in 1761 was elected to Parliament. He was appointed solicitor-general in 1763, and a justice of the court of common pleas in 1770. His principal work is "Commentaries on the Laws of England" (4 vols., 1765–69), which acquired a high reputation and is extensively used by students of law. His style is clear, ornate, and graceful, but his method is not scientific, and he was not well qualified to judge of the law from a legislator's point of view. Died Feb. 14, 1780. His "Commentaries" were severely criticised by Bentham. According to Horne Tooke, his work is "a good gentleman's law-book—clear, but not deep." (See CLITHEROE, "Life of Sir W. Blackstone," 1780; Foss, "The Judges of England.")

Blackstone (WILLIAM), a clergyman of the Church of England, and the first white inhabitant of Boston, Mass., who settled at Shawmut, now Boston, in 1623, but left the place in 1633, not liking his Puritan neighbors. He is said to have died in Rhode Island in 1675.

Black Swamp, a township of Winston co., Ala. P. 632.

Black Tin, the name given by miners to tin ore ready for the process of smelting.

Black'ville, a post-village, capital of Barnwell co., S. C., is on the South Carolina R. R., 47 miles E. S. E. of Augusta, Ga., and 90 miles W. N. W. of Charleston. It has one weekly newspaper. Pop. of township, 2327.

Black Vomit, the name of the hæmorrhagic discharge from the stomach peculiar to YELLOW FEVER (which see).

Black Wad, a name sometimes given to the native black oxide of manganese. (See MANGANESE.)

Black Walnut (the *Juglans nigra*), a valuable timber tree of the U. S., belonging to the order Juglandaceæ, and growing from Florida northward, and especially westward, being rare at present in New England. It is a handsome tree, which produces a nut which, though edible, is less so than that of the European walnut, while its timber is even more valuable. The wood is employed for gunstocks, furniture, the finishing and flooring of rooms, and a great variety of purposes.

Black War'rior, a river of Alabama, is formed by the junction of the Locust Fork and Mulberry Fork, which unite near the S. extremity of Walker county. It flows south-westward, and enters the Tombigbee about 2 miles above Demopolis. Its length is estimated at 175 miles. Steamboats ascend this river from its mouth to Tuscaloosa. Bituminous coal is found on this river.

Black'water, a township of Cooper co., Mo. Pop. 548.

Blackwater, a township of Pettis co., Mo. Pop. 1603.

Blackwater, a township of Saline co., Mo. Pop. 1784.

Blackwater, a township of Franklin co., Va. P. 1706.

Blackwater, a tp. of Prince George co., Va. P. 911.

Blackwater, a township of Surry co., Va. Pop. 1235.

Black'well (ANTOINETTE BROWN), an American lady, born in Henrietta, N. Y., May 20, 1825, studied theology at Oberlin College, O., and was ordained pastor of a Congregational church at South Butler, N. Y., in 1853. She has taken an active part in the Woman's Rights movement and other reforms. She was married in 1856 to Samuel C. Blackwell.

Blackwell (ELIZABETH), M. D., born at Bristol, in England, in 1821, was the first woman who ever obtained the degree of M. D. in the U. S. She came to the U. S. with her parents in 1831, and taught school at Cincinnati from 1838 to 1847. Having studied medicine in private, she applied for admission to the medical colleges of Philadelphia, New York, and Boston without success. She was at last admitted by a unanimous vote into the College of Geneva, N. Y., in 1847, and graduated as M. D. with honor in 1849. She afterwards studied midwifery in Paris, and began to practise in New York City in 1851, where she has for the most part since resided. In 1854, with her sister Emily, she opened the New York Infirmary for Women and Children. In 1859 she delivered a course of medical lectures in London.

Blackwell (LUCY STONE). See STONE (LUCY).

Black'well's, a township of Polk co., N. C. Pop. 1179.

Blackwell's Island, in the East River, is a part of New York City, and has a lunatic asylum, workhouse, almshouse, penitentiary, smallpox, charity, and fever hospitals, one for incurables, one for epileptics and paralytics, and an asylum for the blind. The island has an area of 120 acres, and was named from a family which long owned it. At its N. end is a stone lighthouse, with a fixed red light 54 feet

above the sea; lat. 42° 46′ 15″ N., lon. 73° 56′ 08″ W. Pop. 5717.

Black Wolf, a township of Winnebago co., Wis. Pop. 847.

Black'wood (William), a Scottish publisher, born in Edinburgh in 1776, was the founder of "Blackwood's Magazine." He commenced business as a bookseller in 1804, and issued the first number of his magazine in 1817. It obtained speedy success and a high reputation, to which the writings of Scott, John Wilson, and J. G. Lockhart greatly contributed. Its editors advocated the political creed of the Tories with powerful sarcasm and considerable virulence. Mr. Blackwood was the chief manager of the magazine until his death in 1834, and was succeeded by his sons. Under their direction it has maintained its reputation, and has received contributions from many eminent authors, including Bulwer, W. S. Landor, De Quincey, and W. E. Aytoun.

Blad'der [Lat. *vesica;* Fr. *vessie*], a musculo-membranous sac contained in the anterior part of the pelvis. It is absent in all invertebrate animals. A few cartilaginous fishes possess it; so do Batrachia (frogs, etc.) and Chelonia (turtles). No birds have it, although the ostrich and cassowary have a dilatation of the cloaca somewhat resembling it. It is present in all Mammalia. In man the bladder is nearly triangular when empty, oval when full. The ureters (one on each side) convey the urine to it from the kidneys; and this is voided, by the contraction of the bladder, through the urethra. The entrance to the latter is guarded by a valve, partly muscular, called by some anatomists the *sphincter vesicæ*. Distension of the bladder (retention of urine) from any obstruction of the urethra is a very painful and sometimes dangerous affection. It may be spasmodic, but it is more often the effect of a stricture or contraction of the passage from local disease. In low fevers it is not uncommon for a kind of paralytic distension of the bladder to occur. In either of these cases the removal of the urine by means of a catheter is of great importance. The bladder is also liable to inflammation (*cystitis*) and to chronic irritability; either of which may cause great distress. (For stone in the bladder see Calculus.)

Blad'der-Nut (*Staphylea*), a popular name of several plants of the order Sapindaceæ. They are so called because the fruit is a bladdery, membranous, and inflated capsule enclosing hard, bony seeds. They are shrubs or small trees with pinnate leaves, five stamens, and five petals. The *Staphylea pinnata* is a native of Europe, and is planted as an ornamental tree in English shrubberies. Another species, the *Staphylea trifolia*, or American bladder-nut, is a native of the U. S. It is a shrub about ten feet high, having three ovate leaflets. The seed of these species is aperient, and the wood is suitable for turning.

Blad'derwort (*Utricularia*), a genus of aquatic plants of the order Lentibulaceæ, comprises numerous species which abound in tropical and temperate parts of both hemispheres. Their flowers adorn the surface of lakes, ponds, and stagnant or shallow waters. Fourteen species or more of them are found in the Atlantic U. S. They are remarkable for a provision by which the plant, which is ordinarily submerged in water, is raised to the surface, in order that the flowers may expand in the air. The leaves and stems are furnished with little bladders or vesicles, which become filled with air at the time of flowering. The air is afterwards removed, so that the plant sinks again, and ripens its seeds at the bottom. A few species which do not grow in the water have no bladders.

Bla'den, a county in the S. E. of North Carolina. Area, 800 square miles. It is intersected by Cape Fear River, and bounded on the N. E. by South River. The surface is mostly level, and partly occupied by pine forests and many small lakes, which abound in fish. A portion of the soil is sandy, but marl occurs in considerable quantities, and the river-bottoms and swampy tracts are highly fertile. Rice, corn, and some cotton are produced. The county is traversed by the Wilmington Charlotte and Rutherford R. R. It has manufactures of tar and turpentine. Capital, Elizabethtown. Pop. 12,831.

Bla'denboro', a post-twp. of Bladen co., N. C. P. 1005.

Bla'densburg, a post-village of Prince George co., Md., on the Eastern Branch of the Potomac and on the Baltimore and Washington R. R., 6 miles N. E. of Washington. A battle fought here Aug. 24, 1814, between the British and Americans, resulted in the capture of Washington. Pop. 410; of Bladensburg township, 3006.

Bladen Springs, a post-village of Choctaw co., Ala., 3 miles from the Tombigbee River and 85 from Mobile, has six copious saline chalybeate springs, much resorted to for the cure of bowel and kidney complaints and chronic rheumatism and dyspepsia. The country around is hilly, well-timbered, and healthful. It has one weekly newspaper.

Blaeuw, Blaeu, or **Blauw** (Willem), an eminent Dutch geographer and publisher, born in 1571. He was a pupil of Tycho Brahe. He produced a terrestrial globe which surpassed all former works of that kind, and a number of maps. Among his publications was an "Atlas of the Seas or Aquatic World." Died Oct. 18, 1638.

Blagoweshtshensk' (*i. e.* "good news"), the capital of the province of the Amoor, in Siberia, 20 miles N. of the Chinese city Aijun, on the Amoor. It was founded in 1858, and consists mostly of government buildings. Some trade is carried on here between the Chinese and the Russians. Pop. in 1867, 3107.

Blain, a town of France, department of Loire-Inférieure, 22 miles N. N. W. of Nantes. Here are the ruins of a strong castle. Pop. 6865.

Blaine (James Gillespie), an American legislator, born in Washington co., Pa., Jan. 31, 1830. He graduated at Washington College in 1847, removed to Maine in early life, and became editor of the "Portland Advertiser." He was elected to Congress by the Republicans of Maine in 1862, and was re-elected five times. He gained distinction as a debater, and was chosen Speaker of the House of Representatives in Mar., 1869, and again in 1871 and 1873.

Blainville, de (Henri Marie Ducrotay), M. D., F. R. S., a distinguished French zoologist and anatomist, born at Arques, near Dieppe, Sept. 12, 1777. He studied comparative anatomy under Cuvier, who employed him as his assistant. In 1808 he received the degree of doctor of medicine. He was appointed professor of anatomy and zoology in the Faculty of Sciences of Paris in 1812, and was admitted into the Institute in 1825. In 1832 he succeeded Cuvier as professor of comparative anatomy in the Museum of Natural History. He acquired a high reputation as a teacher and a writer. Among his most important works are "Lectures on General and Comparative Physiology" (3 vols., 1833), and "Osteography, or a Comparative Iconographic Description of the Skeleton and Dentary System of the Five Classes of Vertebrated Animals" (1839–49, unfinished). Died May 1, 1850.

Blair, a county in S. Central Pennsylvania. Area, 650 square miles. It is intersected by the Frankstown Branch of the Juniata River, and also drained by the Little Juniata. The surface is mountainous. The main range of the Alleghany Mountains extends along the N. W. border of the county, which is traversed by a parallel ridge called Dunning's Mountain. The soil of the limestone valleys is fertile. Grain and wool are important products. Iron is one of the chief articles of export. Bituminous coal is extensively mined. The county is intersected by the Central R. R., and has various manufactures. Capital, Hollidaysburg. Pop. 38,051.

Blair, a township of Clay co., Ill. Pop. 857.

Blair, a township of Grand Traverse co., Mich. P. 383.

Blair, a post-village, capital of Washington co., Neb., in a township of the same name, on the Missouri River and on the Omaha and North-western R. R., 29 miles N. N. W. of Omaha, and on the Sioux City and Pacific R. R. It has a brick court-house, a jail, and is in a fine farming region. It has a school-house costing $20,000, and one weekly paper. Pop. 494; of township, 917.

V. G. Lantry, Ed. "Blair Times."

Blair, a township of Blair co., Pa. Pop. 1571.

Blair (Austin) was born at Carolina, Tompkins co., N. Y., Feb. 8, 1818, and graduated at Union College in 1839, studied law, removed to Michigan, and has held many public offices; was governor of the State (1861–65), and member of Congress (1867–73).

Blair (Francis Preston), an American journalist, born at Abingdon, Va., April 12, 1791. He graduated at Transylvania University, and became in 1830 editor of the "Globe," a Democratic daily paper published at Washington, D. C. He was a personal friend and adviser of Gen. Jackson while the latter was President, and continued to edit the "Globe" until 1845. He supported Van Buren as a candidate for the Presidency in 1848, and joined the Republican party in 1855. D. at Silver Spring, Md., Oct. 18, 1876.

Blair (Francis Preston, Jr.), a lawyer, son of the preceding, was born at Lexington, Ky., Feb. 19, 1821. He graduated at Princeton in 1841, was elected a member of Congress by the Free-Soil party of St. Louis, Mo., in 1856, after which he acted and voted with the Republicans for several years. He joined the Union army in 1861, and obtained the rank of major-general. In 1864 he commanded a corps of Sherman's army in the campaign which resulted in the capture of Atlanta. Having joined the Democratic party, he was selected as a candidate for the vice-presidency

by the convention which nominated Horatio Seymour for the presidency in 1868. He was chosen a U. S. Senator for Missouri in Jan., 1871. D. at St. Louis, Mo., July 8, 1875.

Blair (Hugh), D. D., an eminent Scottish divine, born in Edinburgh April 7, 1718, was licensed as a minister of the Church of Scotland in 1741. In 1758 he became one of the ministers of the High Church of Edinburgh, the highest promotion that a Scottish clergyman can obtain. His sermons were admired for their polished style, but were not remarkable for originality or profoundness. In 1762 he was appointed professor of rhetoric and belles-lettres in the University of Edinburgh. He published five volumes of sermons (1777–1800), which were once very popular, but their reputation has declined. His "Lectures on Rhetoric" were published in 1783, and were used in many schools. Died Dec. 27, 1800. (See James Finlayson, "Life of Hugh Blair," 1801.)

Blair (James), D. D., born in Scotland in 1656, entered the Anglican ministry, came to America in 1685, in 1689 became commissary of the bishop of London for Virginia and Maryland, was the founder and first president of William and Mary College (1693), and rector of Williamsburg, holding all these and other important offices till his death, Aug. 1, 1743. Besides other works, he published a commentary on the "Sermon on the Mount" (5 vols. 8vo, 1722), highly commended by Waterland, Doddridge, and Bickersteth.

Blair (John), an American jurist, born at Williamsburg, Va., in 1732. He graduated at William and Mary College, and studied law in London. Having previously filled several high offices, he was appointed by Washington judge of the Supreme Court of the U. S. (1789). Died Aug. 31, 1800.

Blair (Montgomery), an American officer and politician, born May 10, 1813, in Franklin co., Ky., graduated at West Point in 1835, serving while in artillery in Florida war till he resigned, May 20, 1836; counsellor at law in St. Louis, and U. S. attorney for the district of Missouri 1839–43, judge of the St. Louis court of common pleas 1843–49, solicitor of the U. S. in the court of claims 1855–58, councillor at law in Montgomery co., Md., 1853–61, and since 1863, being counsel for plaintiff in the famous Dred Scott case; president of the Republican committee of Maryland 1860, and postmaster-general of the U. S. 1861–64. George W. Cullum, *U. S. Army.*

Blair (Robert), a Scottish poet, born at Edinburgh in 1699, was a relative of Hugh Blair, noticed above. He was ordained minister of Athelstaneford in 1731. He wrote a poem of undoubted merit entitled "The Grave," which was not printed until after his death. Died Feb. 4, 1746.

Blairs'burg, a post-township of Hamilton co., Ia. Pop. 310.

Blairs'town, a post-village of Leroy township, Benton co., Ia. It has one weekly newspaper. Pop. 682.

Blairstown, a post-township of Warren co., N. J. Pop. 1379.

Blairs'ville, a post-village, capital of Union co., Ga., is about 90 miles N. by E. from Atlanta. Gold and marble are found in the vicinity.

Blairsville, a post-borough of Indiana co., Pa., on the Conemaugh River and the Pennsylvania R. R., 56 miles E. of Pittsburgh. A branch railroad extends northward 16 miles to the town of Indiana. Grain, lumber, and coal are shipped here. Blairsville has a national bank. P. 1054.

Blairsville, a post-village of York co., S. C. P. 487.

Blair'ton, a post-village of Belmont township, Peterborough co., Ontario, Canada, has extensive iron-mines and a postal savings bank. Pop. about 350.

Blake, a township of Colleton co., S. C. Pop. 2255.

Blake (Charles F.), U. S. N., born in 1842 in Pennsylvania, graduated at the Naval Academy in 1861, became an ensign in 1863, a lieutenant in 1864, and a lieutenant-commander in 1866. He served on board the steam sloop-of-war Brooklyn at the battle of Mobile Bay Aug. 5, 1864, and is thus referred to in the report of Capt. James Alden, her commanding officer: "The other division officers, Captain Houston of the marines, Lieutenant Charles F. Blake, Ensigns Cassel and Sigsbee, with their assistants, Master's Mates Duncan and Stevens, fought their guns nobly and well." Foxhall A. Parker, U. S. N.

Blake (Francis B.), U. S. N., born Nov. 8, 1837, in Pennsylvania, graduated at the Naval Academy in 1857, became a lieutenant in 1861, and a lieutenant-commander in 1863, resigned June 15, 1870. On the night of Sept. 14, 1861, while serving on board the frigate Colorado, he participated in the very gallant exploit of destroying the privateer Judith, "moored at the S. end of the Pensacola navy-yard, under the protection of a battery and field-piece." He was attached to the steam gunboat Kennebec in her attempted passage of Forts St. Philip and Jackson, April 24, 1862, and at Vicksburg, June 28, 1862.
Foxhall A. Parker, U. S. N.

Blake (George A. H.), colonel of U. S. cavalry and brevet brigadier-general U. S. army, was born in Pennsylvania, and became first lieutenant in the Second Dragoons in 1836. He served honorably in Florida, Mexico, on the frontiers, and in the late civil war. He was wounded at Gaines's Mill in 1862, and received his brevet for his conduct at Gettysburg.

Blake (George Smith), a naval officer, born at Worcester, Mass., in 1803. He served in the Mexican war, and was made superintendent of the U. S. Naval Academy at Annapolis in 1857, and a commodore in 1862.

Blake (Homer C.), U. S. N., born Feb. 1, 1822, in Cleveland, O., entered the navy as a midshipman Mar. 2, 1840, became a passed midshipman in 1846, a lieutenant in 1855, a lieutenant-commander in 1862, a commander in 1866, and a captain in 1871. On the evening of the 11th of Jan., 1863, Blake, in the merchant steamer Hatteras, which had been converted into a government vessel for blockading purposes, encountered the privateer Alabama, built in England with all the latest improvements of a man-of-war, and after a most spirited resistance was forced to surrender, "the Hatteras going down, bow first, ten minutes after the crew left her decks." Capt. Blake, in his official report of the action, dated Jan. 21, 1863, says: "The battery upon the Alabama brought into action against the Hatteras numbered seven guns, consisting of four long 32-pounders, one 100-pounder rifled gun, one 68-pounder, and one 24-pounder rifled gun. The guns used in the action by the Hatteras were two short 32-pounders, one 30-pounder rifled Parrot, and one 20-pounder rifled Dahlgren." Blake was carried in the Alabama to Port Royal, Jamaica, whence, after being paroled, he was permitted to return to the U. S., and so soon as he was regularly exchanged he obtained a command in the North Atlantic blockading squadron, where he remained, doing good service in co-operation with the Army of the James, until the close of the civil war. Foxhall A. Parker, U. S. N.

Blake (John Lauris), D. D., an American biographer and compiler, born in Northwood, N. H., Dec. 21, 1788. He graduated at Brown University in 1812, became rector of an Episcopal church in Boston. He published many school-books and a "Gen. Biographical Dictionary." D. July, 1857.

Blake (Robert), born at Bridgewater, in Somersetshire, in 1599, was elected to Parliament in 1640, and when the civil war began in 1642 raised a troop with which he fought against the royalists. He gained distinction by his defence of Taunton in 1645. In 1649 he was appointed "general of the sea." He destroyed or captured nearly all of Prince Rupert's fleet in the Tagus in 1651. In 1652 he became chief admiral, and in May of that year gained a victory over Van Tromp, who attacked Blake in the ensuing November near Goodwin Sands. Blake was defeated, but in Feb., 1653, he attacked Van Tromp and gained a victory in a running fight of three days. In 1654 he chastised the dey of Tunis. He destroyed the Spanish plate-fleet at Santa Cruz in 1657. He died at Plymouth Aug. 17, 1657.

Blake (William). See Appendix.

Blake (William Phipps), A. M., Ph. B., was born in New York City June 1, 1826, and graduated at the Sheffield Scientific School, New Haven, Conn., in 1852. In 1853 he was mineralogist and geologist for the U. S. Pacific R. R. exploring expedition in California, in connection with which he wrote several reports; was editor of the "Mining Magazine" 1859–60; he was 1861–63 mining engineer for the Japanese government; in 1863 engaged in explorations in California and Nevada, became professor of mineralogy, geology, etc. in the College of California, and geologist to the State board of agriculture; in 1867 was commissioner of California to the Paris Exposition, removed in 1867 to New Haven, Conn., was chosen executive commissioner of the Centennial Commission, and in 1873 went as special agent to the Vienna Exhibition. He is vice-president of the American Institute of Mining Engineers, and a prominent officer of the International Patent Congress. Among his numerous professional writings are "Silver Ores and Silver Mines" (1861), a "Report on the Production of the Precious Metals," etc., and various contributions to the U. S. reports on the Paris Exposition, which were edited by him. In 1871 he published "Mining Machinery," etc.

Blake (William Rufus), born in 1805 at Halifax, Nova Scotia, studied medicine, but in 1825 (after playing some time in the theatre at Halifax) he appeared at the Old Chatham Theatre, N. Y. He soon attained the first rank as a comedian, excelling particularly in eccentric characters. Died at Boston April 22, 1863.

Blakely, a post-village, capital of Baldwin co., Ala., is on the Tensaw River, near Mobile Bay, and on the Mobile and Montgomery R. R., 13 miles E. N. E. of Mobile.

Blakely, a post-town, capital of Early co., Ga., is about 88 miles S. of Columbus and 150 miles S. W. from Macon. It has two churches, Baptist and Methodist, and one newspaper. W. W. Fleming, Ed. "Early County News."

Blakely, a township of Luzerne co., Pa. Pop. 767.

Blakely, a post-borough of Luzerne co., Pa. Pop. 659.

Blakely (Johnston), a naval officer, born in Ireland Oct., 1781. He came with his parents to the U. S., graduated at the University of North Carolina in 1800, entered the U. S. navy in 1800, and obtained command of the sloop Wasp in 1813. In June, 1814, he captured the British sloop-of-war Reindeer, and in the ensuing September defeated and sunk the sloop Avon. The Wasp never returned to port, and the fate of Captain Blakely and his crew was never ascertained.

Blakely's, a township of Chambers co., Ala. P. 1162.

Blakesburg, a post-village of Adams township, Wapello co., Ia. Pop. 236.

Blanc (Auguste-Alexandre-Philippe-Charles), a distinguished writer on the fine arts, born at Castres, France, Nov. 15, 1813. He is a brother of Louis Blanc. Besides a long series of valuable contributions on subjects connected with the fine arts to various French journals, he is the author of a "History of French Painters of the Nineteenth Century," of which only the first volume has been published; of a biographical notice of Grandville, and of "The Works of Rembrandt," which first appeared in folio in 1853, and in 1859 was republished with additions in 2 vols. 4to. A new edition, enriched with many additional illustrations, has just been announced (1873). It is the best work on Rembrandt. He was the most important contributor to the "History of the Painters of all the Schools," a very complete and extensive work begun in 1849 by Armengaud, and continued till its completion in 1859, under the editorship of Blanc, with the assistance of able writers, such as Delaborde, Mantz, Silvestre, and P. Chasles. Blanc has been twice Director of Fine Arts in France—once in 1848, when he replaced M. Garraud, and again in 1871. At present (1873) he still holds the place, for which he is eminently fitted. Clarence Cook.

Blanc (Jean Joseph Louis), a French historian and radical, born in Madrid Oct. 28, 1813, was educated in France. He founded in Paris in 1839 the "Revue du Progrès," which advocated social and political reform. In 1840 he published an able work on the "Organization of Labor." His next important work was a "History of Ten Years—1830–40," which had a very damaging influence on the popularity of Louis Philippe. He was a member of the provisional government formed in Feb., 1848, and was very popular with the Socialists and workingmen of Paris, who revolted and were defeated in June, 1848. He then went into exile, and resided in England for many years. Early in 1871 he was elected to the National Assembly by the voters of Paris. Among his works is a "History of the French Revolution" (12 vols. 8vo, 1847–62), the style of which is eloquent and dignified.

Blan'cet, a township of Scott co., Ark. Pop. 325.

Blanc, Le, a town of France, in the department of Indre, is finely situated on the river Creuse, 32 miles W. S. W. of Châteauroux. It has manufactures of cloth, linen, pottery, leather, etc. Pop. 5956.

Blanchard, a township of Hancock co., O. P. 1304.

Blanchard, a township of Hardin co., O. Pop. 1250.

Blanchard, a township of Putnam co., O. Pop. 1593.

Blanchard, a post-township of Piscataquis co., Me. Pop. 164.

Blanchard (Albert G.), an American general, born in Massachusetts about 1810, served in the Mexican war, and having entered the Confederate service was made a brigadier-general in 1861.

Blanchard (François), a French aëronaut, born at Andelys in 1753, was noted for his mechanical ingenuity. He constructed a balloon with wings and a rudder, with which he ascended in Mar., 1784. In 1785 he crossed the Channel in this balloon, and landed in England, for which exploit the king of France gave him a pension. He made many other ascents. Died Mar. 7, 1809. His wife, who had been his companion in several aërial voyages, was killed in consequence of the burning of her balloon in 1819.

Blanchard (Laman), an English *littérateur*, born at Great Yarmouth May 15, 1803. He became in 1831 acting editor, under Bulwer, of the "New Monthly Magazine." He contributed many verses and other articles to several periodicals and annuals, and was assistant editor of the "Examiner." His wife became insane, and he committed suicide Feb. 15, 1845. (See Bulwer's "Memoir of L. Blanchard," prefixed to Blanchard's "Essays and Sketches," 1849.)

Blanchard (Thomas), an American mechanic and inventor, born in Sutton, Mass., June 24, 1788. He invented a wonderfully ingenious machine for turning gunstocks, which is still in use, and he obtained twenty four patents for his various inventions. Died April 16, 1864.

Blanche of Castile, queen of France, a daughter of Alfonso IX. of Castile, was born in 1187. She was married in 1200 to the dauphin of France, who became King Louis VIII., and she acquired much influence in affairs of state. When Louis died, in 1226, she became regent of the kingdom, which she governed with ability during the minority of her son, Saint Louis. She was eminent for virtue and wisdom. Died Dec. 1, 1252. (See Macheco, "Vie de Blanche Castile," 1820; T. Nisard, "Histoire de la Reine Blanche," 1842.)

Blan'chester, a post-village of Clinton co., O., on the Marietta and Cincinnati R. R., 41 miles E. N. E. of Cincinnati, at the junction of the Hillsboro' branch. Pop. 513.

Blanch'ing [from the Fr. *blanche*, "white"], a process by which gardeners arrest the progress of secretions in the leaves of plants, in order to render them more wholesome and palatable as food. Celery, sea-kale, and other plants are usually blanched by the exclusion of light from them, which deprives them of their natural green color and of certain bitter properties. The blanching is effected in various modes, as heaping up the earth against the growing plants, or covering them with boxes or blanching-pots made of earthenware and perforated with many holes.

Blan'co, a county in Central Texas. Area, 727 square miles. It is intersected by the Pedernales River, and also drained by the Rio Blanco. The soil is mostly prairie, easily cultivated and productive. Stock-raising is the chief pursuit. Cotton and corn are raised. Capital, Blanco. Pop. 1187.

Blanco, a post-village, capital of Blanco co., Tex., is 45 miles W. S. W. of Austin City. It has one weekly newspaper.

Bland, a county in S. W. Virginia. Area, 330 square miles. It is drained by the North Fork of the Holston River and by several creeks. The surface is partly mountainous. Grain, tobacco, and wool are the chief products. Capital, Bland Court-house. Pop. 4000.

Bland, a township of Prince George co., Va. P. 2260.

Bland (Richard), an American writer and patriot, born in Virginia in 1708, was educated at William and Mary College and the University of Edinburgh, and was elected to Congress in 1774. He published "A Letter to the Clergy on the Twopenny Act" (1760) and "An Inquiry into the Rights of the British Colonies" (1766). Died Oct. 27, 1776.

Bland (Col. Theodoric), M. D., born in Prince George co., Va., in 1742, was an uncle of John Randolph of Roanoke. He entered the army in 1777, and gained the confidence of Washington, who employed him in several important affairs. In 1780 he was elected a member of Congress, in which he remained till 1783. Having been again chosen a member of that body in 1789, he died at New York June 1, 1790.

Bland Court-house, a post-village, capital of Bland co., Va.

Bland'ford, a township of Hampden co., Mass. It has a public library and some manufactures. Pop. 1026.

Blan'dinsville, a post-village of McDonough co., Ill., on the Toledo Peoria and Warsaw R. R., 78 miles W. by S. from Peoria. Pop. 1565; of Blandinsville township, 1707.

Bland'ville, a post-village, capital of Ballard co., Ky., about 28 miles W. S. W. of Paducah. Pop. 385.

Blane (Sir Gilbert), F. R. S., a Scottish physician, born at Blanefield, in Ayrshire, Aug. 24, 1749. He became private physician to Lord Rodney, who took command of the fleet in the West Indies in 1780. Dr. Blane served as chief physician to that fleet during the war, and published in 1783 "Observations on the Diseases of Seamen." He was physician to St. Thomas's Hospital, London, from 1785 to 1795, and became first physician to William IV. in 1830. Among his works is "Elements of Medical Logic" (1819). Died June 26, 1834.

Bla'nes, a seaport-town of Spain, in the province of Gerona, on the Mediterranean, 30 miles by rail S. of Gerona. It is on the railway from Barcelona to Gerona. Pop. 5888.

Blank Verse, the name applied to the heroic verse of five feet without rhymes. Blank verse is peculiar to the

Italian, English, and German languages, having been imported into the two latter from the first. In Italian the line is of eleven syllables, and is used invariably in the drama, and frequently in serious poetry, epic or didactic. In England it was first adopted by the earl of Surrey in his translation of the fourth book of the "Æneid" (1547), and first applied to dramatic uses by Lord Buckhurst in his tragedy of "Gorboduc" (1561). It has since been the accepted metre of English dramatic and heroic verse. The Miltonic verse is constructed with closer attention to the melody of the cadence and cæsura than the dramatic; it admits also less frequently of the eleventh syllable, which in English poetry must be regarded as a sort of license; while Shakspeare and other dramatists occasionally double the short syllable at the end, and thus extend the number to twelve.

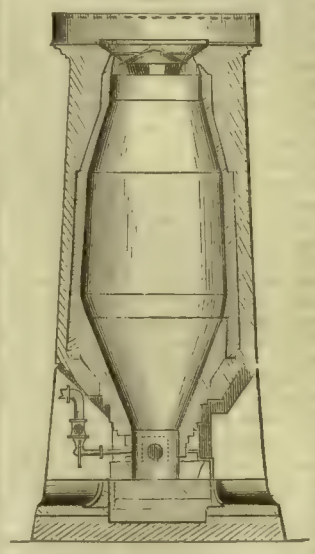
Blanqui (JÉROME ADOLPHE), a French political economist, born at Nice Nov. 20, 1798. He became in 1833 professor of economy in the Conservatory of Arts and Trades in Paris. He advocated free trade. Among his works are a "Summary of the History of Commerce and Industry" (1826), and a "History of Political Economy in Europe from the Ancients to the Present Time" (2 vols., 1837–38), which is highly esteemed. Died Jan. 28, 1854.

Blanqui (LOUIS AUGUSTE), a French republican, born in 1805, brother of the preceding, took an active part in the revolutionary movements of 1830, 1839, and 1848, and was a leading spirit in various incendiary secret societies. He went beyond the most advanced in radical ideas. He was condemned to death in 1840, and afterwards repeatedly to long terms of imprisonment, but the penalty was in every case relaxed. He was a leader of the insurgents who attempted to dissolve the National Assembly in May, 1848. He founded the Société Republicaine Centrale, for which he was condemned to four years' imprisonment in 1861. In the Paris Commune, in 1870, he was a central figure, was captured by the Versaillists, who, it was claimed, refused to exchange him for Archbishop Darboy, and was transported in 1872.

Blaps [probably from the Gr. *βλάπτω*, to "injure," so called on account of its supposed dangerous character; see below], a genus of insects of the order Coleoptera, is the type of a family called Blapsidæ. There are numerous species of this genus, all of a dark color and destitute of wings. They feed on decayed vegetable matter, frequent dark and damp places, and have the power of secreting an acrid, irritating fluid of a peculiar and penetrating odor, which they can throw to a distance of six inches. A British species, the *Blaps mortisaga*, is called darkling beetle and churchyard beetle. In some parts of Europe the peasantry have a superstitious dread of this insect. No *Blaps* is found in the U. S.

Blar'ney, a village and castle of Ireland, in Munster, is on a rivulet of its own name, 4 miles N. W. of Cork, and surrounded by beautiful scenery. The castle and groves of Blarney are celebrated in song. The castle, which once belonged to the earls of Clancarty, stands on a steep rock, at the base of which is a deep valley. Among the relics of this ruined castle is the famous "Blarney stone," which, according to the popular opinion, imparts to those who kiss it a peculiar style of eloquence, or great skill in the use of complimentary speech.

Blä'ser (GUSTAV), an excellent German sculptor, born at Düsseldorf May 9, 1813. Among his numerous works may be mentioned equestrian statues of Frederick William III. and Frederick William IV., the colossal statue of "Borussia" (Prussia) at Berlin, and a bust of Humboldt in the New York Central Park.



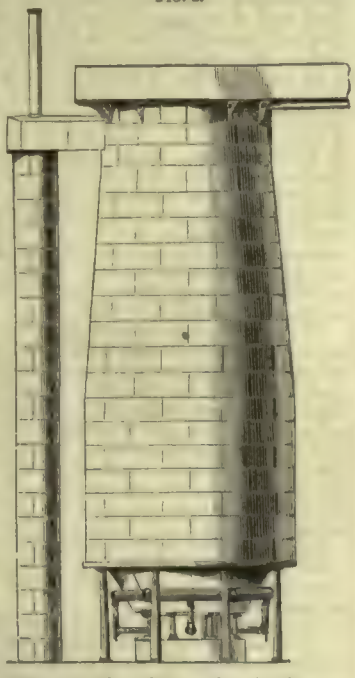
Blas'phemy [Gr. *βλασφημία*], an indignity offered to the Deity or to religion. According to Blackstone, it is denying the being and providence of God, contumelious reproaches of our Saviour Christ, and profane scoffing at the Holy Scripture, or exposing it to contempt and ridicule. It has been otherwise defined to be the act of wantonly uttering or publishing words casting contumelious reproach or profane ridicule upon God, Jesus Christ, the Holy Ghost, the Holy Scriptures, or the Christian religion. If the words were written or printed, there might be a case of blasphemous libel. If oral, the case would be one simply of blasphemy. The law does not brand as a crime serious discussion or the promulgation in a temperate manner of opinions opposed to Christianity. Blasphemy is an offence punishable as a misdemeanor at common law. In many of the States the crime is punishable by statute.

Christianity is declared by the courts to be a part of the common law, which recognizes that the good morals and orderly conduct of the community are closely connected with a respect for religion, and that insults to the Author of Christianity and malicious attacks on his religion tend to the dissolution of civil government. While the law of this country grants the fullest enjoyment of liberty of conscience and religious belief, and free and decent discussion on any religious subject, it will not allow malicious and blasphemous revilings of the Author of the religion professed by the majority of the community, nor of the religion itself, nor of the Scriptures in which it is taught.

Blaste'ma [Gr. *βλάστημα*, a "bud" or "budding"], in botany, the embryo in a seed, or the axis of growth of an embryo; that is, the plumule and the radicle, with the part which connects them. In biology, blastema is the name applied to the rudimental mass or protoplasm from which tissue is developed.

Blast Furnace [Ger. *Hochofen;* Fr. *haut fourneau*]. In its primary signification the term blast furnace implies an elevated shaft lined with a refractory material, designed for the reduction of metals from their ores. The shaft is open at the top, where the ore, fuel, and fluxes are charged, and supplied with a blast of air near the bottom, where openings are provided for removing the metal and cinder. The term has, however, by custom become almost entirely restricted to furnaces for the reduction of iron. In its essential details a blast furnace consists of a stack, in whole or in part of masonry, surrounding a vertical chamber or shaft of circular section. The diameter of the shaft usually increases from the top downward and from the bottom upward. The lower part of the furnace is called the *hearth*, and has the smallest diameter. At its upper part are one or more openings through which the blast of air is introduced, and in the lower part, or *crucible*, the molten iron and cinder collect. The hearth is prolonged towards the front of the furnace, and is closed by the *dam*, and covered in on top by the *tymp-arch*. The dam is formed of firebrick or other refractory material. It slopes inward towards the interior of the furnace, and has its outer vertical face covered with a cast-iron plate, called the *dam-plate*. At the bottom of the dam is a channel communicating with the interior of the furnace, through which the molten iron is tapped off, and on its upper edge is a notch, called the *cinder-notch*, over which the cinder flows. The tymp-arch is covered by the *tymp*, a long, hollow casting, through which water constantly circulates. The blast is supplied through *tuyeres*, from one to eight in number, which are set into the masonry of the furnace. They are hollow truncated cones, supplied with a constant current of water to prevent the iron of which they are composed from melting. Into these *water-tuyeres* are fitted the *nozzles* of blast-pipes, which are connected with the *blast main* which encircles the furnace. The sloping walls connecting the hearth with the widest part of the furnace are called the *boshes*. This term is very generally, though incorrectly, used to express the greatest diameter of the furnace. In many cases there is no sharp line of demarcation between the hearth and the boshes, the former being simply a continuation of the curved walls of the boshes.

FIG. 1.



In constructing a blast furnace, the upper portion is built on pillars (of iron or masonry), and is entirely independent of the boshes and hearth, which can be removed and reconstructed without interfering with the body of the stack. The top or *mouth* of the furnace, where the materials are charged, may be either entirely and permanently open, or provided with an arrangement which closes the furnace except during charging, when it is opened by some simple mechanism. The *tunnel head* is a hood or chimney, either of sheet iron or brick, over the mouth of the furnace, provided with suitable openings to allow the charge to be dumped into the furnace. The gases of the furnace, which were formerly allowed to escape and burn at the mouth, are now almost universally utilized. This is effected by making openings in the walls of the furnace—some distance below the top in open-mouth furnaces, but as near the top as possible where the top is closed—and conducting the gases by suitable channels either to the boilers or hot-blast

stoves, or both, where they are burned. With closed-top furnaces the utilization of the gases is complete; with open-top a considerable quantity escapes and burns at the mouth.

The essential accessories of a blast furnace are the blowing engine, hot blast stoves, and hoist. There are three varieties of blast-engines in use: the vertical-beam engine, the horizontal, and the upright. The latter have the steam cylinder either directly above or below the blast cylinder. They are rapidly gaining in favor, owing to their compactness and efficiency. The blast, on leaving the blowing cylinder, passes to the hot-blast stoves. These consist of a series of cast-iron pipes, through which the blast passes, heated on the outside by the combustion of the gases of the furnace. The gases are usually burnt in a combustion chamber under the chamber containing the pipes. In this way the heat is more uniformly distributed, and there is less danger of the pipes being injured by the heat. Recently Siemen's system of regenerative heating has been applied to hot-blast stoves with the best results. In this system the gases are burned in a chamber, and the products of combustion pass through a network of firebrick, which becomes intensely heated. The gases are then caused, by means of valves, to pass into a second stove like the first, and burned as before, while the blast is conducted through the first stove. The blast and gases are made to alternate in this way at regular intervals. The temperature of the blast as it enters the furnace varies within wide limits. There are but comparatively few furnaces at the present day driven with cold blast, the temperature employed varying from 300° to 1000° F. With the firebrick stove above mentioned a temperature of from 1500° to 1600° F. has been attained. The blast on leaving the stoves passes through the main to the furnace, and is there distributed to the tuyeres. The pressure employed varies with the kind of fuel used. Charcoal furnaces usually are blown with a half to one and a half pounds, though sometimes as high as four pounds are used. Coke furnaces are blown with three to four pounds, while anthracite furnaces require four to seven pounds.

FIG. 2.

Hoists or lifts serve to raise the ore, fuel, etc. from the ground to the level of the mouth of the furnace, where they are charged. There are many varieties, as the pneumatic, hydraulic, and steam hoist. Occasionally a furnace is favorably situated on a hill-side, and no hoist is needed.

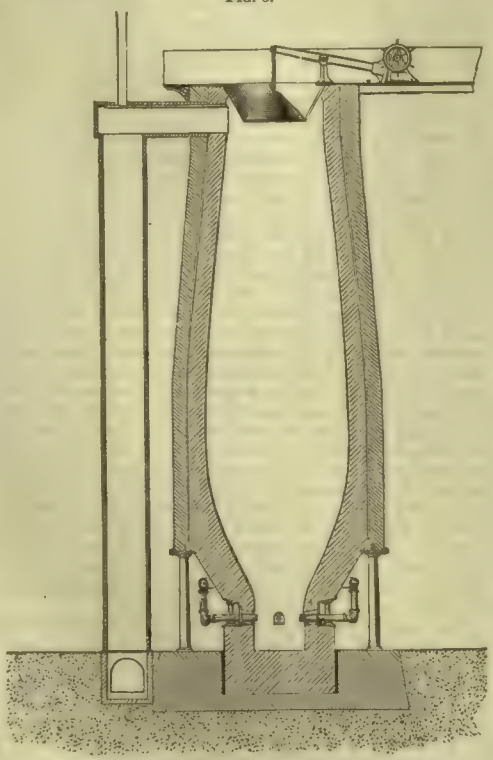
Fig. 1 is a section of a modern blast furnace in the Cleveland district of England. Its height is 75 feet; greatest diameter 24 feet at an elevation of 24 feet; diameter of hearth, 8 feet; height of hearth, 8 feet; diameter of mouth, 15 feet. There are three tuyeres, 4½ inches in diameter. Cubic capacity, 20,000 feet. Yield, 350 tons of iron per week.

Figs. 2 and 3 represent an elevation and vertical section of a modern American furnace at Chicago. Its height is 66 feet; greatest diameter, 17 feet; yield, 350 tons iron per week. The gases are taken off at the top of the furnace, and descend by a vertical flue, then by an underground channel to the boilers and hot-blast stoves. The contrivance for closing the mouth of the furnace, shown in the drawings, is known as the cup and cone, or bell and hopper. This arrangement is one of the simplest, and the one most generally adopted.

The blast furnace of the present day is an outgrowth of the small primitive furnaces still to be met with in Eastern countries for reducing iron ores. It differs from them, however, in three essential particulars. The low furnaces produce an unmelted mass of soft iron, and a cinder rich in oxide of iron, and the process is intermittent. A blast furnace produces a compound of iron and other substances, principally carbon, which is fluid at the temperature of the furnace: the cinder is composed of earthy ingredients, and is almost entirely free from iron, and the process is continuous. Intermediate between the two is the German Blauofen, or Blascofen, ten to sixteen feet in height, which, according to the manner in which it is worked, can be made to yield either soft or cast iron. These furnaces have no fore-hearth, but are built with closed fronts—a construction which has lately been applied to large blast furnaces successfully, but the system has not been extensively adopted.

The history of the development of blast-furnace construction for the last half century is almost entirely a record of increasing dimensions, both in height and diameter, having for a consequence greater yield, and, within certain limits, greater economy of fuel. The flat boshes of the older furnaces and the rapid narrowing upward towards the mouth have been generally replaced by steeper boshes and wider mouths. There have been, however, no universally accepted principles of blast-furnace construction developed, as far as regards the interior outline. The Cleveland district of England affords a striking instance of the growth of furnaces in height and capacity. Furnaces were built

In 1851,	42	feet	high,	15	feet	diam.,	capacity	4,566	cubic feet.
" 1861,	62	"	"	20	"	"	"	12,778	" "
" 1870,	90	"	"	30	"	"	"	41,149	" "



The Blast-furnace Process.—The charge introduced into the mouth of a blast furnace consists of iron ore, which varies greatly in richness and purity in different regions; fuel, either raw coal, coke, or charcoal; and, ordinarily, limestone, the latter serving to unite with the earthy matters of the ore and form a fluid slag or cinder. The action of the furnace, expressed in its simplest form, is as follows: Air is blown through the tuyeres, and comes in contact with incandescent fuel. The oxygen of the air is speedily converted into carbonic oxide gas, which, together with the nitrogen of the air, rises through the descending charge. The reaction of the carbonic oxide and oxide of iron of the ore results in the formation of metallic iron and carbonic acid gas; the latter, ascending, escapes at the mouth of the furnace, while the former descends to the hottest part of the furnace, where it melts and drops into the hearth. The earthy matters of the charge fuse likewise, and collect in the hearth, floating on top of the molten iron. At regular intervals the slag and iron are tapped off: the former is thrown away, and the latter is cast in moulds of sand or iron, and forms "pigs." Although this simple statement of the blast-furnace process is correct as far as the end result is concerned, yet the reactions which occur in the furnace are, in reality, very complex and dependent on many conditions. The reducibility of different varieties of ore is very dissimilar: while some varieties require a high temperature and long exposure to an atmosphere rich in carbonic oxide gas, other varieties yield up their oxygen at a comparatively low temperature and short exposure to an atmosphere relatively poor in carbonic oxide. According to Bell, a gaseous mixture of 40 to 45 volumes of carbonic acid to 100 of carbonic oxide fails to exert any appreciable effect on Cleveland iron-stone at a temperature of melting zinc (782° F.), but the same mixture possesses decided reducing power at a red heat. Again, some ores are rapidly reduced with the above gaseous mixture at a temperature at which Cleveland iron-stone is unaffected.

The reduction of iron ores, or the removal of the oxygen of the oxide of iron, does not simply consist in the abstraction of oxygen by carbonic oxide. The investigations of Bell prove that reaction of carbonic oxide and oxide of iron is a very complex one. The first effect is the formation of some carbonic acid and some metallic iron. The further action of carbonic oxide on the metallic iron thus formed causes the carbonic oxide to break up into carbonic acid and carbon, the latter being deposited in the form of a black powder on the reduced metal. This combined process of reduction and carbon deposition continues until the iron is nearly all in the metallic state; but absolute reduction is never attained by the action of the carbonic oxide alone. As this product, composed of iron and carbon and some oxide of iron, descends into the hotter regions of the furnace, the carbon thus deposited is partially removed by the carbonic acid, but it is not until the point of fusion is reached that the last traces of oxygen are removed. It is probable that the carbon found in the pig iron is a part of the carbon deposited in the ore. The amount and rate of carbon deposition depends on the temperature and the relative amount of carbonic acid present in the gases. It may begin as low as 392° F., but decreases rapidly as soon as a red heat is reached. The most favorable temperature is between 752° F. and 842° F. The temperature of

incipient reduction of sesquioxide of iron by carbonic oxide is variously given by different observers. Bell's determination is the lowest by far—viz. 284° F.—while the oxidation of metallic iron, according to the same observer, does not begin below 752° F.

It is evident that the economical production of iron in the blast furnace is mainly a matter of the amount of fuel used. A saving of the fuel in the process can be effected in two ways: first, by increasing the heat of the descending charge; and second, by increasing the heat of the ascending blast. The first of these conditions is realized by adding to the height or diameter of the furnace; in other words, increasing its capacity, so as more effectually to intercept the heat of the escaping gases; and the second condition is accomplished by direct heating of the air forced into the furnace. It was long considered that there was no limit to the saving that could be effected by increasing the capacity of the furnace and temperature of the blast, but Bell has shown that the profitable limit has probably been attained in both instances, at least in so far as the smelting of Cleveland ore is concerned. The practical limit of capacity in a blast furnace is reached when the gases which are given off at the mouth no longer have the power to abstract oxygen from the ore—a condition dependent on the temperature of the gases, and the relative amount of carbonic oxide they contain. But gases which are inactive on one ore at a given temperature may still have power to reduce another ore at the same temperature; consequently, the height and capacity of a blast furnace is dependent on the kind of ore smelted in it. In the case of Cleveland ore (containing in a calcined state 41 per cent. of iron), of difficult reducibility, Bell finds that the profitable limit is reached in furnaces of from 12,000 to 15,000 cubic feet

Fig. 3.

capacity, with temperature of blast about 900° F. The escaping gases then have a temperature of 600 to 700° F., and contain 6.58 hundredweight of carbon, in the form of carbonic acid, for each ton of pig iron produced, and 40 to 45 volumes of carbonic acid to 100 volumes of carbonic oxide. The consumption of fuel under these circumstances is from 21½ to 22 hundredweight of coke for 1 ton of pig iron produced. Furnaces of 30,000 and 40,000 cubic feet capacity, driven with a blast of 1400 or 1500° F., do not exhibit any further economy of fuel. In smelting richer and more readily reducible ores a small cubic capacity suffices to attain the minimum expenditure of fuel. A notable instance is the Urbna furnace in Austria, working spathic ores. It is 36 feet high, and has a capacity of only 1200 cubic feet, but makes 140 tons of iron per week with 14 hundredweight of charcoal per ton of iron, the temperature of blast being 392° F.

The cause of the great economy of fuel effected by the hot blast—say, on an average, 10 to 11 hundredweight per ton of iron—has long puzzled metallurgists, and the subject cannot be said to be yet entirely removed from the sphere of speculation. The researches of Bell in England and Akerman in Sweden have, however, recently thrown great light on the subject. The following considerations show where the principal sources of economy lie; in other words, why the combustion of a given amount of fuel, outside of the furnace and conveyed through the blast, is more than equivalent to the same amount of fuel burnt in the furnace itself. The fuel burnt before the tuyeres is oxidized merely to carbonic oxide, and gives per unit of carbon only 2400 heat-units; while the fuel in the hot-blast stoves is burnt to carbonic acid, and gives, per unit of carbon, 8000 heat-units, or more than three times the amount in the first instance. Although not more than one-half of this heat is available, owing to loss by the chimney and by radiation, yet there is still a gain from this source. The principal source of saving, however, is to be found in the fact that the heat brought into the furnace by the blast is unaccompanied by any increase in the bulk of the gases in the furnace; whereas the same amount of heat produced by the combustion of the fuel before the tuyeres would have been accompanied by the amount of air necessary for its combustion. This decrease in the bulk of the gases, consequent upon the use of hot blast, acts, first, by diminishing the rapidity of the upward current, thus allowing longer contact of the gases with the ore; and, second, as there is less gas escaping from the furnace, less heat will be carried off in this way.

As the reduction of the ore is dependent upon the temperature and composition of the gases, it is evident that the amount of heat which we may supply by the blast has a limit, for this heat is unaccompanied by the production of carbonic oxide. When, therefore, the fuel used in the furnace has been so far reduced in amount as only to supply the minimum amount of carbonic oxide needed for reduction of any given ore, further increase of the temperature of the blast can be of no advantage, as the heat thus conveyed to the furnace will either escape at the mouth, or it will, by increasing the heat of the furnace, cause a loss of fuel by enabling the escaping carbonic acid to take off another equivalent of carbon.

The product of the blast furnace is *pig* or *cast iron*. Its composition is dependent on the ores and fuel used. It always contains 3 to 4 per cent. of carbon, and in some varieties as high as 5 per cent. The carbon exists in two forms in pig iron—chemically combined, and in the form of graphite. The darker and more highly graphitic varieties are formed at the highest temperatures. The higher the temperature and the more silica the charge contains, the more silicon will be reduced and unite with the iron. A high temperature has also the tendency, in very basic charges, to reduce some of the metals of the alkaline earths.

Sulphur is more readily removed in the cinder at an elevated temperature, while the total phosphorus of the charge goes almost entirely into the pig iron, whatever the temperature may be.

The production of a blast furnace depends on its capacity, the richness and reducibility of its ores, the nature of the fuel, and the temperature of blast. While some small furnaces yield but three tons daily, the production of some of the mammoth furnaces of England is eighty tons daily. The composition and character of the cinder or slag from a blast furnace depends on the nature of the ore and the temperature of the furnace. It consists mainly of a double silicate of lime and alumina.

T. M. Drown, *Metallurgist.*

Blast'ing [from the Ang.-Sax. *blæsan*, to "blow"]. The use of gunpowder in quarrying stone probably dates back almost to the invention of that explosive. In ordinary practice the blocks of stone are separated from the mass in the quarry by means of one or more *blasts*, each blast being made by first drilling a hole into the rock by the use of a *drill*, operated either by hand, or—as is now the practice in large works, especially large tunnels or shafts—by machinery driven by steam or compressed air.

In removing very large masses of rock quickly, to make way for a railroad, to furnish stone in sufficient quantities for the rapid construction of an important breakwater, or to prepare the site for a fort, it has become the custom to run galleries into the rock, and to place in chambers prepared for the purpose very large charges of powder of sufficient power to bring down the whole face of a cliff or side of a mountain, as was the case at Dover and Holyhead in England, and at Lime Point, entrance to San Francisco Bay, Cal. Each of these methods for removing rock will be described in turn.

In hand-drilling the operation is performed by means of a *drill* or *jumper*, which is formed from a bar of steel,

or of iron tipped with steel at one end, which is flattened out into a fan shape, with a sharp cutting edge extending on each side a little beyond the body of the drill, as seen in Fig. 1, so that the drill may have free play in working. The drills are of lengths suited to the depths of the holes to be drilled, it being customary to use a short drill in commencing a hole, and longer ones in succession as the hole is deepened. Their diameters also vary, generally with the depths of the hole, but are also much modified by the kind of explosive used, blasting powder requiring much more space for the charge than nitro-glycerine and its compounds.

Fig. 1.

Drill.

In drilling shallow holes of one inch or less diameter, the quarryman holds the drill in one hand (see Fig. 2), turning it a little with each blow, and with the other hand wields a hammer weighing from four to seven pounds. (See Fig. 3.) In this way he can drill in granite an average of eight feet in a day.

In drilling holes ranging from one to three and a half inches in diameter, and two to fifteen feet in depth, three men are usually required (Fig. 4), one to hold and turn the drill, and the other two to wield hammers (Fig. 5) weighing from fourteen to eighteen pounds, striking the drill alternately. The progress thus made in granite has been from two and a half to twelve feet per diem, in holes varying respectively from three and a half to one and a half inches in diameter.

To prevent the cutting edge of the drill becoming heated, and thereby softened, water is frequently poured into the hole, and a wisp of straw, hay, or a rag is laid around the drill at the mouth of the drill-hole to prevent the water spurting out when the drill is struck by the hammer.

From time to time the fragments and powdered stone have to be taken out of the drill-hole by means of a *spoon* or *scraper*. (Fig. 6.)

Another form of drill, called the *churn-drill* or *churn-jumper*, is frequently used, when the holes are vertical or nearly so. (Fig. 7.) It is usually seven or eight feet long, but may be as much longer as required for deeper holes. It is sharpened at each end into a cutting drill edge, and sometimes has an iron bulb in the middle to give additional weight in falling, and consequently greater effect in drilling. Two men are usually employed to operate it, raising it, turning it about one quarter round, and letting it fall, cutting the rock by the force of gravity. (Fig. 8.) Sometimes a spring rod and line are used to facilitate the operation, enabling one man to operate the drill. (Fig. 9.) The progress made is better than with the drill and hammer, being about sixteen feet per diem, but the cutting edges suffer greater injury, becoming oftener dulled or broken, rendering frequent sharpening necessary.

The next step, after finishing the drilling and removing the chips, powdered stone, etc. from the bottom of the drill-hole, is to determine the *strength of the charge*. In former times an inferior kind of gunpowder, called blasting powder, was generally used, and is still employed in many quarries in preference to the quicker and stronger explosives, apparently for the reason that its slower ignition, by allowing a gradual development of its expansive force, produces a greater, and, for their purposes, a better, effect upon the rock, breaking it into large masses, better suited for "dimension stone." In furtherance of this idea many quarrymen have mixed with the powder certain proportions of other materials, as fine dry sawdust, in the proportions of one-third sawdust for small charges, and one-half for large, and quicklime in the proportion of one-third lime; and have also in some cases managed to have an air-space over or around the charge. The results are stated to have been satisfactory. At Cherbourg, France, in blasting rock for the breakwater, sawdust, obtained from the softer kinds of wood, as elm or beech, was mixed with gunpowder in equal proportions, and the effect, as far as concerns the quantity of rock removed, is reported as having been equal to that of similar blasts in which the charge was wholly gunpowder. The masses were, however, larger, and therefore better suited for use upon the breakwater.

Fig. 2.

Fig. 3.

Hand Hammer.

Of late years the necessity for a more active agent for use in gold and silver mining, and in excavating railroad tunnels, and large cuttings in solid rock, has brought into use more powerful explosives. Nitro-glycerine, first invented and used in Europe, has been introduced to a considerable extent in this country. At the Hoosac Tunnel, where its qualities have been much improved by Prof. Mowbray, it has been manufactured and used exclusively since the summer of 1868. The result has been an improvement in the rate of monthly progress, which, including that resulting from the use of machine drills, has increased from 50 to 150 feet, and the quantity of rock removed in the same time, from $194\frac{7}{13}$ cubic yards to $1147\frac{5}{13}$ cubic yards.

Many combinations of nitro-glycerine are also in use, some of which are claimed to be safer than, and almost if not quite as effective as, nitro-glycerine. Of these *dualin*, invented by Dittmar, and manufactured at Neponset, Mass., is much used. This consists essentially of dried sawdust soaked with as much nitro-glycerine as it will contain. The nitro-glycerine, being thus fixed, is not apparently liable to the changes incident to a liquid state, nor to explosion by shocks. *Giant powder* or *dynamite*, made by soaking nitro-glycerine into a silicious sand, or infusorial earth consisting of millions of microscopic shells, which readily absorb and retain the nitro-glycerine, is claimed to be safe from shocks, and is much used in the mines of California, Nevada, and other Western States and Territories. *Gun-cotton* has been used in England, and the trials of the disks prepared by Prof. Abel have shown marked results of its great explosive power. In the demolition of one of the towers erected in London for the International Exhibition of 1862, some of the charges of gun-cotton were only one-sixteenth, by weight, of the powder used in similar charges in other parts of the same building.

To determine the quantity of powder or other explosive that must be placed in a mine of any kind, we should take

Fig. 4.

into consideration the nature of the soil or rock, its tenacity, weight, and the quantity of the explosive necessary to throw up a cubic yard of it. After ascertaining this by actual experiment, the charge necessary for another mine or blast in the same material may be found by what is called the "miners' rule;" which is, that "the charges of two similar mines are to each other as the cubes of their lines of least resistance," or $c : c' :: l^3 : l'^3$.

The "line of least resistance" is the line along which the exploded charge finds the least resistance to its vent in the open air. Generally, it is the shortest line from the centre of the charge to the surface of the rock or ground. Quarrymen rarely understand the correct use of this line in determining the quantity of powder for a charge, usually confounding it with the depth of the drill-hole. In some cases this is not far from correct, as is seen in Fig. 10, where the line AB is the line of least resistance for the charge BC. But were the hole drilled to the depth G, FG being the position of the charge, the line HE becomes the line of least resistance.

A simple rule, very generally followed, is to "fill the

hole one-third full." This for holes of medium diameter may not be far wrong, but where the diameter is larger than usual an excessive charge will be the result of its application. This is readily seen from the fact that one-third of the length of a 2-inch hole will contain nearly *twice* as much powder as the same length of a 1½-inch hole, and a 2½-inch hole will contain nearly *three times* as much.

The true line of least resistance is measured from the *centre of the charge*, and not from the bottom of the drill-hole. This distinction is important, as will be seen by observing in the following table—taken from Gen. Pasley's "Memorandum on Mining"—the different spaces occupied by the same charge in holes of various diameters:

Diameter of the hole.	Powder contained in one inch of hole.		Powder contained in one foot of hole.		Depth of hole to contain one pound of powder.
inches.	lbs.	oz.	lbs.	oz.	inches.
1	0	0.419	0	5.028	38.197
1¼	0	0.942	0	11.304	16.976
2	0	1.676	1	4.112	9.549
2¼	0	2.618	1	15.416	6.112
3	0	3.77	2	13.24	4.244
3¼	0	5.131	3	13.572	3.118
4	0	6.702	5	0.424	2.387
4¼	0	8.482	6	5.784	1.886
5	0	10.472	7	13.664	1.528
5¼	0	12.671	9	8.052	1.263
6	0	15.08	11	4.96	1.061

Thus, if we have a 1-inch hole, 42 inches deep, charged,

Fig. 5. Fig. 6. Fig. 7.

Large Hammer. Spoon. Churn Drill.

according to the common rule, with 14 inches of powder, the centre of the charge, being seven inches from the bottom of the hole, will lessen, by that distance, the commonly understood line of least resistance (the depth of the hole), giving 35 inches, which is the true line. As the diameter of the hole increases the two lines approximate more nearly, until with a 6-inch hole they differ only by about half an inch.

Aware of the unequal results from following the common rule, many quarrymen are accustomed to determine the charge by *appearances*, including in that term the nature of the rock, position of planes of stratification, diameter of drill-hole, and a mental comparison with similar mines with which they have had experience. In those quarries and mines, however, which are worked with the best system and economy the charges are almost always determined by the "miners' rule," the charge in pounds being obtained by multiplying the cube of the line of least resistance, expressed in feet, by a certain fractional number, the value of which depends upon the nature of the rock to be blasted.

Fig. 8.

The following table, taken from Lieut.-Gen. Sir John Burgoyne's "Notes on Blasting Rock," gives the charges of "Merchant's blasting powder" used in the granite quarries of Kingstown, near Dublin, Ireland, which were generally found to be sufficient to fracture the rock:

Lines of least resistance, in feet.	Charges of Merchant's blasting powder.		Remarks.
	lbs.	oz.	
1	0	0½	To make sure, ¼ or ½ oz. should be added to so small a charge.
2	0	4	
3	0	13½	
4	1	0	
5	3	14½	
6	6	12	
7	10	11½	
8	16	0	

The above charges, according to the "miners' rule," are all proportional to the cubes of the lines of least resistance in feet.

In the demolition of the walls of the building erected for the International Exhibition of 1862 the charges, when arranged in the wall in three-lined intervals, were equal to ⅝

Fig. 9.

$(l.\ l.\ r.)^3$ (five-eighths of the cube of the line of least resistance, in feet); for two-lined intervals the charges were $\frac{1}{4}\ (l.\ l.\ r.)^3$; and for one-lined intervals, from $\frac{1}{4}\ (l.\ l.\ r.)^3$ to $\frac{3}{10}\ (l.\ l.\ r.)^3$.*

In blasting rock, a hard quartzose schist, for the construction of a pier to form the new harbor of Holyhead, England, in 1850–51, the charges of Merchant's blasting powder ranged from $\frac{2}{7}\ (l.\ l.\ r.)^3$ to $\frac{1}{26}\ (l.\ l.\ r.)^3$, depending upon

* "Professional Papers of the Corps of Royal Engineers," vol. xiv., p. 148.

the positions of the charges in relation to the planes of stratification.*

In the three large charges used to blast down Round Down Cliff (composed of chalk) near Dover, England, in 1843, their strength was calculated at $\frac{1}{5}\frac{1}{2}$ $(l.l.r.)^3$. †

At Delhi, India, in blasting hard quartzose rock the charges for lines of least resistances of 1, 2, 3, 4, 5, and 6 feet were, respectively, 4, 8, 14, 20, 26, and 36 ounces. ‡

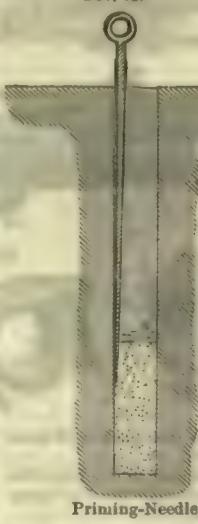
Fig. 10.

In the large blast in sandstone at Lime Point, entrance to San Francisco Bay, Cal., in 1868, the lines of least resistance being between 45 and 50 feet, the charges were 4000 pounds and 3500 pounds, or about $\frac{1}{2}\frac{1}{7}$ $(l.l.r.)^3$.

Charging the Drill-hole.—After the strength of the charge has been determined by any of the above rules, and all moisture removed from the bottom of the drill-hole by means of wisps of straw, hay, or bits of rags, the charge is introduced. If the hole be vertical, the powder is poured in by means of an ordinary funnel of tin, or, preferably, copper; but if the hole is inclined, the funnel is lengthened out by attachable sections, so as to reach nearly to the bottom of the hole, in order that the powder may be lodged at the bottom, without allowing any particles to adhere to the sides, as they would do if poured in loosely. The danger of premature explosion from the tamping-bar striking fire against the sides of the hole is thereby avoided. For this purpose, also, the tamping-bar (Fig. 11) should be shod with copper.

Fig. 11.

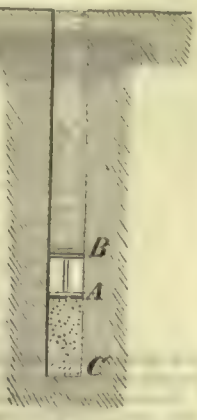
Tamping Bar.



A wooden rod is used to press down the powder and to dislodge any grains that may have attached themselves to the sides of the hole. If the hole be horizontal or nearly so, the charge is placed at the bottom of the hole by using a semi-cylindrical scoop with a long handle. The charge is placed in the scoop, which is then carried to the bottom of the hole, and being turned over is then withdrawn, leaving the powder at the bottom.

If the hole is inclined upward, a cartridge to contain the powder must be used; this is pressed home by the wooden rod, and if the inclination of the hole be great, a wad of straw or hay is pressed up against it to hold it in place until the tamping can be introduced.

Tamping.—The *priming-needle* is next used. This is a long wire tapering towards the point, so as to be easily withdrawn after the tamping is rammed around it, and enlarged at the other end to form an eye for the introduction of an iron bar in withdrawing it. (Fig. 12.) It should be tipped with copper, and would be better if made entirely of that material. The needle is introduced so that its tip shall penetrate well into the charge. It is usually wrapped with paper, so that when withdrawn the paper may remain as a wall to the fuse-hole, preventing any loose particles of tamping from falling into and choking it. The needle being held firmly against one side of the drill-hole (Fig. 12), the tamping is introduced. First, a wadding consisting of some loose elastic material, as a wisp of straw, hay, or piece of dry sod, is inserted over the powder; then an inch or two of broken brick, or dry clay, or soft stone chips without any flinty substances in them, are thrown in and lightly rammed with the tamping-iron and hammer; then a few more inches of brick or stone chips are put in and well rammed, and so on successively to the top of the hole, when the last one or two inches are filled with damp clay and rammed; after which the needle is withdrawn.

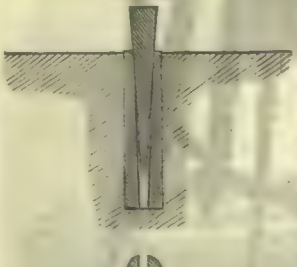


It is stated that if an *air-space* (as AB, Fig. 13) be kept open between the charge and the tamping, leaving the

Fig. 12.

Priming-Needle.

Fig. 13.



Air-Space.

charge AC to fill one-half or two-thirds of the space BC, the effect will be the same as for a full charge filling the entire space. The expedient, however, is not often used in practice.

Materials for Tamping.—Broken brick slightly moistened, rotten stone, quarry chips not containing any flinty substances liable to strike fire, well-dried clay, and sharp pit-sand, are good tamping materials. Opinions have been much divided in this country and in Europe upon the comparative merits of sand and clay for tamping. Elaborate experiments were made at Fort Adams, under the direction of Colonel (afterwards Brigadier-General) Totten, U.S. Engineers, to determine the value of sand for blasting purposes. Sand was forced upward through brass and iron tubes by means of a piston to which great power was applied. The resistance of the sand to this force was so great as to reduce to powder the sand in contact with the inside of the tube before the mass could be forced out of it. Trials were also made with gunpowder as the expelling force. "A musket barrel of ¾-inch bore was charged with two inches of powder and thirteen inches of packed sand. On firing, the barrel was burst, but the sand was not driven out." "A piece of musket barrel taken from near the muzzle, and open at both ends, was charged at one end with five and a half inches of brick-dust, hard rammed, and at the other with five and a half inches of sand, well packed, with one inch of powder between them, a priming-hole being bored to communicate the fire. The explosion of the powder burst the barrel, but neither the sand nor the brick-dust was driven out." In conclusion, the report of Lieut. Brown says: "The experience at Fort Adams proves that the resistance offered by sand is quite sufficient for blasting rocks, and the advantages attending its use are, that it is much less troublesome than the usual mode, and that it is perfectly safe. To ensure success, the space left above the charge should have a length of ten or twelve times as great as the diameter of the hole." ‖

Fig. 14.

Plug and Feather.

Experiments made at the works carried on at Kingstown, near Dublin, Ireland, to test the relative values of sand and clay for tamping, exhibited in their results a marked superiority in the latter over the former, which was very often blown out without cracking the rock, while the clay tamp-

‖ "Journal of the Franklin Institute," July and Aug., 1836.

ing in another hole of the same dimensions held firmly, the rock being cracked. Sand well packed gave better results than when poured loosely into the drill-hole, but not equal to those given by clay. The sand was from the sea-shore, and of course water-worn. Sharp pit-sand would probably have given better results. Of the three varieties, coarse, fine, and medium sand, the medium proved to be the best.

In blasting rock at Cherbourg, France, the experience

Fig. 15.

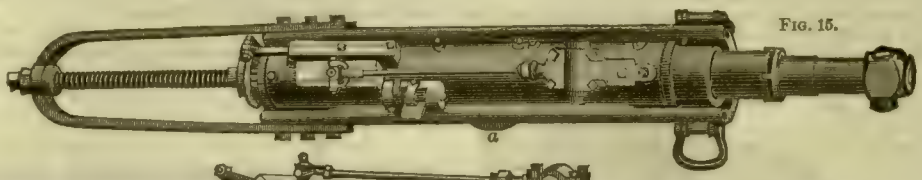

Fig. 16.

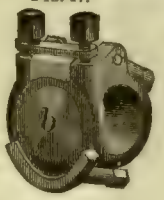
Fig. 17.



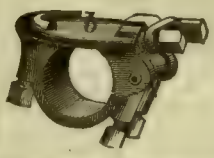


Fig. 18.

was in favor of sand-tamping, which was used with great success and exclusively of all others.*

In using nitro-glycerine, sand-tamping is much preferable, as the shocks from ramming any other kind of tamping are liable to explode the charge.

Many contrivances, such as cones, plugs, and wedges, have been employed to place over the charge in the drill-hole for the purpose of increasing the resistance of the

Fig. 19.

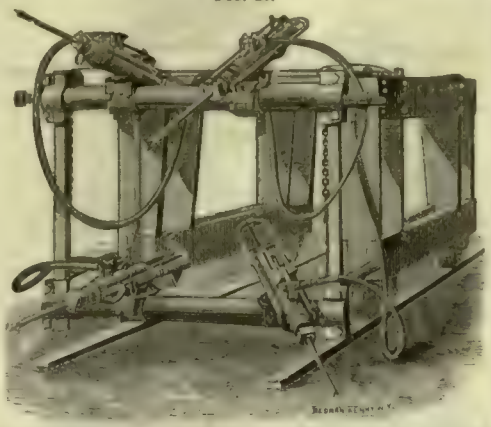
tamping, but they consume time in their proper placement and confinement in position, and are also expensive. Their use, therefore, is confined to particular blasts, which require unusual time and trouble in their preparation, and from which compensating results are expected.

* "Mémoire sur la digue de Cherbourg," par J. M. F. Cachin, page 51, note.

To obtain greater effect from a given drill-hole, the bottom of the hole has sometimes been enlarged by the use of acids to form a sort of chamber for the reception of the charge. At Marseilles, France, in blasting a calcareous rock, dilute nitric acid was poured to the bottom of the drill-hole through a small leaden tube. The effervescence produced by the decomposition of the rock, escaping to the surface through an outer tube, carried with it the substances of the dissolved rock.

Priming the Charge.—The usual way is to fill the needle-hole with fine powder, then place in connection with the powder at its mouth a slow match, made by soaking coarse paper in saltpetre or a solution of powder. The slow match is made long enough to allow the quarryman, after lighting one end of it, to seek a place of safety before the explosion takes place. Sometimes the priming is contained in straws, joined together end to end so as to make a tube sufficiently long to reach the charge. This is inserted in the needle-hole, and fire is communicated, as above, by a slow match or portfire.

Bickford's safety fuse and others of similar character are frequently used, especially in wet localities. The fuse is cut so that when one end is inserted into the charge the other will project about an inch above the mouth of the hole. The wadding is then put in, and after it the tamping is rammed around it in the same way as around the needle. This fuse possesses great advantages over the common priming when the drill-hole is horizontal or inclined upward, or much water is present. In the latter case the charge should be contained in a waterproof cartridge, and the junction of the fuse with it be made watertight by means of a wrapping of twine covered with wax.



At Cherbourg the use of the needle and the usual tamping was dispensed with. A straw tube, such as has been described, filled with priming composition, was placed in the drill-hole, the lower end being inserted into the charge. Fine and thoroughly dried sand was then poured in until the drill-hole was full. The upper end of the straw was then opened and the composition ignited, the slowness of burning affording time for the miner to seek shelter.

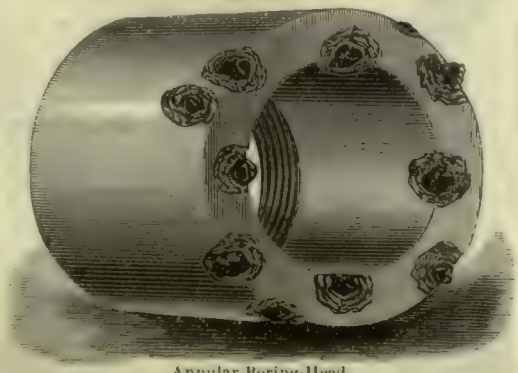
At Delhi, India, a reed filled with powder was used to fire the charge. The reed was inserted into the needle-hole, and the top being split, a piece of rock was laid upon one of the splits to prevent it falling into the hole. The powder being ignited by a piece of touch-paper and a train, the reed flew to the bottom of the needle-hole like a rocket, and ignited the charge.

Of late years the use of electricity in blasting has much increased, especially since the introduction of nitro-glycerine and its compounds, and gun-cotton, which can best be fired by the shock of a minor explosion. If ignited, they burn without any explosive effect. In firing a charge of powder all that is necessary is to make a short interruption of the conducting wires in connection with the charge. In passing the electric current a spark is produced at the point of interruption sufficient to ignite the powder. In firing nitro-glycerine or gun-cotton an "exploder" containing a sensitive priming composition is necessary. Those used at the Hoosac Tunnel are made there by Prof. Mowbray, by first inserting the ends of two insulated wires into a small wooden

cylinder, where they are accurately fixed in position, so as to give a spark upon the passage of the electric current. The wooden cylinder is then filled with the priming composition (composed of sulphide and phosphide of copper and chlorate of potash), and this is then connected with a

FIG. 20.

copper cap containing fulminate of mercury, and the whole enclosed in a wooden cylindrical case made watertight. The resistance of the copper cap adds much to the force of the exploder, and ensures the effective explosion of the nitro-glycerine.



A frictional electric machine made by Mr. H. Julius Smith of Boston is very portable, and has been found useful for firing mines. The ebonite disk for exciting electricity is turned by a small crank between two rubbers covered with sulphuret of tin, and all is enclosed in a compact case of vulcanite. By simply turning the crank backward the connection of the poles of the battery with the conducting wires is made, and the charge is fired.

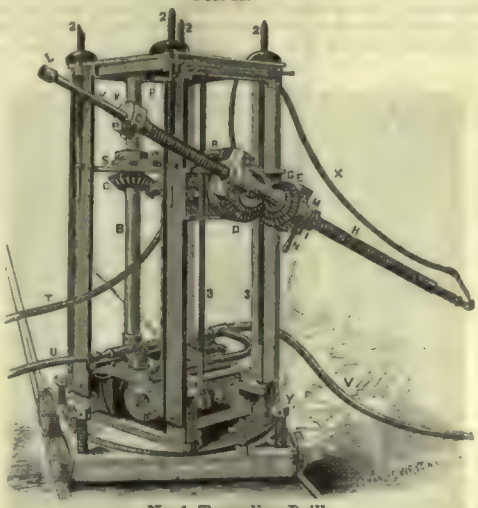
A magneto-electric machine made by Ritchie & Sons of Boston is used at the Hoosac Tunnel, and possesses the power of firing 150 charges simultaneously. The conducting wires used are of copper encased in a watertight covering of gutta-percha.

Cutting up Large Blocks.—In reducing the masses thrown out by a blast to the sizes of "dimension stone" required for use, lines of small holes are usually cut in the direction required, selecting, if possible, the natural lines of cleavage. These small holes are wedge-shaped, about three inches long, two inches deep, and three inches apart. Into these iron wedges are inserted, and struck with a heavy iron hammer, in succession, from one end of the row to the other.

Splitting with the "plug and feather" is more generally used where it is desired to obtain a uniform split surface to a considerable depth. A row of circular holes, about one inch in diameter, five or six inches in depth, and the same distance apart, are drilled along the line to be split. Two feathers are then placed on opposite sides of each hole. The *feather* (Fig. 14), when in position, is like an inverted iron wedge having a smooth surface to receive the *plug*, and a circular back to fit the sides of the drill-hole. Between these feathers the plug (a long narrow wedge) is in-

FIG. 21.

Annular Boring-Head.



serted, the faces of the plug and feathers being parallel to the desired line of cleavage. The plugs are then driven in succession as above, until the rock splits.

In the large quarries at Aberdeen and Peterhead in the north of Scotland the charges used are merely sufficient to break the rock into large masses. A process called "bulling" is then had recourse to. This consists in filling the vertical cracks and fissures opened by the blast with powder, and firing it. The explosion throws the blocks forward in their beds some inches, if not several yards, into positions convenient for splitting up.

Quarry Shields.—In a populous locality, or one where it is difficult for the quarrymen to reach a place of shelter from the small fragments of rock that are sent by the blast flying through the air, it is usual to cover the rock around the hole with brush or loose plank or timbers weighted with stone. These prevent the fragments from flying so far. Shields of boiler iron and of plank strongly nailed together are used in very confined localities, as in drifts and shafts of mines. The iron shields used in the quarries near Glasgow, Scotland, were two and a half feet square by one-fourth of an inch thick.

Steam Drilling-Machines.—The length of time required, as well as the great labor and expense of drilling by hand, has led to the introduction, in large private and public works, of drilling-machines driven by steam or compressed air. Sommeiller invented a machine which was used with success at the Mount Cenis Tunnel. This was driven by compressed air conveyed into the headings in pipes, the the compressors being situated near the E. and W. entrances to the tunnel. Subsequently the Burleigh drill, similar to the above, was patented in this country, and is now manufactured largely by the Burleigh Drill Manufacturing Company at Fitchburg, Mass. This has been used in the Hoosac Tunnel since the summer of 1866, giving great satisfaction, the progress by its use and that of nitro-glycerine having since increased from 50 to 150 feet per month, notwithstanding the size of the heading had been more than doubled in the mean time. The value of this machine warrants a brief description.

FIG. 22.

No. 1. Tunneling Drill.

Figs. 15 and 16 show a top and side view of the Burleigh drill, as now made. It consists of three parts—the cylinder, the cage, and the piston. "The cage is merely a trough with ways on either side, in which the cylinder, by means of a feed-screw and an automatic feed-lever, is moved forward as the drill cuts away the rock. The piston moves back and forth in the cylinder, propelled and operated substantially like the piston of an ordinary steam-engine. The drill-point is attached to the end of the piston, which is a solid bar of steel. The piston is rotated as it moves back and forth by ingenious and simple mechanism. The forward movement of the cylinder in the trough is regulated by an automatic feed as the rock is cut away, the advance being more or less rapid as by the variation in the nature of the rock the cutting is fast or slow." When the drill is in operation a small jet of water is kept playing into the drill-hole to cool the drill-point and to soften the rock. "When the cylinder has been fed forward the entire length of the feed-screw, it may be run back, and a longer drill-point inserted in the end of the piston." The drilling-machine is attached to the clamp (see Figs. 17 and 18) by means of a circular plate (*aa*, Figs. 15 and 16) with a bevelled edge cast upon the bottom of the cage near its centre. This plate fits a corresponding cavity (*bb*, Figs. 17 and 18) in one side of the clamp, and is held there firmly in any required position by the tightening of a screw. By the

motions upon one plane of the plate in its cavity, and upon another, at a right angle to the first, of the clamp upon the bar, and the sliding endwise of the clamp upon the bar, it will be seen at once that any position and direction of the drill is attainable. It only remains to attach the bar, of any reasonable length, to a convenient carriage or frame."*

These frames are of various forms, made to suit the different circumstances under which the drill is usually used. Of these various forms, the one shown in Fig. 19 is adapted to quarry work, open-cut, surface, or shafting work. The adjustable legs admit of its being placed upon uneven surfaces of the rock. Fig. 20 shows a frame adapted for use in a tunnel. It mounts four drills upon two bars, the lower of which may be raised or lowered by means of chains, pulleys, and a windlass.

In the Hoosac Tunnel the motive-power is compressed air, and this is much better than steam for all tunnel and shaft work. By its escape, upon being worked off, it cools the headings, refreshes the air, and creates a current out of the drift or shaft, which carries off the vitiated air caused by blasting, respiration, and burning candles. The results of its use upon other works have also been very satisfactory. The progress made in deepening the Illinois and Michigan Canal is reported as being from twelve to fifteen holes drilled daily, each hole being from 7 to 8 feet deep and 4½ inches in diameter, or from 90 to 110 feet per diem, equal to the labor of thirty to thirty-five men. At Poughquag, N. Y., in very hard, seamy rock, it drilled 40 holes, 4 inches in diameter, per day, equal to the work of twenty men. At the works of improvement at Hallet's Point, carried on by the government, it was reported for 1868 and 1869 that the drill performed twice the amount of work in the same time as, and at one-third the expense of, hand-labor.

Diamond Drill.—The first application of the diamond to drilling rock was made by Prof. Rodolphe Laschot, a civil engineer of Paris, who found that a rotating drill armed with diamond points could be made to bore holes in rock rapidly to great depths by forcibly injecting a stream of

FIG. 23.

water into the hole through the drill. He also arranged the diamond teeth upon the end of a cylinder or boring-head, so that a hole with an annular cross section could be bored, leaving a cylindrical core in the middle. Fig. 21† shows the arrangement of the black diamonds upon this bit or boring-head, which is a steel cylinder about four inches in length. They are placed in three rows—one on the end, one upon the inner, and one upon the outer edge. The diamonds in the row on the end cut the forward path of the drill, while those in the two other rows enlarge this path to admit the free ingress and egress of water to cool the diamond point and moisten and soften the rock. Fig. 22 exhibits one of the numerous forms of the machine adapted to tunnelling purposes.

The motive-power is furnished by two oscillating engines AA, both attached to the same crank-shaft B. This upright shaft by the gear C communicates its motion, with double velocity, to the bevelled gears D and F, and from

FIG. 24.

thence to G and E. E is keyed to the screw-shaft H at the clutch M. G has a tubular axis which has a female screw cut inside to receive the male screw on the shaft H, thus forming a long nut in which the shaft revolves. The velocities being different, the effect of the two screws, like that of a differential screw, is to feed forward the drill to its work. By changing the diameters of the bevelled gears G and F any desired feed may be obtained. In extremely hard rock the feed of one inch for 400 revolutions is used, allowing the diamonds to cut only $\frac{1}{400}$ of an inch in each revolution. The drill-rod being rotated at the rate of 600 revolutions per minute, the above feed will give a progress of 1½ inches per minute or 7½ feet per hour. In rock of ordinary hardness the drill is fed forward at the rate of 1 inch to 300 revolutions, boring 2 inches per minute or 10 feet per hour.

By throwing the clutch M out of gear, the revolution of the drill-shaft is suspended, and by the action of the nut-gear G is run rapidly back, thus withdrawing the drill-rod from the hole bored. The drill-rod J consists of a tubular boring shaft made of lapwelded tube, with the bit or boring-head described above screwed on to one end. As the drill cuts an annular channel into the rock, the cylindrical core left by the cutters passes up into the hollow drill-rod, and is drawn out with the drill-rod in sections of from eight to ten feet. The drill-rod may be extended so as to bore any depth required. It may also, by convenient arrangements provided, be turned in any direction, or raised or lowered, as desired. Water is injected into the drill-hole through the hollow drill-rod by means of a double-acting plunger pump situated at R.

Fig. 23 represents a more portable form of the machine, adapted to use in a shaft. It is mounted upon a movable frame, which is fixed in position by jack-screws pressing against the sides of the shaft. The motive-power (steam

D, débris remaining after the explosion, denoting proposed escarpment previous to blast.

or compressed air) is admitted through a pipe leading to the surface above, the quantity being regulated by a stop-cock near the hand of the attendant. The advantages

*Circular pamphlet of the Burleigh Rock-Drill Company, Fitchburg, Mass.

†Circular pamphlet of Severance & Holt, manufacturers of diamond-pointed rock-drills, 16 Wall street, N. Y.

claimed for this drill are—that holes may be bored to any required depth, thus permitting the charge to be placed at the point where its effect is desired, and enabling prospecting holes, or drain-holes for water, to be run in galleries or sunk in the bottom of shafts of mines; that the holes are perfectly cylindrical and of uniform diameter, thus permitting the use of cartridges of very nearly the diameter of the holes.

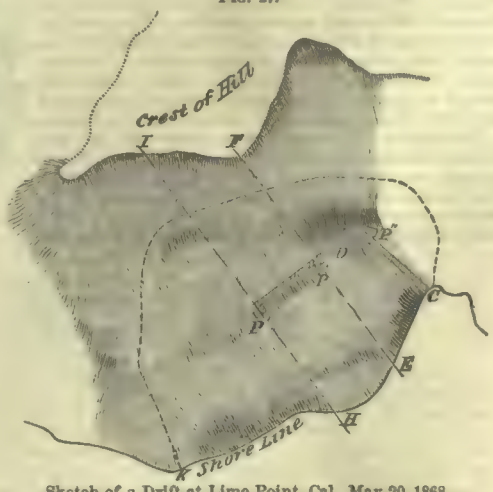
FIG. 26.

N. B. The section of the cliff at the entrance of the galleries is shown by thick dotted lines, and the outline of the débris is shown by thin dotted lines. The part removed by the explosion is shown by light shading.

At Hallet's Point, where both drills were used by Gen. Newton, the Burleigh drill gave the best results in tunnel-work, but for prospecting or drilling long holes for other purposes, it is stated that the diamond drill cannot be dispensed with.

Blasting by Galleries.—In cutting the way for the South-eastern Railway it became necessary to blast down a portion of Round Down Cliff, near Dover, England, composed of compact chalk.* It was decided to run a gallery into the cliff, and to place three large charges five feet in rear of the centre line of the railway, and three feet above its level. The gallery, 4′ wide and 5′ 6″ high, was run 20 feet above the level of the railway. (Fig. 24.) Three shafts, made in the form of a truncated cone, 3′ in diameter at top and 5′ at bottom, to offer greater resistance to the tamping being blown out, were then sunk 17 feet. (Fig. 25.) Branches were then run at right angles to the drift-way, made of a wedge-shaped form, 2 feet wide at the shafts and 4½ feet at the chambers, for the reason stated above. Chambers of oblong form were excavated at right angles to the branch drifts.

The charges were calculated at $\frac{1}{13}$ of the cubes of the lines of least resistance, which for the middle charge was 72 feet, and for the two end ones 56 feet each, giving respectively 7500 pounds and 5500 pounds, or a total charge of 18,500 pounds. The powder for the charges, in bags, was placed in deal boxes put together in the chambers, a vacant air-space being left around the boxes. The galvanic wires for exploding were connected with two branches within each chamber, each branch attached to a primer filled with finest rifle powder, and having the ends of the galvanic wires connected therein by fine platinum wires. The tamping consisted of blocks of chalk laid dry and compactly. It filled the branches, the shafts, and was extended in the drift ten feet on each side of the shafts. The charges were fired by means of three separate batteries, each consisting of a Daniell battery of 18 cells, and two Grove's batteries of 20 plates each. These were connected with the charges by three separate sets of wires. The circuit was completed and the mines fired simultaneously by three attendants acting by words of command. The ignition was followed by a deep hollow sound. "The bottom of the cliff yielded very gently to the force of the powder, assuming a curved form beyond the general face; then the upper part began to give way, and finally the whole slid out into the sea, carrying everything before it in the most magnificent manner."† Four hundred thousand cubic yards of the chalk cliff were removed. This blast is remarkable as being the first large one, on land, at which the galvanic wire was used to fire several charges simultaneously.



In the construction of the large pier to form the new harbor of Holyhead, England, it was found that the ordinary process of blasting, even on the largest scale, could not supply the quantity of stone required—2500 to 3000 tons per day. It was therefore decided to operate by sinking shafts and running galleries, whichever would soonest reach the seat of the charge, and to use large quantities of powder, properly distributed in several chambers.‡ The rock consisted of an extremely hard quartzose schist.

The first large blast was made on the 1st of Nov., 1850, and by the 2d of Aug., 1851, the number had reached 58, with a total result of 293,890 tons of rock removed by the explosion of 103,092 pounds of Merchant's blasting powder, or an average of $2\frac{85}{100}$ tons to a pound, at a mean cost of 4¾*d.* per ton. The charges of powder averaged one-fourteenth of the cube of the line of least resistance, in feet. They were so placed that this line should, if possible, be perpendicular to the planes of stratification. The results were so satisfactory that the method was continued.

The galleries were from 3 to 4 feet wide and 5 to 5½ feet high. In excavating them, holes were drilled from 1½ to 2 feet deep, 1¼ inches diameter, which were charged with from 4 to 6 ounces of powder, well tamped. Two parties of two men each relieved each other day and night, excavating 1¾ feet per day. In the shafts, 6 feet by 4 feet, the progress was not so great. In loading, the powder in sacks was passed from hand to hand to the chamber, where it was usually poured into a deal box prepared to receive it. The tamping was formed of red clay, well rammed, every 6 inches for the first 10 feet, every 12 inches for the next 10 feet, and every 18 inches for the remaining distance. The charges were fired by a Grove's voltaic battery.

Fig. 26 represents the arrangement of galleries and chambers for a large blast of 12,000 pounds of fine-grained powder, which was fired on the 22d of Nov., 1860.‡ A gallery was run in 34 feet from the face of the cliff; then a shaft was sunk 14½ feet, from the bottom of which level galleries were driven right and left, and four returns were made, at the extremities of which the chambers were formed, about 3 feet below the level of the ground-line of the quarry. The powder for the charge, in 50-pound bags, was passed in by hand to the chamber, where the loader emptied them into larger canvas bags coated with tar. These were closely piled in the chamber. The tamping was composed of red clay, and was extended out to the entrance.

FIG. 27.

Sketch of a Drift at Lime Point, Cal., May 20, 1868.

In estimating the quantity of powder for the charges no specific rule founded on the lengths of the lines of least resistance was followed, but the cubical contents of the rock to be removed was divided by the number of cubic

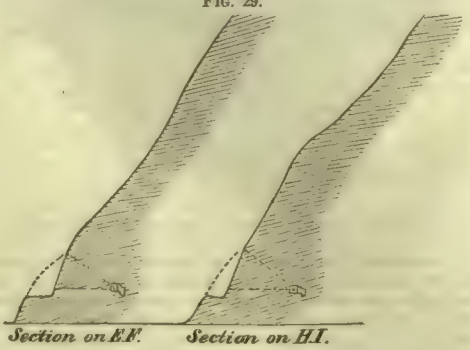
† "Professional Papers of the Corps of Royal Engineers," vol. vi., p. 188.

‡ Ibid., vols. ii. and vii.

‡ Ibid., vol. x.

feet in a ton, and this result divided by the number of tons of rock that had been found, in previous blasting, could be thrown up by one pound of powder. In this case it was 1 pound to 3 tons. The total charge (12,000 pounds) was then divided into four charges, according to their lines of least resistance, the tenacity of the rock near each one, and the proximity of joints. The resulting charges averaged one-fourth of the cubes of the lines of least resistance.

Fig. 28.



Sketch of Powder-Chamber.

The charges were fired by one of Grove's batteries. The blast threw out 40,000 tons of rock, thus averaging 3⅓ tons to the pound of powder used.

In May, 1868, a large blast was made in the face of the bluff at Lime Point, entrance to San Francisco Bay, Cal., by Major Mendell, Corps of Engineers, to prepare the site for a fort at that point. The rock is described as "a metamorphosed or changed portion of the sandstone formation." Its stratification was very much bent and contorted, "resembling the compressed and crumpled leaves of a book." An entrance gallery was run into the cliff 45 feet (Fig. 27), starting twenty feet above low water, and ascending 1 inch in 10 feet to drain off the water; then the main gallery made two turns to the left to gain a direction parallel to the face of the cliff, extending 80 feet farther with the same grade, at the end of which a chamber was formed for one charge. Another chamber was formed 60 feet from the first. The gallery was commenced with dimensions of 6′ height by 4′ width, giving space enough for two men to work and to swing the striking hammer. It was then decided to use dualin and giant powder. This permitted a reduction of the size of the drill-holes to diameters of ⅞ inch, and depths of 18 inches, and a consequent reduction of the drilling force and size of the drift, one man being able to perform the drilling in a drift 4 feet high by 3 feet wide. The cartridges were 5 to 8 inches long, and were tamped. The priming, consisting of fulminate of mercury contained in a copper cap, was fired by a fuse. The floor of the chambers P and P′ were 1½ feet above the floor of the gallery. (Fig. 27.) Two wooden boxes were put together in them, into which the gunpowder for the charges was emptied as it was brought in in sacks which had been filled from casks opened at the entrance to the gallery: 3500 pounds were placed in the first and 4000 in the second chamber. Two priming caps, connected with two sets of branch wires from the main wires, were placed in each charge. The two main wires connecting with the battery were contained in a small wooden box, which also contained two lines of water fuse to be used if the wires failed.

In tamping, the vacant space about the box was filled with sand and sods, without ramming. A wall of sods was then placed in front of the box; a little way in rear of this a second wall of sods, with the space between the two well rammed with clay. This was continued, sods and clay alternating, to the mouth

Fig. 29.

of the gallery. The face of the cliff in front had been cut away (Fig. 29), to increase the effect of the blast.

The charges were exploded simultaneously by means of Beardsley's magneto-electric machine. "The report was dull, and scarcely noticeable. The base of the hill was upheaved, and moved slowly outward. The rock and earth above, left unsupported, slid in large masses, a considerable portion falling into the sea." The portion of the hill near the entrance gallery was not displaced; the tamping of this portion was therefore removed, and a charge of 2650 pounds of powder was placed in a third chamber at P″. It was exploded in the same manner as the others, and brought down that part of the cliff.

The dotted line (Fig. 27) shows the extent of the breach made by the three charges. About 5500 cubic yards of rock were blown down.

The above three examples sufficiently illustrate the course that has been pursued in blasting by galleries since the first blast of the kind in 1843, and afford an excellent indication of the proper method to be followed in similar operations. (See also Submarine Blasting, by Gen. John Newton, U. S. Eng'rs.) J. G. Foster, *U. S. Army.*

Blas'toderm [from the Gr. βλαστάνω, to "germinate," and δέρμα, the "skin"], a minute thin membrane on that surface of the yelk which, whatever may be the position of an egg, is, by a peculiar arrangement, always uppermost; the germinal membrane or *cicatricula.* (See Embryology, by Prof. J. C. Dalton, M. D.)

Blat'ta, a genus of insects which includes the cockroaches, belonging to the order Orthoptera. Several species of this insect are disgusting household pests, of which the most offensive is *Blatta orientalis.* (See Cockroach.)

Blau (Ernst Otto Friedrich Hermann), a German Orientalist, born April 20, 1821, was sent in 1852 as attaché to the Prussian embassy in Constantinople, and in 1854 and 1855 travelled through Asia Minor and the Greek Islands. He has written, besides various articles for different magazines, "Commerzielle Zustände Persiens" (1858).

Blauw-Boc [Dutch for "blue buck," so named from its blue-black color], the *Antilope leucophæa* an exceedingly swift antelope whose habitat extends from Cape Colony to Senegambia. It is six feet long and three and a half feet high. It fights when at bay, and is then dangerous. Its flesh is poor. The name is also given to the pygmy antelope (*Cephalophus pygmæa*), which is only a foot high. It is found in South Africa. It is of a bluish-slate color.

The Blauw-Boc.

Bla'zonry, the art of deciphering coats-of-arms; also that of expressing or describing a coat-of-arms in appropriate language. The word is supposed to be derived from the German *blasen,* to "blow," and to have originated in the ceremonial of tournaments, from which so many other terms and usages in heraldry are derived, it having been customary on these solemn occasions for the herald to blow a trumpet when he called out the arms of a knight on ushering him into the lists. Blazonry requires a knowledge of—1. The points of the shield, which are nine in number; 2. The field—that is, the tincture or tinctures forming the ground of the coat; 3. The charges or devices borne on the field; 4. The ordinaries.

Bleach'ing [from the Ger. *blei'chen,* to "whiten" (from *bleich,* "white" or "pale"); Fr. *blanchir*], a process by

which the natural colors of various substances are discharged, so as to whiten them. Bleaching is extensively applied to the textile fibres: linen, cotton, wool, and silk; and to straw, paper-stock, ivory, wax, animal and vegetable oils, etc. Until the close of the last century the agents employed were air, light, and moisture, aided by weak alkalies and acids. More recently the process has been wonderfully hastened by the use of such powerful agents as chlorine and sulphurous acid. Numerous other agents possessing bleaching properties have been from time to time recommended, but they have not as yet been used to any extent. Such are bromine, ozone, permanganates, chromates, etc. The selection of the bleaching agent depends as much upon the properties of the article to be bleached as upon the coloring-matters to be removed. Cotton, flax, and many other vegetable fibres, being composed of cellulose, one of the most permanent of all organic bodies, are capable of withstanding the action of acids, alkalies, and chlorine, while the animal fibres, silk and wool, being of very different composition, are destroyed by these agents, and must be bleached by the milder sulphurous acid.

Modern bleaching includes much more than the mere application of chlorine or sulphurous acid. The goods are subjected to certain preliminary cleansing processes, such as washing in cold or hot water, boiling with alkaline lyes or soaps, and treatment with acids. By these operations many resinous, fatty, and other impurities, either natural or introduced during the preparation of the yarn, cloth, etc., are removed from the fibre. The more powerful agents are then used for removing the last traces of coloring-matter.

Special Methods.

Bleaching Linen.—This is a very ancient art. We read in the Scriptures of "fine linen, white and clean." The old method, still practised in some localities, consisted in the alternate treatment of the cloth with alkaline and acid liquids, and exposure on the grass to air, light, and moisture. Holland long enjoyed the reputation of possessing the best bleacheries. The brown linen of Scotland was sent over early every spring to be bleached, and on its return in the late autumn was sold under the name of "Hollands," a name still retained in the trade for certain kinds of bleached linen. The word "lawn" is another name of similar origin, having been applied to a finer quality of linen cloth bleached on better grass-plots, or lawns. The Dutch process lasted from March till September, and consisted of the following distinct operations, often repeated: (1) steeping in water four or five days, or in an alkaline lye forty-eight hours. (2) Bucking or bawking, boiling in an alkaline lye. (3) Crofting, or exposing on the grass for several weeks, and sprinkling from time to time with water. (4) Souring with buttermilk. After every dipping the cloth was washed with soap, then with water. The process was necessarily very expensive and laborious. In 1749 the Dutch method was introduced into Scotland, where it was considerably shortened by the employment of dilute solutions of sulphuric acid in place of buttermilk. In 1784, Berthollet investigated chlorine, publishing his results in 1787, and announcing the bleaching properties of this element. Prof. Copeland introduced this agent at Aberdeen. Chlorine was first used in aqueous solution, then in alkaline solution, and finally, in 1798, Charles Tennant of Glasgow introduced chloride of lime, which has been almost exclusively used ever since. Bleaching linen is still a tedious operation, as the fibres are heavily incrusted with impurities; the actual loss during the operations of bleaching being one-third the original weight, while cotton loses only one-twentieth. Steeping, washing, bawking, and crofting are still found necessary, and are several times repeated. Souring is effected with hydrochloric or sulphuric acid. The goods are then chlorinated with hypochlorite of potash, made by mixing chloride of lime with carbonate of potash. Washing, souring, soaping, scalding in soapsuds and weak lye, and crofting, complete the operation. A fortnight is the shortest time in which the bleaching can be effected, and often a much longer time is necessary.

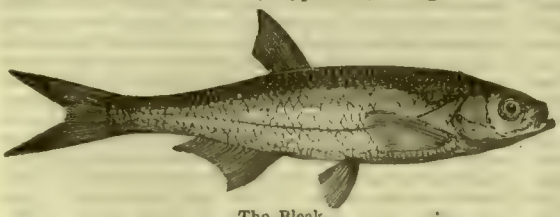
Bleaching Cotton.—Cotton is either bleached in the yarn or in the cloth. The following description of the process employed in American print-works will sufficiently illustrate the methods in common use: The cloth is (1) "singed", by a shearing-machine or by passing over a red-hot roll or over a series of gas flames; (2) it is "limed," boiled for a night with milk of lime; (3) washed; (4) soured with dilute sulphuric acid; (5) washed; (6) bawked, boiled for a night with soda-ash and rosin; (7) washed; (8) bawked with a weak soda-ash lye for seven or eight hours; (9) washed; (10) chemicked with a weak solution of chloride of lime; (11) washed; (12) soured with dilute sulphuric acid; (13) washed—the entire series of operations being completed in three or four days.

Bleaching Wool.—Wool is (1) washed on the sheep, to remove sweat and much of the dirt, including a peculiar substance called suint, which is a neutral salt of potash with a peculiar organic acid. Owing to the high price of potash, this suint has recently attracted considerable attention, and a special industry has been established in the French wool districts for its preservation and utilization. The wool contains from 15 to 33 per cent. of suint, a nine-pound fleece containing twenty ounces of suint, or six to seven ounces of potash. This can be recovered from the water in which the sheep are washed. It is estimated that 3,000,000 pounds of potash can be manufactured annually in the French districts alone. (2) The wool is steeped in soap and water, weak alkaline lye, or putrid urine to remove a peculiar lime-soap which it contains, and other impurities. It is then oiled for spinning, and finally cleansed and bleached, either in the yarn or in the cloth. The operations consist in passing it (3) through a weak warm solution of carbonate of soda and soap; (4) washing with lukewarm water; (5) exposing to sulphurous acid gas. Operations 3, 4, and 5 are sometimes repeated once or twice. The goods may then be blued with carmine of indigo in a weak solution of soap containing a little hydrate of alumina.

Silk Bleaching.—Raw silk contains about 40 per cent. of gummy matter, consisting of albumen, gelatinous substances, wax, fat, resin, and yellow coloring-matter. This is removed by boiling the silk in a solution of soap, and washing with pure water. Bran is sometimes added to the soap to neutralize by the lactic acid it yields any free alkali present. When the silk is to be left white, or dyed or printed with very light colors, it is exposed for a few hours to sulphurous acid gas.

Bleaching Paper-stock.—Cotton and linen rags are bleached in the same manner as cotton yarn and cloth. Old paper is treated with caustic soda to loosen the ink, then with soapsuds, and finally with chloride of lime. Tow and straw are treated with caustic soda and lime, and finally bleached with chloride of lime.

Bleaching Straw.—For the manufacture of hats, bonnets, etc., straw is bleached by (1) exposing it on a meadow to air, sunlight, and dew, with occasional turning; (2) steaming; (3) fumigating with sulphurous acid gas.



Jute is bleached by caustic soda and a chlorine bath made by mixing chloride of lime and sulphate of magnesia in equivalent proportions, and dissolving them in cold water. *Human hair* is said to be bleached on the head to a blonde by the action of aqua regia or of peroxide of hydrogen. *Feathers* are bleached by immersion (1) in a dilute solution of bichromate of potassa containing a little nitric acid, and (2) in a weak solution of sulphurous acid. *Sponges* are bleached by immersion in a warm solution of caustic soda, followed by washing in water and treatment with a hyposulphite of soda solution, to which a little hydrochloric acid has been added. *Ivory* is bleached by rubbing it with pumice-stone and water, and placing it under a glass shade in the sun. It may also be bleached by immersion (1) in a solution of carbonate of soda, (2) in pure water, (3) in a solution of sulphite of soda; (4) to the sulphite of soda is added dilute hydrochloric acid (5) in pure water. *Beeswax* is bleached by exposure to air, sunlight, and moisture in thin ribbons. *Animal and vegetable oils* are often bleached by heating them with a little caustic alkali, by which a small quantity of soap is formed, which settles to the bottom, carrying with it some of the coloring-matter. They are also bleached by exposure in shallow vessels to the sun under glass. *Old engravings* which have turned yellow may be cleansed or bleached by exposure to ozone, generated in a capacious vessel, by a stick of phosphorus partly immersed in water. Immersion for a minute in Javelle water, hypochlorite of soda, is said to answer equally well, though, to prevent injury to the paper, it must be subsequently dipped in water containing hyposulphite of soda.

The Chemistry of Bleaching.—The exact chemical character of the changes which occur in bleaching is not fully established. When the coloring-matter is absolutely destroyed, it is probable that it is generally due to the action of active oxygen, ozone, formed by the agents employed. In some cases, however, sulphurous acid unites with the coloring-matter, forming a colorless compound, the color of which can be restored again. A red rose bleached by this agent returns to its original color when placed in dilute sulphuric acid.

Antichlore.—If free chlorine is allowed to remain in the articles bleached, it is liable to injure their strength and damage the metallic parts of machinery. To prevent this, substances such as hyposulphite or sulphite of soda, protochloride of tin, coal-gas, etc. are employed, but the first mentioned is generally used. These are called Antichlore (which see).

C. F. Chandler.

Bleak (*Leuciscus alburnus*), a small and beautiful fresh-water fish of the family Cyprinidæ, belongs to the

The Bleak.

same genus as the minnow and dace. It is about six inches long, is found in many European rivers, and is esteemed as a delicate article of food. The inner surface of its scales is lined with a silvery substance which is used for making artificial pearls and white beads to adorn ladies' dresses.

Bleb, or Bulla [Lat. *bulla*, a "bubble"], a blister-like elevation of the cuticle containing a watery fluid. Blebs are characteristic of some skin diseases, such as pemphigus, and are occasionally seen in fevers and disordered conditions of the digestion.

Blech'num [Gr. βλῆχνον], a widespread genus of ferns which has representatives in Europe and North America.

Bled'soe, a county in Tennessee. Area, 330 square miles. It is drained by the Sequatchie River. The surface is hilly or mountainous. Grain, wool, and tobacco are the staples. Coal is found. Capital, Pikeville. Pop. 4870.

Bledsoe (Albert Taylor), LL.D., an American officer and teacher, born 1809 in Kentucky, graduated at West Point in 1830. He served as lieutenant of infantry at Fort Gibson till he resigned Aug. 31, 1832. He was adjunct professor of mathematics and teacher of French in Kenyon College, O., 1833–34, professor of mathematics in Miami University, O., 1835–36, counsellor-at-law in Springfield, Ill., 1840–48, professor of mathematics in the University of Virginia, 1848–53, and during the civil war assistant secretary of war of the Southern Confederacy. He is author of an "Examination of Edwards on the Will," 1845, and "A Theodicy, or Vindication of the Divine Glory," 1856, and other works; contributor to the principal literary, scientific, and theological reviews of the U. S., and now principal of a female academy at Baltimore, Md., and editor of the "Southern Review" (Methodist).

George W. Cullum, *U. S. Army.*

Bleeck'er, a post-township of Fulton co., N. Y., has manufactures of lumber and leather. Pop. 970.

Bleed'ing, or **Hæm'orrhage** [from the Gr. αἷμα, "blood," and ῥέω, to "flow"], in surgery, denotes the escape of blood from the vessels which normally contain it. When the escape takes place into the tissues it is called "extravasation." Hæmorrhage into an internal cavity is said to be "concealed." A slight cut through the integument is usually followed by loss of blood, chiefly from the capillaries. Capillary bleeding will in many cases cease spontaneously, or it may require compression or the application of medicines, such as persulphate of iron or tannic acid. These medicines are called hæmostatics or styptics. Arterial bleeding is recognized by the fact that the blood escapes in jets and is of a bright-red color. Arterial bleeding tends spontaneously to grow less, both from the feebleness of the heart's action which naturally follows, and from the retraction and contraction of the arterial walls, and the consequent formation of a clot of blood, which plugs the wound; but it may be necessary to resort to ligation or tying, to acupressure or compression of the artery by needles, or to pressure, mechanical or by hand, upon the course of the artery between the heart and the wound. A handkerchief may be tied around and then twisted with a stick. The wounded part should be elevated if possible. Venous bleeding is not generally very formidable. It may be recognized by the steady flow of dark blood. A great source of danger when large veins are cut is that air may enter the circulation; in which case death may immediately follow.

Hæmorrhage from an internal and inaccessible surface may be treated by astringents, as gallic acid, or by ergot, which is especially important in puerperal hæmorrhage. Some individuals have what is known as the hæmorrhagic diathesis—a disposition to bleed excessively even after a slight injury. A tendency to hæmorrhage from the mucous surfaces is characteristic of some diseases, such as typhoid fever.

Bleeding, or Blood-letting, the abstraction of blood from the circulation as a means of curing or preventing disease. This operation is performed either by opening a vein (venesection or phlebotomy), by abstraction from the capillaries by means of leeches or cups, or more rarely by opening an artery (arteriotomy). Bleeding was formerly in extensive use in the treatment of many diseases, generally of an acute or active character; and though it has to a great extent been superseded by other measures, of late years it has been attracting the attention of the medical profession as a valuable therapeutic measure in a certain limited class of diseases. While it is liable to abuse, and while, like many other active measures in the treatment of disease, it may become a source of mischief, it is nevertheless, when used with judgment, a valuable help in the treatment of some disorders.

Bleek (Wilhelm Heinrich Immanuel), born in Berlin Mar. 8, 1827, settled in Cape Town in 1856, where he became librarian of Sir George Grey's valuable library. He wrote, among other works, a vocabulary of the Mozambique languages (1856), a "Handbook of African, Australian, and Polynesian Philology" (London, 1858), "Comparative Grammar of the South African Languages" (vol. I., 1862), "Reynard the Fox in South Africa, or Hottentot Fables and Tales" (1864), and "Ursprung der Sprache" (1868). Bleek was probably the first to suggest a rational explanation of grammatical gender.

Blende [from the Ger. *blenden*, to "dazzle"], a name given to the native sulphide of zinc, which British miners call black jack. It abounds in primary and in secondary rocks, and occurs both massive and crystallized in octahedrons and rhomboidal dodecahedrons. Pure blende is composed of 67 per cent. of zinc and 33 of sulphur. It is a valuable ore, but is more difficult to reduce than calamine. This is the chief ore employed in the important zinc industry at Friedensville and Bethlehem, Pa. The term is sometimes applied to sulphides of antimony and of manganese, the former of which is a rare mineral called red antimony.

Blen'don, a post-township of Ottawa co., Mich. P. 718.

Blendon, a township of Franklin co., O. Pop. 1771.

Blendon, a township of Nottaway co., Va. Pop. 3026.

Blenheim, blĕn'im, or **Blind'heim,** the name of a celebrated village of Bavaria, near the Danube, 23 miles N. N. W. of Augsburg. From it the English have named the famous battle which occurred at the neighboring village of Hochstädt, Aug. 13, 1704. Here the allied armies, commanded by the duke of Marlborough and Prince Eugène (who had about 52,000 men), attacked the French and Bavarians (about 56,000 men), who were commanded by Tallard and the elector of Bavaria. The duke of Marlborough and Prince Eugène gained a decisive victory, and took about 13,000 prisoners. The French and Bavarians also lost nearly 10,000 killed and wounded, besides many drowned in the Danube. The French and Germans call this the battle of Hochstädt.

Blenheim, a thriving village of Harwich township, Kent co., Ontario (Canada), 12 miles from Chatham, has several large factories, and a large trade in grain and fruit. Pop. about 850.

Blenheim, a tp. of Schoharie co., N. Y. Pop. 1437.

Blenheim Dog, or Marlborough Dog, a small and beautiful variety of spaniel, much resembling the cocker in form and appearance, but generally of a black color, with flame-colored spots above the eyes and on the breast and feet. The muzzle is also fuller. The Blenheim spaniel is the *Pyrame* of Buffon. It derives its English name from Blenheim Palace, in Oxfordshire, where the breed has been preserved since the beginning of the eighteenth century. These dogs are sometimes sold at an enormous price.

Blenheim House, a magnificent palace in England, near Oxford, was erected at the public expense for the duke of Marlborough as a testimony of gratitude for his services at the battle of Blenheim (which see). The nation at the same time gave him the royal estate of Woodstock, now called Blenheim Park, which is adjacent to Blenheim House. This edifice was designed by Vanbrugh, and cost more than £500,000. It occupies three sides of a square, and the principal front extends 348 feet from wing to wing. The collection of paintings which adorns the interior is one of the largest and most valuable in England.

Blenk'er (Louis), a German patriot and soldier, born at Worms in 1812. After the defeat of the revolutionary movement of 1849, of which he had been one of the leaders, he took refuge in the U. S. In 1861 he became a brigadier-general in the Union army. Died Oct. 31, 1863.

Blen'nerhas'sett (Harman), a rich Englishman, born in Hampshire Oct. 8, 1767, who was ruined by his connection with Aaron Burr. He was educated at Trinity College, Dublin. In 1798 he purchased an island in the Ohio River, 2 miles below Parkersburg, and erected on it an ex-

pensive mansion. He advanced money to aid Burr in his enterprises, and was indicted for treason in 1807 as an accomplice of Burr, but was released without a trial. Died Feb. 1, 1831, in Guernsey.

Blennorrhœ'a [Gr. βλέννα, "mucous," and ῥέω, to "flow"], an abnormally copious discharge from any mucous membrane. In discharges termed blennorrhœal there is a mixture of epithelial scales in large quantities from the mucous membrane, with numerous pus-cells. After inflammation of the urinary mucous membrane a gleety discharge frequently continues for a long period. The treatment consists in establishing health by tonics, fresh air, and careful regimen, with astringent lotions to lessen the secretion, and occasional local stimulants to alter the depraved condition of the mucous membrane.

Blen'ny (*Blen'nius*), a genus of fishes of the order Teleostei and family Blenniidæ. To this family the wolf-fish and the gunnel or butter-fish are referred. They are generally remarkable for the abundance of slimy matter with which their skin is covered. Many are destitute of scales. The body is generally of an elongated form. They have only one dorsal fin, which, however, seems in many of them as if composed of two parts. They are found in the seas of many parts of the world. The blennies are small fishes, living in shoals, and often found in pools left dry by the tide. They possess the power of using their ventral fins to aid them in moving about among rocks and sea-weeds. They are seldom used as an article of food, but are in request for the aquarium, on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. The *Blennius ocellaris* (eyed blenny), called also the butterfly-fish, has a large and prominent dorsal fin, in which is a spot resembling an eye. This beautiful fish is common in the Mediterranean, and is sometimes found on the coast of England.

Eyed Blenny.

Many of the blenny family retain their eggs within the oviduct until they are hatched, so that the young are produced alive, and capable of seeking food for themselves. An example of this is found in the viviparous blennies (*Zoarces vivipara*) of the British seas. Several blennies are found on the American coasts.

Blen's Creek, a township of Forsyth co., N. C. Pop. 817.

Bleph'aris [Gr. βλεφαρίς, an "eyelash," referring to the long filaments attached to the fins], a genus of fishes allied to the mackerel and the dory, includes the hair-finned dory, *Blepharis crinitus*, a fish found, though rarely, on the North American Atlantic coast.

The Blepharis.

Blé'ré [Lat. *Bliriacum*], a town of France, department of Indre-et-Loire, on the river Cher, 16 miles E. S. E. of Tours. It has a bridge built about 1150. Pop. in 1866, 3561. Near it is the château of Chenonceaux, which Henry II. of France gave in 1535 to Diana of Poitiers, who, having sumptuously embellished it, was compelled to transfer it to Catherine de Médicis. In 1733 it was purchased by M. Dupin, the wit and beauty of whose widow caused it to be frequented by Fontenelle, Voltaire, Buffon, Rousseau, and others. The castle is in good preservation.

Bles-Bok (*Damalis albifrons*), an antelope of South Africa. Its name is derived from the *blaze* (Dutch, *bles*) of white in its face.

Bles'sed This'tle (*Cnicus benedictus*), a plant of the order Compositæ, a native of Europe, sparingly naturalized in the U. S. It was formerly regarded with great veneration on account of its supposed medicinal virtues, which are celebrated by Burton in his "Anatomy of Melancholy," and by Shakspeare, under the name of *Carduus benedictus*. It is tonic and diaphoretic.

Bles'sington (Margaret Gardiner), Countess of, an accomplished and beautiful Irish lady, born near Clonmel, in Tipperary county, Sept. 1, 1789. Her maiden name was Power. She was married in 1818 to the earl of Blessington, who was her second husband. She travelled with him extensively on the Continent, and after he died in 1829 she lived in Gore House, London, where her soirées were attended by many literati and other eminent persons. She published "Conversations with Lord Byron" (1834), "The Idler in France," and other works. Died in Paris June 4, 1849. (See R. R. Madden, "The Literary Life and Correspondence of Lady Blessington," 3 vols., 1855.)

Bli'dah, or **Blida,** a town of Algeria, in the province of Algeria, about 30 miles S. W. of Algiers. It is pleasantly situated on the border of the Metidjah, is a station on a railway, and is said to be very flourishing. It has been occupied by the French since 1838. Pop. in 1866, 9975.

Bligh (William), an English naval officer, born in 1753. He commanded the ship "Bounty," with which he was sent to Tahiti in Dec., 1787, to procure plants of the bread-fruit tree, in order to plant them in the West Indies. During his voyage for Jamaica with a cargo of these plants a part of his crew mutinied, April 28, 1789, on account of his harsh treatment. The captain and eighteen of his men were sent adrift in the launch, and after much suffering arrived at the island of Timor in June, having traversed 3600 nautical miles in an open boat. The mutineers settled on Pitcairn's Island. Bligh was appointed governor of New South Wales in 1806, but his conduct was so tyrannical that he was expelled in 1808. Died Dec. 7, 1817.

Blight [probably from the Anglo-Saxon *be* and *lihtan*, "to fall upon"], a term in common use for supposed atmospherical injuries received by plants. Before effects were traced to their causes with the same care that they are at present, the sudden discoloration of the leaves of plants, their death, or their being covered with minute insects or small excrescences, was called by the general name of blight; and this blight was attributed to some mysterious influence in the air, to the east wind, or to thunder, because these states of the atmosphere commonly accompanied those phenomena. It is now found that what is called blight is in some cases the effect of insects, to the progress of which a peculiar state of the atmosphere often contributes; while in other cases it is caused by parasitical fungi. These fungi on grain crops are called fireblast, bunt, smut, brand, and rust. The ergot or spurred rye used in medicine is a somewhat similar fungus. Ergot in grain used as food may lead to gangrenous diseases. A fungus upon the grape constitutes *mildew*, a most destructive disease.

The sudden death of plants without apparent cause, and also the withering and drying up of part of their leaves and branches, to which appearance the term blight should perhaps be restricted, are produced by the transpiration of water from the leaves taking place with greater rapidity than it can be supplied by the absorption of the roots, and also by the roots becoming attacked by fungus spawn. In very hot weather in summer branches of fruit trees trained against walls, or of gooseberry bushes on espaliers, are sometimes withered up in a few minutes from this cause. Blight on standard apple or other fruit trees in orchards is often nothing more than the injuries done to the leaves and buds by the caterpillars of certain moths; that on thorn hedges by the caterpillar of the saw-fly or of the ermine, or of some other moths; and that on roses, by the aphides or green-fly.

Blind (Karl), a German liberal politician, born at Mannheim Sept. 4, 1820, had a prominent part in the revolutions of 1848 and 1849, and in 1852 took refuge in London. Having been pardoned by the government of Baden in 1867, he returned to Germany, where he has since distinguished himself as a zealous opponent of the policy of Bismarck.

Blind'age, in fortification, a term applied to a screen made of timber and earth, or any fixture designed to shelter the garrison or conceal their operations from the enemy. The blindage is sometimes formed of fascines, placed on the inner crest of a battery and continued over the top of the embrasures. Other blindages, used to protect the gunners of a battery from a vertical fire, consist of plain and

strong timbers, one end of which is placed on the inner crest of the parapet and the other end on the ground.

Blind-fish. See AMBLYOPSIS.

Blind'ness [Lat. *cæcitas*], the absence of the sense of sight, is caused by disease, defect, or injury of the eye, of the optic nerve, or of that part of the brain connected with it. Blindness may be complete or incomplete; it may exist from birth or may accompany extreme age. It may be transient or permanent. Permanent blindness may follow the various eruptive fevers, especially those of childhood, such as scarlet fever and smallpox. Congenital blindness is generally from deficient development of the nervous apparatus, and is detected by the child being indifferent to light and throwing its head from side to side. Very rarely the power of vision is subsequently developed, except when congenital cataract is removed.

Opacity of the vitreous humor or of the crystalline lens —the latter known as cataract—causes blindness, which comes on gradually. The blindness from cataract is seldom so complete as to prevent the person from distinguishing day from night, or from being aware of opaque bodies passing between him and the light. Opacities of the cornea, if extensive or in the axis of vision, produce some degree of blindness. Advances in knowledge of anatomy have enabled surgeons to restore sight in cases which years ago would have been hopeless.

Night blindness (*hemeralopia*) is a condition in which a person finds, towards evening, that objects are becoming less and less distinct, and at last that he is totally or nearly blind. This affection has attacked bodies of troops exposed to great fatigues and the glare of the sun. If there is no disease within the brain, recovery generally results from protecting the eyes from the light, entire repose, and the use of such remedies as may correct any constitutional defect in the individual attacked.

Day blindness (*nyctalopia*) is characterized by inability to see in a bright light; the subjects of it see more than usually well at night. Captives long immured in dark cells are often affected with it. Among nocturnal animals, as owls, bats, etc., it is the normal condition. It accompanies albinism in some instances.

"The world of the blind," says Prescott, "is circumscribed by the little circle which they can span with their own arms. All beyond this has no real existence." Some subjects of knowledge will always be beyond the blind man's reach. Light, color, and space he cannot fully realize. Cheselden once successfully operated on a boy for blindness. It was two months before he discovered that pictures represented solid bodies; he thought them planes differently colored, and when he began to have some notion of the truth, in touching the canvas of a picture he expected to find something solid upon it. The words sea and sky do not convey the same image to the blind which they convey to us, and there must be a large class of words in the same category. But though the circle of which Prescott speaks is narrow, yet within it the perceptions of the blind are remarkably active and accurate. The fact of their isolation renders their mental operations more concentrated.

As a class, we find the blind to be thoughtful and quiet, with peculiar sensitiveness of mind and feeling; grateful for every kindness; equally tenacious in remembering the least affront, and often self-willed and opinionative. These are but the natural results of scanty information, and a narrow field of observation and acquirement. Not a few blind persons, however, are possessed of peculiar sweetness of disposition, and it is obvious that different conditions may produce great differences of character in such sensitive natures. The loss of the sense of sight, as is well known, is partly compensated for by a wonderfully increased sensitiveness of hearing and touch.

The making of baskets, mats, rugs, list shoes, brushes, knitting, netting, wood-turning, and hair-work are among the trades which the blind practise with success. The study of music is often the blind man's delight. Some blind men have even become famous as musicians—two of them so remarkable that even Handel expressed great delight at their skill. But a pleasing mediocrity is the average attainment of blind players.

Modern civilization is distinguished for its efforts to provide for the mental wants of this unfortunate class. The first school devoted to the instruction of the blind was established in Paris in 1784 by Valentine Haüy, a generous and enthusiastic but impractical man. Asylums, without systematic instruction, had been established at various places in Europe during the Middle Ages, and some of these still exist. The first school for the blind in the U. S. was the New England Asylum (now the Perkins Institution) at Boston, Mass., founded in 1829. Among those who have been distinguished for their zeal and success in this work we may mention Dr. John G. Fisher, the founder of the above school, Dr. S. G. Howe of Boston, Dr. Akerley of New York, Dr. Dunglison and Robert Vaux of Philadelphia. Books for the blind are at present generally printed with raised Roman letters, though various other alphabets, some of them stenographic, have been devised. Some blind persons, however, acquire such a nice sense of touch as to be able to read ordinary printed matter by the fingers alone.

The census of 1870 reports 20,320 blind persons in the U. S., but there is no doubt that many cases of partial and some of total blindness were not reported to the census-takers. The following is a list of institutions for the blind in the U. S.:

Name.	Location.	Year of Found.
Institution for Deaf, Dumb, and Blind	Talladega, Ala	1858
Institution for the Blind	Little Rock, Ark	1859
Institution for Deaf, Dumb, and Blind	Oakland, Cal	1866
Academy for the Blind	Macon, Ga	1853
Institution for the Blind	Jacksonville, Ill	1849
Institution for the Blind	Indianapolis, Ind	1847
Institution for the Blind	Vinton, Ia	1853
Institution for the Blind	Wyandotte, Kan	1868
Institution for the Blind	Louisville, Ky	1842
Louisiana Institution for Instruction of the Blind	Baton Rouge, La	1870
Institution for the Blind	Baltimore, Md	1853
Perkins Institute and Massachusetts Asylum for the Blind	Boston, Mass	1829
Institution for Deaf, Dumb, and Blind	Flint, Mich	1854
Minnesota Institution for Deaf, Dumb, and Blind	Faribault, Minn	1863
Institution for the Blind	Jackson, Miss	1853
Institution for the Blind	St. Louis, Mo	1851
New York State Institution for the Blind	Batavia, N. Y	1867
New York Institution for the Blind	New York City, N.Y.	1831
Institution for Deaf, Dumb, and Blind	Raleigh, N. C	1846
Institution for the Blind	Columbus, O	1837
Institution for the Blind	Philadelphia, Pa	1833
Institution for Deaf, Dumb, and Blind	Cedar Springs, S. C.	1869
Institution for the Blind	Nashville, Tenn	1844
Institution for the Blind	Austin, Tex	1856
Institution for Deaf, Dumb, and Blind	Staunton, Va	1839
Institution for Deaf, Dumb, and Blind	Romney, W. Va	1870
Institution for the Blind	Janesville, Wis	1850

The following list gives the names of some of the chief schools for the blind in Europe:

	Founded		Founded
Paris	1784	Breslau	1819
Liverpool	1791	Barcelona	1820
Edinburgh	1791	Naples	1822
London	1800	Gmünd	1823
St. Petersburg	1806	Lintz	1824
Berlin	1806	Perth	1825
Vienna	1804	Manchester	1827
Prague	1804	Glasgow	1827
Amsterdam	1808	Freisingen	1828
Zurich	1809	Bruchal	1828
Dresden	1809	Hamburg	1830
Dublin	1810	York	1838
Copenhagen	1811	Cork	1840
Stockholm	1817	Munich	1844
Koenigsberg	1818	Lausanne	1844

Besides the above, there is a very great number of local schools for the blind in Europe, some of them of the highest excellence. REVISED BY CHAS. W. GREENE.

Blind'story, or Trifo'rium, the second arcade in the wall which separates the body from the aisles of a church. It is so called as opposed to the clearstory, the uppermost arcade, the apertures of which admit light into the church, while the apertures of the triforium are dark. The blindstory serves to give access to the various parts of the building, and to suspend banners on holidays. The gloom of the blindstory contrasts well with the brightness of the clearstory.

Blind'worm, a popular name of the *Anguis fragilis*, which, however, is not blind nor a worm. It has been usually regarded as a serpent by naturalists, or a link between serpents and saurians (lizards). Mr. Gray has arranged the *Anguis* and several other genera in the order Sauropshidia ("lizard serpents"). The blindworm has a cylindrical body, destitute of external limbs, but the bones of the shoulder and pelvis exist in a rudimentary state. It is found in nearly all parts of Europe, is inoffensive and timid, and moves very slowly; hence it is sometimes called slowworm. Its length varies from ten to fifteen inches or more. When alarmed it contracts itself forcibly and becomes very brittle, so that it is easily broken in two by bending it. (See GLASS SNAKE.)

Bliss (WILLIAM W. S.), A. M., an American officer, born Aug., 1815, at Whitehall, N. Y., graduated at West Point in 1833, and assistant adjutant-general (rank of major) July 7, 1846. He served in the Cherokee Nation 1833–34, as assistant professor at the Military Academy 1834–40, in

the Florida war 1840–41, being chief of staff to commanding general, as assistant adjutant general at head-quarters of Western military departments 1842–45, as chief of staff of Maj.-Gen. Taylor in the military occupation of Texas 1845–46, in the war with Mexico 1846–48, in command of the Western division 1848–49, engineer at Palo Alto, Resaca de la Palma (brevet major), Monterey, and Buena Vista (brevet lieutenant-colonel), as private secretary of President Taylor Mar. 4 to July 9, 1850, and as assistant adjutant-general of the Western division, head-quarters at New Orleans, La., 1850–53. He was presented in 1849, by the State of New York, in "appreciation of him as a soldier and a man," with a gold medal, with suitable devices, for his gallant services in Mexico, and honored with membership of learned associations at home and abroad. He was highly distinguished for his acquirements in science, literature, and languages, was a most graceful and forcible writer, as shown by the celebrated despatches of Gen. Taylor from his pen, and his great wealth of learning and humor made him a most entertaining companion. Died Aug. 5, 1853, at East Pascagoula, Miss., aged thirty-eight.

GEORGE W. CULLUM, *U. S. Army.*

Bliss'field, a post-township of Lenawee co., Mich. Pop. 1766.

Bliss'ville, or **Fredericton Junction,** a post-village of Sunbury co., New Brunswick (Canada), on the Oromocto River, and at the junction of the European and North American R. R. with the Fredericton branch, 41 miles from Fredericton. It has a fine railroad station, several steam-mills, and is a place of growing importance.

Blistered Steel. See STEEL, by A. L. HOLLEY.

Blis'ters are plasters which, when applied to the skin, raise the cuticle into vesicles filled with serous fluid. They have for their object a counter-irritation or diversion of inflammatory action from an internal part to the surface of the body. The common blister is made of cantharides or Spanish fly (*Cantharis* or *Lytta vesicatoria*), mixed with a convenient proportion of lard and wax. If applied too long it produces distressing affections of the urinary bladder. In children and sensitive persons a layer of thin gauze may be placed between the blister and the skin. Under no circumstances should a blister be left long upon children, as it may produce sores which are difficult to heal. When the blister has raised, the vesicles should be pricked and their fluid contents allowed to trickle away, the vesicated surface being then dressed with simple cerate or lard.

Blitt'ersdorf, von (FRIEDRICH LANDOLIN KARL), BARON, minister to the grand duke of Baden, a zealous supporter of the Metternich policy, born Feb. 3, 1792, wrote "Einiges aus der Mappe des Freiherrn von Blittersdorf." Died April 16, 1861.

Bli'tum [Gr. *βλίτον*], a genus of plants belonging to the order Chenipodiaceæ. The common "strawberry blite" (*Blitum capitatum*) of North America is a plant perhaps introduced from the south of Europe, but probably native of both continents. There are several other species likewise common on both sides of the Atlantic.

Block [Fr. *bloc*], a heavy piece of timber; a massy body, solid and heavy; the piece of wood on which criminals are beheaded; the wooden mould on which a hat is formed; any obstacle or obstruction; also a continuous row of buildings. The term is applied in New York and other cities to the space and buildings between each street and the next street.

BLOCK, in architecture, is used to denote large, unworked masses of marble or stone; also a modillion in a cornice, or the small projections left on the stones of some ancient buildings, which are supposed to be indications of the unfinished state of the work, though they are found in elaborately constructed buildings.

BLOCK, in the rigging of a ship, is the part of the apparatus for raising sails and yards, tightening ropes, etc. The uses of blocks are very numerous on shipboard, and to subserve these uses they are distributed about the masts and yards. The block comprises a *shell* or exterior, a *sheave* or pulley on which the rope runs, a *pin* on which the sheave turns, and a *strap* to fasten the block in its place. A single block contains only one sheave; a double block, two; and so on. Besides the designation of blocks according to the number of sheaves they contain (as single, double), they receive other names—such as cheek block, clew-garnet block, clew-line block, etc. Elm is used for blocks, and lignumvitæ for sheaves.

Until 1781 ships' blocks were made by hand. But it required unusual skill and practice to fashion the pieces and put them together so as to possess the requisite strength and facility in working. More than 1400 blocks were required for one of the old seventy-fours, and a proportionate number for other vessels. In 1781 a Mr. Taylor began to make the sheaves and shells of blocks by machinery for the British navy. Sir M. I. Brunel, in 1801, invented machinery for making blocks, which was put into successful operation in 1808. Thomas Blanchard, the American mechanician, invented most ingenious machines for block-making. For his invention and superintending the work, Brunel received from the British government £20,000.

Block (MORITZ), a French writer on statistics and political economy, born at Berlin Feb. 18, 1816. Among his works are "Statistics of France" (2 vols., 1860), "Europe, Political and Social" (1869, both in French), "Die Bevölkerung des Französischen Kaiserreichs" (1861), and "Die Bevölkerung Spanien's und Portugals" (1861). Since 1856 he has published the "Annuaire de l'économie politique et de la statistique."

Blockade, in international law, is the means in time of war of prohibiting neutrals from all intercourse with an enemy's port; and it is carried into effect by an armed force (ships of war or forts), which blocks up and bars export or import to or from the place blockaded. This right is sanctioned by all civilized nations. Blockades may begin in the simple fact of obstructing entrance into a port, or in official notice. According to French doctrine, a vessel may approach the entrance of a port with impunity, and must be warned off by a blockading vessel; but according to English and American practice, due notice given to the public authority of a state makes its vessels liable to penalty for attempting to enter the port. Blockades without notification are chiefly resorted to in an emergency, and are temporary: they require notification at the mouth of the harbor. To constitute a valid blockade, declared intention and actual force are necessary. A blockade ends when a blockading force is withdrawn voluntarily, or is driven off, not by storm, but by a superior hostile force; and to renew it new notification is necessary. The Declaration of Paris in 1856 defines valid blockade to be such as prevents ingress into a harbor. This is somewhat vague, but cuts off all paper blockades, such as those laid by the Orders in Council and the Berlin and Milan Decrees. Only harbors or forts and mouths of rivers can be blockaded, and the latter only so as not to prevent vessels from access to a port of a neutral up the stream. The breach of blockade may be either by coming out of the blockaded port or going in. The breach of blockade subjects the property so employed to confiscation; there is no rule of the law of nations more established than this, and it is universally acknowledged by all civilized governments. The violation of blockade by the master, however, affects the ship, but not the cargo, unless the cargo is the property of the same owner, or unless the owner of the cargo is cognizant of the intended violation.

On the proclamation of peace, or from any political or belligerent cause, the continuance of the investment may cease to be necessary, and the blockade is then said to be *raised*. The blockading force then retires, and the port is open as before to all other nations.

THEO. D. WOOLSEY.

Blockade, in military art, signifies an operation and effort to reduce and capture a fort or town without a bombardment or regular siege, relying solely upon the stoppage of supplies. The attacking party throws up redoubts or other works on the neighboring heights and roads. A part of the investing army sometimes remains in a temporary camp, ready to repel a sortie of the garrison. Forts built on steep and rocky eminences may be reduced more easily by blockade, because the roads or paths by which supplies can be received are few, and can be guarded by a small force.

Block Books. Previous to the invention of printing, besides the calligraphists and illuminators who prepared and adorned the books of scholars and clerics, there existed a separate guild for the fabrication of school-books and books of devotion, as well as calendars and popular medical books for the lay public. These were ornamented with rude paintings. The card-painters were identical with this craft until the beginning of the fifteenth century. As the demand for the products of their art increased, they invented the process of block-printing, cutting into blocks of wood, and sometimes plates of metal, so as to leave the letters and pictures standing out, and applying colors to these and taking impressions. In these xylographic books, sometimes one, sometimes both sides of the sheet were printed.

Block Creek, a township of Wilson co., N. C. P. 1474.

Block'ers, a township of Tuscaloosa co., Ala. P. 950.

Blockers, a township of Edgefield co., S. C. P. 1035.

Block-House, a wooden redoubt or temporary fort, is always covered. It is usually rectangular, is built of logs, and has two stories, one of which is sunk several feet below

the surface of the ground. The upper story projects a few feet beyond the lower on all sides. It is loopholed for the use of muskets. Block-houses have been much employed in the U. S. as a defence against Indians. If exposed to the fire of artillery, they should be formed of double rows of logs three feet apart, with well-rammed earth between them.

Block Island, an island belonging to the State of Rhode Island, situated between Montauk Point, the E. extremity of Long Island, and Point Judith. It constitutes the township of New Shoreham in Newport county. It is 8 miles long and from 2 to 5 miles wide. Block Island light, at the N. extremity, is in lat. 41° 13′ 46″ N., lon. 71° 34′ 17″ W. Pop. 1113.

Block'ley, a former township of Philadelphia co., Pa., on the W. side of the Schuylkill River, is now included in the city of Philadelphia. It is the site of the Blockley Insane Asylum, and of a large almshouse occupied by the paupers of the city.

Block-Printing. See PRINTING.

Block Tin, a name of a variety of tin which is inferior in quality to grain tin. During the process of melting or reduction in a reverberatory furnace the purest tin first fuses, and is withdrawn. The residue, being melted at a higher temperature, is poured into moulds, and is called block tin.

Blod'get (LORIN), an American scientist and writer, born in Chautauqua co., N. Y., May 23, 1823. He received a thorough common-school and academical education. In 1851 he became assistant professor at the Smithsonian Institution at Washington. He sent, in 1852, the results of his researches in climatology to the British Association for the Advancement of Science, and the following year presented a series of papers on the same subject at the meeting of the American Association at Cleveland, which may be said to have laid the foundation of American climatology. In 1853–54, Mr. Blodget had direction of the observations and calculations of the Pacific R. R. survey. Near the close of 1854 he was transferred to the war department, but continued to have charge of the surveys. In 1855 he published a quarto volume of climatological observations, and in 1857, "Climatology in the U. S.," a work extensively circulated and very favorably received in Europe. From 1859 to 1864 he was editor of the "North American," published in Philadelphia, and secretary of the Philadelphia Board of Trade from 1858 to 1864. From 1863 to 1865 he had charge of the commercial bureau of the treasury department at Washington, and published several volumes of official reports. In 1865 he was made U. S. appraiser at large. He contributed articles on finance to the "North American Review" in 1866 and 1867, besides making contributions to various other publications. Mr. Blodget's reputation is perhaps even greater in Europe than in the U. S. Some of his writings on climatology were warmly commended by Alexander von Humboldt.

Blodget (SAMUEL), born at Woburn, Mass., April 1, 1724, became a judge of common pleas in Hillsboro' co., N. H., and served in the Louisburg expedition of 1745. In 1783 he raised a sunken ship with a valuable cargo near Plymouth, and went to Europe to prosecute similar enterprises, but met with small encouragement. He commenced the duck manufacture in New Hampshire in 1781. He afterwards undertook the construction of a canal around Amoskeag Falls. Died at Haverhill, N. H., Sept. 1, 1807.

Bloem'fontein, the capital of the Orange River Free State, in South Africa, on a tributary of the Modder, in about lat. 29° 10′ S., lon. 26° 40′ E. Pop. about 1200.

Blois (anc. *Ble'sæ*), a town of France, capital of the department of Loire-et-Cher, is finely situated on high ground on both sides of the Loire, and on the railway from Orleans to Tours, 36 miles by rail S. W. of Orleans, and 112 miles by rail S. W. of Paris. It has a fine cathedral, a college, a public library, a botanic garden, an episcopal palace, and a hôtel de ville. Here is the celebrated castle of Blois, the scene of many interesting historical events, and once the favorite residence of the kings of France. Francis I., Henry II., and Charles IX. held their courts in this castle, which has been inhabited by many princes. Blois is a place of great antiquity, and was once more important than it is now. It has manufactures of gloves and porcelain, and a trade in brandy, wine, and timber. Here is an aqueduct cut in the rock by the ancient Romans. Pop. 20,068.

Blom'field (CHARLES JAMES), D. D., a learned English prelate, born at Bury St. Edmund's, in Suffolk, May 29, 1786, graduated at Trinity College, Cambridge. He edited several dramas of Æschylus and the works of Callimachus (1824). He became bishop of Chester in 1824, and bishop of London in 1828. He was an efficient promoter of the erection of new churches in London. His principles were "High Church." Died Aug. 5, 1857. (See DR. BIBER, "Bishop Blomfield and his Times," 1857; A. BLOMFIELD, "Life of C. J. Blomfield," 1863.)

Blom'maert (PHILIPPUS), an eminent Belgian author and philologist, born about 1809. He published editions of old Flemish poems, and translated the Niebelungen into Dutch or Flemish iambics. His most important work is a "History of the Belgians" (1849).

Blood [Ger. *Blut*], the principal nutritive fluid of animals, and the most abundant and complex fluid in the animal economy. It consists of a clear, transparent plasma, the "liquor sanguinis," and a great number of floating corpuscles, which are also nearly transparent; while the two together constitute in all the higher animals an opaque red fluid. In most of the invertebrates and in the *Amphioxus*, a fish of a low type, the blood is clear and transparent. In vertebrates only are the corpuscles found. The red color of the blood is brightest in the arteries, while in the veins it assumes a dark, almost blue-black tint. It has a faint odor, often characteristic of the animal from which it is taken. The temperature of human blood in health is probably about 100° F. in the deep-seated vessels. Its specific gravity is about 1060, but is not uniform. The blood-plasma or liquor sanguinis consists of water holding in solution a large proportion of albumen, a much smaller amount of fibrin, a variable amount of the carbonates, phosphates, sulphates, chlorides, and certain organic salts of potash and soda, and of the sulphates and phosphates of lime and magnesia, with a little iron, and certain undetermined organic "extractives." Sugar exists in the venous blood, and so does a fatty emulsion. Urea, the urates, cholesterine, creatine, carbonic acid, and other excrementitious matters are borne along by the blood until excreted by the proper organ. The liquor sanguinis, when its fibrin is removed by coagulation, is called serum—a term which is sometimes applied to the liquid before defibrination. When blood is withdrawn from the circulation, it rapidly separates into a rather firm clot (*coagulum* or *crassamentum*), consisting of fibrin, which when alone is white and clear, but unless washed it is usually colored red by the red corpuscles which it entangles.

If the plasma of blood be defibrinated and then heated, or nitric acid be added, a large white coagulum of albumen will be observed. Albumen is the most abundant, and in nutrition is probably the most important, of the principles of the blood.

The corpuscles already alluded to are of two kinds: (1) the red corpuscles, which constitute nearly half the mass of the blood, to which they give its color. They are flat, biconcave disks, circular in all mammals, except the camels and llamas, in which they are oval, as in the inferior vertebrates. In man they are $\frac{1}{3200}$ of an inch in diameter. (2) The white corpuscles or leucocytes, which are very much less abundant than the others. They are identical with the pus-cells, the colostrum-corpuscles, and with the tissue-cells generally. Their function in the blood is not well known. The white corpuscle is a true cell, while the red corpuscle is not. It is believed by many that the red corpuscles are bearers of oxygen from the lungs to the tissues. The greater part of the iron of the blood is contained in them. Their coloring-matter, hæmoglobine or cruorine, is believed by some theorists to owe its red color to this iron. The composition and physical properties of blood are quite variable, changing with changes of food, of health, or of habits. The circulating fluid of the invertebrates differs widely from true blood, though analogous in origin and uses.

CHAS. W. GREENE.

Blood-bird (*Myzomela sanguinolenta*), a beautiful little species of honeysucker, which receives its name from the rich scarlet color of the head, breast, and back of the male. It inhabits the thickets of New South Wales.

Blood-flower (*Hæmanthus*), a genus of bulbous plants of the natural order Amaryllidaceæ, mostly natives of South Africa, derive their name from the red color of the flowers. They are cultivated in greenhouses for the beauty of their flowers, which grow in heads or clusters. The leaves of some species are linear, and those of others nearly round. The inspissated juice of *Hæmanthus toxicarius* is used by the natives of South America to poison their arrows.

Blood-hound [so called because formerly employed to track wounded game by their blood], a name applied to several varieties of the dog, distinguished for the keenness of their scent and the persistency with which they will follow the track of game. They have been employed in many petty wars to track small forces of partisans, to follow escaped prisoners, etc., as in time of peace they have been trained to hunt felons, poachers, and fugitive slaves. When kept for these purposes they acquire a peculiarly ferocious and bloodthirsty character, but when employed for the chase they are sagacious and trusty. The Cuban

and Russian hounds are celebrated for their ferocity. They differ much from the English hounds, but like them have pendulous ears and lips and a compact and muscular build.

Blood-money, a term anciently applied to money paid by a person guilty of homicide to the next of kin. In England, before the Norman Conquest, the amount of this money was fixed by law, and varied with the rank of the person killed. Similar customs exist now among barbarous races.

Blood-root (*Sanguinaria Canadensis*), a plant of the natural order Papaveraceæ, growing wild in many parts of North America. It is one of our most beautiful early spring flowers. It takes its name from the orange-colored sap of the root, which contains the alkaloid sanguinarina, remarkable for the fine red color of its salts. The root of this plant is a valuable stimulant expectorant, but its use requires caution, for its administration has been followed by the symptoms of acro-narcotic poisoning.

Bloodstone. See Heliotrope.

Bloody Run, a post-borough of Bedford co., Pa., 90 miles W. S. W. of Harrisburg, and on the Huntingdon and Broad Top R. R., 43 miles S. W. of Huntingdon. Here are coal and iron mines. Pop. 557.

Bloom [from the Ger. *Blume*, a "flower"], a flower, a blossom, an expanded bud, the opening of flowers in general. A plant is said to be in bloom when its flowers are open. Bloom is also the blue color or powder found on plums, grapes, and other fruits. The term is also applied to a state of development into the prime and vigor of life and beauty.

Bloom, in fine art, an appearance on paintings resembling the bloom on plums and other fruits. It prevents the transparency and impairs the general effect of a picture. To obviate this defect the picture should be carefully dried before the application of the varnish, which should be heated before it is applied.

Bloom, a post-township of Cook co., Ill. Pop. 1213.

Bloom, a township of Fairfield co., O. Pop. 2071.

Bloom, a township of Morgan co., O. Pop. 987.

Bloom, a township of Scioto co., O. Pop. 2203.

Bloom, a township of Seneca co., O. Pop. 1492.

Bloom, a post-township of Wood co., O. Pop. 1394.

Bloom, a township of Clearfield co., Pa. Pop. 315.

Bloom, a township of Richland co., Wis. Pop. 1171.

Bloom'ary, or **Blo'mary** [from *bloom*, a mass of iron], a furnace for converting pig or cast iron into malleable or "wrought" iron, or for producing malleable iron from iron ore directly. In the latter case it differs from the Blast Furnace (which see), in reducing the ore and producing the iron in a mass or "bloom" without melting it, while the blast furnace produces an impure molten iron, which is tapped off and cast into pigs; the blast furnace working continuously, the bloomary (in many cases) interruptedly. The change of cast into malleable iron by the bloomary process is generally superseded by Puddling (which see), but the former is used to some extent in the U. S. and Sweden in the production of the better kinds of metal. Bloomaries for the direct production of iron are of various forms. The process is one of the oldest known in metallurgy, and rude forms of it are at present used in many barbarous countries. The two best known modern forms of the bloomary (the Catalan furnace and the German bloomary) are at present used in Spain, Southern France, Sweden, Russia, and parts of the U. S. for the reduction of ores, chiefly by means of charcoal. Only the richest ores can be profitably used, and the loss of iron is much greater than by the blast furnace. In the true Catalan forge the charcoal, with a great part of the charge of iron ore, is heaped on the small square hearth opposite to the tuyere, fine ore and charcoal being thrown in from time to time. A moderate blast is maintained, and the whole is stirred at proper times; and in about six hours the iron (which has settled to the bottom in a mass called a *loup*) is removed, and forged at once into a bloom. In the ordinary or German bloomary the ore is first made fine, and then thrown in small quantities upon a charcoal fire with a hot or cold blast (the former being much the better); the iron and melted slag settling down into the hearth. The slag is tapped off from time to time, and the iron loups are at proper intervals withdrawn and wrought into blooms.

The bloomary process is an excellent one in regions where wood is plentiful and cheap and iron ores of a high grade are abundantly found. It is especially practised in Northern New York, where it produces iron of the very best quality, much sought for in the steel manufacture.

Bloom'er, a township of Pottawatomie co., Ia. P. 611.

Bloomer, a township of Montcalm co., Mich. P. 1422.

Bloomer, a township of Chippewa co., Wis. P. 1559.

Bloomer Costume, a style of dress for women, characterized by skirts and Turkish trousers, which Mrs. Ann Bloomer of New York attempted to introduce in 1849. It had but a temporary success.

Bloom'field, a township of Nevada co., Cal. Pop. 636.

Bloomfield, a post-township of Hartford co., Conn. Pop. 1473.

Bloomfield, a township of La Grange co., Ind. Pop. 2254.

Bloomfield, a township of Clinton co., Ia. Pop. 1231.

Bloomfield, the county-seat of Davis co., Ia., has manufactures of ploughs, wagons, and furniture. It has a high-school building costing $30,000, and is the centre of a rich farming district. It is at the junction of the St. Louis Kansas City and Northern and Burlington and Southwestern R. Rs. It has a public library of 2500 vols., two weekly papers, a national bank, and a large trade. Pop. 1553; of Bloomfield township, 2543.

T. O. Walker, Ed. "Democrat."

Bloomfield, a township of Polk co., Ia. Pop. 1132.

Bloomfield, a township of Winneshiek co., Ia. Pop. 1183.

Bloomfield, a post-village, capital of Greene co., Ind., on the Wabash and Erie Canal, 80 miles S. W. of Indianapolis. It has 3 wagon and carriage shops, 3 saddlery and harness shops, 1 planing mill and sash and door factory, 1 steam flouring mill, 1 weekly paper, and an active trade. It is 8 miles E. of the Indianapolis and Vincennes R. R. It is in Richland township. Pop. 656.

W. E. Stropes, Pub. "Weekly Democrat."

Bloomfield, a post-village of Nelson co., Ky. P. 435.

Bloomfield, a township of Oakland co., Mich. Pop. 2105.

Bloomfield, a township of Fillmore co., Minn. P. 888.

Bloomfield, a post-village, capital of Stoddart co., Mo., about 125 miles S. of St. Louis. It has one weekly newspaper. Pop. 379.

Bloomfield, a post-village and township of Essex co., N. J., 4 miles N. N. W. of Newark, on the Newark and Bloomfield and the Montclair R. Rs. It is also connected by horse-railroad with Newark. It has one woollen and two paper mills, an iron foundry, a cabinet-organ factory, a weekly paper, eight churches, and is lighted by gas. Pop. of township, 4580.

Stephen M. Hulin, Ed. of "Record."

Bloomfield, a township of Jackson co., O. Pop. 1775.

Bloomfield, a township of Logan co., O. Pop. 655.

Bloomfield, a post-township of Crawford co., Pa. Pop. 1262.

Bloomfield, a township of Trumbull co., O. P. 798.

Bloomfield, a borough, capital of Perry co., Pa., 24 miles N. W. of Harrisburg. The name of the post-office is New Bloomfield. Pop. 655.

Bloomfield, a post-township of Essex co., Vt. Pop. 455.

Bloomfield, a post-township of Walworth co., Wis. Pop. 1091.

Bloomfield, a township of Waushara co., Wis. Pop. 1123.

Bloomfield (Joseph), born at Woodbridge, N. J., studied law, entered the Revolutionary army in the third regiment of New Jersey troops as captain, serving bravely throughout the war; became attorney-general of New Jersey, governor of New Jersey (1801–12), brigadier-general in the war with Great Britain (1812–15), and an influential Jeffersonian member of Congress (1817–21). Died Oct. 3, 1823.

Bloomfield (Robert), an English pastoral poet, born at Honington, in Suffolk, Dec. 3, 1766, was apprenticed to a shoemaker. He worked at that trade in London, and wrote in a garret "The Farmer's Boy" (1798), a rural poem which obtained great popularity, and was translated into French, Latin, and Italian. Among his other works are "Wild Flowers" and "Ballads and Songs." Died Aug. 19, 1823. (See "Pursuit of Knowledge under Difficulties," vol. ii.; "Blackwood's Magazine" for June, 1822.)

Bloom'ing, a township of Hampshire co., W. Va. Pop. 1195.

Bloom'ingburg, a post-village of Paint township, Fayette co., O. Pop. 312.

Bloom'ingdale, a post-township of Du Page co., Ill. Pop. 1141.

Bloomingdale, a post-township of Van Buren co., Mich. Pop. 1496.

Bloomingdale, a post-village of St. Armand township, Essex co., N. Y., has manufactures of lumber and starch.

Blooming Grove, a post-township of Franklin co., Ind. Pop. 801.

Blooming Grove, a post-township of Waseca co., Minn. Pop. 676.

Blooming Grove, a post-township of Orange co., N. Y. Pop. 2502.

Blooming Grove, a township of Richland co., O. Pop. 1199.

Blooming Grove, a township of Pike co., Pa. P. 378.

Blooming Grove, a post-township of Dane co., Wis. Pop. 1011.

Bloom'ington, a city and capital of McLean co., Ill., at the crossing of the Illinois Central, Chicago and Alton, and Indianapolis and Bloomington R. Rs., at the N. terminus of the Jacksonville branch of the Chicago and Alton, and the western terminus of the La Fayette and Bloomington division of the Toledo Wabash and Western R. R., 60 miles N. N. E. of Springfield. It has 12 churches, manufactures of boots, shoes, paper bags, and ploughs, carworks and repair-shops, employing some 1200 hands, a coal-mine, employing 180 hands, 5 banks, 5 furnaces, 3 weekly and 2 daily papers. It is connected by street railroad with Normal, two miles distant, which is the seat of the State Normal University and the Soldiers' Orphans' Home. Bloomington is the seat of Major Female College, the Illinois Wesleyan University, a Roman Catholic college, and a business college. It is one of the most flourishing and beautiful cities in the interior of the State. Pop. 14,590; of township, 16,419. BRAINARD SMITH.

Bloomington, a post-village, capital of Monroe co., Ind., is on the Louisville New Albany and Chicago R. R., 97 miles N. W. of New Albany and 51 miles S. W. of Indianapolis. It is the seat of the State University, organized in 1829, and has a national bank, important limestone quarries, and manufactures of hard wood, of which there is an unlimited quantity in the county. Large tanneries are in successful operation here, the great oak region furnishing unlimited supplies of bark for this purpose. It has one semi-monthly and two weekly newspapers. Pop. 1032; of Bloomington township, 2860. ED. "PROGRESS."

Bloomington, a township of Decatur co., Ia. P. 266.

Bloomington, a township of Muscatine co., Ia. Pop. 1411.

Bloomington, a post-township of Hennepin co., Minn. Pop. 738.

Bloomington, a township of Buchanan co., Mo. Pop. 1487.

Bloomington, a post-township of Macon co., Mo. Pop. 156.

Bloomington, a post-village, capital of Franklin co., Neb. It has one weekly newspaper.

Bloomington, a post-township of Grant co., Wis. Pop. 1245.

Blooms'burg, the capital of Columbia co., Pa., is on Fishing Creek, near the North Branch of the Susquehanna, and on the Lackawanna and Bloomsburg R. R., 56 miles S. W. of Scranton and 25 miles N. E. of Sunbury. Iron and limestone abound in the vicinity. The town has one national bank and one private banking company, is the site of a normal school with buildings capable of accommodating 500 pupils, and has a number of iron furnaces and foundries, and three weekly papers. Pop. 3341.

H. L. DIEFFENBACH, ED. OF "THE COLUMBIAN."

Bloss, a township of Tioga co., Pa. Pop. 4008.

Bloss'burg, a post-village of Tioga co., Pa., on the Tioga River and on the Blossburg and Corning R. R., 41 miles S. of Corning, N. Y. It has one weekly newspaper, and mines of semi-bituminous coal and of iron.

Blount, a county in the N. of Alabama. Area, 950 square miles. It is drained by the head-streams of the Black Warrior River. The surface is diversified by hills or small mountains. Corn, cotton, and tobacco are produced. It is intersected by the South and North Alabama R. R. Capital, Blountsville. Pop. 9945.

Blount, a county of Tennessee, bordering on North Carolina. Area, 900 square miles. It is bounded on the N. W. by the Holston River and on the S. W. by the Little Tennessee. The surface is diversified by fertile valleys and mountains, one of which is called Chilhowee Mountain. Cattle, corn, wheat, oats, and wool are staple products. The county contains extensive beds of marble, limestone, and iron ore. Capital, Maryville. Pop. 14,237.

Blount, a township of Vermilion co., Ill. Pop. 1532.

Blount (WILLIAM), an American Senator, born in North Carolina in 1744, was a member of the Continental Congress, and became governor of Ohio Territory in 1790. In 1796 he was elected a U. S. Senator for Tennessee, and in 1797 was expelled from the Senate on a charge that he was implicated in a plot to surrender a part of Louisiana to the British. Died Mar. 21, 1800.

Blounts'ville, a post-village, capital of Blount co., Ala., about 50 miles S. of Huntsville. Pop. of Blountsville township, 539.

Blountsville, a post-village, capital of Sullivan co., Tenn., about 100 miles E. N. E. of Knoxville. Pop. 180.

Blouse, a French term applied to a loose linen coat or frock which is generally worn in France by operatives, peasants, and the populace. It is similar to the smock-frock often worn by English wagoners and farm-laborers. In Germany the blouse is sometimes made of woollen stuff, and is tightened to the body by a belt. This garment is so characteristic of the workmen and lower classes of France that the French populace are often called "blouses." This name is given to the loose fatigue-jacket worn by soldiers in the U. S. army.

Blow (HENRY T.), born in Southampton co., Va., July 15, 1817, graduated at the University of St. Louis, Mo., whither he had removed in 1830, acquired wealth in manufacturing, mining, and land speculation, was a prominent Unionist and anti-slavery man before the civil war, was U. S. minister to Venezuela (1861–62), member of Congress (1863–67), and minister to Brazil (1869–71).

Blowing-Machines are used instead of bellows in furnaces and manufactories requiring a large and steady supply of air, and also in the ventilation of mines, where, without an artificial supply, the air would become charged with dangerous gases. These machines are of various construction, but in many of them the blast is made by causing fans enclosed in a hollow cylinder to revolve around a central axis. Others have hollow cylinders in which pistons work, as in the air-pump. The blast is sometimes produced by causing a stream of water to fall through a long tube, in such a way that a large quantity of air is carried down with it.

Blow'pipe [Fr. *chalumeau;* Ger. *Löthrohr*], a tube bent at right angles and terminating in a fine nozzle, for directing a current of air from the mouth across the flame of a lamp, candle, or gas-jet. It produces a conical-pointed flame, intensely hot, which can be readily directed upon small objects by the operator. It is constantly used by the jeweller in soldering, but in the hands of the chemist and mineralogist it is the basis of a distinct and comprehensive system of analysis, both qualitative and quantitative. By using a gentle current of air, and not permitting the nozzle to enter the flame, the entire flame is brought into a horizontal position, but its chemical character is not changed; it is still composed of combustible gases rich in carbon; and as these, when directed upon many metallic oxides, reduce or liberate the metals, this flame is called the *reducing* flame. If, on the other hand, a more powerful current of air is blown into the interior of the flame, a sharp-pointed jet of a blue tint is the result. Many metals, placed just beyond the point of this flame, are rapidly oxidized; hence it is called the *oxidizing* flame. The chemist is thus enabled by the aid of the blowpipe to expose small quantities of minerals or other substances either to a reducing or an oxidizing influence. By holding the substance in platinum-pointed forceps its fusibility can be determined, or it may communicate to the flame some characteristic color. By placing it upon charcoal many important facts can be learned with regard to it; *i. e.* it may produce white or colored deposits upon the coal, or evolve a characteristic odor, etc. By subjecting it at the same time to the action of carbonate of soda it may yield metallic globules or powder, with or without a coating. By the aid of a loop of platinum wire the body under examination may be exposed to the action of borax or salt of phosphorus, when glassy beads of characteristic colors may result. Thus with the aid of the blowpipe the analyst subjects the substance to a series of tests, by which its exact character is revealed. By the use of the balance, clay crucibles, cupels of bone-ash, and a great variety of reagents, the percentages of certain metals can be determined, such as copper, cobalt, nickel, gold, and especially silver. The art of keeping up an uninterrupted current of air through the blowpipe is easily acquired. (See ELDESHORST'S "Manual of Blowpipe Analysis," and PLATTNER'S "Manual of Qualitative and Quantitative Analysis with the Blowpipe.") (See OXY-HYDROGEN BLOWPIPE.) C. F. CHANDLER.

Blow'pipe-and-Ar'row, called also **Gravata'na** and **Pocu'na,** a weapon used by some of the Indians of South America, both in war and for killing game. It is a

straight tube, in which a poisoned arrow is placed and forcibly expelled by the breath. The tube, etc. is from two to twelve feet long, the bore not large enough to admit the little finger. It is made of reed or of the stem of a palm. The arrows are from one or two to eighteen inches long, made of the spines of a palm, sharp, notched so as to break off in the wound, and their points covered with curare or other poison. A little down is twisted round each arrow, to fit the tube. In the hand of a practised Indian it is a very deadly weapon. As his weapon makes no noise, the hunter often does wonderful execution.

Blub'ber, the cellular membrane in which the oil or fat of the whale is enclosed; the layer of fat which lies just beneath the skin of the whale. A single whale often contains thirty tons of blubber, from which about twenty tons of oil are extracted. The blubber serves to protect the whale from cold and to diminish his specific gravity. It is an important article of food to the Esquimaux.

Blü'cher, von (GEBHARD LEBERECHT), prince of Wahlstadt, a celebrated Prussian general, born at Rostock Dec. 16, 1742. He entered the service of Prussia in 1760, became a captain in 1771, and a colonel in 1790. In 1794 he distinguished himself as a cavalry officer in the war against the French, and was raised to the rank of major-general. He led the vanguard at the battle of Auerstadt (1806), from which he retreated to Lübeck. He was defeated and taken prisoner near Lübeck in Nov., 1806. When the war between the allies and Napoleon was renewed in Mar., 1813, Blücher was appointed commander-in-chief of the Prussian army, which he led at Lützen and Bautzen. He defeated Macdonald at the Katzbach in August, and took many prisoners. On Oct. 16 he gained a victory over Marshal Marmont at Möckern, and then formed a junction with the allied armies, which, with his co-operation, defeated Napoleon at the battle of Leipsic, Oct. 17–19, 1813. He was raised to the rank of field-marshal in 1813, and led the Prussian army, about 60,000 strong, which invaded France early in 1814. Between Feb. 10 and 15 he was defeated by Napoleon at Champaubert, Montmirail, Vauchamps, etc., and lost about 15,000 men, but he defeated the same enemy at Laon, Mar. 9, entered Paris at the end of that month, and here received from his king the title of prince of Wahlstadt. On the renewal of the war in 1815 he took command of the Prussian army, and was defeated at Ligny, June 16, but he reached Waterloo in time to decide the victory, June 18, 1815. Died Sept. 12, 1819. He was noted for his energy and rapid movements, and was surnamed Marshal Vorwärts ("Forward"). In 1826 a large bronze statue by Rauch was erected to him in Berlin, and another in Breslau in 1827. (See FOERSTER, "Blücher und sein Umgebung," 1821; PISCHON, "Blüchers Leben, Thaten, und Ende," 1842; VARNHAGEN VON ENSE, "Blüchers Lebensbeschreibung," 1827; "Life and Campaigns of Blücher," London, 1815; SCHERR, "Blücher, seine Zeit und sein Leben," 2 vols., 1862; BIESKE, "G. L. Blücher von Wahlstadt," 1862; and CHESNEY, "Waterloo Lectures," 1874.)

Blue [Lat. *cæru'leus;* Fr. *bleu;* Ger. *blau*], one of the three primary colors, and one of the seven prismatic colors, of which the complementary is orange. The *blue coloring matter of flowers* has been called anthokyan or cyanine; little is known of its chemical constitution. *The blue pigments* are (1) ultramarine, obtained originally from lapis-lazuli, now manufactured artificially; (2) Prussian or Berlin blue, the sesquiferrocyanide of iron; (3) smalt, glass colored blue by oxide of cobalt; modifications of this pigment are called azure blue, cerulean blue, indigo blue, deep blue, king's blue, etc.; (4) Thenard's or cobalt blue, a compound of alumina and oxide of cobalt; (5) verditer or Bremen blue, mountain blue, etc., a basic carbonate of copper; (6) blue ochre or iron blue, native Prussian blue, is a phosphate of protoxide of iron found in many places.

The blue dyes are (1) Indigo. This is applied as Saxon blue, or indigo extract, a solution of indigo in fuming sulphuric acid. Chemic, or chemic blue, is the very acid solution; indigo carmine is the extract neutralized by an alkali, as the indigo vat, indigo reduced to a colorless solution by protoxide of iron or grape-sugar, which becomes blue again in the air. (2) Prussian blue, already mentioned as a pigment. (3) Logwood blue, produced by logwood extract on goods mordanted with alum and cream of tartar. (4) Azuline, or phenol blue, prepared from phenol or carbolic acid. (5) Aniline blues, (*a*) bleu de Lyons, triphenyl-rosaniline; (*b*) Nicholson's, or alkali blue, etc. (6) Toluidine blue. (7) Diphenylamine blue. (8) Chinoline blue, etc. (For details consult the above under their respective names.)

C. F. CHANDLER.

34

Blue, a township of Pottawattomie co., Kan. Pop. 544.

Blue, a township of Jackson co., Mo. Pop. 3603.

Blue Bayou, a township of Sevier co., Ark. Pop. 840.

Blue'beard [Fr. *Barbe bleu;* Ger. *Blau'bart*], the central character of a celebrated fiction, according to which the chevalier Raoul, who has a blue beard, tests his wife's curiosity by entrusting her, during his absence, with the key of a chamber which she is forbidden to enter. She cannot resist the temptation to explore the chamber; her fault is discovered, and he puts her to death. Six wives share this fate, but the seventh is rescued by her brothers, and Bluebeard is slain. The tale appears in innumerable forms. Tieck, in his "Phantasus," has worked up this material into a drama, with romantic and satirical additions; Grétry has made use of it in his opera of "Raoul," and Offenbach has written an opéra bouffe called "Barbe Bleu" (1866).

The historic original of Bluebeard is supposed to be Giles de Laval, lord of Raiz, who was made marshal of France in 1429, and fought valiantly against the English; but he is remembered chiefly for crimes which tradition has painted in the blackest colors. He is said to have taken a pleasure in corrupting young persons of both sexes, and in murdering them for their blood, which he used in magical incantations. Out of this fact, itself half mythical, the tale of Bluebeard has probably grown. Laval was burnt alive near Nantes in 1440.

Blue'bell, a name applied in Great Britain to two widely different wild flowers: (1) the *Hyacinthus non-scriptus,* a hyacinth with beautiful blue flowers, and a root which was formerly gathered for the starch it contains; (2) the *Campanula rotundifolia,* the harebell, very common throughout Europe, and having a wide range in Asia and North America. This and other blue-flowered species of *Campanula* are sometimes called "bluebell" in the U. S., where the name is also in some places very incorrectly given to the blue fringed-gentian.

Blue-bird, or **Blue Warbler** (*Sylvia sialis, Erythaca sialis,* or *Sialia sialis*], a bird of the family Sylviadæ, is a general favorite in the U. S., which it visits as a summer bird of passage, and is welcomed as a harbinger of spring. It prefers the vicinity of human habitations, and often builds in orchards and gardens. It is nearly equal to an English robin in size. The upper part of it is a rich sky-blue color; the breast and throat are a reddish chestnut. Its song is a mellow, sweet-toned, and agreeable warble. This bird lays about five pale blue eggs. The male and female both defend their nest and young with remarkable courage when attacked by serpents or other animals.

The Blue-bird.

Blue Books, the name applied to the reports and papers printed by the British Parliament, because they are usually covered with blue paper. The term is also applied to the reports sent annually by the governors of colonies to the colonial secretary. The practice of printing the proceedings of the House of Commons began in 1681, when disputes ran high on the question of excluding the duke of York from the succession. The documents printed by the House of Commons accumulated gradually in bulk and variety, until they reached their present extent. In 1836 the House adopted the practice of selling their papers at a cheap rate. The chief contents of these papers at present are the votes and proceedings of the House; the bills; the estimates for the public services; the accounts of expenditures; any documents which the ministry may voluntarily

or at the demand of the House produce; reports of committees or commissions appointed by the Crown and the government. The blue books of a session often fill fifty or sixty thick folio volumes. Their contents are heterogeneous, and to a great extent cumbersome and valueless. They are not prepared on any uniform system or subjected to general revision or editing. There is an official list of the *personnel* of the U. S. government published annually at Washington, which is entitled "The U. S. Blue Book."

Blue Creek, a township of Adams co., Ind. Pop. 820.

Blue Creek, a township of Paulding co., O. P. 163.

Blue Earth, a county in the S. of Minnesota. Area, 750 square miles. It is partly bounded on the N. by the Minnesota River, traversed by the Mankato or Blue Earth River, and also drained by the Maple River. The surface is undulating, and diversified by fertile prairies, forests, and small lakes. Grain, wool, cattle, and dairy products are the chief staples. It is intersected by the St. Paul and Sioux City R. R. Capital, Mankato. Pop. 17,302.

Blue Earth City, the capital of Faribault co., Minn., is on the Mankato or Blue Earth River, 100 miles in a direct line S. S. W. of St. Paul. It has one weekly paper. It is to be connected with Mankato by railroad. Pop. of township, 1121. ED. OF "POST."

Blue Eye (*Entomiza cyanotis*), sometimes called **Blue-Cheeked Honey-Eater,** a beautiful bird abundant in New South Wales. It is a species of honey-sucker, and feeds on insects and honey, which it obtains chiefly from the blossoms of the *Eucalyptus*. It is gregarious and remarkable for its graceful movements.

Blue Eye, a township of Talladega co. Ala. Pop. 1414.

Blue'fields, or **Blewfields,** a river of Central America, in the Mosquito Territory, flows eastward, and enters the Caribbean Sea at the town of Bluefields, which has a good harbor, and is in lat. 12° N., lon. 83° W.

Blue'fish (*Temnodon saltator*), an acanthopterygian fish of the family Scomberidæ, is sometimes called "horse mackerel." The upper part of it is of a bluish color. It derives its specific name from a habit of leaping out of the water. It frequents the coasts of the U. S. in spring and summer, is very swift and voracious, and preys on the mackerel and other fishes. The weight of it varies from five to ten pounds. It is a fine fish for the table.

Blue Gowns, or **King's Beadsmen,** a former class of privileged mendicants in Scotland. There was long a custom of appointing beadsmen with a small royal bounty, who ultimately degenerated into a class of authorized mendicants. In theory their duty was to pray for the king. Each of the beadsmen on the king's birthday received a gown of blue, a loaf of bread, a bottle of ale, and a leathern purse containing a penny for every year of the king's life. Every birthday another beadsman was added to the number. A large pewter badge was attached to the breast of the gown, which, besides the name of the bearer, had the inscription, "Pass and Repass." The practice of appointing beadsmen was discontinued in 1833, at which time there were sixty on the roll.

Blue Grass, called also **Green Meadow Grass** and **June Grass** (*Poa pratensis*), a species of grass which is a native both of Europe and America, distinguished from other species of its genus by its flat panicles, smooth culms and sheaths, and short, blunt ligules. Though common in many regions, this grass attains its chief value in that part of Central Kentucky which is called the "blue-grass region," where it is considered to afford the most important crop that can be raised by farmers. It is chiefly cultivated for pasturage, though on certain soils it makes excellent hay. To this grass Kentucky owes her great reputation as a stock-raising State.

Blue Grass, a post-township of Scott co., Ia. P. 1420.

Blue Grass, a township of Highland co., Va. Pop. 1418.

Blue Hill, a post-township of Hancock co., Me. It has an academy and some manufactures. Pop. 1707.

Blue Lake, a post-township of Muskegon co., Mich. Pop. 381.

Blue Laws, a name applied to certain enactments said to have been made by the legislature of the colony of New Haven, now a part of Connecticut. These laws are said to have interfered seriously with the private life, religious conduct, and even the dress of citizens; but while it is true that not only in New Haven, but in other parts of New England, there was undue interference in these affairs, it is equally certain that many of the "blue laws" of which certain writers have told us never had an existence in any statute-book.

Blue Lead, a name given by miners to galena.

Blue Lick Springs, a village of Nicholas co., Ky., where there are saline mineral springs, the waters of which are sold for medicinal purposes in various of the U. S. The waters closely resemble those of Harrowgate, in England.

Blue Light. See BENGAL LIGHT.

Blue Monday is said to have been so named from an ancient custom in some parts of Europe of decorating churches with blue on the Monday before Lent, this particular Monday, and afterwards all Mondays, being considered holidays for men whose business obliged them to work on Sundays. This practice led to riotous excesses still traditionally remembered, and it was generally suppressed by legal enactments; but the blue Monday is still observed to some extent in certain places.

Blue Mound, a township of Macon co., Ill. P. 1089.

Blue Mound, a township of McLean co., Ill. P. 1219.

Blue Mound, a post-township of Linn co., Kan. Pop. 341.

Blue Mound, a post-township of Livingston co., Mo. Pop. 1048.

Blue Mound, a post-township of Dane co., Wis. Pop. 1165.

Blue Mountain, a post-township of Izard co., Ark. Pop. 454.

Blue Mountain (Pennsylvania). See KITTATINNY.

Blue Mountains, a range in the E. part of New South Wales, and N. of the Australian Alps. It is nearly parallel with the sea-coast, from which it is about 100 miles distant. The highest peaks of this range rise over 4000 feet above the level of the sea. The range long formed a barrier between the settlements on the coast and the interior. In 1815 a road was opened through these mountains to the rich pastures of Bathurst Plains; and now a railroad connects Sidney and Bathurst, crossing the Blue Mountains at an elevation of over 3000 feet.

Blue Nile, or **Blue River.** See BAHR-EL-AZREK.

Blue Pill (*Pilula hydrargyri*), or **Blue Mass,** consists of two parts of mercury rubbed with three parts of conserve of roses till globules of mercury can be no longer detected; to this is added powdered liquorice-root, so that a pill of three grains contains one grain of mercury. In cases of recent and mild disorder or torpor of the liver blue pill is much used, either alone or combined with some other drug, such as rhubarb. The dose is from one to three grains twice a day. The doses given by physicians are smaller now than formerly. (See MERCURY, MEDICINAL USES OF.)

Blue Rapids, a village of Marshall co., Kan., on the Central branch of the Union Pacific R. R., 95 miles W. of Atchison, and on the Big Blue River. It has a developed water-power of 1700 horse-power, large flouring and woollen mills, beds of gypsum and water-lime, a weekly newspaper, and Holly waterworks. Pop. of township, 1247.

C. E. TIBBETS, PUB. OF "BLUE RAPIDS TIMES."

Blue Ridge, the range of the Alleghanies which is nearest to the Atlantic Ocean. It extends in a N. E. and S. W. direction through Pennsylvania, Maryland, Virginia, North Carolina, and Georgia. The part of this ridge in Pennsylvania is called the South Mountain. In Virginia it forms the S. E. boundary of the Great Valley, and is remarkable for beautiful scenery. The Peaks of Otter, which are the highest points of this ridge in Virginia, rise about 4000 feet above the level of the sea. From North Carolina, southward, the name of Blue Ridge is invariably applied to the watershed which divides the waters flowing into the Atlantic from those of the Gulf of Mexico.

Blue Ridge, a township of Piatt co., Ill. Pop. 1120.

Blue Ridge, a post-township of Henderson co., N. C. Pop. 1354.

Blue Ridge, a township of Macon co., N. C. P. 157.

Blue Ridge, a township of Watauga co., N. C. P. 460.

Blue River of Indiana rises in Henry county in the E. part of the State, and flows south-westward. After it has united with several streams it receives the name of Driftwood or East Fork of White River.

Blue River, a township of Hancock co., Ind. P. 1125.

Blue River, a township of Harrison co., Ind. P. 1198.

Blue River, a township of Henry co., Ind. Pop. 862.

Blue River, a township of Johnson co., Ind. P. 2573.

Blue River, a township of York co., Neb. Pop. 258.

Blue River, a post-township of Grant co., Wis. P. 660.

Blue Rock, a post-township of Muskingum co., O. Pop. 1093.

Blue Springs, a post-village and township of Gage co., Neb., on the Big Blue, 12 miles S. of Beatrice. It has a fine tubular iron bridge, an extensive water-power, and a large plough factory. Pop. of township, 354.

Blue Stocking [Fr. *bas bleu*], a term applied to literary ladies, and generally with the imputation of pedantry. It originated in England in Dr. Johnson's time, when there existed blue-stocking clubs, at which literary ladies met to converse with distinguished literati. According to Boswell, they were so called because Mr. Stillingfleet, one of the prominent members, always wore blue hose.

Blue Stone, a township of Mecklenburg, co. Va. Pop. 1984.

Blue Sulphur, a township of Greenbrier co., West Va. Pop. 2148.

Blue Sulphur Springs is a post-village of Greenbrier co., W. Va., 22 miles W. of the famous White Sulphur Springs. The springs afford a copious supply of valuable saline chalybeate waters, useful in the treatment of many diseases.

Blue Throat, sometimes called **Blue Breast,** or **Blue-Throated Robin** (*Phanicura Suecica* or *Sylvia Suecica*), a beautiful bird of the family Sylviadæ, is common on the continent of Europe as a summer bird of passage, and is supposed to pass the winter in Africa. It resembles a redbreast in form, but is rather larger, and has a brilliant sky-blue plumage on its throat, below which is a black bar. It sings sweetly, and imitates the notes of many other birds. This is one of the birds which the Italians call Beccafico (which see). It is esteemed as a delicacy, and great numbers are caught in Alsace and Lorraine.

Blue Vitriol, the sulphate of copper. (See Copper.)

Blue'wing Duck, or **Bluewing Teal,** a species of duck (*Anas discors*), an abundant game-bird of America. Vast numbers spend the winter in the marshes near the mouths of the Mississippi, to which they congregate both from the North and the East; the summer migrations of the species extend as far N. as the 57th parallel, and it is plentiful on the Saskatchewan in the breeding-season. It breeds also in the marshes of the South, and is common in Jamaica, where it is a permanent resident. No duck is in higher esteem for the table, and it has been suggested that the bluewing is particularly worthy of domestication. In the summer plumage of the male the upper part of the head is black; the other parts of the head are of a deep purplish blue, except a patch of pure white before each eye; the plumage on the upper parts is brown mixed and glossed with green, except that the wings exhibit various shades of blue, the lesser wing-covers being of a rich ultramarine, with an almost metallic lustre; the lower parts are reddish orange spotted with black; the tail feathers are short and pointed. It is a bird of extremely rapid and well-sustained flight.

Bluff, a high bank or cliff presenting a steep or abrupt front towards a river, lake, or sea. The term is often applied to the high banks of the Mississippi and other Western rivers. Between the bluff and the river sometimes occurs a flat tract of considerable width called a bottom. On the Mississippi below Lake Pepin the bluffs of magnesian limestone rise about 350 feet above the river, and present picturesque scenery.

Bluff, a township of Johnson co., Ill. Pop. 1325.

Bluff, a township of Monroe co., Ill. Pop. 925.

Bluff Creek, a township of Monroe co., In. Pop. 1015.

Bluff Dale, a post-township of Greene co., Ill. Pop. 1440.

Bluff Port, a township of Sumter co., Ala. Pop. 555.

Bluff'ton, a township of Chambers co., Ala. Pop. 2259.

Bluffton, capital of Wells co., Ind., on the Wabash River and on the Fort Wayne Muncie and Cincinnati R. R. It has fine church and high-school buildings, 3 planing-mills, corn-planter manufactory (steam), 2 barrel manufactories, 2 foundries and machine-shops, 2 stave and heading factories, 3 flouring mills, woollen mills, 2 weekly newspapers, and a large grain, lumber, and stock trade. Pop. 1131. Ed. "Bluffton Banner."

Bluffton, a post-township of Winneshiek co., Ia. P. 809.

Bluffton, a post-village of Richland township, Allen co., O. It has one weekly newspaper. Pop. 489.

Bluffton, a post-village and township of Beaufort co., S. C., 16 miles S. W. of Beaufort. Pop. 2047.

Bluh'me (Friedrich), a German jurisconsult, born June 29, 1797, professor of jurisprudence at Göttingen, has contributed materially to modern research in the history of the Roman and ancient German law. He assisted Schrader in his edition of Gaius, and Savigny in the "History of the Roman Law in the Middle Ages," and published, among several learned works, "Die Ordnung der Fragmente in den Pandectentiteln," and an encyclopædia of existing German laws.

Blum (Robert), a German democrat and popular orator, born of poor parents at Cologne Nov. 10, 1807. He founded the "Schiller-Verein" ("Schiller Society") at Leipsic in 1840, and the German Catholic Church at Leipsic in 1845. In 1848 he was the master-spirit of the Saxon liberals or democrats, and a member of the Frankfort parliament, in which he was the leader of the Left or moderate opposition. Having been sent by this party to Vienna, he joined the insurgents of that city, which was soon captured by the Austrian army. Blum was arrested and shot at Vienna Nov. 9, 1848. (See Eduard Duller, "R. Blums Leben und Tod," 1848; E. Franke, "Leben des R. Blum," 1848.)

Blu'menbach' (Johann Friedrich), M. D., an eminent German naturalist, born at Gotha May 11, 1752. He graduated as M. D. at Göttingen in 1775, and wrote for that occasion a remarkable thesis "On the Varieties of the Human Race." In 1778 he became professor of medicine and anatomy in the University of Göttingen, where he lectured for fifty years. He published a "Manual of Natural History" (1780), often reprinted. He may be said to have first placed natural history on the scientific basis of comparative anatomy. Among his works is a "Manual of Comparative Anatomy" (1805), which was translated into many languages. He advocated the doctrine of the unity of the human species, which he divided into five races—the Caucasian, Mongolian, Malay, American, and Ethiopian. Died Jan. 22, 1840. (See C. F. H. Marx, "Zum Andenken an J. F. Blumenbach," 1840.)

Blum'field, a post-township of Saginaw co., Mich. P. 1074.

Blun'derbuss [supposed to be a corruption of the Dutch *donderbus*, from *donder*, "thunder," and *bus*, a "tube;" literally, a "thunder-tube"], a short musket or gun with a large calibre or bore, which has sufficient capacity for several bullets. It has a limited range, but is destructive at close quarters, and was formerly used in the defence of houses against burglars. In the army it has been superseded by the carbine.

Blunt (Edmund), an American hydrographer, born at Newburyport, Mass., Nov. 23, 1799, became in 1833 first assistant in the U. S. Coast Survey. Died Sept. 2, 1866.

Blunt (Edmund March), the father of the preceding, was born at Portsmouth, N. H., June 20, 1770. He published, besides other valuable nautical works, "The American Coast Pilot" (1796). Died Jan. 2, 1862.

Blunt (George William), born in Newburyport, Mass., Mar. 11, 1802, educated in New York City. He is the author of various charts, "Atlantic Memoir," "Sheet Anchor," "Harbor Laws of New York," "Plan to Avoid the Centre of Violent Gales," and compiler of the "American Coast Pilot." He was a commissioner of emigration (1852–54), has been pilot commissioner since 1845, and harbor commissioner since 1867. A man of great public spirit, in the various positions he has held, and still holds, he has been instrumental in correcting many abuses and effecting reforms; and to the interests of New York, as depending upon the preservation of its magnificent harbor and port, he has particularly devoted himself.

Blunt (James G.), M. D., an American general, born at Trenton, Me., July 20, 1826, removed in 1856 to Kansas, and was appointed in 1861 brigadier-general and commander of the department of Kansas. He was made a major-general in 1862. In 1863 he commanded the army of the frontier.

Blunt'schli (Johann Kaspar), professor of political science at Heidelberg, born at Zurich Mar. 7, 1808, and took part in the political movement of 1839 as a conservative. He published a history of Zurich, a history of the Swiss federal laws, extensive treatises on public and private law, and a dictionary of politics.

Blyth (Samuel), a British naval officer, born in 1784, commanded the brig Boxer in an engagement, off Portland, Me., with the U. S. brig Enterprise, Sept. 5, 1813, during which he was killed by a cannon-ball. His remains were interred in Portland with the honors of war by the side of Lieut. Burrows, who commanded the Enterprise, and was also killed.

Blythe, a township of Marion co., Ark. Pop. 190.

Blythe, a township of Schuylkill co., Pa. Pop. 1924.

Bo'a, the name of a genus of large non-venomous serpents, all natives of the warm parts of America, the similar large serpents of Asia and Africa forming the genus *Python*. The family Boidæ (containing the *Pythons*, etc. of the Old World, as well as the true *Boas*, anacondas, etc. of the New)

is almost exclusively tropical, and nearly all the species are of great size and strength. It is related by Livy that a serpent 120 feet in length devoured several soldiers and caused alarm to a Roman army in Africa; the skin is said to have been long preserved at Rome. The mouth of the boas is destitute of poison fangs. Captain J. H. Speke killed a serpent in Africa 51½ feet long. Their teeth are long

Boa Constrictors attacking a Deer.

and directed backward, to prevent the escape of the prey, which is first seized by the mouth, and then the serpent, with a rapidity of motion which the eye of the observer fails to follow, coils itself around it; the muscles of the body afterwards compress it, so that in a few minutes life is extinct. Deglutition then takes place, accompanied with a flow of saliva, not only for lubrication, but to hasten the process of digestion. The food is always swallowed entire, and the process seems to require no small effort. The neck is distended to an enormous degree as the prey passes through. After a repast these serpents spend a considerable time in a state of torpidity—several weeks elapsing before they require a new supply—and in this state they are easily killed.

The lungs consist of two lobes, one much larger than the other, and at the extremity of the larger is a capacious air-bag, supposed to serve for the aëration of the blood during deglutition. The tail has great prehensile power, and its grasp of a tree round which it may be coiled is aided by the opposing action of two claws, one on each side of the anus, which are the representatives of the hinder limbs of the superior vertebrate animals, and which, on dissection, are found to be connected not only with strong muscles, but with bones entirely concealed within the serpent. The head is thick and somewhat elongated; the eyes small; the tail blunt; the scales numerous and rather small; the colors in many species bright and elegantly disposed. The true boas have the plates under the tail single, while in the pythons they are double. They are of four species. The *Boa constrictor* is far from being one of the largest, seldom attaining a length of more than twelve feet. It is common in parts of South America, where its skin is used for making boots and saddles. Uric acid is prepared in Europe from the excrement of the boa. The name boa constrictor is, however, popularly extended to any very large non-venomous serpent. The only known serpent of the boa family in the U. S. is a small species of *Wenona*, found in the Pacific States. REVISED BY C. W. GREENE.

Boadice'a, written also **Voadica,** a warlike British queen, was the wife of Prasutagus, king of the Iceni, who died about 60 A. D. Soon after this date she and her subjects, exasperated by the rapacity and outrages of the Roman soldiers, took arms against them. The Britons took the Roman colonies of Camalodunum and Londinum (London), and killed about 70,000 Romans. She was defeated in 62 A. D. by Suetonius Paulinus, and then killed herself. (See TACITUS, "Annales.")

Boar, the male of the *Sus scrofa*, or swine. When applied to the wild stock of swine found in various countries, the term is used without particular reference to the sex of the animals. The native country of this species is in the Old World, where the wild stock abounds in parts of Europe, in Asia, and in Africa. The wild boars found in the Southern States (especially in Florida) are descended from the domestic swine, but have reverted quite to the wild type in respect to the form of the body, ears, and tusks, the bristly crest on the back, the black or red color, and the striped young. Most writers make all the domestic breeds of swine descendants of the wild stock. Others think the small native pig of the Pacific Islands is of a separate species; but it is asserted by some that no swine were known on these islands till after they were visited by European ships, which certainly left swine and other domestic animals in many parts of Polynesia. A few writers regard the East Indian boar as of a distinct species. Swine with solid hoofs are known in Poland and Hungary. No true swine are native to America or Australia. Boar-hunting has long been regarded as one of the most exciting sports of the chase. It is practised in Europe, India, and Syria—in some places with toils or nets, in others with dogs, which bring the boar to bay, when he is despatched with a spear or long knife. In India he is hunted on horseback and killed with a boar-spear. It is held unsportsmanlike to shoot the boar. When at bay the wild boar is a very dangerous animal.

Board, a form of lumber; a piece of timber sawed thin; if more than one and a half inches thick, it is called a plank; a table; entertainment or food; the deck of a ship or vessel; a table at which a council or court is held; a body of public men constituting a quorum in session. Board is a general term applied to persons in a collective capacity who have the management of some public office or department, bank, etc.; thus the directors of a bank or railroad are called the board of directors; the British lords of the treasury, the board of treasury. In nautical language, board is a space or portion of sea over which a ship passes in tacking.

To "go aboard" or "on board" is to enter a vessel, to embark in it. The mast is said to "go by the board" when it breaks and falls into the water.

To "board," in naval warfare, signifies to enter a ship by force in order to capture it. The assailants sometimes throw on the enemy's deck combustibles, etc., in order to confuse the crew, and then board the ship armed with boarding-pikes, pistols, and cutlasses.

Board'man, a township of Clayton co., Ia. Pop. 1806.

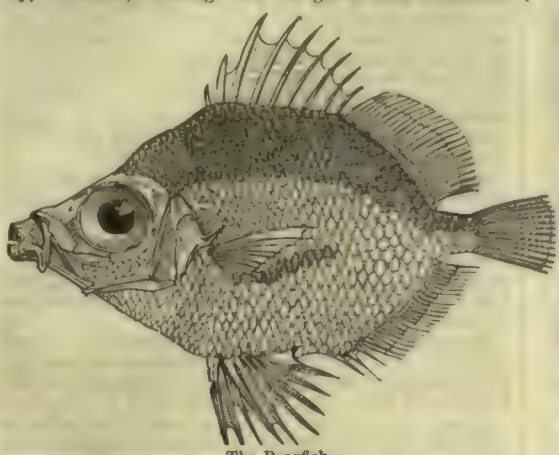
Boardman, a post-township of Mahoning co., O. Pop. 817.

Board'man (GEORGE DANA), an American Baptist missionary, born in Livermore, Me., Feb. 1, 1801, graduated at Waterville College (now Colby University) in 1822, and at Andover Theological Seminary in 1825. He sailed for Burmah July 16, 1825, and distinguished himself by his zeal and devotion to the work among the Karens, being, practically, the founder of the Karen mission. Died near Tavoy Feb. 11, 1831.—His son (Rev. GEORGE D. BOARDMAN, D. D., of Philadelphia) is one of the most brilliant and scholarly clergymen of the Baptist denomination. He was born at Tavoy, in British Burmah, Aug. 18, 1828, and graduated at Brown University in 1852.

Boardman (HENRY AUGUSTUS), D. D., an able and eloquent American divine, was born at Troy, N. Y., Jan. 9, 1808. He graduated at Yale College in 1829, taking the highest honors of his class, and afterwards studied theology at Princeton. Since 1833 he has been pastor of the Tenth Presbyterian church in Philadelphia. Chosen in 1853 by the General Assembly to fill the chair of pastoral theology at Princeton, he declined this position. He has published, among other works, "The Scriptural Doctrine of Original Sin" (1839) and "The Bible in the Counting-house" (1853).

Boardman (RICHARD), one of Wesley's first missionaries to America, born in England in 1738, joined Wesley's conference in 1763, volunteered for America in 1769, preached in New York, and generally through the Middle States, till 1774, when he returned to England, and continued his itinerant ministry till his death at Cork, Ireland, Oct. 4, 1782. He is justly esteemed as one of the chief founders of American Methodism.

Board of Admiralty, a governmental department which has the management of all the affairs of the British navy. (See ADMIRALTY.) It comprises six lords commissioners, who decide collectively on all important questions. Besides this collective action, each has special duties. There are two civil and four naval lords. The first civil lord (always a cabinet minister), besides a general control has the management of naval estimates, finance, appointments, and promotions. The first naval lord manages the distribution of the fleet, discipline, appointment of inferior officers, commissioning ships, sailing orders, and the naval reserve. The second naval lord attends to armaments, manning the navy, the coast-guard, the marines, marine artillery, dockyard brigades, and naval apprentices. The third naval lord attends to naval architecture, machinery, and new inventions. The fourth naval lord has control over the stores, victualling ships, medical affairs, transports, and pensioners. The junior civil lord attends to accounts, mail-packets, Greenwich Hospital, chaplains, and schools. Under these six lords are two secretaries-in-chief, who manage the office-work. The lords all resign when the prime minister resigns.



Board of Ordnance. See ORDNANCE, by CAPT. R. P. PARROTT.

Board of Trade, in Great Britain, a permanent com-

mittee of the privy council, comprising many of the high functionaries of the government, who have the supervision of marine affairs, railways, joint-stock companies, etc., and who also collect and publish statistics and information of all kinds which have a bearing upon the commerce, revenues, and economic conditions of the nation, the colonies, and foreign countries. The results are published in monthly and annual reports.

In the U. S. and Canada boards of trade are voluntary associations of business-men, which in most large towns are organized to promote the financial and commercial interests of the place, and to consider such questions with regard to railway and water communication, foreign commerce, banking, insurance, exchange, supply and demand, etc. as may from time to time demand their attention.

Boar'fish (*Capros*), a genus of fishes of the dory family, or Zeidæ, differing from the genus *Zeus* in the still

The Boarfish.

more protractile mouth (the resemblance of which to the snout of a hog is supposed to have given origin to the name), in the want of spines at the base of the dorsal and anal fins, and of long filaments to the dorsal spines. The body has the usual oval, much-compressed form of the family. The common boarfish (*Capros aper*) is a well-known inhabitant of the Mediterranean, rarely caught on the coasts of England. The flesh is little esteemed.

Boat [Anglo-Saxon, *bat;* Fr. *bateau;* Ger. *Boot;* Danish, *baad;* Sw. *bat*], a small open vessel moved by oars, sails, or horse-power. The name is also applied to a decked vessel moved by steam and called a steamboat. Boats differ greatly in form and dimensions according to the purposes they are intended to serve, and receive various names, as barge, cutter, gig, pinnace, skiff, gondola, yawl, jolly-boat, wherry, canal-boat, ferry-boat, scow, etc. The principal boats attached to a ship of war are the long-boat, launch, barge, pinnace, cutter, jolly-boat, yawl, and gig. The long-boat has a mast and sails, and is employed to fetch wood, water, and heavy stores from the shore to the ship. The launch is more flat-bottomed than the long-boat, and is adapted for service in shallow waters or for ascending rivers. Large vessels sometimes have steam launches armed with guns, for fighting in shallow waters. The barge is a long, narrow boat used to carry the principal officers to and from the ship. The name is also applied to quite a number of other kinds of craft, large and small. The pinnace has usually eight oars, and is intended for the inferior officers. The cutter is broader, deeper, and shorter than the pinnace, is rowed with six oars, and is chiefly employed in carrying light stores and the crew. The jolly-boat is similar in form to the cutter, but smaller, and has only four oars. The yawl is a small boat used for nearly the same purposes as the cutter and jolly-boat. The gig is a long narrow boat of six or eight oars, and is used to convey the chief officers of the ship on expeditions requiring great speed. It is only the larger ships of war that carry boats of all these varieties. Life-boats are kept at dangerous points upon the coasts, and are carried on board many ships. They are designed to be so built that they cannot be capsized or sunk. They were first patented in 1785, and have been much improved since.

The coracle, the most ancient form of boat known in the British Islands, still used in Wales, is a large wickerwork basket, covered with skins or some thin waterproof substance, strengthened by a cross-seat. The birch-bark canoe and skin boats of some of the Indian tribes are essentially identical with the coracle. The wherry is stoutly built, and is designed to carry about eight passengers. It is managed by one sculler or two oarsmen, and it is for the conveyance of passengers or pleasure-parties. The boats used for rowing as a sport are of a much lighter and sharper build.

Boat-Bill (*Cancroma cochlearia*), a bird of the order Grallatores and of the heron family. It differs from the heron chiefly in the form of its bill, which is very broad, and somewhat similar in shape to a boat. The mandibles have been compared to the bowls of two spoons placed one upon the other. It is found in the tropical parts of South America, and feeds on fish. In size it is nearly equal to a domestic fowl.

Boat-fly (*Notonecta*), a genus of aquatic insects of the order Hemipetra and sub-order Heteroptera, derives its name from the form of the body, which resembles a boat, and is well adapted to movement in the water. The insects of this genus have a remarkable habit of always swimming on their backs. The *Notonecta glauca*, called water boatman, is common in England, and is about half an inch long. It can fly well, but seldom uses its wings. Many species are found in this country.

Boating. See Regatta.

Boat-Lowering Apparatus is an arrangement of ropes and pulleys for lowering boats from ships quickly and safely. Every passenger-ship is compelled by law to carry a certain number of boats, and every ship of war carries boats for minor services. Many inventors have directed their ingenuity to this subject, with a hope of devising some method of rapidly lowering boats in a storm, without the danger of accident. The apparatus now most approved is Clifford's, in which the lowering and disengaging are effected by one man seated in the boat.

Boat'swain (commonly pronounced by sailors bō'sn), an officer on a ship of war who has charge of the boats, sails, rigging, cables, anchors, and cordage. He must frequently examine the masts, yards, sails, and ropes, and report their condition. It is also his duty to summon the crew to their work, and to assist in the necessary business of the ship and in relieving the watch. In the performance of his duties he is assisted by a boatswain's mate.

Bobadi'lla, de (Francisco), a governor of Hispaniola and knight of Calatrava, sent in 1500 by Ferdinand and Isabella with plenary powers to investigate the affairs of that colony. He immediately put Columbus, who was then governor, in irons, and sent him to Spain. Columbus was, however, well received at court and by the nation, and was sent back on his fourth voyage, arriving there on the day when Bobadilla started to return to Spain, for he had been recalled. Bobadilla's government had been very disorderly and unfortunate, and hardly had he left the port when his ship was lost in a hurricane, and he was drowned June 29, 1502.

Bob'bin, a cylindrical piece of wood, or a wooden roller, flanged at each end, used to hold yarn, which is wound on it, preparatory to warping, in the weaving of cloth. In throstle-spinning bobbins are an essential part of the machinery, as they receive the thread from the rollers. The number of bobbins used in the various branches of business is enormous. In the thread manufacture alone in Great Britain it is stated that 2,000,000 gross are used annually. Thread-bobbins are turned by a self-acting lathe, which turns out one hundred gross in ten hours, a saving of sixteen-fold as compared with hand-turning; the attendant has to feed the machine by dropping blocks into a hopper, from which they pass into the lathe, where they are finished.

Bob'binet (*i. e. bobbin-net*), a sort of lace or net-fabric woven by machinery, and usually made of cotton. It is a fine and elegant textile fabric of a peculiar texture, which consists in the interlacing of a set of long threads, representing the warp in common weaving with a set of cross ones, in such a manner as to form a mesh texture. Bobbinet is made at Nottingham, England, and in France.

Bobcay'geon, a post-village of Verulam township, Victoria co., Ontario, on an island in Sturgeon and Pigeon lakes, 18 miles from Lindsay. The town is divided by a canal which, with its locks, cost $150,000. It has a large trade in lumber, and has daily lines of steamboats, except in winter. It has one weekly newspaper. Pop. about 1000.

Bobolink', Bob'link, Reed-bird, or **Rice-bird** (*Dolichonyx oryzivorus*), a beautiful American migratory bird of the order Insessores, passes the winter in the West Indies or in tropical regions. It comes northward early in spring, and arrives in May in the latitude of New York State, in which latitude it breeds. It builds its nest in meadows among the grass, and renders service to farmers by the destruction of insects and worms. In May and June the

male is very musical, singing in the air with great volubility and hilarity, and rising and falling as if by a series of jerks. "He chants out," says Wilson, "such a jingling

The Bobolink.

medley of short variable notes, uttered with such seeming confusion and rapidity, that it appears as if half a dozen birds of different kinds were singing all together." The summer plumage of the male is mostly black, variegated with white on the scapularies and tail-coverts, and yellow, which it exchanges in July or August for a plumage like that of the female. This is marked with several shades of brown or dull yellow. Its length is seven or eight inches. About the end of June the birds cease to sing, become gregarious, and move in large flocks to the Middle States. They are called reed-birds in Pennsylvania, where many of them are shot for the table in autumn. In the latter part of autumn immense flocks of them attack the rice-crops of South Carolina, where they receive the name of rice-bird, rice bunting, or rice troopial. Many of them are kept in cages for their song, but they do not sing in autumn or winter.

Bobrinez', a town of Russia, in the government of Cherson, 135 miles N. E. of Odessa. Pop. 6553.

Bobruisk', a town of Russia, on the Berezina, in the government of Minsk, and 92 miles S. E. of Minsk, was formerly fortified. It is connected by steamboat with the towns on the river. Pop. 24,681.

Bo'ca Ti'gris (Chinese, *Hu-mên* or *Fumên*, *i. e.* "mouth of the tiger"), the entrance of the Canton River into the Outer Waters, or Lintin Bay. It is bounded on the E. by the islands of Anunghoi and Chuenpee, and on the W. by the island of Ty-cock-tow. A number of forts and batteries called "Bogue forts," which guard the entrance to the river, were stormed by the British in 1841 and 1857.

Bocca'ccio (Giovanni), or **Boccaccio di Certaldo**, a celebrated Italian novelist and poet, born in Paris or Florence in 1313, was the son of a Florentine merchant and a French woman. He collected many books, and copied rare ancient manuscripts which he was not able to purchase, and was one of the most learned men of that age. At Naples he fell in love, about 1342, with a natural daughter of King Robert of Naples, and to please her he wrote poems entitled "Il Filostrato," "L'Amorosa Visione," and others. He became about 1350 an intimate friend of Petrarch, and returned to Florence, the government of which employed him in several diplomatic missions. His principal work is the "Decamerone, or Hundred Tales" (1353), in prose. These tales have extraordinary literary merit, and are esteemed models of style, but some of them are extremely obscene. From the "Decamerone" Shakspeare derived the subjects of several of his dramas. In 1373, Boccaccio was appointed to lecture at Florence on Dante's "Divina Commedia." He wrote a "Life of Dante." He died Dec. 21, 1375. "There is," says Hazlitt, in Boccaccio's serious pieces, "a truth, a pathos, and an exquisite refinement of sentiment which is hardly to be met with in any other prose-writer whatever." (*Characters of Shakspeare's Plays.*) (See Baldelli, "Vita de Giovanni Boccaccio," 1806; Mazzuchelli, "Scrittori d'Italia;" Longfellow, "Poets and Poetry of Europe.")

Bochart (Samuel), a learned French Protestant Orientalist and theologian, born at Rouen May 30, 1599, studied Arabic, Chaldee, and Syriac under Erpenius at Leyden, and excelled in philology. He became in 1625 pastor of the Protestant church at Caen, where he remained forty-two years, and gained a high reputation as a preacher and writer. His most important works are a "Sacred Geography," in Latin (1646), and "Hierozoicon," or an account of the animals mentioned in the Bible (1663). Died at Caen May 11, 1667. His Geographia Sacra displays great learning and sagacity. (See Morin, "De Vita et Scriptis S. Bocharti," 1692; Edward H. Smith, "S. Bochart: Recherches sur la Vie de cet Auteur illustre," 1833.)

Boch'nia, a town of Austria, in Galicia, 23 miles by rail E. S. E. of Cracow. It has several churches. Here are mines of salt which yield about 15,000 tons annually. Pop. in 1869, 8040.

Boch'old, or **Bocholt**, a town of Prussia, in Westphalia, on the Aa, 42 miles W. S. W. of Münster. It has a castle, and manufactures of silk fabrics, hosiery, and cotton stuffs. Pop. in 1871, 6125.

Boch'um, a Prussian town, in Westphalia, 31 miles by rail N. E. of Düsseldorf, has manufactures of woollens, paper-hangings, hardware, iron, and tobacco, and important mines of coal. Pop. in 1871, 21,193.

Bock (Karl Ernst), a German pathologist and anatomist, born Feb. 21, 1809, became professor of pathological anatomy in Leipsic in 1839. His "Buch vom Gesunden und Kranken Menschen" (9th ed. 1872) has had a wide circulation.

Bock'enheim', a town in Prussia, in the province of Hesse-Nassau, 3 miles N. W. of Frankfort-on-the-Main. It has manufactures of iron-ware, jewelry, and pianos, and a large cattle-market. Pop. in 1871, 8476.

Böckh, or **Boeckh** (August), an eminent German philologist and classical antiquary, born at Carlsruhe Nov. 24, 1785. He was educated at Halle, and obtained in 1810 the chair of eloquence and ancient (or Greek) literature in the University of Berlin, where he taught for forty years or more. His lectures comprised archæology and the history of ancient literature, philosophy, politics, etc. Among his greatest works, which have formed an era in archæology and philology, are "The Political Economy of the Athenians" (2 vols., 1817), which Sir George Cornewall Lewis translated into English, and "Records of the Maritime Affairs of Attica" (1840). He commenced in 1824 the great work called "Corpus Inscriptionum Græcarum" (4th vol., 1867, unfinished). Died Aug. 3, 1867.

Böck'lin (Arnold), a German landscape painter, born in Bâle in 1827, studied under Schirmer at Düsseldorf, and became professor in the art-school of Weimar in 1860. His works are remarkable for brilliancy and harmony of color.

Bode'ga, a post-village and township of Sonoma co., Cal. The village is at the head of Bodega Bay, the entrance to which is in lat. 38° 18′ 20.37″ N., lon. 123° 02′ 28.8″ W. Pop. of township, 1407.

Bo'denstedt' (Friedrich Martin), a German poet and journalist, born at Hanover April 22, 1819. He translated into German the works of several Russian poets, published "The Nations of the Caucasus" (1848; 2d ed., 2 vols., 1855), and became professor of the Slavic languages at Munich about 1854. Among his works is a "Thousand and One Days in the Orient" (2 vols. 1854; 4th ed. 1864).

Bode's Law is the name given by astronomers to an empirical formula which seems to mark the relative distances of the planets. The law, however, was not discovered by Bode, having been put forward before his time by Kepler, and by Titius in 1772.

The law may be thus exhibited: Under the names of the several planets in the order of their distance set the number 4. Then below this row of fours write in order the numbers 0, 3, 6, 12, 24, 48, and so on, the 0 falling under Mercury, the 3 under Venus, and so on. Adding the several columns thus obtained, we have the following result:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
4	4	4	4	4	4	4	4	4
0	3	6	12	24	48	96	192	384
4	7	10	16	28	52	100	196	388

The numbers thus obtained correspond closely with the relative distances of the planets, except only in the case of Neptune. The real distances, calling the earth's distance 10, are as follows:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
3.9	7.2	10	15	27.5	52	95	192	300

It will be seen that the distance of Neptune falls far short of that which Bode's law would assign to a trans-Uranian planet. This empirical law has rendered important services to astronomy.

Similar relations have been detected among the distances of the satellites of Jupiter and Saturn. In the case of Jupiter's system, the constant number is 7, the number multiplied is 4, and the constant multiplier 2½. In the case of Saturn's system, the constant number is 4, the number multiplied is 1, and the constant multiplier 2.

It seems difficult to believe that a law so well marked, and fulfilled so closely in so many instances, is not in reality the result of physical relations of some sort, though it is by no means easy to see what those relations may be.

Bodin (Jean), an eminent French political writer, born at Angers in 1530. He published in 1576 a treatise on government entitled "De la République," and in 1586 a Latin version of the same. He advocated a limited monarchy as the best form of government. In the latter part of his life he was an adherent of Henry IV. Died in 1596. His "Heptaplomeres de abditis rerum sublimium arcanis" (published by Noack, Schwerin, 1857) is considered one of the most interesting books of that age.

Bodle'ian Library, the principal library of Oxford University, restored by Sir Thomas Bodley in 1597, the original library having been destroyed before 1556. Bodley's first presentation was a collection of books, purchased on the Continent for £10,000. Through his influence and example the library was enriched by numerous contributions. Among the earliest benefactors of the Bodleian library, which was opened in 1602 with a collection of about 3000 volumes, were the earl of Pembroke, who presented 250 volumes of valuable Greek manuscripts; Sir Kenelm Digby; and Archbishop Laud, who made a gift of 1300 manuscripts in more than twenty different languages. Upwards of 8000 volumes of the library of Selden went to the Bodleian. Gen. Fairfax presented to it many manuscripts, among which was Dodworth's collection of 160 volumes on English history. During the present century important bequests have been the collections of Richard Gough (1812) on British topography and Saxon and Northern literature; of Edmund Malone (1812); also £40,000 by the Rev. Robert Mason, the interest to be expended on books. The library of Francis Douce was added in 1834. In 1870 it contained 500,000 volumes and 30,000 MSS.

Bod'ley (Sir Thomas), an English diplomatist, born at Exeter Mar. 2, 1544, graduated at Oxford in 1566. He was sent by Queen Elizabeth on diplomatic missions to France, Denmark, and Holland. He expended much money in collecting rare and valuable books, and endowed the great public library of Oxford, called the Bodleian Library (which see). Died Jan. 28, 1612. (See T. Hearne's "Reliquiæ Bodleianæ.")

Bod'mer (Johann Jakob), a Swiss critic and poet, born near Zurich July 19, 1688. He founded in 1721 a literary journal called "Discurse der Maler," which promoted a reform in German literature, and waged a literary war against Gottsched. Among his numerous works (which lack originality) is the "Noachide" (1752). He was professor of history at Zurich for fifty years. He translated "Paradise Lost" into German. Died Jan. 2, 1783. (See J. J. Hottinger, "Acroama de J. J. Bodmero," 1783.)

Bod'min, a town in England, one of the capitals of Cornwall, 26 miles W. N. W. of Plymouth, consists chiefly of one long street in a valley between two hills. It was once an important place. It now contains a court-house, a jail, an ancient priory, and a grammar-school founded by Queen Elizabeth. It is now one of the stannary towns of Cornwall. Pop. in 1871, 4672.

Body Color, a term which, in oil-painting, is applied to the opaque coloring produced by certain modes of combining pigments. When, in water-color painting, colors are laid on thickly, and mixed with white to render them opaque, instead of in tints and washes, the work is said to be executed in body color.

Body's Island, the long, low, sandy strip of land between Roanoke and Albemarle Sounds and the Atlantic Ocean, N. of Oregon Inlet. Body's Island lighthouse, 2 miles N. of Oregon Inlet (lat. 35° 48′ 47″ N., lon. 75° 33′ 20″ W.), is a brick tower with a granite foundation and an iron top, 150 feet high, showing a first-order dioptric white fixed light, 156 feet above the sea. The island is here 2 miles wide, and is in Dare co., N. C.

Boece, or **Boyce** (Hector), a Scottish historian, born at Dundee about 1465. He studied and graduated at the University of Paris, where he became in 1497 professor of philosophy. He was a friend of Erasmus. His chief work is a "History of Scotland" (in Latin, 1526), which is highly esteemed. Died about 1536.

Bœhme'ria [from G. R. Böhmer, a German savant], a genus of plants of the order Urticaceæ, was formerly included in the genus *Urtica* (nettle). The fibres of several species of this genus are used to make ropes, twine, nets, and cloth. The beautiful fabric called China grass-cloth is made of the fibres of *Bœhmeria nivea*, a perennial herbaceous plant, with broad ovate leaves, without stings, cultivated by the Chinese, who call it *tchoo-ma*. It can be propagated by seeds, and it thrives best in shade and moisture. It grows naturally in China, Sumatra, Burmah, and other parts of the East Indies. The Malays call it *ramie*. The cultivation of ramie has been tried in some of the Southern U. S., with decided success. Nepaul produces an important species, *Bœhmeria frutescens*, which grows from six to eight feet high, the fibre of which is said to be equal to flax. The natives call it pooee, yenki, or kienki. This fibre also makes excellent paper, and will probably become an important commercial product. (See Ramie.) The U. S. have one native species.

Bœo'tia [Gr. Βοιωτία], a country or state of ancient Greece, was bounded on the N. by Locris, on the N. E. and E. by the Euboean Channel, on the S. by Attica and Megaris, on the S. W. by the Corinthian Gulf, and on the W. by Phocis. Area, estimated at 1100 square miles. It may be described as a hollow basin, enclosed on the N. by Mount Parnassus and the Opuntian Mountains, on the E. by a continuation of the Opuntian range, on the S. by Mount Cithæron and Mount Parnes, and on the W. by Mount Helicon. The surface is diversified by other mountains and several valleys and plains. It contained a large lake named Copais (now Topolias), which had no outlet except subterranean channels in the limestone mountains. These channels, now called *Katabothra*, were not sufficient to carry off the water of the lake, which sometimes inundated the surrounding plain. To obviate this evil the ancient Bœotians constructed two tunnels through the rock. One of these tunnels was nearly four miles long, with twenty vertical shafts let down into it. These two great works are perhaps the most remarkable monuments of what is called the heroic age. The largest rivers of Bœotia were the Asopus and the Cephissus, the latter of which rises in Phocis and enters Lake Copais. The Asopus flowed eastward through the southern part, and entered the Euripus. Instead of the pure and transparent air of Attica, the air of Bœotia is rendered damp and heavy by vapors rising from lakes and marshes. The winters were very severe, and the snow sometimes lay on the mountains for many days. The soil, which is mostly a rich mould, was very fertile, and produced in ancient times, as well as in the present, abundant crops of grain. The plain of the Copais is especially remarkable for its fertility. Bœotia was famous for meadow and pasture-land, on which were raised the excellent horses of the Bœotian cavalry. The grape and other fruits flourished in this region. Among the other productions was the auletic or flute reed, which grew in the marshes of Lake Copais, and had an important influence on the development of Greek music.

The most remarkable tribes that inhabited Bœotia in the heroic age were the Minyæ, who lived at Orchomenus, and the Cadmeans or Cadmeones, who lived at Thebes. At the commencement of the historical period, the Minyans and other tribes had nearly disappeared, and the country was occupied by the Bœotians, who are supposed to have come from Thessaly. The principal cities formed a confederacy under the presidency of Thebes. Orchomenus was the second city in importance. Among the other towns were Coroneia, Haliartus, Thespiæ, Tanagra, Platæa, and Anthedon. The Bœotians were regarded as a dull, unintellectual people, and less refined and polished than most of the Hellenic tribes. Their natural dulness was ascribed to the dampness and ungenial quality of their climate. According to Cornelius Nepos, they paid more attention to the development of their physical powers than the cultivation

of their minds. Yet this state produced a few great men—Epaminondas, Hesiod, Pindar, and Plutarch. (See FORCHHAMMER, "Hellenika," 1837; LEAKE, "Travels in Northern Greece," 1835; KLUTZ, "De Fœdere Bœotico," 1821; MURE, "Travels in Greece.") WILLIAM JACOBS.

Boer'haave (HERMAN), PH. D., M. D., F. R. S., a Dutch physician of great eminence, was born at Voorhout, near Leyden, Dec. 31, 1668. He studied the ancient languages and history at Leyden, where he took the degree of doctor of philosophy in 1689. He began the study of medicine in 1690, and graduated as M. D. at Harderwick in 1693, after which he practised at Leyden. In 1701 he was appointed lecturer on the theory of medicine in the University of Leyden, and adopted the method of Hippocrates. He afterwards deviated from that method, and substituted mechanical and chemical hypotheses to explain diseases. He published in 1708 an excellent systematic work called "Medical Institutes" ("Institutiones Medicæ in Usus annuæ Exercitationis Domesticos"). He became in 1709 professor of medicine and botany at Leyden, where he acquired great popularity as a teacher. Among his important works are "Aphorisms on the Diagnosis and Cure of Diseases" ("Aphorismi de Cognoscendis et Curandis Morbis," 1709), which is a model for style and other merits, and "Elements of Chemistry" (1724), which some persons consider his capital work. His reputation extended to every part of Christendom, and patients came to consult him from every country of Europe. He received, it is said, a letter from a Chinese mandarin, addressed "To Boerhaave, physician in Europe." He died Sept. 23, 1738, leaving one child, a daughter. He was a sincere Christian and a man of high moral character. (See Dr. S. JOHNSON, "Life of H. Boerhaave," 1834; BURTON, "Life and Writings of H. Boerhaave," 2 vols., 1743.)

Boer'ne, a post-village, the capital of Kendall co., Tex. It is situated on the Upper Cibolo, in a rich and picturesque valley. It was founded by Germans in 1851, and was named in honor of the German writer Louis Börne. Pop. 500, almost all of whom are Germans.

Boers are the farmers in South Africa of Dutch descent. After the annexation of Cape Colony by Great Britain, troubles arose between the government and the boers, and in 1836 many of them left the colony and founded the Orange River Free State and the Transvaal Republic.

Boëthius (ANICIUS MANLIUS SEVERINUS), an eminent Roman philosopher and statesman, was born in 470 A. D. He was liberally educated, became a good Greek scholar, was chosen consul in 510, and gained the confidence of Theodoric, king of the Goths, who reigned at Rome, and appointed Boethius *magister officiorum* in his court. His political influence was exerted for the benefit of the country, but his probity and virtues provoked the enmity of powerful courtiers whose corrupt or oppressive conduct he had opposed. He was accused of treasonable designs, was confined in prison, and finally executed by order of Theodoric in 524 A. D. Whether he was a Christian or not is a matter of uncertainty. He was considered such in the Middle Ages, and the Bollandists gave him the position of a saint. Several theological tracts are attributed to him, and were included in the Leyden edition (1671) of his "Consolation of Philosophy." But there is a predominance of argument in favor of the opinion that he was not, in any proper sense, a Christian, and that the tract on the Trinity was from another hand, probably from a monk of the same name. Boethius holds a place in the history of scholastic philosophy from the fact that a passage from his commentary on the "Isagoge" of Porphyry gave rise to the long-continued discussions between the Realists and the Nominalists. While he was in prison he wrote, partly in verse, "De Consolatione Philosophiæ" ("On the Consolation of Philosophy"), which is his greatest work, and was very popular in the Middle Ages. It was translated into Anglo-Saxon by Alfred the Great. It contains no allusions to Christianity—a fact which can hardly be reconciled with the hypothesis of his being a Christian, considering the circumstances under which it was written. (See BARBERINI, "Exposizione della Vita de Boezio," 1783; DOM GERVAISE, "Histoire de Boëce," 1715; HEYNE, "Censura Ingenii Boethii," 1806; "Life of Boethius," prefixed to Ridpath's translation of the "De Consolatione Philosophiæ," 1785.) M. B. ANDERSON.

Boethius (HECTOR). See BOECE.

Bœuf, a township of Franklin co., Mo. Pop. 3910.

Bœuf, a township of Gasconade co., Mo. Pop. 1277.

Bœuf, Bayou, bī'oo bĕf, a river or creek of Arkansas and Louisiana, is fed by water which it receives from the Mississippi River during inundations. It extends from Chicot co., Ark., south-westward into Louisiana, and unites with the Washita River at the S. extremity of Franklin parish. Steamboats can ascend it 100 miles or more during high water.

Bog [Gaelic, *bog*, "soft," "moist"], a swamp or tract of wet land, covered in many cases with PEAT (which see). Bogs, called mosses in Scotland and swamps in America, often contain the well-preserved trunks of trees, especially of the oak in Ireland and of the cypress in America. In many cases these tracts are higher than the surrounding country, and may thus be easily drained, when they often become very fertile land. (See DRAINAGE.)

Bo'gansville, a township of Union co., S. C. P. 1891.

Bogard', a township of Daviess co., Ind. Pop. 1170.

Bogard, a township of Henry co., Mo. Pop. 1117.

Bogar'dus (EVERARD), second minister of New York (then New Amsterdam), came to America in 1633, and obtained by marriage a farm (the "Dominie's Bouwerie") of 62 acres, now owned by the Trinity church corporation. Having much trouble with the magistrates and people, he resigned in 1647 and sailed for Holland, but was wrecked on the English coast, and with Governor Kieft and many others was drowned Sept. 27, 1647.

Bogardus (JAMES) was born at Cattskill, N. Y., Mar. 14, 1800. In 1814 he was apprenticed to a watchmaker. He made important improvements in cotton-spinning in 1828, invented a gas-meter (1832), a machine for engraving (1836), a pyrometer, and many other mechanical improvements. In 1847 he built in New York the first iron building in the U. S. Died April 13, 1874.

Bog Butter, a substance which is found in peaty earth in some of the bogs of Ireland. In composition and qualities it exhibits the general properties of a fat, and melts at 124° F. It is probably fossil butter.

Bo'genhau'sen, a village of Bavaria, on the Iser, 2 miles N. E. of Munich. Here is the royal observatory of Munich, which was erected in 1817, and is one of the best in Europe; lat. 48° 8′ 54″ N., lon. 11° 36′ 22″ E.

Boggs, a township of Centre co., Pa. Pop. 2135.

Boggs, a township of Clearfield co., Pa. Pop. 784.

Boggs (CHARLES STUART), U. S. N., born Jan. 28, 1811, in New Brunswick, N. J., entered the navy as a midshipman Nov. 1, 1826, became a passed midshipman in 1832, a lieutenant in 1837, a commander in 1855, a captain in 1862, a commodore in 1866, a rear-admiral in 1870, and retired from active service in 1873. He commanded the Varuna at the passage of Forts St. Philip and Jackson and capture of New Orleans. Admiral Farragut, in his official report of the affair, says: "We were now fairly past the forts, and the victory was ours, but still, here and there, a gunboat making resistance. Two of them had attacked the Varuna, which vessel, by her greater speed, was much in advance of us: they ran into her and caused her to sink, but not before she had destroyed her adversaries; and their wrecks now lie side by side, a monument to the gallantry of Captain Boggs, his officers, and crew."

FOXHALL A. PARKER, U. S. N.

Bog'head Coal, a highly bituminous variety of the cannel coal of Scotland, from Boghead, in Linlithgowshire. The varieties of cannel pass into shale by insensible gradations, so that it is impossible to draw a line which shall properly limit the use of the term coal. The boghead is one of these substances, more valuable for gas-making, and for the oils and paraffine obtained from it by distillation, than for fuel. Dr. Fife found a picked specimen to yield on analysis 70 per cent. of volatile matter and 30 per cent. of ash.

Bog-iron Ore, a mineral of variable composition, in which the peroxide of iron often amounts to 60 per cent., the water to 20, phosphoric acid from 2 to 11 per cent., while silicic acid, clay, and other substances make up the rest. Bog-iron ore occurs in alluvial soils, in bogs, lakes, etc. It is of a yellowish or blackish-brown color. Some varieties are earthy and friable; some are in masses of an earthy character, and some compact, with conchoidal fracture. It is abundant in the northern countries of Europe generally; also in various parts of the U. S. When smelted it yields rather inferior iron, which, however, in Germany is largely used for wrought iron. From the large percentage of phosphorus present, bog iron is highly prized for fine castings, since it makes an excellent surface with clean lines and edges. The ore is easily and extensively wrought.

It is stated with confidence that bog ore consists chiefly of the frustules of diatomaceous plants, many of which incorporate into their frustules a large percentage of iron. *Gaillonella ferruginea* is one of the most important of these minute iron-making plants. It is well known that in some places bog ore will again fill up the cavities in the earth from which it has been removed.

Bo'gle, a township of Gentry co., Mo. Pop. 991.

Bog'lipoor, or **Bhag'ulpore,** a city of India, in Bengal, is on the right bank of the Ganges, here several miles wide in the rainy season. It is about 265 miles by rail N. W. of Calcutta. It has several mosques, and an English seminary; also manufactures of coarse silk fabrics. Here are two curious round towers, the origin of which is unknown. Pop. estimated at 30,000.

Bogoduchou, a town of Russia, in the government of Kharkov, on the right bank of the Merla, 30 miles N. E. of Kharkov. Pop. 9999.

Bog'omiles [a name said to be derived from their prayer in a Slavic language, "*Bog milui*," "Lord, have mercy"], a sect of the Eastern Church in the twelfth century. They were founded by Basil, a physician, who is said to have taught an impure Gnosticism, to have rejected all rites, even baptism, and to have proposed to abolish marriage. Basil was burned alive in 1119, but the sect was in existence a century later. (See NEANDER, "Christian History," iv. 552.)

Bo'gos, a negro tribe inhabiting the highlands N. of Abyssinia, which have only recently become known by the explorations of Werner, Munzinger, and Th. Heuglin. The flora and the fauna of the country of the Bogos are exceedingly rich. Mighty sycamores and tamarind trees, and lions, elephants, buffaloes, and antelopes, as well as the rhinoceros and many varieties of beasts of prey, are found here. The total population is estimated by Munzinger at 10,000 persons, of whom only one-third are true Bogos, who speak the Belen language. The rest are tribes subject to them, who speak the Tigre. The Bogos are well formed, and profess Christianity, but have very little religious knowledge. For several years they have paid a small annual tribute to Abyssinia. In recent times the Bogos suffer much from the invasions of the inhabitants of Barla.

Bogota' (formerly SANTA FÉ DE BOGOTÁ), a city of South America, capital of the republic of Colombia, is pleasantly situated on the San Francisco River, which here joins the Rio de Bogotá, and at the foot of two high mountains. It is on an extensive plateau which is about 8800 feet above the level of the sea, and enjoys a mild and genial climate like a perpetual autumn. Lat. 4° 35′ 48″ N., lon. 74° 13′ 45″ W. The adjacent table-land is very fertile, and is enclosed on several sides by high peaks of the Andes. Bogotá is well built, but as it is subject to earthquakes, the houses are generally only two stories high. No vehicles are used in the streets, which are all narrow. It is the seat of an archbishop, and contains a cathedral and numerous churches, a palace of the president, a university, a national academy, a public library, and a theatre. It has several public squares adorned with fountains. Mines of coal, salt, and precious stones occur in the vicinity. A few miles below the city is the great Cataract of Tequendama, where the Bogotá River has a perpendicular fall of 650 feet. Bogotá was founded in 1537. Pop. about 40,000.

Bogue, a post-township of Columbus co., N. C. Pop. 1393.

Bogue (DAVID), D. D., a Scottish preacher, called the founder of the London Missionary Society, was born in Berwickshire Mar. 1, 1750. He preached at Gosport to an Independent church, was the first editor of the "Evangelical Magazine," and wrote an "Essay on the Divine Authority of the New Testament." He was author, in conjunction with James Bennett, of a "History of Dissenters" (3 vols. 8vo, 1689, 1808). He and others founded the London Missionary Society in 1795. Died Oct. 25, 1825.

Bo'gus, an American word signifying "spurious," "fraudulent," was originally applied to counterfeit coin, said by Bartlett to be a corruption of *Borghese*, a noted Western counterfeiter.

Bo'guslaw, a town of Russia, government of Kief, on the river Rossa, 70 miles S. S. E. of Kief. Pop. about 6000.

Bo'gy, a township of Jefferson co., Ark. Pop. 1321.

Bohain, a town of France, in the department of Aisne, 16 miles N. N. E. of St.-Quentin. It manufactures clocks *à carillon*, shawls, and gauzes. Pop. 5322.

Bohe'mia [Lat. *Bohemia*; Ger. *Böhmen* and *Böheim*], a former kingdom of Europe, now a part of the Austro-Hungarian monarchy. It is bounded on the N. by Saxony and Prussian Silesia, on the E. by Moravia and Prussia, on the S. by Lower Austria, and on the W. by Bavaria. It is between lat. 48° 33′ and 51° 3′ N., and between lon. 12° and 16° 46′ E. Its area is 20,064 square miles. It is enclosed on all sides by four chains of mountains, which constitute its natural boundaries—namely, the Erzgebirge ("Ore Mountains"), which separate it from Saxony on the N. and N. W.; the Riesengebirge ("Giant Mountains"), which extend along the N. E. frontier; the Moravian Mountains, which separate it from Moravia on the S. E.; and the Böhmerwald ("Bohemian Forest"), which extends along the S. W. border. The Schneekoppe, which is the highest peak of the Riesengebirge, rises 5275 feet above the level of the sea. The surface of Bohemia is mostly undulating, and belongs to the basin of the Elbe, which rises in the N. E. part. The other principal rivers are the Moldau, which rises in the Böhmerwald, flows northward, and enters the Elbe; and the Eger, which flows through the N. W. part into the Elbe. The Moldau and Elbe are navigable for steamboats. The climate is healthy, and mild in the valleys or lowlands. The mean annual temperature at Prague is 49° F. The soil is generally fertile. The staple productions are rye, oats, barley, flax, and wheat. The grapevine is also extensively cultivated. Nearly one-third of the country is covered with forests. Large numbers of cattle and sheep are raised in some parts of the country. Bohemia is rich in minerals, which are found chiefly in the mountains. Among its mineral resources are copper, tin, iron, lead, cobalt, silver, nickel, zinc, arsenic, sulphur, coal, cinnabar, alum, and precious stones. Here are also quarries of marble, granite, and sandstone. Famous mineral springs occur at Marienbad, Carlsbad, and Töplitz. The manufactures of Bohemia are very important and varied, the principal products being linens, cotton goods, woollens, glass, and paper. The manufacture of damask, cambric, lawn, and other linen goods employs about 400,000 flax-spinners and 50,000 weavers. Over 500,000 spindles are employed in the production of cotton yarn. Beet-sugar is extensively manufactured. The number of paper-mills is over 100. Bohemia has long been celebrated for its glass-works, which employ about 30,000 persons. A considerable quantity of iron is manufactured here. Railways extend from Prague in several directions, connecting it with Dresden, the cities of Bavaria, and those of Moravia. The chief towns are Prague, Pilsen, and Budweis. Bohemia has one university (Prague), twenty-three gymnasia, as well as numerous realschulen and other institutions of learning. A large majority of the inhabitants belong to the Roman Catholic Church, that being the established religion, but other churches are tolerated. The number of Protestants in Bohemia in 1869 was 106,000. Pop. in 1869, 5,140,544, of whom 3,074,000 were Czechs, 1,941,300 Germans, 89,000 Israelites, while the remainder belonged to different nationalities.

Bohemia derives its name from the *Boii*, a Celtic people who settled here before the Christian era, and were expelled by the Marcomanni in the time of the Roman emperor Augustus. It was conquered by the Cechi (or Czechs), a Slavic race, who first established themselves in Bohemia in the second half of the sixth century, and in 630 A. D. made themselves independent. For several centuries the family of the Przemyslides ruled with varying success until in 1310 the kings of the House of Luxemburg ascended the throne, and ruled until 1437. John Huss effected a religious reformation in this country (1400–14), and was burned by the Catholics. The consequence was the sixteen years' war of the Hussites. In 1526, Bohemia was annexed to the dominions of Ferdinand I. of Austria. The majority of the Bohemians in the sixteenth century were Protestants, who, for the assertion of their religious liberty, revolted against the emperor of Austria, and in 1619 elected as their king Frederick, the elector palatine. He was defeated near Prague in 1620 by the Austrians, who then commenced a cruel persecution of the Protestants, and almost exterminated them. The population was reduced in twenty years (1617–37) from 3,000,000 to 780,000. In recent times the country has been agitated by a strong political antagonism between the Czechs and the Germans, the former demanding the re-establishment of a kingdom embracing Bohemia and Moravia, and enjoying the same autonomy in point of administration which has been conceded to Hungary. (See AUSTRO-HUNGARIAN MONARCHY.) A. J. SCHEM.

Bohe'mian Breth'ren, the former name of a sect of Christian reformers, who may be regarded as the remnant of the HUSSITES (which see). After the division of the Bohemian reformers into Calixtines and Taborites, the Council of Bâle (1432) granted the new sects the use of the wine in the communion. This offer drew many of the Calixtines into the Roman Catholic Church, where they were called Utraquists, from the use of both (*utraque*) elements in the Eucharist. But the Taborites, remodelling and still further reforming their creed, which was published in 1504, took the name of Bohemian Brethren. Persecutions raged against them for 150 years, and the vast majority were killed or driven away from Bohemia. In 1567 they recovered freedom of conscience, but numbers of them having removed to Moravia, they took the name of MORAVIAN BRETHREN (which see). The Bohemian Brethren are looked upon by most Protestants as deserving high regard on account of their purity, faithfulness, and the judicious mod-

eration of their doctrines. (See VON ZEZSCHWITZ, "Die Katechismen der Waldenser und Böhmischen Brüder," 1863; PESCHECK, "Reformation in Bohemia," London, 1846.)

Bohe'mian For'est, or **Böh'merwald,** a chain of mountains in Germany, which forms the boundary between Bohemia and Bavaria, and separates the basin of the Danube from that of the Elbe. It extends in a S. E. and N. W. direction, and is about 130 miles long. The rocks of which it is formed are granite and gneiss. The highest summits of this chain are the Aber, 4848 feet, and the Rachelberg, 4743 feet, above the level of the sea. A large portion of these mountains is covered with dense forests. A railway extending from Bavaria to Prague crosses this range through the valley of the Cham.

Bohe'mian Lan'guage, a name commonly applied to one of the principal dialects of the Slavic family of languages. It is sometimes called the *Cechic* (from *Cechi*,* the native name of the people who speak it); it is regarded not only as the harshest (most abounding in consonants), but also as the richest and most expressive, of all the Slavic dialects. The Cechic vowels, *a, e, i, o, u,* are essentially the same as those of the Italian language; *y* resembles in sound our *i*, but is somewhat more obscure; *é*, though written with one letter, is a diphthong pronounced *ya*. The consonants, *b, d, f, k, l, m, n, p, t, v,* and *z,* are pronounced as in English; *c* (as in Polish) has the same sound as our *ts*, even before a hard vowel: thus *ca* is pronounced *tsa*; *g* (like the Swedish *g*) has before the soft vowels *e, i,* and *y* the sound of our *y* consonant; *j* is like *i* or our *y* consonant; *w* sounds like our *v*; *s* is always sharp, as in *this*; *r,* as in French and most other European languages, is always trilled. Certain consonants are modified in sound by placing over them this diacritical sign (ˇ): thus *c, d, n, r, s, t,* and *z* are sounded like our *ch* (in *child*), *d* (in *verdure, i. e. dy* uttered in one sound), *ni* (uttered as one sound, as in *minion*), *rzh* (nearly), *sh, ty* (uttered as one sound, or *t* in *nature*), and *zh*, respectively. L, with a stroke through it, *ł* (like the Polish), has a sound unknown to our language. *Ch* is pronounced as in German; *sch* nearly as in Dutch. In the variety of its terminations of both nouns and verbs the Cechic may be said to resemble the Latin and Greek. The Bohemians (Czechs) possess no contemptible literature. John Huss himself not only revised the translation of the Bible into the Cechic tongue, but wrote tracts, and poetry in hexameter verse. He appears to have been scarcely inferior to Luther in the impulse which he gave to the mental culture of his countrymen. The golden age of Cechic literature, and of the highest intellectual culture of the Czechs, may be placed between 1450 and 1620 (the opening of the Thirty Years' war), after which both rapidly declined. After a period of depression lasting nearly two hundred years, the literature of Bohemia rose again into active life, and since the commencement of the present century writers have appeared in every department of learning and science. (See WENZIG'S "Blicke auf das böhmische Volk, seine Geschichte und Literatur," 1855.) J. THOMAS.

Bo'hemond [Lat. *Bohemun'dus*] **I.,** a famous leader of the first Crusade, born about 1056, was a son of Robert Guiscard, duke of Apulia and Calabria. He joined the crusade with a large army in 1095, and took part in the capture of Antioch in 1098. He remained at Antioch while the other crusaders marched to Jerusalem, and he reigned there as prince of Antioch. He waged war with varying success against the Greek emperor Alexis, and married a daughter of Philip I. of France. Died in 1111.

Bohemond II., a son of the preceding, was a minor at his father's death. He became prince of Antioch in 1126, and fought against the Saracens as an ally of Baldwin, king of Jerusalem. He was killed in battle in 1130.

Bohemond III., a prince of Antioch, was a grandson of Bohemond II. He began to reign in 1163. Died in 1201.

Boh'len (HENRY), a native of Germany, removed to Philadelphia, where he became a wine-merchant. Appointed a brigadier-general in 1862, he served under Fremont and Sigel, and was killed near the Rappahannock Aug. 22, 1862.

Bohlen, von (PETER), a German Orientalist, born Mar. 13, 1796. He became professor of Oriental languages at Königsberg in 1830, and published, besides other works, an able treatise on Indian antiquities entitled "Das Alte Indien" (2 vols., 1830). Died Feb. 6, 1840. (See his "Autobiography," 1841.)

Böh'ler (PETER), a German theologian and Moravian bishop, born at Frankfort-on-the-Main Dec. 31, 1712. He is recognized, in Methodist history, as having given a decisive impulse to Wesley's opinions and career. He removed to America in 1738, and in 1740 founded the town of Nazareth, Pa. Died in London April 27, 1775.

Böhm (THEOBALD), a German musician, born in Bavaria in 1802, is noted for an improvement in the construction of the flute. The Böhm flute is more accurate and even in tone, and more easily fingered, than those formerly in use. He has also introduced improvements in other instruments, and has composed musical pieces.

Böhme, or **Böhm** (JAKOB), a celebrated German mystic, born near Görlitz, in Upper Lusatia, in 1575. He learned the trade of a shoemaker, worked at his trade at Görlitz, and became a member of the Lutheran Church. He had a very fertile imagination and a remarkable faculty of intuition, and professed to be divinely inspired and illuminated. His first work was entitled "Aurora, or the Morning Redness" (about 1612). This was condemned by the ecclesiastical authorities of Görlitz. He published several other works, which were admired by some eminent men, but they appear visionary and unintelligible to the generality of persons. He died at Görlitz Nov. 24, 1624. His works (10 vols., 1682) were translated into English (2 vols. 4to, 1764) by William Law, who was an admirer of Böhme. He was a religious genius of great depth, and can be understood only by people of strong religious feeling and some religious experience: to them he is as sublime as he is obscure to others. (See LA MOTTE-FOUQUÉ, "Notice sur J. Boehm," 1831; FECHNER, "Jakob Böhme, sein Leben und seine Schriften," Görlitz, 1857; GEISS, "Jakob Böhme, der Deutsche Philosoph," Leipsic, 1860.)

Böh'misch-Lei'pa, a town of Bohemia, on the Polzen, 56 miles N. of Prague. It has a gymnasium, and manufactures of woollen and cotton cloths, glass, and hardware. Pop. in 1869, 9244.

Böh'misch-Trü'ban, a village of Austria, in Bohemia, 44 miles by rail N. N. W. of Brünn. P. in 1869, 5141.

Bohn (HENRY GEORGE), a London bookseller of German extraction, born Jan. 4, 1796, has promoted the popularization of good literature by publishing translations from ancient and modern languages, and has made several useful compilations and written a "Handbook of Pottery."

Bohrahs. See ISMAEELIAH.

Böht'lingk, or **Boehtlingk** (OTTO), an eminent Russian Orientalist, born at St. Petersburg May 30, 1815. He has published, among other works, the text of Kâlidâsa's "Sakuntalâ," with a translation (1842), and, conjointly with Roth, a "Sanscrit-German Lexicon," which is said to be unrivalled in this department of literature.

Bo'hun U'pas [Malay for "poison tree"], the *Antiaris toxicaria*, a tree of the Malay and Philippine archipelagoes, of the order Artocarpaceæ. Many grossly exaggerated reports of its fatal qualities have been published. Its poison appears to be of an acrid, not a narcotic character. The stories of the upas valley in Java, where nothing can grow but the upas tree, probably arose from the now well-ascertained fact that certain close mountain-ravines in that island so abound in poisonous volcanic gases that no plant, not even the upas, can live there. Besides the above, another bohun upas, the *Strychnos Tiente*, is found in that region. It abounds in strychnine, and is even more deadly than the other.

Boiar'do (MATTEO MARIA), count of Scandiano, an Italian poet, born at Scandiano about 1432. He was patronized by Ercole, duke of Este, and became governor of Módena in 1481. His chief work is the romantic chivalrous poem "Orlando Innamorato," which he left unfinished, and which was published in 1495. He died Dec. 21, 1494. His poem was modified or written over by Berni, whose version of it was so popular that it nearly supplanted the original, the subject of which was also continued by Ariosto in his "Orlando Furioso." According to Hallam, Boiardo was equal to Ariosto in point of novel invention and just keeping of character. (See G. F. CREMONA, "Elogio del Conte M. M. Bojardo," 1827.)

Boi'i, an ancient Celtic people who emigrated across the Po and occupied Umbria, where they waged war for several centuries against the Romans. They were defeated by the Romans in 283 B. C., and became allies of Hannibal when he invaded Italy in 218 B. C. Many years later the Romans expelled them from Umbria, and drove them beyond the Alps. A portion of the Boii migrated to the country on the N. side of the Danube, and founded the kingdom of Boiohemum (Bohemia), from which they were expelled by the Marcomanni in the time of Augustus. From them also Bavaria takes its name.

Boil [Lat. *furunculus*], a hard, painful, inflammatory tumor on the surface of the body, which begins as a point of a dusky red color, and is hot, aching, and throbbing.

* Pronounced *cha'kee.*

These symptoms increase in severity for several days, when it is of a conical form, with a broad firm base, and has on the apex a whitish point, which contains a little matter; this opens and after a few days more there is discharged a slough of cellular tissue, and the cavity left heals, leaving a depressed scar. Boils often attack young and plethoric persons, and their appearance is not incompatible with robust health, although they may be so numerous as to greatly reduce the strength. Men in training for athletic exercises, or others who have suddenly changed their habits, are subject to them. Sometimes boils continue to succeed each other for a length of time. The treatment of boils is simple. The intestinal canal should be cleared by laxative medicines, and the digestive powers improved by tonics and antacids. The tincture of perchloride of iron is often a useful remedy. The skin should be kept healthy by frequent washing, while the inflamed point should be poulticed. Wet lint is a sufficient application after the core has been thrown off. Free incision of the boil greatly hastens its course.

Boildieu, or **Boieldieu** (Adrien François), a French composer, born at Rouen Dec. 15, 1775. He went to Russia in 1803, and was there appointed chapel-master to the emperor Alexander, but he returned to Paris in 1811. Among his works are the operas "La Dame Blanche," "Jean de Paris," and "My Aunt Aurora." Died Oct. 8, 1834. (See Réveuille, "Boieldieu, sa Vie et ses Œuvres," 1854.)

Boileau, or, more fully, **Boileau-Despréaux** (Nicolas), an eminent French poet and satirist, born near Paris Nov. 1, 1636. He was liberally educated, and followed no profession but that of an author. He began his literary career by a satire entitled "Adieu of a Poet to the City of Paris" (1660), the style of which was much admired. In 1666 he produced "Seven Satires," which were very successful. He became a friend of Racine and La Fontaine. His "Twelve Epistles," which appeared after 1669, indicate a more mature genius than his satires, and excel in the ease and grace of the versification. He wrote to Racine and other friends numerous letters, which are very interesting as materials for the literary history of his time. Among his best works are the "Lutrin" ("Reading-desk," 1674) and the "Art of Poetry" ("L'Art Poétique," 1674), which is an exquisite performance, and is considered by some French critics as equal to Horace's "Art of Poetry." Boileau was admitted into the French Academy in 1684. He had an immense influence on French literature. His character is represented as pure and generous. He was visited in 1700 by Addison, to whom, as Macaulay remarks, he talked on his favorite theme, literature, long and well; indeed, as his young hearer thought, incomparably well. He died in Paris Mar. 13, 1711. (See D'Alembert, "Éloge de Boileau;" Desmaizeaux, "Vie de Boileau," 1712; Daunou, "Éloge de Boileau," 1787; L. S. Auger, "Éloge de Boileau-Despréaux," 1805.)

Boiler. See Steam-Engine, by Prof. W. P. Trowbridge.

Boiling-Point, the temperature at which the elastic force of the vapor of any liquid is equal to the pressure of the atmosphere. When a vessel containing water is heated, the temperature rises and vapor silently passes off from the surface; but at 212° F., or 100° C. (the barometric column standing at 30 inches at the sea-level) steam begins to be formed in bursts at the bottom, and rising through the liquid, throws it into commotion. If the steam is allowed freely to escape, the temperature of the water rises no higher. The water is then said to *boil*, and the temperature at which it remains is its *boiling-point*. Every liquid has a boiling-point of its own.

Table of Boiling-Points of Various Liquids.

Liquid sulphurous acid.	17.6°	Water	212°
Aldehyde	71.8	Butyric ether	238.8
Ether	96.3	Perchloride of tin	240.2
Carbon bisulphide	118.5	Terchloride of arsenic	273
Acetone	133.3	Bromide of silicon	308
Bromine	145.5	Terebene	322.9
Wood spirit	151.3	Naphthalin	422.2
Ethylic alcohol	173.0	Sulphuric acid	620
Benzole	177.4	Mercury	662

The boiling-point of liquids is altered by various circumstances. Water with common salt in it requires greater heat to make it boil than pure water. In a glass vessel the boiling point is several degrees higher than in one of metal. But what most affects the boiling point is variation of pressure. When the barometer stands at thirty inches, showing an atmospheric pressure of fifteen pounds on the square inch, the boiling-point of water is 212°. When part of the pressure is removed, it boils before coming to 212°, and when the pressure is increased the boiling-point rises. Thus in elevated positions, where there is less air above the liquid to press on it, the boiling-point is lower than at the level of the sea. An elevation of 510 feet makes a diminution of one degree F.; at higher levels the difference of elevation corresponding to a degree of temperature in the boiling-point increases; and a method is thus furnished of measuring the heights of mountains. At the city of Mexico, 7471 feet above the sea, water boils at 198.1°; at Quito, 9541 feet, at 194°; in the Himalayas, at the height of 18,000 feet, at 180°. Boiling water is thus not always equally hot, and in elevated places many substances cannot be cooked by boiling. Under the receiver of an air-pump water may be made to boil at the temperature of summer, and ether when colder than ice. This effect of diminished pressure is largely turned to account in sugar-boiling, in preparing extracts, in distilling vegetable oils, and in other processes where the substances are apt to be injured by high temperature. By increasing the pressure water may be heated to any degree without boiling. Papin's digester is formed on this principle. Under a pressure of two atmospheres the boiling-point rises to 249° F.; of ten atmospheres, 356° F.; of fifty atmospheres, 511° F. At a depth of thirty-four feet the pressure of water is equal to an atmosphere, or fifteen pounds on the square inch; and thus at the bottom of a vessel of that depth the water must be heated to 249° F. before it is at its boiling-point.

If a small quantity of water be poured into a silver basin heated above the boiling-point, but below redness, it will begin to boil violently, or perhaps burst into steam at once. But if the basin is heated to redness, the water will gather itself into a globule, and roll about on the hot surface without coming to the boiling-point. It is remarkable that water which has been freed from air by long boiling has its boiling-point much raised. It has been known to reach 275° F. without boiling. F. A. P. Barnard.

Boiling Spring, a twp. of Lexington co., S. C. P. 354.

Boiling Spring, a twp. of Alleghany co., Va. P. 1388.

Bois Blanc Island, in Lake Huron, 10 miles S. E. of Mackinaw, Mich., is 10 miles long and 3 wide, and has a lighthouse on the E. end; lat. 45° 45′ N., lon. 84° 55′ W.

Bois Brulé, a post-twp. of Perry co., Mo. Pop. 1337.

Bois de Boulogne, a grove or public park in the environs of Paris, on the right bank of the Seine, about 3 miles W. of the city. It is nearly 3 miles long and 1 mile wide. It was the finest promenade in the vicinity of Paris, but many of the trees were cut down and burned when that city was besieged by the Germans in 1870.

Bois d'Arc [Fr. for "bow-wood"], (popularly pronounced bo'dock), a name given to the Osage orange tree (*Maclura aurantiaca*, order Artocarpaceæ) in some parts of the U. S. It is often used for a hedge-plant. As a tree its timber is tough, elastic, and extremely useful. It is a near relative of the fustic tree, and its wood yields a yellow dye. It was used by the Indians for making bows and arrows. (For its use in hedge-fences, see Osage-Orange.)

Bois d'Arc, a township of Hempstead co., Ark. P. 632.

Bois d'Arc, a tp. of Montgomery co., Ill. Pop. 1177.

Boisé. See Big Wood River.

Boisé, a county of Idaho, bordering on Montana, is bounded on the E. by the Rocky Mountains. It is drained by the Salmon River, the East Fork of the Salmon, and by several forks of the Boisé River which rise within its limits. The surface is partly mountainous. The inhabitants are mostly employed in mining gold, which is found in various parts of the county. Grain and wool are raised, and timber abounds. Many of the inhabitants are Chinese. Capital, Idaho City. Pop. 3834.

Boise (James Robinson), Ph. D., LL.D., born in Blandford, Hampden co., Mass., Jan. 27, 1815, graduated at Brown University in 1840, and was tutor of Latin and Greek in that college from 1840 to 1843, and professor of Greek till 1850. From 1852 till 1868 he was professor of Greek in the University of Michigan. Since then he has filled the same position in the University of Chicago. Prof. Boise has published several classical text-books, among which are editions, with English notes, of Xenophon's "Anabasis" and the first six books of Homer's "Iliad."

Boisé City, the capital of Idaho and of Ada county, is in the southern portion of the Territory, on Boisé River, 50 miles above its confluence with the Snake, in the great Snake River Valley; lat. 43° 34″ N., lon., about 116° W. It is surrounded by a fine agricultural and grazing country, and derives large support from the rich placer and quartz mines in the mountain districts within 50 miles N., S., and E. The principal business-houses are fireproof brick. The city has a national bank, U. S. assay-office, a penitentiary, 3 hotels, 2 churches, 1 high school, 2 grist-mills, a tri-weekly and weekly newspaper, and job printing-office, and various mechanical industries. Two large ditches, bringing the water from Boisé River, give an abundance of water-power, and side ditches for irrigating purposes

carry the water to every lot in the city. Four stages arrive and depart daily, N., E., W., and S. Pop. 995.
MILTON KELLY, ED. "IDAHO STATESMAN."

Bois-le-duc [Dutch *S'Hertogenbosch, i. e.* "Duke's Wood"], a fortified town of Holland, capital of North Brabant, is at the junction of the rivers Aa and Dommel, 30 miles S. S. E. of Utrecht. It is a clean and well-built town, intersected by several canals, and defended by a citadel and two forts. It has a fine cathedral, a college, an academy of art, an arsenal, and a grammar-school in which the celebrated Erasmus studied. Here are manufactures of cutlery, ribbons, woollen goods, linen thread, etc. It was founded in 1184 by the duke of Brabant in a wood while hunting; hence its name. Pop. 24,579.

Boisserée (SULPIZ), an eminent architect and antiquary of French extraction, was born at Cologne Aug. 2, 1783. He devoted himself to the collection of specimens of early German art, in which he was aided by his brother Melchior (1786–1851). They collected about 200 pictures, which were purchased by the king of Bavaria, and are called the "Boisserean Collection." He published "Monuments of Architecture on the Lower Rhine from the Seventh to the Thirteenth Century" (1830–33), and "Views, Plans, and Details of the Cathedral of Cologne, etc." (1823). Died May 2, 1841.

Boissonade (JEAN FRANÇOIS), a distinguished French classical scholar, born in Paris Aug. 12, 1774. He became professor of Greek in the University of Paris in 1812, was admitted into the Academy of Inscriptions in 1813, and became professor of Greek in the College of France in 1828, which position he held until a few days before his death. He edited several Greek classic authors, and published "Sylloge Poetarum Græcorum" (24 vols., 1823–26). He acquired a high reputation as a Hellenist, and gave a powerful impulse to the study of classical literature. Died Sept. 8, 1857.

Boissy d'Anglas, de (FRANÇOIS ANTOINE), COUNT, a French statesman, born at Saint Jean Chambre (Ardèche) Dec. 8, 1756. He became a moderate member of the States-General in 1789, and of the Convention in 1792. He was a member of the Committee of Public Safety in 1794, was chosen president of the Tribunate in 1802, was created a senator and count by Napoleon in 1805, and a peer of France by Louis XVIII. He wrote several political essays and a "Life of Malesherbes" (1819). Died Oct. 20, 1826.

Boivin (MARIE ANNE VICTOIRE GILLAIN), M. D., an eminent French midwife, born April 9, 1773, was educated in a nunnery, and afterwards studied the elements of medicine. She married in 1797, but was soon left a widow with one child. To gain a living she worked in the Maternité Hospital, of which she became superintendent in 1801. The king of Prussia gave her the civil order of merit, and the University of Marburg the degree of M. D. She wrote valuable professional works. Died May 16, 1841.

Bo'ker (GEORGE HENRY), an American poet, born in Philadelphia in 1823, graduated at Princeton, N. J., in 1842. He published "The Lesson of Life and other Poems" (1847); "Calaynos," a tragedy (1848), which was performed with great success in England; "Leonore de Guzman," and "War Lyrics" (about 1862), which were received with favor. In the autumn of 1871 he was appointed minister to Turkey.

Boke's Creek, a township of Logan co., O. P. 1344.

Bokha'ra [Lat. *Bucharia;* anc. *Sogdiana* and *Transoxiana*], or **Uzebekistan',** called also **Great Bucharia,** a state of Central Asia, in Independent Toorkistan, is bounded on the N. and W. by Russian Toorkistan, and on the S. by Afghanistan and Toorkomania. Area, estimated at 76,200 square miles. The high mountain-range of Hindoo-Koosh extends along the southern border of Bokhara, the E. part of which is occupied by offsets from the Bolor Tagh, but the greater part of the country is level. This level tract resembles the dry steppes and sandy wastes of the basin of the Caspian. The largest rivers of Bokhara are the Amoo (Oxus), the Jihoon, and the Samarcand River, or Kohik. Along the banks of these rivers there is arable and fertile land, which is about one-tenth of the whole country. The climate is moderate. Gold is found in the sands of the Oxus, but Bokhara is deficient in metals and timber. Among the products of the soil are cotton, rice, wheat, barley, silk, tobacco, and abundant fruits. The inhabitants raise great numbers of camels, sheep, goats, and horses. They manufacture silk stuffs, firearms, cutlery, shagreen, gold and silver ornaments, sabres, etc. This country derives commercial advantage and importance from its position between Russia and the south of Asia. The population is composed of a mixture of races, who mostly profess the Mohammedan religion. Bokhara partly corresponds to the ancient *Bactria.* It was conquered by Jengis Khan in 1222, and was famed as a seat of learning under Tamerlane. The Uzbecks became masters of it in 1505. In 1864 the Russians moved up the Syr-Darya, captured several important cities, together with the northern half of Bokhara, and formed the government of Toorkistan. Between 1866–68 the Russians conquered the cities of Samarcand and Katty Kurgan, with the territory belonging to them. Since then Bokhara has become more and more dependent upon Russia. In 1870, Russia conquered Badakshan and gave it to Bokhara, and in 1873, owing to the victory of the Russians over Khiva, the Amoo was made the boundary between Khiva and Bokhara. Capital, Bokhara. Pop. estimated at 2,500,000.

Bokhara (*i. e.* "treasury of sciences"), a famous city of Central Asia, the capital of Bokhara, is situated on a plain near the river Sogd or Zerafshan, 138 miles W. S. W. of Samarcand. The streets are very narrow and ill paved, the houses are small, have flat roofs, and are built of sun-dried bricks. Bokhara is probably the most important commercial town of Central Asia, and has numerous extensive bazaars, in which nearly all kinds of goods can be procured. Among the articles exported from it are silks, cotton, wool, coarse chintzes, lapis-lazuli, and dried fruits. This city is said to have 360 mosques, some of which are beautiful structures. It has long been famous as a seat of Mohammedan learning, and is said to contain over 100 colleges, with about 10,000 students. Among the principal edifices is the palace of the khan, which is enclosed by a wall about sixty-five feet high. Bokhara was ruined by Jengis Khan about 1232, and was rebuilt at the end of his reign. The pop. is variously estimated at from 60,000 to 180,000.

Bol (FERDINAND), a Dutch painter and engraver, born at Dort in 1611, was a pupil of Rembrandt. He painted history and portraits with success, and produced some good etchings. Died in 1681.

Bo'lan Pass, a pass in the mountains of Beloochistan, is 50 miles long, and is on the route from Sinde to Kandahar and Kelat. The highest part of the pass is 5793 feet above the level of the sea. The average ascent is ninety feet in a mile. The Bolan River rises here. In 1839 a small British army with heavy artillery marched through this pass from Sinde to Afghanistan.

Bo'las (the "balls"), a Spanish-American name for a missile used by the Indians of the South American plains, and borrowed from them by the Guachos. It consists of a pair of balls (formerly made of clay by the Indians, but now often of iron) fastened together by a thong of hide. The bolas are hurled with great precision at the ox, horse, guanaco, or ostrich, and, entangling the legs of the animal, detain it till it can be captured or killed. Sixty feet or more is a moderate range for the bolas, which are thrown from the saddle.

Bolbec, a town of France, in the department of Seine-Inférieure, is on a small river of its own name, and 20 miles by rail E. N. E. of Havre, on the railway which connects Paris with the latter place. It is well built, and is adorned with fountains. Here are manufactures of cotton, linen, and woollen fabrics, and chemicals. Pop. 9063.

Bold Spring, a township of Shelby co., Ala. P. 537.

Bole [Lat. *bo'lus;* Gr. βῶλος, a "lump or mass"], an earthy substance resembling clay, and consisting essentially of silica, alumina, and red oxide of iron. It occurs in nests and veins in basalt and other rocks in various countries. It feels greasy between the fingers; is white, yellow, red, brown, or black; has a dull resinous lustre; is friable, and adheres to the tongue. Armenian bole has a red tint, is often used for coloring false anchovies, and is also employed in coloring tooth-powders and in veterinary medicine. Lemnian earth, a bole from the island of Lemnos, was at one time prescribed as a tonic and astringent medicine, and acted beneficially from the large percentage of oxide of iron present. The boles are employed in veterinary practice. When bole is calcined it becomes hard; and when afterwards levigated, a coarse red kind is used as a pigment under the names of English red and Berlin red. French bole is pale-red; Bohemian bole, reddish-yellow; Silesia bole, pale-yellow; and Blois bole is yellow. The boles are absorbent, astringent, and somewhat tonic.

Bole'ro (named from its inventor), a Spanish national dance, generally in the time of a minuet, and with a peculiar rhythm. It is accompanied with the music of the guitar and castanet, and with songs. The dancer seeks to represent by pantomime the successive symptoms and emotions of amorous affection.

Boles, a post-township of Franklin co., Mo. P. 5183.

Bole'tus [Gr. βωλίτης], a genus of fungi of the division Hymenomycetes. It comprises several species, which re-

semble the mushroom (*Agaricus*) in form, but instead of having gills, the under side of the cap (*pileus*) is occupied by a layer (*hymenium*) quite distinct from the body of the pileus in substance, and pierced by pores, so as to be composed of numerous small tubes united together. *Boletus edulis* is used as food in France and Germany, where it grows on the ground in woods and mossy places. In moist, warm summers it is very abundant. The part which is eaten is the flesh of the cap, which is firm, white, and delicate. Several other species are edible.

Bo'leyn, or **Bul'len** (ANNE), queen of England, born in 1507, was a daughter of Sir Thomas Bullen, afterwards earl of Wiltshire. Her mother was a daughter of the duke of Norfolk. She was educated at the French court, and became about 1525 one of the maids-of-honor to the English queen, Catherine. Henry VIII., attracted by her beauty, applied to the pope to obtain a divorce from Catherine, and married Anne privately early in 1533. She became the mother of the princess Elizabeth in September of that year. She showed favor to the cause of the Reformation. Having been supplanted in the favor of the king, she was accused of criminal intercourse with several men, was condemned by a jury of peers, and beheaded May 19, 1536. Some writers think that her crime was not proven. (See FROUDE, "History of England," vol. ii.; MISS BENGER, "Memoirs of Anne Boleyn;" MISS STRICKLAND, "Queens of England.")

Bolgrad', a town of Roumania, on the river Yalpookh, 23 miles N. of Ismail, and on the frontier between Russia and Turkey. In 1856 it was ceded by Russia to Turkey. Pop. 8415.

Bo'li, a town in Asiatic Turkey, in Anatolia, 85 miles N. W. of Angora, inhabited by Turks and Armenians. The manufactures are gold ornaments and leather. Pop. about 10,000.

Bol'igee, a township of Greene co., Ala. Pop. 1770.

Boli'nas, a post-township of Marin co., Cal. Pop. 625.

Bolingbroke (HENRY ST. JOHN), VISCOUNT, a celebrated English author and statesman, born at Battersea Oct. 1, 1678. He was educated at Eton and Oxford, and was extremely dissipated in his youth. Having entered Parliament in 1700, he soon became a prominent orator of the Tory party, and was appointed secretary of war in 1704. He lost this office when the Whigs obtained power in 1708, but he continued to be a favorite counsellor of Queen Anne, who dismissed the Whigs in 1710, and placed Harley at the head of a ministry in which St. John was secretary for foreign affairs. He received in 1712 the title of Viscount Bolingbroke, and in 1713 concluded the treaty of Utrecht, which ended a long war between England and France. He quarrelled with Harley (earl of Oxford), and supplanted him as prime minister in July, 1714. His ambitious hopes were blasted by the death of Queen Anne (Aug., 1714), which also frustrated his designs and schemes to restore the Stuart dynasty. He was attainted in 1715, but he had escaped to France, and entered the service of the Pretender as his prime minister. In 1724 he was permitted to return to England, but not to enter Parliament. He wrote for the "Craftsman" many articles against Walpole, and published, besides other works, a "Dissertation on Parties" (1739) and "Remarks on the History of England" (1743). Died Dec. 15, 1751. He was brilliant and versatile, but not profound. His collected works, which have little merit except style, were published by Mallet in five volumes in 1754. (See GOLDSMITH, "Life of Lord Bolingbroke;" G. W. COOKE, "Memoirs of Lord Bolingbroke," 1835; "Edinburgh Review" for Oct., 1835 F. VON RAUMER, "Lord Bolingbroke und seine Werke," 1841; CHARLES DE RÉMUSAT, "Bolingbroke, sa Vie et son Temps," 1853.)

Bo'ling Green, a township of Pettis co., Mo. P. 2467.

Bol'ivar, a county in the W. of Mississippi. Area, 800 square miles. It is bounded on the W. by the Mississippi River, which separates it from Arkansas. The surface is an alluvial plain, part of which is often inundated by the river. The soil is fertile and produces cotton and corn abundantly. Capital, Beulah. Pop. 9732.

Bolivar, a township of Jefferson co., Ark. Pop. 1732.

Bolivar, a township of Poinsett co., Ark. Pop. 867.

Bolivar, a township of Benton co., Ind. Pop. 776.

Bolivar, a post-village, capital of Polk co., Mo., 110 miles S. W. of Jefferson City. It has a fine high-school building, three churches, two newspapers, a woollen mill, cotton-gin, flouring mill, and other manufactories, three hotels, and a large trade. Pop. 635.

JAS. DUMARS, ED. "FREE PRESS."

Bolivar, a post-township of Allegany co., N. Y. P. 959.

Bolivar, a post-village of Lawrence township, Tuscarawas co., O. Pop. 413.

Bolivar, a post-village of Fairfield township, Westmoreland co., Pa. Pop. 298.

Bolivar, a post-village, capital of Hardeman co., Tenn., 1 mile S. of Hatchee River, on the Mississippi Central R. R., 28 miles S. of Jackson and 68 miles E. of Memphis, in an excellent cotton region, with fine water-power and plenty of timber. It has a foundry, steam saw and grist mill, two male and two female academies, seven churches, and one weekly newspaper. Pop. 889.

M. R. PARRISH, ED. "BOLIVAR BULLETIN."

Bolivar, a township of Jefferson co., W. Va. P. 2892.

Boli'var, one of the nine states of the South American confederation of Colombia, is bounded on the N. by the Caribbean Sea, E. by Magdalena and Santander, S. by Antioquia, and on the W. by Cauca. Area, 26,600 square miles. Besides the Magdalena, which flows along its entire W. boundary, the only river of importance is the Cauca. The surface is mostly level, and covered with forests. The principal towns are Cartagena, the capital, and Mompox. Pop. in 1870, 225,060.

Bol'ivar [Sp. pron. bo-lee'var], (SIMON), or **Boli'var y Pon'te,** surnamed THE LIBERATOR, a South American patriot, born at Caracas July 25, 1783, inherited an ample fortune. He studied law at Madrid, and afterwards joined the patriots who revolted against Spain in 1810. He served as an officer under Miranda in several battles. Having obtained the command of a separate army, he defeated the Spaniards, and entered Caracas in triumph in Aug., 1813, soon after which he was appointed dictator. He was defeated and driven out of Venezuela in 1814, but again rallied to the standard of liberty near the end of 1816, and gained several victories over the Spanish general Morillo in 1817. In Feb., 1819, a congress was opened at Angostura, and Bolivar was chosen president. In Dec., 1819, Venezuela and New Granada were united to form the republic of Colombia, of which Bolivar was elected the first president. He gained a victory at Carabobo in June, 1821, and in 1822 led an army into Peru, which he liberated from the Spaniards. He became dictator of Peru in 1823, and made a tour through that country, in which he was received with triumphal demonstrations. In honor of him the southern part of Peru was named Bolivia, and erected in 1825 into a separate state, of which he became president for life. He was also re-elected president of Colombia in 1826. In 1829, Venezuela seceded from the republic of Colombia, which was much disturbed by faction. Bolivar had many enemies who denounced his ambition. He died Dec. 17, 1830. (See DUCOUDRAY-HOLSTEIN, "Mémoires de S. Bolivar," 1829.

Bolivar City. See ANGOSTURA.

Bolivar Point is at the N. side of the entrance to Galveston Bay, Tex., in Chambers co., lat. 29° 22′ 02″ N., lon. 94° 45′ 34″ W. It has an iron lighthouse 110 feet high, with a fixed white light 117 feet above the sea.

Boliv'ia, a South American republic, is bounded on the N. and E. by Brazil, on the S. by the Argentine Republic and Chili, and on the W. by Peru and the Pacific Ocean. Area, 535,000 square miles. The population is estimated (Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872) at 2,000,000. The S. W., W., and central parts of the republic contain the highest mountains in the New World, comprising the Cordilleras from lat. 24° S., with the plateau of Potosi, 13,000 feet high, from which two chains branch off, the western, containing many volcanoes, with its highest point, Mount Sajama, 22,760 feet high, and the eastern, with Mount Illampu, probably the highest in America, 24,744 feet, and Mount Illimani, 23,990 feet. The only lake of any importance, Lake Titicaca, on the N. W. boundary, is situated at an elevation of 12,850 feet, and has an area of 5300 square miles. The most important rivers of Bolivia are the Veni or Beni, Mamore, and Guapore, which empty into the Madeira, and the Pilcomayo and Paraguay, which flow to the Parana. Five climatic regions are distinguished: 1, the *Puna brava*, between the elevation of 13,000 feet and the snow-limit; 2, the *Puna*, between 11,000 and 13,000 feet, in which potatoes, oca, quinoa, and barley are cultivated, and fine forests are met with; 3, the *Cabezera de Valle*, between 9000 and 11,000 feet, producing wheat, corn, and European vegetables; 4, the *Valle*, or *Medio Yunga*, between 6000 and 9000 feet, the finest region in Bolivia; besides the products found in the regions above named, many tropical fruits occur here, and the best cinchona is gathered; 5, the *Yunga*, the region of the tropical forests, producing cacao, coca, bananas, and all classes of tropical fruits.

Bolivia is rich in precious metals and useful minerals. Silver is found all through the Bolivian cordillera, while gold is not only found in large quantities, associated with quartz, in the mountains, but is found in the beds of all the numerous rivers that come down from the mountains.

Besides these, copper, tin, mercury, lead, and iron are also found. Salt is also produced in large quantities, while the rich beds of coal have as yet not been touched. Besides the products mentioned above, coffee, cotton, tobacco, indigo, and sugar-cane are extensively cultivated. The inhabitants consist of whites, Indians, and a large number of half-breeds, but very few negroes. The Indians are mostly Chiquitos, Majos, and Chiriquanos. The Roman Catholic religion predominates, and the country contains the archbishopric of La Plata and the bishoprics of La Paz, Santa Cruz, and Cochabamba.

The public education of the nation is on a very low stage as yet. It is under the direction of the presidents of the three universities and the minister of education. The state of the finances is very low indeed. The public debt in 1871 amounted to 10,845,520 pesos, the receipts in 1867 to 4,529,345 pesos, and the expenses in the same year to 5,957,275, leaving a deficit of 1,427,930 pesos. The army consists of 51 generals, 359 superior officers, 654 other officers, and about 2000 privates. The imports are estimated at 6,000,000 pesos, and the exports at 5,000,000. No railroads exist at present. A line has been projected from Tacna to La Paz, and another from Caracoles to the Pacific. The executive power is vested, according to the constitution of 1868, in a president elected for four years, and the legislative in a congress. Bolivia is divided into 11 departments: Chuquisaca, Potosi, Oruro, Tarija, Atacama, La Paz, Mejillones, Santa Cruz, Beni or Veni, Cochabamba, and Melgareja. The capital is Sucre.

History.—The W. part of Bolivia belonged to the old empire of the incas of Cuzco, which existed from about 1018–1524, and which had a high degree of civilization. In 1538 the Spaniards entered the country and conquered it, and in 1557 the inca Sairi Tupac resigned his power to Philip II. But the Spanish dominion was not firmly established until 1780. In this year Bolivia, under the name of Charcas, became a part of the viceroyalty of La Plata or Buenos Ayres. In 1809 the disorders in Spain also caused considerable revolutionary movements in Bolivia. The revolution gradually spread over the whole country, and was carried on with varying successes until 1824. In July, 1825, a congress assembled and declared the country independent, and called the new state Bolivia, in honor of Gen. Bolivar, who had materially aided them. Aug. 25, 1826, a constitution was adopted, and Gen. Sucre was elected president. In 1828 he was forced to leave the country. After a terrible civil war Santa Cruz became president, and succeeded in raising the prosperity of the country considerably. In 1835 he invaded Peru, defeated the rebels, and annexed a part of Southern Peru. A federal republic was formed and Santa Cruz elected protector. But Chili and the Argentine Republic, which had jealously watched his growing success, now took up arms against him, and, although at first victorious, he was in consequence of internal disorders defeated by Chili in 1839, and fled to Guayaquil. After some more revolutions, Gen. Ballivian succeeded in sustaining himself as president in 1840. He conducted the government with vigor, and introduced many reforms. Gamarro, who tried to unite Bolivia with Peru, was repulsed, and the Bolivian troops even entered Peru. Peace was concluded June 7, 1842, and the restoration of the former boundaries was agreed upon. But new troubles arose in the interior, and Gen. Velasco superseded Ballivian, only to be himself superseded in Dec., 1848, by Gen. Belzu. Belzu ruled for over six years, having gained the favor of the lower classes. In 1855 he was compelled to resign by the popular indignation against his arbitrary measures, but had enough influence left to secure the election of his son-in-law, Cordova, who continued the obnoxious policy of Belzu, and in Nov., 1857, was defeated by Dr. Linares, who succeeded him. Linares's attempts to introduce reforms remained futile in consequence of the opposition of his opponents. He was deposed in 1861, and was succeeded by his minister of war, Acha. In 1864, after increasing internal strifes, Belzu made an invasion from Peru. In December of the same year Gen. Melgarejo first defeated Acha, and then defeated and killed Belzu. In 1866, Bolivia joined the alliance of Peru, Ecuador, and Chili against Spain, and in the same year settled amicably the border difficulties with Chili. In 1868 a new congress was elected, which legalized all the acts of Melgarejo. In the same year a contract was made with Col. G. E. Church of New York to open steam-navigation on the Madeira. At the same time citizenship was extended to all Americans who declared their intention to settle permanently in Bolivia. In Feb., 1869, Melgarejo overthrew the constitution of 1868, but in May restored it again. In 1869 a new revolution broke out, Melgarejo was defeated, and Morales declared president. In 1872, Morales was shot by his nephew La Fayé, and was succeeded by Don Adolfo Ballivian.

(See Dolence, "Bosquejo Estadistica de Bolivia," 1851; Wappäus, in Stein and Hörschelmann's "Handbuch der Geographie," 7th ed., 1863–70; Cortes, "Ensayo sobre la Historia de Bolivia," 1861; and Reck, "Geographie und Statistik der Republik Bolivia," in Petermann's "Mittheilungen," 1866 and 1867.) A. J. Schem.

Bol'khov, a town of Russia, government of Orel, on the Nugra, 30 miles N. of Orel. It is built mostly of wood, and has about twenty churches, also manufactures of gloves, hosiery, hats, and leather. Hemp, hides, oil, and tallow are exported. Pop. 18,491.

Bol'landists, a term applied to certain Jesuits who compiled, and are compiling, a voluminous work called "Acta Sanctorum," or "Lives of the Saints" (53 vols., 1643–1794). They derived their name from John Bollandus. (See Bollandus.) After his death the work was continued by a number of men, among whom were Daniel Papebroek, Conrad Janning, P. van den Bosche, Suyskens, and Hubens. In 1837 a new Bollandist association was formed by the Jesuits in Belgium, who have continued the work of publication. The sixtieth volume, published in 1867, comes down to the saints of October 29. It is stated that 2000 saints remain whose lives are unwritten, and that at least fifty volumes folio will be required to complete the work. As far as they have gone they have by no means exhausted the old calendars. According to Alban Butler, their work, at least in the early part, does not exhibit much scholarship. (See L. P. Gachard, "Mémoire historique sur les Bollandistes," 1835.)

Bollan'dus, or **Bol'land** (John), a Flemish Jesuit, born at Limburg Aug. 13, 1596. In conjunction with Godfrey Henschen, he published in 1643–58 five volumes of the "Acta Sanctorum." Died Sept. 12, 1665. (See Bollandists.)

Bollène, a French town, in Vaucluse, on a hillside, 24 miles N. of Avignon. It manufactures silk. Pop. 5412.

Bolles (Lucius), D. D., born at Ashford, Conn., Sept. 25, 1779, educated at Brown University, ordained pastor of a Baptist church at Salem, Mass., 1805, and secretary of the Baptist Board of Foreign Missions from 1824. Died Jan. 5, 1844.

Bol'linger, a county in S. E. Missouri. Area, 500 square miles. It is drained by Castor and Crooked Creeks. The surface is hilly or uneven; the soil is fertile. Cattle, grain, tobacco, and wool are produced. Iron ore and kaolin are found here. It is intersected by the St. Louis and Iron Mountain R. R. Capital, Marble Hill. P. 8162.

Bolo'gna, a province of the kingdom of Italy, was previous to 1860 a delegation of the Papal States. It is bounded on the N. by Ferrara, on the E. by Ravenna, on the S. by Florence, and on the W. by Módena. Area, 1392 square miles. The southern part is mountainous; the soil is mostly very fertile. Among the staple products are silk, wine, grain, olive oil, hemp, flax, and rice. Capital, Bologna. Pop. in 1871, 439,166.

Bologna (anc. *Felsina* and *Bononia*), a famous city of Italy, capital of the above province, is situated in a fertile plain near the northern foot of the Apennines, 23 miles by rail S. E. of Módena and 83 miles by rail N. of Florence; lat. 44° 30′ N., lon. 11° 21′ E. Several railways extend from this point to Ferrara, Ancona, Módena, and Florence; that which connects it with Florence crosses the Apennines by numerous tunnels. Bologna is a handsome city with well-paved streets, lined with rich and varied colonnades, which afford shelter from the rain and sun, and it is adorned with many beautiful churches and fine palaces of the nobility, richly furnished with paintings of the old masters. Among the remarkable edifices are the Palazzo del Podestà; the Palazzo Maggiore del Publico; the leaning tower of Asinelli, built about 1110, and 256 feet high; the cathedral, rich in works of art; the church of San Stefano, one of the oldest in Italy, and containing Greek frescoes of the twelfth century; the church of San Petronio, a noble specimen of the Italian Gothic style, adorned with many masterpieces of painters and sculptors; and the church of San Domenico, in which may be seen sculptures by Michael Angelo, and paintings by Guido, L. Caracci, and Colonna. The number of churches in Bologna is about seventy-four.

Bologna is one of the great centres of learning in Italy. Its university, said to have been founded as early as 425, is the oldest in the peninsula. This school attained great celebrity, and was attended by thousands of students from all parts of Europe. The number of its students about the year 1260 is said to have amounted to 10,000. Several female professors have occupied chairs in this institution. The library of the university has about 200,000 volumes and 1000 valuable MSS. Bologna has an academy of fine arts and several theatres. Here are important manufactures of silk goods, velvet, crape, chemicals, paper, musical

instruments, and sausages. This city was the native place of many eminent painters, including Albano, the three Caracci, and Guido; also of Pope Benedict XIV., Galvani, and Malpighi. A town called *Felsina*, founded here by the Etruscans, was perhaps as ancient as the city of Rome. The Romans, who obtained possession of it in 189 B. C., changed its name to *Bononia*. It was taken by Charlemagne in 800 A. D., and was the capital of the most powerful Italian republic from 1118 to 1274. It was annexed to the Papal States in 1514, and to the new kingdom of Italy in 1859. Pop. in 1871, 115,957.

Bologna, da (Giovanni), a Flemish sculptor, born at Douay in 1524, went to Italy when quite young, where he won great and lasting fame. His chief works are the "Rape of the Sabines" in the Loggia di Lanzi at Florence, the "Mercury" of the Uffizi, and the great fountain of Bologna (1564). Died in 1608.

Bologna Stone, a radiated variety of heavy spar (sulphate of baryta) which is found near Bologna, and is sometimes called "Bologna phosphorus." When calcined, pulverized, and made into cakes with gum-water, these cakes, after exposure to the sun, emit a phosphorescent light.

Bo'lor Tagh, or **Belur Tagh,** a high mountain-chain of Central Asia, extends along the W. boundary of the Chinese empire, which it separates from Khoondooz and Kafiristan. Its direction is nearly N. and S. It extends from lat. 35° to 45° N., and is connected with the Hindoo-Koosh on the S. The altitude of its highest peaks is said to be 19,000 feet or more.

Bolse'na (anc. *Volsinii* or *Volsinium*), a town of Italy, on the N. shore of Lake Bolsena, about 20 miles N. N. W. of Viterbo. It is now a small and mean village, but in ancient times it was an important Etruscan city and the capital of the Volsci. It was taken and destroyed in 280 B. C. by the Romans, who built here another city. This was the native place of Sejanus. Pop. 2100. The lake was celebrated in the Middle Ages for its eels. Pope Leo X. visited the island in this lake, on which ruins of beautiful castles, built by the Farnese, are still visible.

Bolt, a dart or pointed shaft, a thunderbolt; also a strong cylindrical pin of iron or other metal. Iron bolts are often used to fasten doors and protect dwelling-houses and warehouses against robbers. Metallic bolts, with a head at one end and a screw-thread and nut at the other, are extensively used in building ships and houses, in order to bind together timber or masonry. Bolts in shipbuilding are usually either iron or copper, and are of various forms and sizes, some being many feet long.

Bol'ton, a post-village of Albion township, Peel co., Ontario (Canada), on the Toronto Grey and Bruce Railway, 25 miles from Toronto, has a large trade in provisions, grain, and flour. It has one weekly newspaper.

Bolton, a post-township of Tolland co., Conn., has quarries of excellent flagging-stone. Pop. 576.

Bolton, a post-township of Worcester co., Mass., on the Boston Clinton and Fitchburg R. R., 43 miles W. N. W. from Boston. It has a public library, and is the seat of the Houghton School. Pop. 1014.

Bolton, a post-village and township of Warren co., N. Y., on Lake George, is noted for fine scenery. P. 1135.

Bolton, a post-township of Chittenden co., Vt., 18 miles N. W. of Montpelier, has manufactures of tubs, measures, boxes, lumber, etc. Pop. 711.

Bolton-le-Moors, an important manufacturing town of England, in Lancashire, on the Croal, 11 miles by rail N. W. of Manchester. Several railways extend from this place to Liverpool, Manchester, and Blackburn. Bolton returns two members to Parliament. It is one of the principal seats of the cotton manufacture, and is the birthplace of the inventors Arkwright and Crompton. The chief products of its manufactories are muslins, fine calicoes, counterpanes, dimities, cotton shawls, and fustians. Here are also paper-mills, foundries, and machine-shops. Numerous coal-mines are worked in the parish of Bolton. The manufacture of cotton and wool was introduced into this place by the Flemings about 1337. Pop. in 1871, 82,854.

Bo'lus [Gr. βῶλος, a "mass"], a dose of medicine given in a mass larger than a pill, yet small enough to be swallowed. The bolus is now seldom used.

Bo'marsund', a fortress of Russia, on the S. E. side of the island of Aland; lat. 60° 12′ 40″ N., lon. 20° 15′ E. This important fortress was taken by the allied English and French fleets in Aug., 1854, and was afterwards blown up by the allies.

Bomb, bŭm [Fr. *bombe;* Lat. *bom'bus*], or **Bombshell,** a kind of shell: a hollow ball of cast-iron which is filled with powder or other explosive substance, is discharged from a mortar or heavy ordnance, and explodes when it strikes the ground or before it falls. The powder in it is usually exploded by a fuse or hollow tube filled with a slow-burning compound, which is ignited by the discharge of the mortar. The largest bomb in ordinary use is thirteen inches in diameter, weighs about 195 pounds, and is charged with seven or eight pounds of powder. Bombs are thrown at angles varying from twenty to forty-five degrees. (See Mortar.)

Bom'ba, a surname or nickname given to Ferdinand II., king of the Two Sicilies, in consequence of his cruel bombardment of Messina Sept. 2–7, 1848.

Bom'bard, an ancient kind of ordnance, very short, thick, and wide in the bore. It differed from the mortar in shooting forth stones instead of iron shells. Some of the bombards used in the fifteenth century propelled stones weighing from 200 to 500 pounds each.

Bombardment. In the strict meaning of the term, a bombardment is the firing from mortars of *bombs*—(that is, shells or incendiary projectiles) into a fortress or place to compel, or aid in compelling, its surrender. "Bombardments," says Bardin (*Dict. de l'Armée*) "are an impolitic and barbarous means, since it attacks non-combatants, and is rather a warfare against the inhabitants than against the armed defenders, exasperating the people and *nationalizing* the strife." Of the bombardments recorded may be mentioned that of Genoa in 1684; of Tripoli in 1685, 1728, and 1747; Barcelona, 1691. Brussels was bombarded in 1694 by Louis XIV. ("3000 bombs and three times as many red-hot shot" were thrown in); Prague was bombarded in 1759; Breda, Lille, Lyons, Maestricht, Mayence in 1793, and Menin, Valenciennes, Le Quesnoy, Ostende, Nieuwpoort, and Lécluse in 1794. Some resisted—as Lille and Mayence—others succumbed. That of Lille is most noted, this small place being subjected for 140 hours (6 days and nights) to the fire of 12 mortars and 24 cannons. During the siege of Antwerp in 1832 thirty-one thousand six hundred and eighty-nine shells were thrown into the citadel without material effect in accelerating the surrender.* Glogau, Breslau, and Schweidnitz were bombarded by the French in 1806 and 1807. During the long two years' blockade, 1809-10, of Cadiz by the French under Marshal Victor it was found impossible to reach the city from the lines with shells from ordinary mortars: long bronze howitzers of 10 inches calibre were cast at Seville (one of which is now to be seen as a trophy (see Fig. 1) in St. James's Park near the Horse Guards, London) and called *à la Villantroys*, from the French colonel of artillery who had proposed them. These, elevated 45°, threw their projectiles 5000 metres (3 miles) into the heart of the city; but to attain this range it was found necessary to load the shells (already weighing 95 lbs.) with lead, to the exclusion of most of the bursting-charge. In bursting they produced no effect, and it is stated that the inhabitants were "scarcely aware of the bombardment."

Fig. 1.

At the siege of Vera Cruz by Gen. Scott in Mar., 1847, three mortar batteries each containing four (10-in.) mortars and a battery of 8 large (8-in.) howitzers were estab-

* Monster-mortars, like monster-guns, date far back in the history of artillery. One made at Ghent and used in the siege of Oudenarde is yet exhibited in the latter city. At the siege of Antwerp a mortar of sixty centimetres (24 inches) calibre, weighing 7000 kilogrammes and throwing a shell of 300 kil. (1100 lbs.), designed by Col. Paixhans, was used. It threw 15 shells in the last two days of the siege. It was thought that if one fell on a magazine it would destroy it; but the shells actually thrown caused no serious damage. (*Spectateur Mil.*, 1833.) It was fired with 8 kil. of powder, but its full charge was 13 kil. Fired subsequently with this charge it burst.

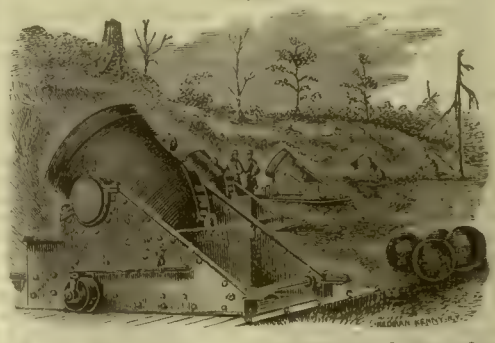
lished bearing upon the quarter called "La Merced." On the 23d Gen. Scott summoned the place and a conference was had; it proving fruitless, the 12 mortars opened on that day and the howitzer battery the day following. The fire continued throughout the 25th, 26th, and 27th. The La Merced quarter soon became ruinous—200 persons are said to have been injured. The fears of an assault caused Gen. Morales to surrender on the 27th. A shot from the Fort St. Juan entered one of our mortar batteries on the 22d, killing by its "wind" (for though knocking off his cap, the skin was not broken) Capt. Jno. R. Vinton, 3d artillery. During the bombardment our fleet kept up a cannonade on the fort which, though intact, surrendered a few hours after the city.

De Blois (*Capitaine d'Artillerie*) published in 1848 a "*Traité des Bombardements*" to maintain that this means has not, as asserted, fallen into disuse; that bombardments reduce places with much less loss of time, munitions and blood than regular sieges; and, finally, to defend the system "against the unjust reprobation cast upon it in characterizing its employment as an act of barbarity."

The cases cited by him, nearly all of which have been referred to in this, scarcely sustain his thesis; still very recent examples go to prove that it is an agent which will continue, under certain circumstances, to be resorted to. Grivel ["*La Marine dans L'attaque des Fortifications et le Bombardment des villes*," Paris, 1856] maintains that in the use of *curved* fires, combined with direct, naval armaments will in future find the most effective method of attacking fortified places. By the term *curved fires* he includes fire by which projectiles from rifled guns (or even smooth-bores) can, by elevating the piece, be sent, at long ranges, into the interior of a place. The increase of calibre of modern artillery, and more especially the introduction of the rifled principle, has made such fires as effective as that from mortars, and the term "bombardment" is now extended to such.

At Odessa this species of bombardment was first effectively employed in 1854. The results attained there suggested to the allies the advantages to be derived from this application of floating artillery, and the subsequent bombardment of Sweaborg was provided for, in 1855, by adding to the fleet 21 mortar vessels which were towed to within about 2 miles (3400 metres) of the centre of the Russian arsenal, while the gunboats of the squadron, keeping in constant motion, approached to distances of two or three thousand metres. The fire was maintained 45 hours during which 4150 projectiles (2828 of which mortar shells) were thrown into the place, killing and wounding 2000 men and destroying magazines, supplies, and shipping.

At an early period of our civil war the project of capturing New Orleans was mooted. The reduction of the Forts Jackson and St. Philip seemed a necessary preliminary. For this object a fleet of 20 mortar vessels bearing, each, one of the new model 13-inch mortars, weighing 11,500 lbs, were prepared and under command of Commander (now Admiral) David D. Porter, added to Admiral Farragut's fleet. These vessels were moored to the right bank of the river at distances of 3000 to 4000 yards from the forts, their positions being screened from view by the woods. The bombardment commenced on the 18th April, 1862, continued six days and six nights during which time 7500 bombs were fired, of which 1080 exploded in the air and 1113 were afterwards counted as having fallen upon the fort and solid ground of glacis and levees, and 3339 were computed to have fallen in the wet ditches and overflowed lands surrounding the fort [for the levees being broken by the shells the site was overflowed]. At the end of this bombardment Admiral Farragut forced the passage with his fleet, and, destroying the Confederate flotilla of iron-clads and gunboats, the forts surrendered.



Fort Jackson has a portion of its guns in casemates of the curtains; the arches were of brick of very moderate thickness, roofed with concrete, affording at the crown a thickness of 3 feet of masonry. These were covered by the earthen parapet and terreplein. In the flanks of the bastions were flanking casemates, the brick arches of which were not only destitute of earth covering but of the usual concrete roofing. All the guns of Fort St. Philip were "en barbette." An engineer officer (Gen. Weitzel) examined the work immediately after its capture, and states:

"Fort St. Philip stands with one or two slight exceptions to-day without a scratch. Fort Jackson was subjected to a torrent of 13-inch and 11-inch shells during 144 hours. To an inexperienced eye it seems as if this work were badly cut up. It is as strong to-day as when the first shell was fired at it. The garrison did not bomb-proof the citadel" (*i. e.* had not placed earth over the heavy timber blindage spanning the walls for that purpose) "consequently the roof and furring caught fire. This fire with subsequent shells ruined the walls so much that I am tearing it down and removing the débris to the outside of the work. Three shot furnaces and three cisterns were destroyed. At several points the breast height walls were knocked down. One angle of the magazine on the north side of the postern was knocked off. Several shells went through the flank casemate arches (which were not covered with earth) and a few through the other casemate arches (where two or more struck in the same place). At several points in the casemates the thirteen inch shell would penetrate through the earth over the arches, be stopped by the latter, then explode and loosen a patch of brickwork in the soffit of the arch about 3 feet in diameter and three quarters of a brick deep, at its greatest depth." "To resist an assault, and even regular approaches, it is as strong to-day as it ever was." Gen. Abbot subsequently examined Fort Jackson, and reports that in one case a curtain casemate arch was broken through where there was 3 feet of masonry and 6½ feet of earth (the earth being a very pervious river formation). It does not appear that, otherwise, the forts were much injured or that the efficiency of their fire upon the fleet was seriously impaired. Doubtless, however, the loss of "morale" in the garrison which induced the surrender was due not merely to the successful passage and the destruction of the floating defences, but to the physical exhaustion arising from the six days bombardment and subsequent furious artillery contest with our fleet; and the bombardment is not therefore to be reckoned as without influence in the final result. This conclusion has an important bearing; for the writer, in calling for the use of mortars, in a memoir prepared for the Navy Department, did not maintain that the passage could not be forced; but contended that "to *pass* these works, merely, with a fleet and appear before New Orleans is merely a raid—no capture. New Orleans and the river cannot be held until communications are perfectly established."

Mortar vessels as well as improvised iron-clads were at an early date provided for our fleet in the upper Mississippi. After the fall of Forts Henry and Donelson and the evacuation of Columbus, the agency of bombardment (in conjunction with the fire of the cannon of the fleet) were first brought to bear upon the fortified position of Island No. 10 in the Mississippi, a short distance below New Madrid (Missouri). The bombardment was kept up from Mar. 16 to April 8 (1862), the mortar vessels at one time numbering sixteen. The works and troops being disseminated over an extensive area (the island being over a mile long and 1½ mile wide), neither the bombs nor the cannonade appear to have had much influence in causing the surrender. A similar remark is applicable to Fort Pillow, situated on the Mississippi, about 100 miles above Memphis.

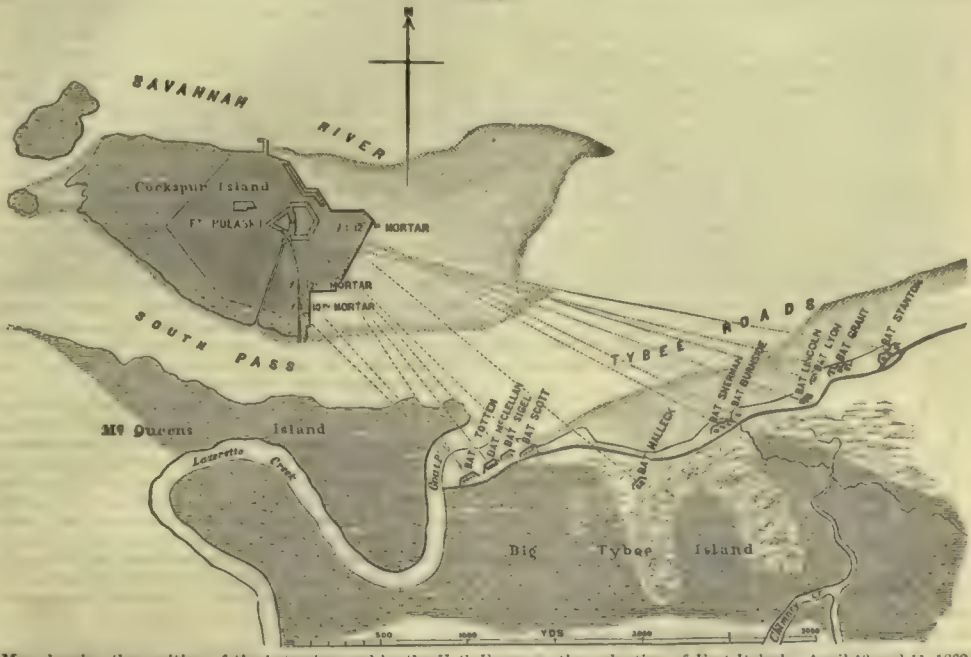
When the course of events decided the establishment of a siege before Yorktown, in April 1862, the Assistant Secretary of the Navy, Mr. Fox, notified Gen. McClellan that ten of the new 13-inch mortars, which had been provided for naval purposes, would be placed at his disposal. As easy water communication made their application practicable, they were accepted and put in battery on the margin of a navigable arm of Wormley Creek, at about 2500 yards distance from the ramparts of the town.

FIG. 2.

Besides the above there were established a battery of ten 10-in. siege mortars at 2000 yards, another of five 10-in. sea-coast mortars at 2500 yards, and another of five 10 and five 8-in. siege mortars at 1600 yards. The place was evacuated before our siege and mortar batteries opened.

Fort Pulaski, situated on Cockspur Island, mouth of Savannah River, Ga., and defending the river approach to Savannah, was captured by bombardment and breaching, April 11th 1862, by the U. S. forces under command of Gen. Gillmore. The fort is pentagonal in form with brick casemates on all sides and brick scarp-wall. It mounted one tier of guns in embrasure and one *en barbette*.

The artillery of the besiegers consisted of thirty-six



pieces distributed in eleven batteries along the shore of Tybee Island, at various distances from the work as follows (see Fig. 3):

No. 1—3 heavy 13-in. mortars	3,400 yards	distant.
" 2—3 " " " "	3,200 "	"
" 3—3 10-inch columbiads	3,100 "	"
" 4—3 8-in. "	3,045 "	"
" 5—1 heavy 13-inch mortar	2,790 "	"
" 6—3 " " " "s	2,600 "	"
" 7—2 " " "	2,400 "	"
" 8—{3 10-in. columbiads / 1 8 " " }	1,740 "	"
" 9—{5 30-pdr. Parrott rifles / 1 48- " James rifle (old 24 pdr.)}	1,670 "	"
"10—{2 84- " " " (old 42-pdr. / 2 64- " " " (old 32-pdr.}	1,650 "	"
"11—4 10-inch siege mortars	1,650 "	"

Batteries 8, 9, and 10 were designed to breach the scarp wall of the work, and all the other batteries to keep down its fire and destroy its barbette armament. Some of the 13-inch mortars were served with the view of breaching the casemate arches.

The bombardment began about 8 o'clock on the morning of April 10th 1862. By half past 9 A. M. all the batteries were in active operation, and were so maintained until the dusk of evening, a period of about ten hours. Throughout the night firing was kept up with two 13-inch mortars, one 10-inch mortar, and one 30-pounder Parrott rifle, the object being to prevent the garrisons making any arrangement for their protection by piling sandbags behind that portion of the wall selected for breaching or against the wall of the magazine, which would be exposed to direct fire

FIG. 3.

Map showing the position of the batteries used by the U. S. Forces in the reduction of Fort Pulaski, April 10 and 11, 1862.

as soon as the breach should be effected in the scarp-wall. During the first day's firing the breach was fairly begun in the pan-coupé connecting the South and South-East faces. On the morning of the 11th, a little after sunrise, all the batteries were again opened, the breach was rapidly enlarged, and by 2 o'clock in the afternoon the scarp wall for a length of about forty-five feet had fallen into the ditch. The fire from the breaching batteries passed freely through two of the casemates, endangering the safety of the powder-magazine on the opposite side of the work. At two o'clock the fort raised a white flag and surrendered.

The wall was found to be greatly shattered, much beyond the limits of actual breach, so that one hundred feet of its length had to be replaced by new brick-work. (See Fig. 4.)

FIG. 4.

Fort Pulaski: front view of breach, from opposite side of ditch.

The number of shots fired is shown below:

From—

Mortars: 1,144 13-in. shells and 588 10-in. shells.
10-in. columbiads: 203 shots and 321 shells.
8- " " : 298 " " 428 "
84-pdr. James rifles (old 42-pdr. rifled): 190 shots and 207 shells.
64- " " " (" 32 " "): 380 " " 16 "
48- " " " (" 24 " "): 133 " " 116 "
30- " Parrott " : 150 shots and 1,101 shells.

It was estimated that 110,643 pounds of metal thrown from the breaching batteries struck the breached portion of the wall, equal to 2,458 pounds per lineal foot of wall, the average distance of the breaching gun from the work being 1,687 yards. With small smooth-bore guns at 500 yards distance, used during the Peninsular war in Spain, it was estimated by Sir W. Dennison that 2,544 pounds of metal was expended per lineal foot of wall, in breaching good rubble masonry backed by earth.

The barbette armament of Fort Pulaski was so much injured during the first day as to render it unserviceable. No injury was inflicted upon the arches by mortar shells. Not more than one-tenth of the 13-inch shells fired fell inside the work.

Only twenty pieces of ordnance of the fort bore on the besiegers' batteries on Tybee Island.

The recapture of Fort Sumter and the occupation of Charleston was from the first deemed by the federal government as of urgent importance.

Fort Sumter was a strong casemated brick-work of five faces, designed to mount a total armament of 135 guns, two tiers in embrasure and one *en barbette*, located on a shoal on the south side of the entrance to the inner harbor, at its narrowest point, and three and a half miles from the nearest part of Charleston City. The scarp wall was 7½ feet thick and 40 feet high above the enrockment from which it rose. The embrasures of the second tier had never been finished, and before the siege began had been walled up with brick. The fort never received its full armament. The nearest land is the north end of Morris Island, nearly due south about 1400 yards distant from the fort, and from this point the island—a narrow strip of sand—stretches along the coast in a southerly direction for a little more than three miles and a half. When siege operations began, the Confederates had possession of the whole of Morris Island, and had erected a strong and heavily-armed earthwork—Fort Wagner—1300 yards from the north end of it, and 2700 yards from Fort Sumter, with the object of holding at least the northern half of the island, in order to prevent the establishment of batteries

thereon, within effective breaching distance of Fort Sumter. They also had defences on the south end of the island to prevent its capture. The plan of attack agreed upon comprised:

1. The capture of the south end of Morris Island by assault.

2. The siege and capture of Fort Wagner.

3. The demolition of Fort Sumter by batteries established on the north end of Morris Island; and

4. The entrance of the monitors into the inner harbor, and their passage up to the city of Charleston.

This programme was carried out with the following results:

On the 10th of July, 1863, the south end of Morris Island and the several batteries erected for its defence was captured by a brigade of infantry, which approached in small boats and landed under fire.

Two open assaults of Fort Wagner—on the 11th and 18th of July respectively—demonstrated the impracticability of carrying the position by that method of attack.

The plan of operations was then changed so as to give the demolition of Fort Sumter precedence, in point of time, over the capture of Fort Wagner, in order not to delay unnecessarily the entrance of the fleet and the capture of Charleston, for although Fort Wagner, in the hands of the besieged, was intended to prevent the erection of effective batteries against Fort Sumter, it did not protect the channel of approach by Fort Sumter to the inner harbor, or any of the channel obstructions erroneously supposed to exist there.

First Bombardment of Fort Sumter.—The demolition of Fort Sumter over the heads of the garrison of Fort Wagner was then the next step in the modified plan.

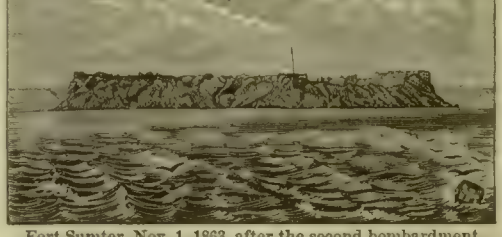
The armament placed in position for this purpose, and their several distances from Fort Sumter, are shown in the following table:

1.	2 8-inch Parrott rifles	3,516	yards distant.
2.	3 6.4 " " "	3,447	" "
3.	2 6.4 " " "	3,428	" "
4.	2 8 " " " and 2 80-pdr. Whitworth rifles	3,938	" "
5.	1 8-inch Parrott rifle	4,172	" "
6.	1 8 " " " and 2 6.4 " " "	4,272	" "
7.	2 6.4 " " "	4,278	" "
8.	1 10 " " "	4,290	" "

Firing from these batteries commenced on Aug. 17th, 1863. Its first stage ended Aug. 23. The firing from the most advanced of these batteries, which were less than 900 yards distant from Fort Wagner, was seriously interfered with and at times partially suspended, by the galling fire from that work, to which the cannoniers were almost constantly exposed. The combined fire of mortars and light pieces, aided by the gunboats and iron-clads, failed to subdue it, and it was necessary occasionally to turn the breaching batteries upon it. The result of this seven days' bombardment is thus given in the official report of the chief of artillery of the siege:

The fire from the breaching batteries upon Sumter was incessant, and kept up continuously from daylight till dark, until the evening of the 23d. For five days all the guns were directed upon the gorge wall, and had resulted it bringing it down to such an extent that on the evening of the 21st a practicable breach had been accomplished. On the morning of the 22d the fire from Batteries Nos. 1, 2 and 3 was directed upon the south-easterly face or right flank of the work, with the view of dismounting the guns on the barbette of this face, which commanded the entrance to the harbor, as well as to destroy the guns on the north-easterly face, which this fire would take in reverse. The fire upon the gorge had, by the morning of the 23d, succeeded in destroying every gun upon the parapet of it, and, as far as could be observed, had disabled or dismounted all the guns upon the parapet of the two faces looking towards the city, which it had taken in reverse. The parapet and ramparts of the gorge were, for nearly the entire length of the face, completely demolished, and in places every thing was swept off down to the arches, the débris forming an accessible ramp to the top of the ruins.

There being nothing further to gain by a longer fire upon this face, all the guns were directed this day upon the south-easterly flank, and continued an incessant fire throughout the day. The demolition of the fort at the close of this day's firing was complete, so far as its offensive powers were considered. Every gun upon the parapet was either dismounted or seriously damaged; the terre-pleine for the entire circuit of the place must have been shattered and ploughed up by our projectiles, hundreds of which had been seen to strike upon it. The parapet could be seen in many places, both on the sea and channel fronts, completely torn away down to the terre-pleine. The place, in fine, was a ruin, and effectually disabled for any immediate defence of the harbor of Charleston.



Having accomplished the end proposed, orders were accordingly issued, on the evening of the 23d, for the firing to cease, having been continuously sustained for seven days. There had been thrown five thousand and nine projectiles, of which about one-half had struck the fort. The weight of metal thrown during the seven days ending Aug. 23d was 289,986 pounds, omitting that expended by the four rifles in the naval battery (No. 4), say 20,000 pounds. The enemy remained in possession of the work, having constructed a system of subterranean galleries within the ruined casemates of the fort.

Second Bombardment of Fort Sumter.—Fort Wagner was captured on the morning of Sept. 7, thus giving the besiegers possession of the whole of Morris Island. Heavy guns bearing upon Fort Sumter were at once established in Fort Wagner and on the north end of the island. Up to this time the gorge wall only had been breached. The south-east face, the only one seen from Morris Island except the gorge, remained standing, although badly shattered in many places. Reports having been made by reconnoitering parties that the garrison were attempting to remount guns on this face, it was determined to cut down that face with the rifled guns established in Fort Wagner and on the north end of this island, so that the fire of the besiegers passing over the débris of the gorge and north-east face would take the casemates of the opposite or channel fronts in reverse, and prevent the mounting of guns there.

Fire was opened on the south-east face on the 26th of October. The armament used for this purpose comprised one 10-inch, two 8-inch and nine $6\frac{4}{10}$-inch rifles, one 10-in. columbiad and four 10-inch sea-coast mortars. The distances of these several guns from Fort Sumter varied from 2,500 to 1,300 yards.

In a few days the S. E. face was more completely a ruin than the gorge wall. The débris formed a continuous and practicable ramp, reaching from the water to the summit of the breach. The two faces of the work seen from Morris Island were both in ruins, many of the casemate arches of the channel fronts had fallen in from the reverse fire, and the entire armament of the work had been destroyed or removed to prevent destruction. (For these notices of bombardments of Forts Pulaski and Sumter, the writer is indebted to the distinguished officer who commanded, Gen. Q. A. Gillmore.) A view of the work after the second bombardment is shown below.

FIG. 5.

Fort Sumter, Nov. 1, 1863, after the second bombardment.

The recent great European war furnished numerous examples of a resort to bombardment as an auxiliary to siege or blockade, of which the most conspicuous are the sieges of Strasburg and Paris. The former city, fully invested on the 8th of August, was attacked by regular siege approaches and surrendered (Sept. 27) only after, its walls breached, it became exposed (according to Gen. Ulrich) to the "doubtful chances of sustaining an assault." But a bombardment from Krupp guns, howitzers and mortars commenced Aug. 18th and threw shells into the streets of the city with ruinous effect and to the serious injury of the venerable and magnificent cathedral.

Paris was invested soon after the surrender at Sedan; and it was doubtless believed that its surrender would follow. No attempt or regular siege was ever made and it was not until late in December (probably owing to the difficulty of collecting siege artillery, the Strasburg and numerous minor sieges employing all available) that from the heights of Chatillon a cannonade was opened upon the southern forts. Early in January shells commenced to be thrown from the same point into the southern quarters of Paris and this was continued till the 27th. On the 21st January a violent cannonade and bombardment was opened upon the detached forts of St. Denis and also upon the

town, 120 shells falling there in one hour (22d) and many hitting the ancient cathedral. The population took refuge in Paris. At the time (1840–48) the defenses of Paris were constructed the extreme range of projectiles did not exceed two and a half miles; and it was in relation to the artillery service of the day that the forts were located. Hence they did not perfectly protect Paris (as intended) from bombardment, which, however, had no important

Fig. 6.

Fort Sumter, Dec. 9, 1863. Interior view from the south-west angle—from a drawing made by the Confederates. The original bears the autograph approval of the Confederate general commanding the Department of South Carolina, Georgia, and Florida, and may therefore be assumed to be correct. Morris Island and the U. S. fleet are seen on the right, and Sullivan's Island and Fort Moultrie on the left. The right of view shows the gorge face and the top of the adjoining face looking down the harbor. Both were breached by the Morris Island batteries, although oblique to the line of fire. The débris formed an easy ascent from the water to the crest. The left and foreground show the other faces, in ruins from the reverse fire from Morris Island. The interior slopes were subsequently made much steeper by the besieged than shown in the view, and were revetted with gabions. Bomb-proof quarters were also constructed under the ruins for the garrison. These quarters consisted of a continuous gallery all around in the ruins, protected on top and on the side next Morris Island by thick embankments of earth. Throughout the autumn of 1863 the ruins contained no mounted guns. It was simply an infantry outpost. It repulsed a naval assault from small boats Sept. 8, 1863, and was held until February, 1865. On April 14, 1865, the fourth anniversary of its capture by the Confederates, the U. S. flag was again raised over the ruins with imposing ceremonies.

effect. The distance from the Prussian batteries on the heights of Chatillon to the nearest fort (Vanvres) is about one mile—to the nearest part of the "*enceinte*," 2¼ miles; to the populous regions of the southern quarters 3 miles; to the Palace of Luxembourg, Pantheon, Hotel des Invalides, and the "monumental" portions of Southern Paris, 3½ miles. Hence the modern rifle (Krupp's guns of the Prussians) extends its range (with high elevation) to all these regions.

In 13 days from 5th to 18th of January it is computed that about 500 shells a day fell in Paris, hitting and wounding 308 persons, a fourth of whom mortally, *i. e.*, an average of 25 persons each day and 25 shells for each person hit. The shells made little distinction of age or sex though it is asserted that during the latter days more women and children than men were struck. The number of private edifices hit averaged 50 a day, double the number of persons hit. The surface over which the bombardment extended was about 2000 hectares (5000 acres) or one-fourth the total area of Paris. (The batteries being mainly on the heights of Chatillon south of Paris and of the southern forts this area is mostly on the left or south bank of the Seine.) The population of this portion may be estimated at about 500,000. The Pantheon, the Museum, the Hotel des Invalides (with its church and tomb of Napoleon) are among the monumental structures of this portion of the city. All were more or less injured.

It is asserted (L. Simonin, Revue des Deux Mondes, Feb., 1871) that in a military point of view the bombardment by itself was wholly inefficacious.

Nevertheless, though a city so extensive as Paris may endure a protracted bombardment, the destruction of life and property is something serious, and it must especially be so in *small* fortified towns; hence the increased range and accuracy of hollow projectiles have rendered the old system of closely surrounding a town with a continuous rampart or enceinte both useless and dangerous unless supplemented by a system of detached forts sufficiently in advance to keep an enemy's artillery beyond that distance, from which he might destroy the place by his shells; and it is now contemplated to supplement the fortifications of Paris by a second and much further removed cordon of detached forts.

Small forts, by *themselves*, may however very safely defy bombardment, if reasonably provided with casemates or bomb-proofs. Fort Jackson, subjected to vertical fire only, was materially intact after a six days' bombardment, though doubtless the surrender was in *some* degree due to it. Fort Pulaski surrendered because its walls were thrown down and its magazines exposed, by the agency of *direct* fire. Fort Sumter was reduced to a ruin by breaching fire directed against its exposed vertical walls, but it never surrendered: while the little sand work, Fort Wagner, defied both direct and curved fire for two months and was finally evacuated. An attempt to destroy by shells the bomb-proof or timber blindage covered with sand which sheltered its garrison—the exposed end of which could be seen over the parapet—signally failed; the sand running in quite as fast as it could be blown away by shells.

Hence, though the fortification of capitals, great naval or military depots, must, if attempted at all, be undertaken on an immense scale, yet the applicability of modern rifled guns (in place of *mortars*) to the purposes of bombardment, and the increased range of their curved fire, has not destroyed the utility of small forts as elements of the outer cordon of great fortified places, or, used isolatedly, for the special purposes of guarding great military routes, railroads, or water approaches.

J. G. Barnard, *U. S. Army*.

Bom'bax, a genus of large soft-wooded trees of the natural order Sterculiaceæ (which see), nearly related to the baobab tree. They are natives of tropical climates, especially America. They yield great quantities of cotton, but the fibre is short, does not spin well, and is not durable. Nevertheless, in India cloth is made of it to a small extent. It would probably make good paper.

Bombay', a presidency of British India, is bounded on the W. by the Indian Ocean or Arabian Sea. Area, 87,639 square miles. A large portion of the surface is mountainous. The long range of the Western Ghauts extends parallel to the sea-coast in a direction nearly N. and S. Between this range and the sea is a narrow tract called the North and South Concans, the climate of which is very hot and moist. The annual rainfall in the Concans is more than one hundred inches, in consequence of the vapors of the south-west moonsoon being intercepted by the Ghauts. This province is intersected by the Nerbudda and Taptee rivers, which flow westward into the Gulf of Cambay, and is also drained by the sources of the Godavery and the Kishna, which run in the opposite direction. The soil of the valleys and plains is fertile. Cotton and rice are the staple productions of this region, which contains the richest cotton-fields of India. Sugar and indigo are also raised here. Among the indigenous plants are the cocoa-palm and the teak tree. Bombay has important manufactures of silk stuffs

and of woollen and cotton cloths. In 1867 it had 1159 miles of railway in operation. The administration of this country is vested in a governor and three councillors, subject to the superintendence, direction, and control of the governor-general of India in council. To this province belongs the naval force for all the presidencies. Capital, Bombay. The annual revenue for the fiscal year 1864–65 amounted to £9,393,160. Pop. in 1872, 13,983,998.

Bombay [from the Port. *Bom Bahia* (or *Boa Bahia*), *i. e.* "good harbor"], a city and seaport of British India, the capital of the above province. It is situated on the S. end of the island of Bombay and on the Indian Ocean; lat. 18° 56′ N., lon. 72° 54′ E. It has an excellent harbor, affording good anchorage for ships of the largest size, and is favorably situated for commerce, being in a direct line between Calcutta and Aden. It is the W. terminus of a railway which connects it with Calcutta. The mean temperature is 82° F. At the southern end of the island, which is eight miles long and three miles wide, is the fortified European town, and one mile N. of that is the Black Town, in which the Hindoos and Mohammedans reside. Between these two towns is the esplanade and the barracks. Among the most remarkable buildings are the town-hall, mint, cathedral, the custom-house, the library of the Asiatic Society, the Elphinstone Institution, the missionary houses, the Grant Medical College, the great Hindoo temple of *Momba Dêvi*, and the Jamsetjee Hospital. The chief articles of export are raw cotton, shawls, opium, coffee, pepper, ivory, and gums. Bombay imports raw silk, sugar, and silk stuffs from China, and cotton yarn, cotton cloth, hardware, glass, copper, etc. from England. The exports of Bombay for the year ending Mar., 1870, amounted to £24,690,819; the imports for the same year were £22,232,435. Bombay, excepting Calcutta and Canton, is the greatest commercial emporium of Asia, and is the chief Indian port connected with the establishment of steam navigation between India and England. There is now a regular communication by steamers between Bombay and England through the Red Sea and the Mediterranean. Steamers also ply between this port and Point-de-Galle in Ceylon. Among the races that compose the population of Bombay, the Parsees, descended from the Persian fire-worshippers, are distinguished for their respectability, wealth, and commercial enterprise. The Parsee family of Lowjee is extensively engaged in shipbuilding, which is regarded as the most important interest of the city. Pop. in 1871, 646,636.

Bombay, a post-township of Franklin co., N. Y. Pop. 1488. It contains a part of the reservation of the St. Regis Indians.

Bombay Hook Island, Delaware, is a part of Duck Creek hundred, Kent co., and is separated from the mainland by Duck Creek. Its N. end (lat. 39° 21′ 46″ N., lon. 75° 30′ 19″ W.) has a brick lighthouse 36 feet high, with a fixed white light 46 feet above the water.

Bom'bazine [Lat. *bombycina*, "made of silk"], a thin fabric, of which the warp is silk and the woof is worsted. It is manufactured extensively at Norwich, England, for ladies' dresses and for mourning apparel.

Bomb-Ketch, an obsolete form of mortar-vessel, which was nearly seventy feet long and drew eight or nine feet of water. It was usually rigged with two masts, and carried two mortars.

Bomb Lance, an explosive missile used in the whale-fishery, consists of a cylindrical shell of iron armed with a sharp and heavy point of a triangular form. It is charged with powder, introduced through an opening at the rear end of the shell, and the opening is afterwards stopped by melted lead. The lance is discharged from the barrel of a musket, and is exploded by a fuse after it has penetrated the body of the whale.

Bomb-Proof, a term applied to a military structure of great thickness and strength which is capable of resisting the explosive force of bombs falling on it. The powder-magazine of a fort is usually protected by a bomb-proof vault built of stone or brick, and covered with three or four feet of earth. (See CASEMATE.)

Bom'ford (GEORGE), an American officer, born in New York in 1780, graduated at West Point in 1805, chief of ordnance, U. S. A., May 30, 1832, with the rank of colonel. He was engaged as an engineer upon the construction of fortifications till 1812, when he was placed on ordnance duty. To the skill and inventive talent of this invaluable officer the country was largely indebted preceding and during the war of 1812–15 with Great Britain, he being almost the only one well informed as to the manufacture of ordnance and ordnance stores; he also introduced the bomb-cannon under the name of "columbiads." Brevetted lieutenant-colonel Dec. 22, 1814, for meritorious services in the ordnance department. After 1842 he was on inspection duty, and made many ingenious and valuable experiments on the best forms for heavy artillery. Died Mar. 25, 1848, at Boston, Mass., aged sixty-eight.

GEORGE W. CULLUM, *U. S. Army.*

Bomford (JAMES V.), a son of the preceding, born in New York, graduated at West Point in 1832, served with distinction in the Mexican war, winning several brevets. He became colonel of the Eighth Infantry in 1864, and served with honor in the late civil war.

Bom Jardim (*i. e.* "good garden"), a town of Brazil, province of Bahia, in a rich and beautiful valley, 20 miles S. by E. of Crato. It has a considerable trade and large manufactures of millstones. Pop. about 6000.

Bo'na, or **Bonah** [Fr. *Bone;* anc. *Hippo Regius;* called by the Arabs *Beled-el-Arab*], a fortified seaport-town of Algeria, in the province of Constantine, is on a bay of the Mediterranean, 74 miles N. E. of Constantine; lat. 36° 54′ N., lon. 7° 48′ E. It is finely situated at the foot of a hill near the mouth of the river Seibous or Sebus, and is defended by Fort Cigogne, which is on the top of the hill. Bona was occupied by the French in 1832, since which it has been much improved. It has new markets, bazaars, and reading-rooms; also manufactures of tapestry, saddles, and native clothing. Wool, hides, grain, and coral are exported from it by steamboats. Near Bona are the ruins of the great city of *Hippo Regius,* once the see of Saint Augustine. It was destroyed by the Arabs in 646 A. D. Pop. in 1866, 17,841.

Bona (GIOVANNI), a cardinal of the Roman Church, was born at Mondovi, in Piedmont, Oct. 10, 1609, was made cardinal in 1669, and died at Rome Oct. 25, 1674. His principal works are "De Divina Psalmodia," 1663, and "Res Liturgicæ," 1671. He was equally distinguished for piety and learning.

Bo'na De'a (the "good goddess"), a Roman divinity, the sister or wife of Faunus, was worshipped only by the Roman women, who concealed her name from the men. According to some authorities, she was identified with Ops. Her annual festival was celebrated on the 1st of May, in the house of the consul, with mysterious rites, from which all males were strictly excluded. Her symbol was a serpent.

Bo'na Fi'de [Lat.], "in good faith," without fraud, innocently; without notice. A *bona fide* purchaser is one who purchases for a valuable consideration, without notice. This subject is of great importance in equity jurisprudence. It is a general rule that a court of equity will grant no relief against a purchaser in good faith. If, on the other hand, the purchaser has notice, actual or constructive, of the equitable rights of others, he will stand in no better position than the person from whom he acquired his title. Thus, if a mortgage of land were cancelled through mistake by a mortgagee, a purchaser in good faith from the mortgagor would hold free from the mortgage. On the other hand, if he had notice of the facts, a court would set up the mortgage against him as well as against the mortgagor. (See NOTICE.) The same question is presented in the case of bills of exchange, promissory notes, and other commercial paper. If the acceptor or maker has a defence to it as to the payer, it will in general be shut off as to a purchaser in good faith before maturity. But if the purchaser had notice of the defence before the purchase, he would stand in the same position as the payee.

Bonald, de (LOUIS GABRIEL AMBROISE), VICOMTE, an eminent French publicist and ultra-royalist, born near Milhau Oct. 2, 1754. He emigrated in 1791, and published a "Theory of Political and Religious Power" (3 vols., 1796). Having returned to France about 1806, he was elected to the Chamber of Deputies in 1815, and acquired much influence under the Bonapartes and the Bourbons. He advocated absolutism and the infallibility of the pope. In 1823 he became a peer of France. Among his works is "La Législation Primitive" (3 vols., 1820). Died Nov. 23, 1840. (See HENRI DE BONALD, "Notice sur le Vicomte de Bonald," 1841.)

Bo'naparte, a town of Van Buren co., Ia., on the Des Moines Valley R. R., 35 miles N. W. of Keokuk. It has one of the largest woollen factories W. of the Mississippi, an extensive furniture and sash, door, and blind establishment, flouring mill, saw-mill, pottery, etc. It possesses fine water-power. It has one weekly paper. Pop. of township, 1341. ED. "VAN BUREN DEMOCRAT."

Bonaparte (CARLO), a Corsican lawyer, born Mar. 29, 1746, was the father of Napoleon I. He married in 1767 Letitia (Letizia) Ramolino, and had five sons and three daughters. He became counsellor and assessor of Ajaccio in 1773. Died Feb. 24, 1785.

Bonaparte (CAROLINE MARIE ANNONCIADE), queen of Naples, a daughter of the preceding, was born at Ajaccio

in 1782. She was married in 1800 to Joachim Murat, who became king of Naples in 1808. She was the mother of two sons and two daughters. After the death of her husband she took the title of countess of Lipona. Died in 1839.

Bonaparte (Charles Lucien Jules Laurent), prince of Canino, a son of Lucien Bonaparte, was born in Paris May 24, 1803. He was distinguished as an ornithologist, and took little part in political affairs. His wife was a daughter of Joseph Bonaparte. He resided in Philadelphia and Italy, and published "American Ornithology, or a History of the Birds of the U. S." (3 vols., 1825–33), which is highly commended. Died in Paris July 30, 1857.

Bonaparte (Jerôme), king of Westphalia, a brother of Napoleon I., was born at Ajaccio Nov. 15, 1784. He entered the French navy in 1800, and during a visit to the U. S. married, in 1803, Miss Patterson of Baltimore, without the consent of Napoleon. This marriage was annulled by order of Napoleon in 1805. Jerome served as general of brigade against the Prussians in 1806, and was crowned king of Westphalia in 1807. In the same year he married a daughter of the king of Würtemberg. He lost his throne in Oct., 1813, and led a division at Waterloo in June, 1815. After he had passed many years in exile he became a marshal of France in 1850. Died June 24, 1860.

Bonaparte (Jerôme Napoléon), a son of the preceding by his first wife, was born in England in July, 1805, and graduated at Harvard in 1826. He greatly resembled Napoleon I. in appearance. He left two sons, Jerôme and Charles Joseph. Died June 17, 1870.

Bonaparte (Jerôme Napoléon), an American and French officer, grandson of Jerôme Bonaparte, king of Westphalia, and grand-nephew of Napoleon I., born 1830 at Baltimore, Md., graduated at West Point in 1852, and till his resignation of his lieutenancy in the Mounted Riflemen, Aug. 16, 1854, served on frontier duty. He entered the French imperial army Sept. 5, 1854, as second lieutenant of the Seventh Dragoons, became chef d'escadron Third Cuirassiers Aug. 15, 1865, and was transferred Mar. 16, 1857, to the Dragons de l'Imperatrice. He served in the Crimean war against Russia 1854–55, engineer at Balaklava, Inkerman, Tchernaia, and the siege of Sebastopol; for all of which active and distinguished services he was decorated by the sultan of Turkey with the "Medjidie Order," made knight of the Legion of Honor of France, and received the Crimean medal from the queen of England. He was in the Algerian campaign in 1856–57, engaged in several actions with the Kabyles; in Italian campaign against Austria 1859, engaged at Montebello, Solferino, and various outpost affairs, receiving for his gallantry the French "medaille d'Italie" and the decoration of "Military Valor" from the king of Sardinia; in garrison at various posts 1859–67, and in the guard of the empress of France 1867–72. On the fall of the empire he with difficulty escaped from the hands of the Commune in Paris.

George W. Cullum, *U. S. Army.*

Bonaparte (Joseph), king of Spain, the eldest brother of Napoleon I., was born in Corsica Jan. 7, 1768. He studied law, married Julie Marie Clary, and was elected to the French Council of Five Hundred in 1797. He negotiated the treaty of Lunéville with Austria in 1801, and that of Amiens with England in Mar., 1802. On these and other occasions he showed considerable talents for diplomacy. Urged by the imperious will of Napoleon, he accepted the throne of Naples in 1806, though he does not appear to have been ambitious of such a position. He was transferred in May, 1808, to the throne of Spain against the will of the majority of the Spanish people, who obstinately resisted the domination of the French. During his nominal reign many battles were fought between the French and the allied English and Spanish armies, who expelled him from Spain in June, 1813. In 1815 he emigrated to the U. S., and lived at Bordentown, N. J., under the name of the count de Survilliers. He died at Florence, in Italy, July 28, 1844. (See A. du Casse, "Mémoires et Correspondance du Roi Joseph," 10 vols., 1854; Thiers, "History of the Consulate and the Empire.")

Bonaparte (Letizia Ramolino), the mother of Napoleon I., was born in Corsica Aug. 24, 1750. She was considered a beauty, and had an uncommon intellect. According to her son Napoleon, "she had a great character, with much energy, elevation, and pride." She was married to Carlo Bonaparte in 1767. In 1804 she received the title of Madame Mère. Died Feb. 2, 1836.

Bonaparte (Louis), a brother of Napoleon I., was born at Ajaccio Sept. 2, 1778. He entered the army in youth, and served at Arcola and Rivoli (1797). In compliance with Napoleon's will, he married Hortense de Beauharnais in 1802, and became king of Holland in June, 1808. He and his wife separated about 1807, in consequence of their incompatibility. As nominal king of Holland he was not able to pursue the policy which he preferred, but was compelled by Napoleon to sacrifice the interests of the Dutch to the designs of the emperor, who was offended because Louis was not sufficiently subservient. Louis abdicated the throne in 1810, after which he resided in Italy. He was the putative father of Napoleon III. Died at Florence June 29, 1846. (See Thiers, "History of the Consulate and the Empire;" "Mémoires sur la Cour de Louis Napoléon et sur la Holland," Paris, 1828.)

Bonaparte (Louis Napoleon). See Napoleon III.

Bonaparte (Louis Lucien), a son of Lucien and a nephew of Napoleon I., was born Jan. 4, 1813. He was elected to the French National Assembly in 1849, became a senator in 1852, and grand officer of the Legion of Honor in 1855. He is distinguished for his labors in philology and chemistry.

Bonaparte (Lucien), prince of Canino, a brother of Napoleon I., was born at Ajaccio May 21, 1775. He was an active and energetic republican in the French Revolution. In 1795 he married Christine Boyer, a woman of obscure birth. He was chosen in 1798 a member of the Council of Five Hundred, in which he opposed the Directory. On the 18th Brumaire (Nov., 1799) he displayed great resolution, and efficiently promoted the success of Napoleon. Lucien became minister of the interior in Dec., 1799, ambassador to Spain in 1800, and a tribune in 1802. Having lost his first wife, he married in 1803 a widow named Jouberthon without the consent of Napoleon, who was angry at the match. Lucien went into exile, and refused the throne of Italy, which Napoleon offered him on condition that he should divorce his wife. He was in France during the Hundred Days, 1815, and actively supported Napoleon in that crisis. He passed the latter part of his life in Italy, and died at Viterbo June 29, 1840, leaving five sons and six daughters. With the exception of his brother Napoleon, he was undoubtedly the most eminent and talented member of his family. (See Lucien Bonaparte's "Autobiographic Memoirs," 1836; P. W. Forchhammer, "Denkrede auf den Fürsten von Canino, L. Bonaparte," 1840.)

Bonaparte (Lucien Louis), a son of Charles Lucien, was born at Rome Nov. 15, 1828. He entered the priesthood, and on Mar. 13, 1868, was made a cardinal priest.

Bonaparte (Marie Anne Élise), princess de Piombino, a sister of Napoleon I., was born in Corsica Jan 3, 1777. She was married in 1797 to Felix Bacciochi, a Corsican officer, and received in 1805 the title of princess of Lucca and Piombino. She was for about six years (1809–14) grand duchess of Tuscany, which she ruled with ability. Died Aug. 7, 1820.

Bonaparte, Napoleon. See Napoleon I.

Bonaparte (Napoléon Joseph Charles Paul), Prince, a son of Jerôme, king of Westphalia, was born at Trieste Sept. 9, 1822. His mother was a daughter of the king of Würtemberg. As a professed democrat he was elected to the French Constituent Assembly in 1848. In 1852 he received the title of prince, and was recognized as the heir of his cousin, Napoleon III., in case the latter should die without issue. He married Clotilde, a daughter of King Victor Emmanuel. His features resemble those of his uncle, Napoleon I. He was banished from France in 1873.

Bonaparte (Pauline), Princess Borghese, born at Ajaccio in 1780, was the most beautiful of Napoleon's sisters. In 1801 she became the wife of General Leclerc, who died in 1802. She was married in 1803 to Prince Camille Borghese, an Italian, from whom she soon separated. A statue of Pauline, executed by Canova, is said to resemble the Venus of Praxiteles. Died in 1825.

Bonaparte (Pierre Napoléon), a son of Lucien, was born at Rome Sept. 12, 1815. He passed his youth as an adventurer in America, Italy, and Greece, and committed several homicides. In 1869 he murdered, in his own house near Paris, Victor Noir, for which he was sentenced to pay a fine.

Bona'sa, a genus of gallinaceous birds of the family Tetraonidæ, and one of the genera included in the popular term "grouse." It comprises the hazel-grouse, a European bird, the *Tetrao bonasa* of Linnæus. This bird, which is about as large as the common partridge, is prettily mottled with gray and reddish brown. It prefers the deep solitude of the forests. Its flesh is so highly esteemed that it is consistent with German etiquette to serve it twice in succession on the table of a prince. Another species of this genus is the American ruffed grouse (*Bonasa* (or *Tetrao*) *umbellus*), which is about eighteen inches long, and is called the pheasant in Pennsylvania and the partridge in New

York and New England. The male has on each side a large shoulder tuft or ruff. In the breeding season it struts with erected ruff and tail like a turkey-cock. The loud thumping or "drumming" sound heard in the localities frequented by this bird is produced by the bird beating on its sides with its wings. It is heard most often in the morning and evening. This handsome bird makes its nest on the ground in the forests. Its flesh is a favorite article of food.

Bonaventu'ra (Giovanni di Fidanza), Saint, an eminent Italian scholastic theologian, born in Tuscany in 1221, was called the Seraphic Doctor. He taught theology in Paris, became general of the order of Franciscans in 1256, and a cardinal in 1273. He had great influence in the Church, and was venerated for his ascetic piety and the miracles ascribed to him. Bonaventura was one of the most eminent of the Schoolmen. "His great mind," says Neander, "grasped the whole compass of learning as it existed in his time." Among his numerous works are "Breviloquium," "Biblia Pauperum" ("Poor Man's Bible"), and "Itinerarium Mentis in Deum" ("Progress of the Mind towards God"). He died July 14, 1274, was canonized in 1482, and was made a doctor of the Church in 1587. (See J. C. Boulé, "Histoire de la Vie de Saint Bonaventure," 1747; Ignaz A. Fessler, "Bonaventura's mystische Nächte, oder Leben und Meinungen desselben," 1807.)

Bonaventure, a county in the E. part of Quebec, is bounded on the S. by the Bay of Chaleurs, and is intersected by the Grand Cascapediac, Matapediac, and several other rivers of considerable size. The Mistouche and Restigouche, forming its S. W. boundary, separate it from New Brunswick. Area, about 3200 square miles. Capital, New Carlisle. Pop. in 1871, 15,923.

Bonavis'ta, a port of entry and capital of Bonavista district, Newfoundland, is one of the oldest towns on the island. It has a rather poor harbor, a jail, and a fine Anglican church. Its people are mostly fishermen, but agriculture is also carried on. Pop. about 2600. The lighthouse on Cape Bonavista (lat. 48° 41′ 56″ N., lon. 53° 5′ 20″ W.) is a catoptric revolving white and red light, 150 feet above the sea.

Bond [from the root of the noun *band*, and the verb *bind*], in law, an instrument in writing, sealed and delivered, whereby a person binds himself to pay a sum of money. It is also called a deed. It is either simple or with a condition. A bond is said to be simple when the engagement to pay is absolute. An instrument in the form of an ordinary promissory note becomes a simple bond if executed under seal. The most common form of bond is one executed under a condition. The instrument in this case consists of two parts—the engagement to pay, and the condition upon which the engagement to pay will become inoperative and void. The condition may be either for the payment of money or the performance of an act, such as the faithful execution of the duties of a public office or of agency or other authority. When for the payment of money, it is usually called a "money bond." In this case it is common to make the engagement to pay, called the penalty, double the amount expressed in the condition of the bond. The penalty will not, however, necessarily limit the amount of the recovery. In other words, in certain cases more may be recovered than the amount named in penalty of the bond; as, for example, the real debt and the interest accruing from delay in payment. At an early day, if the money named in the condition was not paid punctually, the whole penalty could be recovered. Courts of equity, however, regarded this result as in the nature of a forfeiture, and confined the recovery to the debt and the interest. When the bond is given for the performance of an act, the recovery is limited to the damages sustained by non-performance. The person who enters into the bond is called the *obligor;* the person to whom the engagement is made is termed the *obligee.* When it is executed by two or more persons, they may be either "joint" obligors or "joint and several;" that is, they may either bind themselves collectively, or both collectively and separately. An execution of the instrument by two persons simply would be joint. Express words should be used to create a "joint and several" obligation. This is an important distinction where some of the obligors are sureties, as is usual in bonds executed by incumbents of a public office. In the case of a *joint* bond, if one of the sureties should die, his estate would be discharged both in law and equity. This would not be the case had it been both *joint* and *several,* since the individual obligation would remain, though that which is joint would be at an end. A bond is otherwise termed a specialty. It is of a higher grade than an ordinary contract, which is termed a simple contract. Accordingly, if A should owe money to B for goods sold or services rendered, and should give his bond for the amount, the original claim would be merged in the bond, and if the debt were not paid an action could be brought only on the bond. This would not be the case if A had given B his promissory note, or other engagement not under seal, for the amount of the claim. If the note were not paid at maturity, the original cause of action would remain. A bond, as a general rule, is not negotiable, but assignable. A purchaser would take it subject to the equities between the original parties. (See Assignment.) The obligor of the bond commonly professes not only to bind himself, but his heirs, executors, administrators, etc. However, if these words were omitted, his obligation would be transferred to these successors in interest to the extent of the assets received from the obligor, it being a general rule in the U. S. that a debtor's property, both real and personal, is liable for his debts in the hands of heirs and other successors in interest. T. W. Dwight.

Bond, a county in Central Illinois. Area, 400 square miles. It is traversed by Shoal Creek, an affluent of the Kaskaskia River, which touches the S. E. corner of the county. The surface is diversified by fertile, undulating prairies and tracts of woodland. Cattle, wool, grain, and butter are important products. Coal is found here. It is intersected by the St. Louis Vandalia and Terre Haute R. R. Capital, Greenville. Pop. 13,152.

Bond, a township of Lawrence co., Ill. Pop. 1087.

Bond (George Phillips), an American astronomer, born at Dorchester, Mass., May 20, 1825, graduated at Harvard in 1845. He aided his father, W. C. Bond, in the observatory at Cambridge, and wrote several works, among which is an article "On the Construction of the Rings of Saturn," and a work on Donati's comet. D. Feb. 17, 1865.

Bond (Henry), M. D., born at Watertown, Mass., Mar. 21, 1790, graduated at Dartmouth in 1813, settled in Philadelphia as a physician in 1819, where he gained a high reputation. He published, besides many professional papers, a "History and Genealogies of Watertown" (1855), one of the best works of its class. Died May 4, 1859.

Bond (Thomas Emerson), D. D., M. D., a physician and Methodist writer, born at Baltimore, Md., in Feb., 1782. He became a professor in the medical college of Maryland, and afterwards a local Methodist preacher. He edited the "Christian Advocate and Journal," an influential Methodist publication, for twelve years, and wrote important pamphlets in defence of his Church. Died Mar. 19, 1856.

Bond (William Cranch), an American astronomer, born at Portland, Me., Sept. 9, 1789, was a watchmaker. He was appointed director of the observatory of Harvard University. He distinguished himself by his observations on Saturn, and discovered a satellite of that planet. Died Jan. 29, 1859.

Bon'dager, in Scotland, a laborer who rents a cottage from a farmer under an obligation to work for him at current wages at certain seasons. There are male and female bondagers. When wanted, they are obliged to turn out, though at a sacrifice of wages.

Bonded Warehouse. See Warehousing System.

Bön'der, a name given to the yeomanry of Sweden and Norway. The bönder often claim an aristocratic origin, and display a rude and antiquated hospitality to visitors. They have many virtues as a class, and constitute a large majority of the population.

Bondoo', or **Bondou,** a small kingdom of Western Africa, in Senegambia, is about lat. 14° to 15° N. and lon. 11° to 13° W. It is bounded on the E. by the river Falemé, which separates it from Bambook. The surface is mostly level; the soil is fertile, well watered, and extensively covered with forests. The staple productions are cotton, indigo, maize, tobacco, and millet. Among the forest trees are the baobab and acacia. Iron is abundant here, and wild animals are numerous. The Foolahs are the most numerous of the tribes which inhabit Bondoo. The government is an absolute monarchy. Capital, Bulibani, a mean town on the Falemé. Pop. estimated at 1,500,000.

Bone [Ger. *Bein;* a word found in various forms in all Germanic languages], the substance of which the hard internal skeleton or framework of most vertebrate animals is formed, although some of the lower fishes have no bony skeleton, one of cartilage taking its place, while the surface (exoskeleton) of some of these cartilaginous fishes is covered with bony plates. In animals below the vertebrates there is no true bone, for the hard internal shell ("cuttle-fish bone") of certain cephalopods differs in composition from bone.

Living bone is of a reddish-white tint externally, and is of a much deeper red within. It consists of two parts: (1) an organic substance called ostein (converted by boiling into gelatine), besides a little fat, nerves, and blood-vessels, and some cartilage, amounting in all to about one-third of

the whole, though the percentage is greater in young subjects. If a bone be soaked in dilute hydrochloric acid for a sufficiently long time, the organic matter alone remains, having the form of the original bone, and being flexible, tough, and translucent. If, on the other hand, a bone be burned in a hot fire with a strong blast of air, the animal matter is all burned away, leaving (2) the earthy or inorganic matter, a white, brittle mass, with just the form of the original bone. It consists of calcium phosphate (which constitutes more than half the weight of the whole bone), together with calcium carbonate and fluoride, magnesium phosphate and sodium chloride, with traces of other elements. The proportions vary in different parts of the skeleton, in the same bone at different ages, in various diseases, and in the corresponding bones of different species. Bones are usually covered at their ends and in some other parts by cartilage; but the greater part of the surface is covered by a tough, skinny membrane called periosteum; and hollow bones have a similar membrane within, called endosteum. These membranes are of the utmost importance in the growth, nourishment, and repair of bones. The endosteum also nourishes the marrow, a substance the importance of which in the animal economy has but recently been duly appreciated. It is probable that the marrow, like the closed glands, has, especially in the fœtal state, an important part in the preparation of nutriment for the organism generally.

From the periosteum, arteries and nerves enter the bone, traversing the longitudinal "Haversian canals," which are from $\frac{1}{250}$ to $\frac{1}{705}$ of an inch in diameter, and lined with a delicate membrane resembling periosteum. Each canal is surrounded by concentric layers of bone, constituting an "Haversian rod" or "system" in which are certain variable vacuities called "Haversian spaces," which appear to be produced by the absorption and disassimilation which is continually going on in all tissues. Bone also contains innumerable "bone-cells," each occupying a cavity called a "lacuna." The lacunæ send out branches called "canaliculi," each $\frac{1}{11000}$ to $\frac{1}{20000}$ of an inch in diameter, which communicate freely with each other, and which are filled with blood-plasma. Bones are said to consist of two kinds of tissue, the compact and the cancellous; but the two differ only in relative density and the relative size of the contained cavities, in the proportion of oily matter, and perhaps in the proportion of earthy ingredients, which appears to be greatest in compact bones.

Osseous tissue is liable to several diseases, such as caries, necrosis, rachitis (rickets), osteomalacia, periostitis, cancer, exostosis, etc., each described under its own name. (For descriptions of the several bones and of their relations to each other, see OSTEOLOGY and the names of particular bones, such as CLAVICLE, HUMERUS, etc.)

CHAS. W. GREENE.

Bone, Chemical Composition of. Bones consist of bone-cartilage, or ossein, and earthy salts, besides a certain quantity of fat, which is easily removed by ether, and is not considered as a constituent of the bone. By burning bones till white, the ossein is destroyed, and the earthy salts remain as brittle bone-ash. By subjecting the bones to the action of dilute hydrochloric acid the earthy salts are dissolved and removed, and the ossein remains as a flexible, translucent substance retaining the forms of the bones. This ossein or bone-cartilage consists of about 50.13 carbon, 7.07 hydrogen, 18.45 nitrogen, and 24.35 oxygen. By long boiling with water it is completely dissolved, being converted into gelatine, which sets to a jelly on cooling. The ratio of ossein to earthy salts is very variable in different animals, and also in the bones of the same animal. Human bones average, perhaps, ossein 34 and earthy salts 66 per cent. The earthy salts contain, in 100, phosphate of lime 83.889, phosphate of magnesia 1.039, carbonate of lime 13.031, fluoride of calcium 0.470, and chloride of calcium 0.286. M. Papillon found that the bones of pigeons and rats which he had fed with food containing phosphate of strontia and phosphate of alumina contained considerable quantities of these compounds. Bones undergo considerable changes in composition in certain diseases.

Uses of Bones.—Bones are extensively used for soup, though it is stated by Liebig and others that the gelatine derived from them is not only valueless as food, but positively objectionable. Others strenuously deny the truth of the statement. In the arts, bones are employed as substitutes for ivory for buttons, handles of knives, brushes, etc., and for combs; they are also used as cattle food in the form of bone-meal; as a fertilizer, either in the form of bone-meal, bone-ash, or after treatment with sulphuric acid. They are used for the manufacture of BONE-BLACK (which see), of gelatine, of phosphorus, of phosphate of soda, superphosphate of lime for raising bread, and bone-ash is used for cupels.

C. F. CHANDLER.

Bone-Ash is the residue left on burning bones; it amounts to about 66 per cent. of the weight of the original bones. It consists of the earthy salts of the bone, the composition of which in 100 parts is given above. Bone-ash is largely exported from South America. It is used as manure, for the manufacture of superphosphates, phosphorus, cupels, and is an important constituent of English china.

C. F. CHANDLER.

Bone-Black, or **Animal Charcoal,** is the residue left on calcining bones in close vessels. The bones are placed either in retorts, like those used in making coal-gas, or in iron pots. On the application of heat destructive distillation takes place. Combustible gases escape, accompanied by vapors which condense to ammoniacal water and offensive oils. Bone or Dippel's oil is thus produced. The residue in the vessels amounts to about 50 per cent. in weight of the original bones. It is passed between rollers, and separated by sieves into different sizes. Bone-black usually contains, after exposure to the air, from 1 to 6 or 7 per cent. of moisture. The average composition of dry bone-black, in 100, is carbon, containing nitrogen, 10, phosphate of lime, including a little phosphate of magnesia, 88, carbonate of lime, 8, sulphate of lime, 0.2, alkaline salts, 0.8, oxide of iron, 0.1, and silica, 0.3.

Animal charcoal possesses to a high degree the property of absorbing gases, and also of absorbing various substances from solutions. Its action is not limited to any one class of substances. It absorbs vegetable bases, bitter principles, astringent bodies, coloring-matters, iodine, metallic oxides, salts, etc. Its chief application in the arts is for the purification of sugar. The raw sugar is dissolved in water, more or less completely freed from suspended impurities by the aid of blood, and filtered through bags of cotton cloth, and then passed through high cylinders of iron containing the bone-black. It is thus almost completely decolorized, and at the same time freed from lime and other salts, and from certain organic substances which interfere with crystallization. On subsequently concentrating the solution in the vacuum-pan it readily yields perfectly white loaf sugar. (See SUGAR.) By washing with warm water, and subjecting to a red heat in suitable retorts, the black is *revivified*, when it may be used again. Sometimes it is also purified by fermentation and treatment with small quantities of dilute acids or alkalies. By repeated reheatings, however, the black becomes greatly condensed, owing to the semi-fusion of the phosphate of lime, and its decolorizing and purifying power is reduced to such a degree that it must be replaced by fresh black. This exhausted black, as well as the fine dust which is not suited for sugar-refining, finds a ready market for the manufacture of superphosphates to be used as fertilizers, for the manufacture of phosphorus, etc. In France, pulverized bone-black in fine powder is often boiled with the raw sugar before it goes to the bag filters.

When bone-black is to be used for decolorizing acid solutions, the phosphate of lime is first removed from it by dilute hydrochloric acid. Bone-black is sometimes employed to remove lime from highly calcareous waters. Many other forms of charcoal possess these properties, but none of them have been found so well adapted for the use of sugar-refiners as bone-black. Under the name of ivory-black animal charcoal is used as a pigment, especially for the preparation of shoe-blacking.

C. F. CHANDLER.

Bone Creek, a township of Butler co., Neb. P. 384.

Bone-Dust, a valuable manure, obtained by grinding bones in stamping-mills, by heavy revolving wheels, or by passing them through toothed iron rollers. The bone is sometimes subjected to the action of hot water and steam in a digester at a temperature of about 275° F., which dissolves out two-thirds of the gelatine and leaves a friable mass. Bone-dust is applied to the soil either in its ordinary insoluble state or as dissolved bones, the fertilizing force of which is expended in the first year.

Bone-Gelatine. See GELATINE.

Boneset, a common name of the *Eupatorium perfoliatum*, an herbaceous plant, a native of the U. S., growing in low or moist places. It is a bitter weed, having hairy leaves, which are united at the base around the stem, and are serrate, very veiny, and wrinkled. An infusion of the leaves is used as a tonic, diaphoretic, etc.

Bon'fire [*bann*, a "beacon," and *fire*], a fire kindled as an expression of public joy in the open air, usually on a conspicuous place, as the top of a hill or in the street of a city. The materials consumed are tar-barrels, wood, and other combustibles. The practice of kindling bonfires is very ancient.

Bon'gar (*Bungarus* or *Pseudoboa*), or **Rock Snake,** a genus of venomous serpents, natives of the East Indies. They are allied to the *naja*, and are distinguished by a

much-keeled back, which has a row of hexagonal scales larger than the rest. The *Bungarus annularis* sometimes measures six or seven feet in length.

Bon'ham, a city and capital of Fannin co., Tex., on Bois d'Arc Creek, 270 miles N. N. E. of Austin, and on the line of the Transcontinental R. R., has two fine flouring mills, two newspapers, a saw and planing mill, several benevolent societies, two churches, four schools, and one carriage factory. Pop. 928.

W. S. Gass, Ed. "Texas News."

Bonham (Milledge L.), a statesman and Confederate general, born in South Carolina about 1815, graduated at South Carolina College in 1834, became a lawyer, and served in the Mexican war. He was a member of Congress from 1856 to 1860, and became governor of South Carolina in 1862–64.

Bonha'nis, a township of Wilcox co., Ala. Pop. 1709.

Bonheur (Rosa), an eminent French painter of animals, born at Bordeaux Mar. 22, 1822, was a pupil of her father, Raymond Bonheur. She produced in 1850 "The Nivernais Ploughing," in the Luxembourg gallery, "The Horse Fair" (1853), "Horses in a Meadow," and "Cows and Sheep in a Hollow Road."

Bonhomme, a county of Dakota, bordering on Nebraska. Area, 450 square miles. It is bounded on the S. by the Missouri River. The soil is fertile, and adapted to the production of grain. Capital, Bonhomme. Pop. 608.

Bonhomme, a post-village, capital of Bonhomme co., Dak., on the Missouri River, 36 miles W. of Yankton.

Bonhomme, a post-township of St. Louis co., Mo. Pop. 6162.

Bo'ni, or **Bony,** a state in the S. W. peninsula of the island of Celebes, is about 80 miles long, and is on the W. side of the Gulf of Boni. The surface is partly mountainous. The soil of the N. part is fertile, producing rice, sago, and cassia. The natives manufacture cotton cloth and articles of gold and iron. The British attacked the Bonese in 1814, and killed their king as a punishment for their piracy.

Boni, Gulf of, called also **Bughis Bay,** separates the two southern peninsulas of Celebes. It is nearly 200 miles long, and from 40 to 80 miles wide. It is dangerous to navigation from its numerous reefs.

Bon'iface [Lat. *Bonifacius*] **I.,** Saint, Pope, was elected in 418 A. D. Saint Augustine dedicated several works to him. Boniface died in 422.—Boniface II., a Goth, born at Rome, succeeded Pope Felix IV. in 530. Died in 532 A. D.—Boniface III. was chosen pope in 607, and died the same year. He was the first to whom the title of "universal bishop" was given by the Greek emperor (Phocas).—Boniface IV., Pope, born at Valeria, in Italy, succeeded Boniface III. in 608. He converted the pagan Pantheon of Rome into a church. Died in 615.—Boniface V., a native of Naples, became pope in 619. He died in 625, and was succeeded by Honorius I.—Boniface VI., a native of Rome, succeeded Formosus in 896, and died fifteen days after his election. He was an abandoned character.—Boniface VII., considered by some authors an anti-pope, was elected in 974 as a rival of Benedict VI. He was driven out of Rome in 975. He was starved to death in prison in 985.—Boniface VIII., Cardinal (Benedetto Gaetani), was born at Anagni about 1228. He became pope in 1294. He issued a bull forbidding all the clergy to pay any tax on ecclesiastical property, by which he was involved in a contest with Philip the Fair of France. He excommunicated Philip, who accused the pope of heresy and simony, and caused him to be imprisoned at Anagni. Boniface was skilled in both civil and canon law, and published the sixth book of "Papal Decretals." He died Oct. 11, 1303. (See Dante, "Inferno," canto xxvii.; W. Drumann, "Geschichte des Papstes Bonifacius VIII.," 2 vols., 1852; Luigi Tosti, "Storia di Bonifazio VIII.," 1847.)—Boniface IX. (Pietro Tomacelli) succeeded Urban VI. in 1389. He was a despotic ruler, and was accused of selling benefices and indulgences. He died Oct. 1, 1404, and was succeeded by Innocent VII.

Boniface [Lat. *Bonifacius*], (Winfrid), Saint, called the Apostle of Germany, was born in Devonshire, England, about 680. He began in 716 to preach in Germany, where he converted a great number of people and founded schools and monasteries. He was made bishop by Pope Gregory II. in 723, and in 732 Gregory III. made him archbishop and primate of all Germany. In 718, in 723, and again in 738, he visited Rome, and brought the German Church into complete subjection to the papacy. Pepin le Bref, whom he consecrated king of the Franks in 752, appointed him archbishop of Mainz. June 5, 755, he was assassinated by a pagan mob at Dockum in West Friesland, and his remains were finally taken to the famous abbey of Fulda, which was founded by him. (See Willibald, "Life of Saint Boniface;" George W. Cox, "Life of Saint Boniface," 1853.)

Bonifa'cio, Strait of (anc. *Fretum Gallicum*), is between Corsica and Sardinia. The narrowest part of it is 7 miles wide. The navigation is obstructed by rocks, which are favorable to the production of coral, a large quantity of which is obtained here.

Bo'nin, or **Archbishop Islands,** in the Pacific Ocean, extend from lat. 26° 30′ to 27° 44′ N., and are about lon. 142° E. They are divisible into three groups, the most northern of which are called Parry Islands, and the most southern, Baily Islands. Area, about 120 square miles. Peel Island, which is one of the middle group, is occupied by a small number of European and Polynesian colonists, the only inhabitants of the group. Spain claims this group.

Bonito, bo-nee'to, a name given to several fishes of the family Scomberidæ, which are allied to the mackerel. One of these, *Thynnus pelamys*, sometimes called the stripe-bellied tunny, is a native of tropical seas, and is often seen pursuing the flying-fish. It is a beautiful fish, about two and a half feet long, and resembles a mackerel in form. The color of its back and sides is a brilliant steel-blue. Four dark lines extend along each side of the belly from the throat to the tail. Its flesh, though rather dry, is eaten

The Bonito.

and relished by many, but is sometimes poisonous. The term bonito is applied to two species found in the Mediterranean, the *Auxis vulgaris* and the *Pelamys Sarda*. The former is of a uniform blue color, without stripes, and has an average length of about fifteen inches. It is usually eaten salted. The *Pelamys Sarda* is distinguished from the tunny by large and strong teeth. It measures about two feet in length, and is found on our Atlantic coast.

Bo'nitz (Hermann), a German philologist, born July 29, 1814, became professor at Vienna in 1849. He published an edition of the "Metaphysics" of Aristotle (2 vols., 1849), "Platonic Studies," and other works.

Bonn (anc. *Bonna*), a city of Rhenish Prussia, beautifully situated on the left bank of the Rhine, 19 miles by rail S. S. E. of Cologne. It is on the railway which connects Cologne with Coblentz. It has an ancient cathedral, which is a fine specimen of the Romanesque style. Here are manufactures of cotton goods, earthenware, and soap. Bonn is the seat of a celebrated university founded in 1818, which has a library of 200,000 volumes, and is attended by nearly 1000 students. Connected with it are an observatory, a botanic garden, and a museum of natural history. The buildings of this institution are excellent and very extensive. Niebuhr, A. W. Schlegel, Hermes, Simrock, and other eminent men have been professors in this university. Here are several large and elegant hotels for the accommodation of tourists, who are attracted by the picturesque scenery of the vicinity. Bonn is a very ancient town. *Bonna*, which was an important Roman station, is said to have been rebuilt by the emperor Julian in the fourth century. It was conquered by the French in 1802, and annexed to Prussia in 1814. It is the native place of Beethoven. Pop. in 1871, 26,020.

Bonnefemme, a township of Howard co., Mo. P. 1249.

Bon'ner (Edmund), an English prelate notorious as a persecutor, was born about 1495. He gained the favor of Henry VIII., who about 1532 sent him on a mission to the pope, and appointed him bishop of Hereford in 1538 and bishop of London in 1539. Having showed himself hostile to the Protestant cause, he was deprived of his bishopric in 1549, but he was restored on the accession of Queen Mary in 1553. He was the principal instigator of the bloody persecutions which disgraced the reign of Mary. Refusing to take the oath of supremacy on the accession of Elizabeth in 1558, he was imprisoned in the Marshalsea, where he died Sept. 5 1569. (See Froude, "History of England.")

Bonner (Robert), proprietor of the "New York Ledger," was born in the north of Ireland April 28, 1824. He came to America in early youth and learned the trade of a printer. He went to New York in 1844 and purchased the "New York Ledger," which, by energy and business talents, he made extremely successful. He has made munificent gifts of money to the College of New Jersey at Princeton, and is noted for liberality in charitable causes.

Bon'net, in fortification of the old school, is a small defence-work constructed at salient angles of the glacis or larger works. It has only two faces, with a parapet three feet high and ten or twelve broad. A larger kind, with three salient angles, is called a priest's bonnet.

Bonnet (Charles), LL.D., F. R. S., an eminent Swiss naturalist and philosopher, born at Geneva Mar. 13, 1720. He made discoveries in the reproductive and other functions of insects, etc., which he announced in his "Treatise on Insectology" (2 vols., 1745). He published in 1754 a valuable work "On the Use of the Leaves of Plants." Among his other works (all in French) are "Considerations on Organized Bodies" (1762) and "Philosophical Palingenesis" (3 vols., 1769), in which he argued that the Christian revelation is true. Died May 20, 1793. (See H. B. de Saussure, "Éloge historique de C. Bonnet," 1787; J. Trembley, "Mémoire de la Vie de C. Bonnet," 1794; A. Lemoine, "C. Bonnet de Genève, Philosophe et Naturaliste," 1850.)

Bonnet Carré, a post-village in St. John the Baptist parish, La. It has one weekly newspaper.

Bonnet Piece, a gold coin of James V. of Scotland, so called because the king's head is decorated with a bonnet instead of a crown. It weighed seventy-two grains, and was struck in 1539. "In beauty and elegance of workmanship," says De Cardonnel, "it approaches the nearest to the Roman coins, and very much surpasses all the coinage at that period or ever since."

Bonneval, de (Claude Alexandre), Count, a French adventurer, born in Limousin July 14, 1675. He deserted from the French army and entered the service of Austria, in which he distinguished himself by several daring exploits, and obtained the rank of general. Having quarrelled with the governor of the Low Countries, he was condemned to death by a court-martial about 1724, but the penalty was commuted to exile. He entered the Turkish army, took the name of Achmed, and became a pasha of three tails. Died Mar. 27, 1745. (See D. Fassmann, "Leben des Grafen von Bonneval," 1740; "Memoirs of the Bagshaw Count Bonneval," London, 1750.)

Bonneville (Benjamin L. E.), an officer, born in Tennessee, graduated at West Point in 1815. He became a captain in the U. S. army, and served in the Mexican war (1846–47). He published a "Journal of an Expedition to the Rocky Mountains."

Bon'nycastle (Charles), born at Woolwich, England, in 1792, was a son of John, noticed below. He was one of the professors brought over by Mr. Jefferson for the University of Virginia in 1825. He at first occupied the chair of natural philosophy, and afterwards that of mathematics. He published a treatise on "Algebra," one on "Inductive Geometry," and various scientific papers. Died at Charlottesville, Va., Oct., 1840.

Bonnycastle (John), an English mathematician, born in Buckinghamshire. He was professor of mathematics at the Royal Military Academy at Woolwich, and published, besides other works, "Elements of Geometry" (1789) and "Elements of Algebra" (2 vols., 1813), which were highly esteemed. Died May 15, 1821.

Bonnycastle (Sir Richard Henry), a son of the foregoing, born in 1791, served in Flanders and against the U. S. (1812–15), becoming in 1848 lieutenant-colonel of British engineers. Most of his life was passed in British North America. He published "Canada as it Was, Is, and May Be," and other works on Canada, and one on "Spanish America" (1818). Died in 1848.

Bo'no, a post-township of Lawrence co., Ind. Pop. 1005.

Bonpas, a township of Richland co., Ill. Pop. 891.

Bonpland (Aimé), an eminent French botanist, born at La Rochelle Aug. 22, 1773. He studied medicine and botany at Paris, and formed a friendship with Humboldt. In 1799 he accompanied Humboldt in a scientific expedition to South America, where they travelled about five years. After their return to France he published a splendid work entitled "Equinoctial Plants collected in Mexico" (2 vols., Paris, 1808–16, with 140 plates). He had collected 6000 species of plants, of which 3500 were entirely new. He became professor of natural history at Buenos Ayres in 1816, and departed in 1821 on an excursion to the Andes, but as he was passing through Paraguay he was arrested by order of Dr. Francia, who detained him as a prisoner nearly ten years. After his release in 1831, he resided for many years in Uruguay, and died May 11, 1858. Humboldt, Bonpland, and Kunth published a work called "Nova Genera et Species Plantarum" (7 vols., 1815–25, with 700 plates).

Bonpland, Lake, of California, is in Eldorado co. It is about 14 miles long and 6 miles wide.

Bo'nus (a Latin adjective signifying "good") is used in English to denote a premium given for a charter or other privilege; also a special allowance or extra dividend to the shareholders of a company. If the previous dividend has been 4 per cent., and if the profits of the current year are equal to 5 per cent. of the capital, the directors sometimes declare a dividend of 4 per cent., and add a bonus of 1 per cent.

Bonus, a post-township of Boone co., Ill. P. 1164.

Bonyhad, a town of Hungary, in the county of Tolna, 106 miles W. of Szegedin. Pop. in 1869, 5610.

Bony Pike (*Lepidosteus*), a genus of ganoid fishes found in America, especially remarkable as being examples of a type of fishes now almost extinct, but which in the old red sandstone period were extremely numerous. To this genus belong the gar-pike and the alligator-gar of the U. S. The latter is sometimes six feet in length, and resembles the alligator in appearance. It is thought by some naturalists to approach the character of the reptiles.

Bonze, a name given to the priests of Fo (or Booddha) in Japan and China. They profess celibacy, and are addicted to ascetic practices and superstitious notions and rites. They are generally very ignorant. Some of them live in monasteries. They usually wear a yellow dress. (See Gautama.)

Boo'by (*Sula fusca*), a species of aquatic birds of the same genus as the gannet, and of the family Pelicanidæ. It is found on the coasts of tropical and sub-tropical countries. It seldom swims, but is a bird of powerful wing, and feeds on fish, which it catches near the surface of the water by a sudden plunge. It is remarkable for stupidity and slow movement on the land, and will sometimes remain motionless when it is approached by a man, and permit itself to be killed with a club. The boobies are persecuted by the albatross and frigate-bird, which sometimes compel them to give up the fishes they have caught, and even to disgorge those they have devoured.

Bood'dha, or **Buddha,** the title of an Asiatic divinity, or rather of a series of divinities, whose votaries or worshippers are said to constitute more than one-third of the human race. The name is derived from the Sanscrit verb *bud* ("to know"), and signifies, literally, "wisdom," and also the "wise one" or the "sage;" but it has been applied particularly to certain divine sages who are believed to have become possessed of transcendent power as well as wisdom. It is one of the remarkable features of the Hindoo system of belief, Brahmanical as well as Booddhistic, that they hold the doctrine of accumulative merit to an unlimited extent; not only can one in the present life, by persevering prayer, penance, and sacrifice, gradually acquire great merit, but this merit is supposed to be transferred to his account in the next life. It is thus that those beings who become Booddhas are enabled to acquire, in the course of innumerable transmigrations, an amount of merit which for all practical purposes may be termed infinite; and this merit, according to a commonly-received belief, confers infinite wisdom and power. The aspirants to the Booddhaship (called in Sanscrit Bôdhisattvas) are supposed, in the course of their countless transmigrations, to be born sometimes as *dêvas* (inferior deities), and sometimes in the form of various animals, even insects or animalcules; but when they are about to assume the rank of supreme Booddha, they are always born as men, and their human form becomes glorified, when they attain their highest perfection and take their rank as the supreme power of the universe. But they continue only a very brief period in this exalted state; they soon die and pass into nirvâna—a term variously interpreted; according to the majority of Booddhists, including those of Ceylon, it signifies simply non-existence or annihilation, but according to others, the soul, in nirvâna, does not cease to be—it merely ceases its separate existence, having been absorbed into the essence of the supreme, eternal Spirit. The latter view is held by the Aishwarikas of Nepaul, who call the eternal Spirit Adi-Booddha (*i. e.* "First Booddha"). It is supposed that there have been innumerable Booddhas in the eternity of the past, each being separated from his nearest successor by a space of several thousand years. (For a more particular account of the doctrines of the Booddhists, see Gautama.)

J. Thomas.

Bood'room', Budroum, or **Bodrun,** a seaport-town of Asiatic Turkey, in Anatolia, is finely situated on the N. shore of the Gulf of Cos, about 96 miles S. of Smyrna; lat. 37° 2′ N., lon. 27° 25′ E. It has a safe harbor, defended by a castle which was built by the Knights of St. John in 1402. The streets are narrow and dirty. Pop. estimated at 12,000. It probably occupies the site of the ancient *Halicarnassus*, a great city of Caria, the birthplace of Herodotus. Here are remains of ancient magnificence.

Boofa'rik, or **Boufarik,** a village of Algeria, 18 miles S. S. W. of Algiers, on the road from Algiers to Blidah and Oran, is an important military station. It has a trade in cotton, grain, olives, oranges, etc. Pop. 5627.

Book [Anglo-Saxon, *boc;* Ger. *Buch*, supposed to be from the root of *Buche*, "beech," because thin pieces of this wood were used for writing before paper was invented], the general name of almost every literary composition, but in a more limited sense applied only to such compositions as are large enough to form a volume. Short and fugitive pieces are denominated *pamphlets*, in contradistinction to books, which are of greater length and embrace more general or permanent topics. According to their sizes and forms, books are distinguished as folios, quartos, octavos, duodecimos, etc. The materials of which books have been composed have differed much in different nations and in different stages of civilization. Plates of lead and copper, bricks, stone, and wood were anciently employed for this purpose. At a later period the bark of trees formed the chief material, as is indicated by the meaning of the words which in some languages are employed for the term book (*liber*). Materials for books were afterwards derived from the Egyptian plant papyrus, but as the demand increased more durable materials were sought for, and leather, made chiefly from the skins of goats or sheep, was employed for this purpose. Next followed the use of parchment, on which the ancient manuscripts were chiefly written, but all these systems were swallowed up by the invention of PAPER, which, though long known in China and Japan, was not made in Europe until about the thirteenth century, and facilitated the circulation of knowledge to an incalculable extent. The first books were in the form of blocks and tablets, but when flexible materials came into use it was found more convenient to roll them up in a scroll, called by the Romans *volumen* (from *volvo*, to "roll"). Books were anciently written on one side only of rolls of paper or parchment. When written on both sides they were called *opisthographi*. To save the expense of writing materials, it was sometimes the custom to wash out what were considered unimportant writings, and use the paper or parchment again. These were then called PALIMPSESTS (which see). Leaves of palm-trees are still used in parts of India, etc. for making manuscript books.

REVISED BY C. W. GREENE.

Book'binding, the art of fastening together and enclosing the leaves of a book for preservation and use, has been practised for many centuries. Long before the invention of printing the written leaves of missals and other books were united together, and enclosed in covers of wood, parchment, and other materials. Much labor and expense was bestowed on a single volume, and the covers were frequently decorated with jewels and ornaments of gold and silver. Some of these volumes are still preserved in the monasteries and museums of the Old World, and are objects of interest and study.

Since the invention of printing, and especially from the beginning of this century, the rapid advancement of the mechanical arts, the extension of education, and the general diffusion of knowledge have made books as much a necessity of life as food and clothing, and their preservation is therefore an object of importance.

The modern operations of bookbinding may be grouped in two main divisions—"forwarding" and "finishing," the first comprehending what is necessary for the preservation of books, the latter pertaining to their embellishment. In each of these departments there are various subdivisions, which may be noted. The sheets are generally received from the printer in bundles containing a thousand, more or less, of one kind.

The first operation is to fold the sheet, by means of a thin piece of ivory or bone, about nine inches long, called a "folder." The object of this is to bring the pages together in regular order; and on the care with which the folding is done much of the appearance of the book depends. The next process is "gathering" and "collating." Gathering consists in putting together one each of the various sheets of which the book is made, and collating is the examination of the numbers 1, 2, 3, etc., which are placed at the foot of the outside page of the folded sections, and which are called "signatures."

The next thing required is to make the book solid. This is done by placing it either in a hydraulic press or under some other form of pressure, such as the nature and size of the book may require. After being pressed the book is prepared for sewing by having indentations made in the back of the sheets by passing them over rapidly revolving circular saws. They are now sewed on a frame called a "sewing-bench," each sheet being sewed around twine bands, which are afterwards fastened to the boards. Much of its durability depends on the sewing being well done, and all large work is improved by having the sections at the beginning and end of the book cross or "whip-stitched."

The greater part of the labor has so far been done by women, who by practice acquire great dexterity in the performance of the various processes. Machinery has been used with considerable success in folding, and lately a machine has been introduced for sewing, but all work in the early stages is still in great measure done by hand-labor. In the more advanced stages of binding machinery is used extensively, and our description will be in accordance with the methods pursued where large quantities are constantly being bound, and where machinery is used to facilitate production. The book, after being removed from the sewing-bench, and having about an inch of the twine left on either side to fasten to the pasteboard cover, has the end leaves applied. These are of colored, white, or marble paper, as the nature of the work may require. The book is now "cut" by being fastened tightly in a cutting-machine, and a vibrating knife is brought down on the edge, which is cut off smoothly at the point desired. The edges are either left white, are colored by being sprinkled with color thrown on finely with a brush, or are marbled, which is done by dipping the edge on colors which float on the surface of gum-water. The "comb edge" so much used is made by a comb being drawn through the colors on the surface of the gum-water before the book is dipped. If the book is to have gilt edges, it is placed in a press and a coating of red color applied. The edges are then sized with white of egg, and gold-leaf laid over the size. When the sizing is thoroughly dry, the gold is burnished with agate or bloodstone.

A coating of glue is now applied to the back, and when partially dry by a slight hammering on the back a round is formed in the front and back. The book is then fastened firmly between iron clamps in a backing-machine, lately invented, and a roller is pressed heavily across the back, which turns part of it over either side of the clamps, making a groove to hold the board of which the inside of the cover is made. The piece of silk braid or colored cloth which projects over the leaves of the back inside the cover, and is called the "head-band," is now fastened with glue, and the whole back has a lining of cloth or strong rope paper firmly applied to it with glue and paste. The open or spring back is now made by applying two thicknesses of paper, open in the centre, but fastened at the edges—one thickness of the paper being attached to the back of the book, and the other thickness to the leather or other material of which the outside cover may be made. The book is now ready for the cover, the outside of which may be of muslin, sheepskin, calf, Turkey morocco, or such other materials as may be desired. The cover, or "case," is made by boards being cut larger than the leaves of the book, over which the outside material is fastened by glue or paste, a space being left between the two boards large enough to fit the back of the book in, the boards being required to fit nicely into the grooves made in backing. Much of the material used for boards of common books is straw, but all good work should have a hard, smooth board made of rope. The edge of the board is frequently ground off on a rapidly revolving emery wheel, which makes a bevelled edge, now much used.

After the cover is dry the embellishment is done by stamping in gold, blank, and colors. If in gold, the leather or cloth is sized with albumen, and gold-leaf laid on with oil. The ornamental die or lettering being fastened in an "embossing-press" and heated, it is brought with sufficient pressure on the cover to make the gold-leaf adhere. The surplus gold being brushed off, leaves the impression of the die. The dies are cut in brass or steel, and very elaborate and beautiful designs, which a few years ago would have taken many weeks to execute by hand-labor, are now produced almost instantly by the embossing-press.

The cover having received all intended ornament, the back of the book is glued and fitted into it, the end-papers are pasted to the inside of the cover, and the book is placed in a press to remain till dry. When removed from the press it is ready for the publisher and the public.

"Half binding," much used for library and reference books, is that style of binding where the back and corners are covered with leather, and the sides with cloth or paper.

The old process of "forwarding" by hand, in which each

book is backed by a hammer and cut singly by press and plough, and the book finished by the slow method of former times, is still followed to some extent in small binderies, but requires no minute description, as the system is almost obsolete for books in quantities.

In America, during the last quarter of a century, machinery for the binding of books has been invented, improved, and applied to a greater extent than in any other country; hence books in large editions are produced in a style of great elegance and durability, and at prices so moderate as to be within reach of all classes of the community. The number of persons engaged in bookbinding throughout the various States is very large. In the cities of New York, Philadelphia, and Boston many of the establishments employ from 100 to 300 hands (about one-half of the number being women), and produce from 1000 to 5000 volumes per day. James Somerville, *Bookbinder, New York.*

Book-Catalogues. See Catalogues of Books.

Books, Censorship of. See Censorship of Books.

Book-Club, a society for the purchase of books to be read by its members. It is customary in book-clubs, after the books have been read by all, to sell them at auction. These clubs are quite numerous in Great Britain.

Book-keeping is the art of recording, in a regular and systematic manner, the transactions of merchants or other persons engaged in pursuits connected with money. There are two modes of keeping books of account—the one by what is termed *single*, and the other by *double entry*. Both are in general use. The system of single entry is much the simplest mode of book-keeping, and consists of only a day-book and a ledger. In the day-book the dealer enters his sales and purchases, and in his ledger he carries the former to the debit of his customers, and the latter to the credit of the merchants who supply him with goods. By making at any time a list of the sums due to him by his customers, and of those due by him to wholesale merchants, the dealer may, after adding to the debts due to him the value of his stock on hand, arrive at an approximation to the real state of his debts and assets. This, however, is but an imperfect method of book-keeping, and in the case of wholesale mercantile business, where extensive and multifarious transactions have to be recorded, recourse is had to the system of *double entry*. This system possesses all the advantages of single entry, besides being so complete and comprehensive in its principles, and so certain in its results, as to admit of universal application.

No authentic accounts exist of the origin of book-keeping. The double-entry system appears to have been first practised in the latter part of the fifteenth century in Italy, then the great centre of the mercantile world.

The objects of book-keeping are to exhibit transactions in the most minute detail and in the most condensed form; advancing from the earliest stage to the latest by such clear and lucid steps as to admit of every fact being traced in its progress, so as to be secured at every step against error.

The three principal books required under the system of double entry are a cash-book, journal, and ledger. In the first of these every transaction is recorded where money is one of the elements. The journal forms a most important part of the system. It exhibits a narrative of every transaction of which an actual transfer of money does not form one of the elements, arranging the facts in as simple a form as correctness and intelligibility will admit of; and the results of those entries in the journal are afterwards introduced into the ledger, which thereby becomes a key to the history of every transaction. In like manner cash transactions are often introduced into the journal, and are at stated periods classed and arranged in a condensed form and transferred to the ledger. The journal is advantageously ruled with four columns—two for entries debtor, and two for entries creditor; and all the transactions being connected either with personal and property accounts or nominal accounts, such as charges, profit and loss, and so forth, they are classed accordingly in the columns on the debtor or creditor side of the journal respectively; and as the debit entries are at all times equal to the credit entries, the aggregate of the two columns on the debtor side must tally with the aggregate of the two on the creditor side of the journal. Experience and practice are occasionally suggesting minor improvements upon the forms of the cash-book, journal, and ledger to suit particular cases; and indeed an intelligent book-keeper may accomplish much by a judicious classification of the facts in auxiliary books; but the fundamental principles of the double-entry system of book-keeping remain perfect and unchanged; and after the length of time during which they have successfully withstood all attempts at innovation or change, it may safely be affirmed that the system is the best hitherto discovered.

Bookselling, or the **Book-Trade,** may be treated of as consisting of two branches: 1st, the wholesale business, usually in the hands of publishers; and 2d, the retail branch, to which more frequently the term bookselling is applied.

Booksellers are mentioned by Horace and other ancient writers, and they are known to have existed as a distinct class in university-towns of Europe during the Middle Ages; but the book-trade was quite unimportant until after the invention of printing, when a great stimulus was given to this branch of industry, more especially at first in Germany. In nearly all European countries the printing and vending of books were subject to a great variety of restrictions, including a more or less strict government censorship, which, in England, ceased in 1695. On the other hand, publishers seem about this time to have had a remarkable disregard of the rights of authors, in whom copyright was first vested by act of Parliament in 1709. Since the beginning of the present century the book-trade of the U. S., from the smallest beginnings, has grown to a position of great importance. The retail book-trade is conducted both by subscription-agents and by regular dealers.

Boo'lâḳ, Boulac, or **Bulak,** a town of Egypt, on the right bank of the Nile, about a mile from Cairo, and at the origin of the Pelusiac arm of the Nile. It formerly stood on an island. The vessels navigating the Nile discharge their cargoes at Boolâk, which is the port of Cairo, and contains a custom-house. It has manufactures of cotton and silk, a government printing-office, and a very valuable museum of Egyptian antiquities. Pop. about 13,000.

Boolga'rin, Boulgarine, or **Bulgarin** (Thaddeus), an eminent Russian writer, born in Lithuania in 1789. He served as an officer in the army of Napoleon I., after whose fall he settled in St. Petersburg and devoted himself to literature. He published popular novels entitled "Mazeppa" and "Ivan Vuizhegin" (1829), and other works, among which is "Russia in its Historical, Statistical, Geographical, and Literary Aspects." Died Sept. 13, 1859.

Boom [that is, "beam," from the Dutch *boom* and German *Baum*, a "tree" or "beam"], in nautical language, is a general name for long poles or spars employed to extend the bottom of sails. Some of them taper regularly from the middle towards each end. According to their different modes and places of application, they are respectively named jib-boom, flying-jib-boom, studding-sail-boom, main-boom, square-sail-boom, spanker-boom, etc.

Boom is also the name of a strong iron chain or cable stretched across a river or harbor to obstruct the passage of hostile vessels of war. The chains are moored and are floated by logs. They ought to be defended by a battery. An iron steamer might cut or break the chain unless it is very strong. It is desirable that two or more chains should be stretched across.

Boom, bōm, a town of Belgium, in the province of Antwerp, is on the river Rupel at its junction with the Brussels Canal, 9 miles S. of Antwerp. It has a gymnasium and extensive brick- and tile-works, tanneries, ropewalks, and manufactures of sail-cloth. Pop. 10,064.

Boo'mer (George B.), an American general, was born at Sutton, Mass., July 26, 1832, and became a citizen of St. Louis in early youth. At the battles of Iuka, Champion Hills, and Vicksburg he behaved with conspicuous gallantry. He was killed in a charge at Vicksburg, May 22, 1863.

Boom'erang, an instrument used in war and the chase by the aborigines of Australia. It is about two feet in length, flat on one side and rounded on the other, and is made of hard wood bent into a curve nearly resembling an obtuse angle. The method of using this remarkable weapon is very peculiar. It is taken by one end with the bulged side downward, and thrown forward as if to hit some object twenty-five yards in advance. Instead of continuing to go directly forward, as might be expected, it slowly ascends in the air, whirling round and round, and describing a curved line, till it reaches a considerable height, when it begins to retrograde, and finally sweeps over the head of the projector and falls behind him. This surprising motion is produced by the reaction of the air upon a missile of this peculiar shape. The Australians are said to be very dexterous in hitting birds and other small animals with this weapon, as, being behind the thrower, they are perhaps not aware that they are objects of attack. It is asserted that a kind of boomerang is employed by some of the hill-tribes of Southern Hindostan.

Boon'dee, a town in East India, capital of a rajahship of the same name, 90 miles S. E. of Ajmeer, has an old and a new town, the former surrounded by a strong wall. It contains a palace, well-built houses, and level streets, and a fine temple of Krishna, other large temples, fountains, etc.

Boone, a county of Arkansas, bordering on Missouri, is drained by the White River. Area, 696 square miles. The surface is a fertile plateau, rich in minerals. Cotton, corn, and tobacco are the principal crops. It was formed in 1869 from parts of Carroll and Marion. Capital, Harrison. Pop. 7032.

Boone, a county of Illinois, bordering on Wisconsin. Area, 280 square miles. It is intersected by the Kishwaukee River, an affluent of Rock River, and also drained by the Piskasaw Creek. The surface is undulating, and diversified by prairies and woodlands; the soil is very fertile. Cattle, grain, wool, and dairy products are raised. The county is traversed by several divisions of the Chicago and North-western R. R. Capital, Belvidere. Pop. 12,942.

Boone, a county in Central Indiana. Area, 408 square miles. It is drained by the Eagle and Sugar creeks. The surface is undulating or nearly level, and was formerly covered with dense forests of the oak, ash, beech, and sugar-maple. The soil is fertile and deep. Grain, wool, cattle, and dairy products are raised. It is intersected by the railroad which connects Lafayette with Indianapolis. Capital, Lebanon. Pop. 22,593.

Boone, a county in Central Iowa. Area, 576 square miles. It is traversed and nearly bisected by the Des Moines River, and also drained by Beaver Creek. The surface is uneven or undulating; the soil is fertile. Cattle, wool, and grain are the chief productions. Coal and timber abound in it. The county is intersected by the Chicago and North-western R. R. Capital, Boonesborough. Pop. 14,584.

Boone, a county in the extreme N. part of Kentucky. Area, 300 square miles. It is bounded on the N. and W. by the Ohio River, and is adjacent to the "Great North Bend" of that stream. The surface is hilly or undulating; the soil is productive, and is based on Trenton limestone. Live-stock, grain, and tobacco are raised. It is intersected by the Louisville Cincinnati and Lexington R. R. Capital, Burlington. Pop. 10,696.

Boone, a county in Central Missouri. Area, 648 square miles. It is bounded on the S. W. by the Missouri River, and on the E. by Cedar Creek, and is traversed by Roche Percée River. The surface is undulating; the soil is very productive. Tobacco, grain, and live-stock are raised. Among the mineral resources are coal and limestone. It is intersected by the St. Louis Kansas City and Northern R. R. Capital, Columbia. Pop. 20,765.

Boone, a county of the E. central part of Nebraska. Area, 912 square miles. The S. part constitutes a portion of the Pawnee reservation. The county is drained by the Pawnee Loup and its branches; the soil is fertile. It was organized since the census of 1870. Capital, Hammond.

Boone, a county of the S. W. part of West Virginia. Area, 525 square miles. It is bounded on the N. E. by Coal River, and also drained by Laurel Creek. The surface is hilly or mountainous, and mostly covered with forests. The soil of the valleys is fertile. Grain, stock, and tobacco are extensively raised. Bituminous coal is found. Capital, Madison. Pop. 4553.

Boone, a township of Columbia co., Ark. Pop. 827.

Boone, a township of Scott co., Ark. Pop. 937.

Boone, a township of Union co., Ark. Pop. 642.

Boone, a township of Boone co., Ill. Pop. 1536.

Boone, a township of Cass co., Ind. Pop. 1262.

Boone, a township of Crawford co., Ind. Pop. 494.

Boone, a township of Harrison co., Ind. Pop. 1870.

Boone, a township of Madison co., Ind. Pop. 1078.

Boone, a township of Porter co., Ind. Pop. 1215.

Boone, a township of Warrick co., Ind. Pop. 4042.

Boone (called **Montana** in the U. S. census of 1870), a city of Boone co., Ia., is the end of a division of the Chicago and North-western R. R., and a round-house and machine-shops of the company are located here. It is a thriving town, and has two weekly newspapers, a national bank, six churches, and is a good manufacturing point, being near both coal and timber. Immense quantities of coal are shipped from here. Pop. 2415.

J. Hornstein, Pub. "Boone County Democrat."

Boone, a township of Dallas co., Ia. Pop. 552.

Boone, a township of Hamilton co., Ia. Pop. 1837.

Boone, a township of Wright co., Ia. Pop. 146.

Boone, a township of Bates co., Mo. Pop. 1257.

Boone, a township of Crawford co., Mo. Pop. 839.

Boone, a township of Douglas co., Mo. Pop. 480.

Boone, a township of Franklin co., Mo. Pop. 1655.

Boone, a township of Greene co., Mo. Pop. 1692.

Boone, a township of Maries co., Mo. Pop. 692.

Boone, a township of Texas co., Mo. Pop. 323.

Boone, a township of Wright co., Mo. Pop. 123.

Boone, a township of Davidson co., N. C. Pop. 1311.

Boone, a post-village, the capital of Watauga co., N. C., in a township of the same name, 177 miles W. by N. of Raleigh. Pop. of township, 737.

Boone (Daniel), a famous American pioneer and hunter, born in Bucks co., Pa., Feb. 11, 1735. He emigrated to North Carolina, where he married. In 1769, with five companions, he penetrated into the forests of Kentucky, which were then uninhabited by white men. He was captured by Indians, but escaped, and continued to hunt in that region for more than a year. Having returned home early in 1771, he moved with his own and five other families to Kentucky in the autumn of 1773. To defend his colony against the savages, he built in 1775 a fort at Boonesborough, on the Kentucky River. The Indians attacked this fort several times in 1777, but were repulsed. Boone was surprised and captured by them in Feb., 1778. They took him to Detroit, and treated him with lenity, but he soon escaped, and returned to his fort, which he defended with success against 450 Indians in Aug., 1778. He removed in 1795 to a place which is nearly forty-five miles W. of St. Louis, Mo., and found there a new field for his favorite pursuits. Died Sept. 20, 1820. (See Sparks, "American Biography," vol. xiii., second series; W. H. Bogart, "Life of Daniel Boone," 1857.)

Boone (Enoch), son of the preceding, and the first white male child born in Kentucky. Died Mar. 8, 1862, aged 84.

Boonesborough, a small village of Madison co., Ky., on the Kentucky River, about 18 miles S. E. of Lexington. Here is the site of a fort built in 1775 by Daniel Boone, the pioneer, which was the first fort erected in the State.

Boonesville, capital of Prentiss co., Miss., a thriving town on the Mobile and Ohio R. R., 20 miles S. of Corinth, at the highest point on that road, is the seat of Paine Male School (Methodist) and Booneville Male Academy. It has four churches, one weekly paper, one cotton-press, and one planing-mill. Pop. 458.

John H. Miller, Pub. "Prentiss Recorder."

Booneville, a post-village, capital of Owsley co., Ky., on the South Fork of the Kentucky River, about 60 miles S. E. of Lexington. Pop. 111.

Booneville, or **Boonville,** a river-port, capital of Cooper co., Mo., is situated on the right (S.) bank of the Missouri River, 227 miles by water and 187 miles by railroad W. by N. of St. Louis. It stands on a bluff about 100 feet above the river, is very healthy, and has an advantageous position for trade. It has a national bank. A railroad 25 miles long extends from Booneville southward to the Missouri Pacific R. R. Lead, coal, marble, hydraulic lime, and iron are abundant here. During the recent civil war a Confederate camp was established at this place. On the 16th of June, 1861, Gen. Lyon reached Rockport, opposite Booneville, and on the following day attacked the forces in camp at Booneville under Col. Marmaduke. The Confederate force amounted to only about 2500 raw troops, poorly armed and utterly deficient in drill; they were easily routed, abandoning two guns and a large quantity of clothing, camp equipage, etc. Booneville has three weekly newspapers. Pop. 3506; of Booneville township, 5319.

Boon Hill, a post-township of Johnston co., N. C. Pop. 1445.

Boon Island, 10 miles E. of the harbor of York, Me., is in lat. 43° 07′ 16″ N., lon. 70° 28′ 16″ W. It has a granite lighthouse 123 feet high, showing a fixed white dioptric light of the second order, 133 feet above the sea.

Boons'boro', the county-seat of Boone co., Ia., 1½ miles E. of Des Moines River, on the Chicago and North-western R. R., 121 miles W. of Cedar Rapids, 40 N. N. W. of Des Moines, in the edge of the best body of timber in the State. Coal is excellent, abundant, and extensively mined. The river affords good water-power, and the scenery in this part of the Des Moines Valley is picturesque. It has six churches, two school edifices, a town-hall, public library, a literary association, a weekly newspaper, two farming implement factories, two furniture, two wagon and carriage, and one stave and barrel factory, one steam grist-mill, and two potteries. Pop. 1518.

Means & Downing, Pubs. "Boone County Republican."

Boonsboro', a post-village and township of Washington co., Md. It has one weekly newspaper. Pop. of village, 835; of township, 2579.

Boons'brook, a township of Franklin co., Va. Pop. 2078.

Boon's Lick, a township of Howard co., Mo. Pop. 1686.

Boon's Station, a township of Alamance co., N. C. Pop. 1100.

Boon'ton, a city of Morris co., N. J., is on the Rockaway River and on the Boonton branch of the Delaware Lackawanna and Western R. R., about 30 miles from New York City and 16 miles from Paterson, N. J. It has iron-works among the largest in the U. S., if not in the world, the rolling-mills, nut-mills, plate-mills, nail-mills, and blast furnaces covering at least 50 acres of land. It has one weekly paper. Pop. of township, 3458.

S. L. Garrison, Ed. "Republican."

Boon'ville, the capital of Warrick co., Ind., is 11 miles from the Ohio River and 17 miles from the city of Evansville, at the crossing of the Lake Erie Evansville and South-western and the Vincennes and Owensboro' R. Rs. It has one weekly paper. Pop. 1039.

Wm. Swint, Ed. of "Enquirer."

Boonville, a post-village of Oneida co., N. Y., on the Utica and Black River R. R., 35 miles N. of Utica, and on the Black River Canal. It has several churches and mills, one bank and one weekly newspaper. Pop. 1418; of the township, 4106.

Boonville. See Booneville.

Boonville, a township of Yadkin co., N. C. Pop. 1058.

Boor'hanpoor', or **Burhanpoor** [Hindoo, *Barhanpoora*], a city of Hindostan, the ancient capital of the Candeish, is on the river Taptee, 309 miles by rail N. E. of Bombay. It is on the Great Indian Peninsular R. R. It is one of the largest and best-built cities of the Deccan, and has wide and regular streets and brick houses. Among the remarkable buildings is a mosque built by Aurungzeb, and an old royal palace which is nearly ruined. This city was taken by Akbăr about 1600. It has manufactures of gold and silver thread for brocade. Pop. 20,000.

Boor'los, or **Bourlos,** a shallow lagoon of Lower Egypt, in the delta of the Nile, about 5 miles E. of Rosetta, is 38 miles long. It communicates by a single channel with the Mediterranean, from which it is separated by a narrow tongue of land.

Boo'ro, Buru, or **Bouro,** an island of the Malay Archipelago, is about 60 miles W. N. W. of Amboyna, and lies between lat. 3° and 4° S., and between lon. 126° and 127° E. Area, estimated at 2000 square miles. The surface is mountainous, but the soil is fertile. It contains Mount Dome, which is said to be 10,400 feet high. Cajeli Bay, on the N. side, affords good anchorage.

Boo'roogird', Boorojird, or **Burugird,** a town of Persia, province of Irak-Ajemee, is in a fertile valley about 184 miles N. W. of Ispahan, and 74 miles S. S. E. of Hamadan. It has a castle and several mosques. It has an extensive trade in cotton goods, of which it is said to export over 1,000,000 francs' worth annually. Pop. 10,000.

Boos'sa, or **Boussa,** a town of Central Africa, in Soodan, is on an island in the Niger, in about lat. 10° 20′ N., lon. 4° 30′ E. It is enclosed by a wall. Pop. estimated at 14,000. Mungo Park died here.

Boot [Fr. *botte*; Sp. *bota*, a "boot," originally a "leathern bottle," and applied to a boot from its fancied similarity to a bottle], a covering for the foot and lower part of the leg, which seems to have been worn in England as far back as the times of the Anglo-Saxons. Various similar coverings for the foot are known to have been worn in Egypt and other countries in very ancient times, but they all seem to have more closely approached the shape of the modern shoe. Before the time of the wars of the Roses the boot was a part of the regular dress of knights. The names "top-boot," "Wellington boot," "jack-boot," etc. are applied to forms of the boot that have been worn at various times.

Boot, an instrument for the judicial torture of accused persons and recusant witnesses, once used in Scotland. It was a case made of wood or iron, which enclosed the leg, and wedges were driven between the boot and the leg until the questions asked were satisfactorily answered. In many cases the leg was crushed and still no answer was given. The use of this torture was not abolished until the reign of Queen Anne.

Boot (John Fletcher). See Appendix.

Boo'tan', Boutan, Bhotan, or **Butan,** a state or country of India, is bounded on the N. by the Himalaya Mountains, which separate it from Thibet, on the E. by Thibet, and on the S. and W. by Bengal. It extends from lat. 26° 18′ to 28° N., and from lon. 88° 30′ to 92° 30′ E. Area, estimated at 64,500 square miles. The surface is mountainous. The Peak of Shumalari on the N. border rises about 27,000 feet above the sea. In the central parts are mountains from 8000 to 10,000 feet high, covered with forests of pine, ash, maple, birch, etc. Wheat, barley, rice, and maize are cultivated here. The religion of Bootan is Boodhism. The people practise polyandry and polygamy. The state is ruled by an actual sovereign called Deb-Rajah, and has a nominal head called Dherma-Rajah, who is treated as a god, but has little power. Pop. about 1,500,000.

Boö'tes [Gr. Βοώτης], a name of Philomelus, a son of Ceres and a brother of Plutus. He is said to have invented the plough, and used it in cultivation of the soil. To reward him for this service he was translated into a constellation, under the name of Boötes.

Boötes, a northern constellation, is represented on celestial globes as a man holding in one hand a club, and in the other a leash by which he leads two hunting-dogs. This constellation comprises Areturus, a star of the first magnitude. Boötes is bounded on the N. by Draco, on the E. by Corona Borealis and Serpens, on the S. by Virgo, and on the W. by Canes Venatici and Coma Berenices.

Booth, a name which seems to have been originally given to tents and other temporary structures for the use of dealers at fairs. These afterwards became permanent, stall-like structures in streets and public places, and were for a long time much employed by respectable merchants, as similar structures are even now in Oriental countries.

Booth (Abraham), born at Blackwell, Derbyshire, England, in May, 1734, from 1769 till his death pastor of the Baptist church in Goodman's Fields, London. He was author of "The Reign of Grace" (1768) and "Pædobaptism Examined," 2 vols. 12mo, 1784. The latter work was republished in 2 vols. 8vo in 1829, and is regarded by the Baptists as an able argument in defence of their opinions. Died in 1806.

Booth. This name, long eminent on the stage, was first made famous by Barton Booth, born in 1681. He first appeared in 1698 at Dublin, Ireland, in Thos. Southern's "Oroonoko." In 1701 he first acted in London, as Maximus in Lord Rochester's "Valentinian." Thenceforward his career was prosperous and distinguished. He left the stage in 1728, and died in 1733. He was deemed excellent in such various parts as Hotspur, Antony, Othello, and Henry VIII. He wrote a masque entitled the "Death of Dido" (1716). He was twice married, but left no children. He was an Englishman of good family, a good classical scholar, a quaint poet, and a notably handsome person. His grave is at Cowley, near Uxbridge, England.—Junius Brutus Booth, born near London May 1, 1796, first appeared on the stage Dec. 13, 1813, at Deptford, England, as Campillo, in Tobin's "Honeymoon," and within four years became famous in London as Richard III. and Sir Giles Overreach. These and Pescara were his great parts. He first acted in America, July 13, 1821, at Richmond, Va., as Richard III. His career on the American stage was one long triumph—marred, however, by intemperance and incipient insanity. He died on a Mississippi River steamboat, Nov. 3, 1852, and was buried at Baltimore, Md. His wife was a Miss Holmes, of Reading, England. His children were: Junius Brutus, Rosalie Anne, Edwin Thomas, Annie Sydney, and Joseph Addison, who are living (1873), and Henry Byron, Mary, Frederick, Elizabeth, and John Wilkes, who are dead.—Edwin Booth, a son of J. B. Booth, born at Baltimore Nov. 15, 1833, first appeared on the stage, Sept. 10, 1849, at the Boston Museum, as Tressel, in "Richard III." After several years of "strolling" in California and Australia, he returned to New York and other Northern cities, and speedily acquired a high professional rank. He opened Booth's Theatre, N. Y., Feb. 3, 1869—one of the best theatres in the world. His name, as an actor, is identified with Hamlet, Richelieu, Iago, Bertuccio, and Lucius Brutus. His acting is remarkable for intellectual power, refinement, and gleams of passionate fire. Wm. Winter, *of the New York "Tribune."*

Booth (John Wilkes), the assassin of Abraham Lincoln, born in Harford co., Md., in 1838, was a brother of Edwin, noticed above. He became an actor, and in the civil war sided with the Confederates. To avenge the "lost cause," he formed a conspiracy with Suratt, Powell, and others. On the 14th of April, 1865, he entered Ford's Theatre, Washington, and shot President Lincoln, who was sitting in a private box. Exclaiming, "*Sic semper tyrannis!*" he leaped down to the stage and broke his leg, but he mounted a horse that was standing ready and escaped to Virginia. He concealed himself in a barn near Bowling Green, where he was discovered by the detectives, and, refusing to surrender, he was shot, April 26, 1865.

Booth (Mary L.) was born at Yaphank, N. Y., April 19, 1831, has published a "History of the City of New York" (1859–67), and more than thirty volumes of French

translations, prominent among which are the works of De Gasparin, Cochin, and Laboulaye on the American civil war, and Henri Martin's "History of France." From its beginning, in 1867, she has been editor of "Harper's Bazar."

Booth'bay, a post-township of Lincoln co., Me., on the Atlantic Ocean. Many of the inhabitants are employed in coasting and the fisheries. Pop. 3200.

Boo'thia Fe'lix, a peninsula or island of North America, in the Arctic Ocean, extends from lat. 69° to 75° N. It is bounded on the E. by Boothia Gulf. It was discovered by Sir John Ross, and named in honor of Sir Felix Booth.

Booth's Creek, a township of Taylor co., West Va. Pop. 1134.

Boott (Francis). See Appendix.

Boo'ty [from the root of the Ger. *beuten*, to "buy," to "capture"], in international law, personal property captured on land by a public enemy in time of war. It differs from prize, which is captured at sea. (See Prize.) In the case of prize the ownership of the property does not pass to the captor until condemnation by a prize court. Booty belongs to the captor after an undisturbed possession of twenty-four hours, and the right of *post liminium* is at an end. (See Post Liminium.) In strictness of law, booty belongs to the sovereign, and not to the individual soldier who captures it. It is quite common for the sovereign power to bestow a portion or the whole of it upon its subjects. This matter, however, is not governed by international rules, but by the municipal law of the captor.

Bopp (Franz), an eminent German philologist, was born at Mentz Sept. 14, 1791. He studied languages in Paris and Göttingen, and became in 1821 professor of philology at Berlin. He published a "Glossarium Sanscritum" and a "Critical Grammar of the Sanscrit Tongue." He was an efficient promoter of the study of Sanscrit, and is regarded as the founder of the science of comparative philology. His most important work is a "Comparative Grammar of the Sanscrit, Zend, Greek, Latin, Lithuanian, Old Sclavonian, Gothic, and German Languages" (1833), which has been translated into English and published at Oxford (3 vols., 1845–50). Died Oct. 23, 1867. (See Preface to the English translation of Bopp's "Comparative Grammar," 1845.)

Bo'ra, von, or **Boh'ren** (Katharina), a German nun who became the wife of Martin Luther, was born in Saxony Jan. 29, 1499. She was converted to the Lutheran doctrines, and escaped from her convent in 1523. She was married to Luther in June, 1525. In his last will he commended her as a good wife. She died Dec. 20, 1552. (See Walch, "Geschichte der Catharina von Bora," 2 vols., 1752–54; Hoffmann, "Catharina von Bora," 1845.)

Boraç'ic (or **Bo'ric**) **Aç'id** (B_2O_3), a compound of two equivalents of boron with three of oxygen. It is obtained in white shining scales, which are soluble in water and in alcohol, to the flame of which this acid imparts a beautiful green color. Boracic acid occurs native in certain lagoons of Tuscany, and in a crater in the island of Vulcano (Volcano), north of Sicily. The native boracic acid is of great commercial importance in the manufacture of borax. It also occurs in the form of borax (biborate of soda) in many waters, especially in certain springs and lakes in Thibet and California.

Bor'age (*Borago*), a genus of herbs of the order Boraginaceæ, have five stamens and a wheel-shaped corolla, the mouth of which is closed with five teeth. The common borage (*Borago officinalis*) is a native of Europe, has blue flowers, and rough, hairy leaves and stems. It is mucilaginous and emollient. It was formerly much cultivated, and supposed to possess valuable medicinal virtues and exhilarating qualities.

Boragina'ceæ, a natural order of exogenous plants, natives of temperate climates. It comprises nearly 600 species, mostly rough, hairy herbs, with alternate entire leaves. The corolla is generally regular and imbricated in the bud, with five stamens inserted on the tube of the corolla. It has a single style and a deeply 4-lobed ovary, which forms in fruit four seed-like nutlets or achenia. The whole plant is mucilaginous and emollient. Among the examples of this order are borage, alkanet, and comfrey (*Symphytum*), to which some botanists add the fragrant heliotrope.

Bo'rax, or **Bibo'rate of Soda** (sodium-biborate or sodic-biborate), a compound of boracic acid and soda ($2NaBO_2.B_2O_3.10H_2O$), is found native as a saline incrustation on the shores of lakes in Persia, Thibet, and India. The impure borax collected on these shores is called *tincal* or crude borax, which is also found in Peru, Chili, California, Nevada, and other regions. Borax is also prepared from boracic acid by solution in boiling water, and the addition of a boiling solution of carbonate of soda (Na_2CO_3). It is also prepared from borate of lime, a salt largely procured from Chili, Peru, etc. The common hexagonal crystalline borax contains ten equivalents of water, one of soda, and one of boracic acid. When it crystallizes in octahedrons it contains only five atoms of water. Borax is a white salt of a sweetish taste, soluble in twice its weight of boiling water. It is useful as a flux in promoting the fusion of metallic mixtures, and producing fusible silicates in assaying and in welding iron. As an agent in experimenting with the blowpipe it is valuable for the readiness with which it forms colored glasses with various metallic oxides. It is also used in medicine, and as a detergent in the laundry. More than 4,000,000 pounds are annually produced from native boracic acid in Italy, hot springs affording the heat necessary in the manufacture. (See Boracic Acid.)

Borax Lake, a small lake in California, N. of San Francisco, the water of which is a strong solution of borax. Crystals of borax are also found in large numbers in the muddy sediment at the bottom. Many hundreds of tons of these have been collected and sent to San Francisco.

Borda (Jean Charles), an eminent French mathematician and astronomer, born at Dax May 4, 1733. He served as an engineer in the army, and became a captain in the navy. As a naval officer he fought for the U. S. in 1778–82. He wrote several scientific works, contributed much to the progress of nautical science, and invented or improved the reflecting circle. Aided by Delambre and Méchain, he measured an arc of the meridian from Dunkirk to the Balearic Isles. Died Feb. 20, 1799.

Bord à Plouffe, a post-village of Laval co., Quebec (Canada), on the Isle Jesus and on the river des Prairies, 10 miles N. of Montreal, has a very large trade in lumber and horses. Pop. about 1200.

Bordeaux, a city and seaport of France, capital of the department of Gironde, is finely situated on a plain on the left bank of the river Garonne, 58 miles from its mouth and 364 miles by rail S. S. W. of Paris; lat. 44° 50′ N., lon. 0° 34′ W. It has a capacious harbor, and is accessible by vessels of 600 tons at all stages of the tide. The river, which is here about 650 yards wide, is crossed by a noble bridge of seventeen arches. Bordeaux is an archbishop's see. It is connected by several railways with Paris, Toulouse, Marseilles, and other towns. It is probably the most commercial city of France except Marseilles. The harbor is large enough to admit 1200 vessels of the largest size. Its commerce extends to all parts of the world. The newer portions of the city have wide streets and pleasant promenades lined with trees. Among its remarkable edifices are the Gothic cathedral, built or commenced about 1100; the church of Saint Croix, more than 850 years old; the town-hall; the Hôtel de la Marine; the bridge, which cost about $1,300,000; and the Great Theatre, which is one of the finest in Europe, and was built by Louis XVI. Bordeaux contains a mint, a college, a university or *Académie Universitaire*, a normal school, a school of navigation, and a public library of 120,000 volumes. Here are extensive manufactures of wine, brandy, chemicals, printed calicoes, woollen goods, carpets, hats, paper, etc. The chief articles of export are wine, brandy, vinegar, dried fruits, turpentine, and glass bottles. Wine of superior quality, called Médoc, claret, or Bordeaux wine, is produced in this vicinity. The principal merchants of Bordeaux are engaged in the wine-trade. The Canal du Midi affords a communication with the Mediterranean. Pop. 194,241.

Burdigala was founded before the Christian era, and was the capital of the Bituriges Vivisci. It became the capital of Aquitania Secunda in the reign of Hadrian. In 1152 it was transferred to the crown of the English kings by the marriage of Henry II. with Eleanor of Guienne. The famous Black Prince held his court here. It has belonged to France since 1451. Among the remains of the ancient city is a palace of Gallienus. During the revolution of 1789 this city was the head-quarters of the Girondists, and suffered terribly at the hands of the Terrorists. In consequence of the damage to its commerce by the continental system of Napoleon, Bordeaux was one of the first cities to declare for the Bourbons. On Dec. 10, 1870, the seat of government was transferred to Bordeaux while Paris was besieged by the German armies and several members of the provisional government were shut up in the metropolis. The provinces were then subject to the authority of Gambetta and his colleagues, who, after they had been driven from Tours by the approach of the enemy, removed to Bordeaux. The National Assembly, elected in Feb., 1871, met first in this city, but removed to Versailles in March of that year.

Bordeaux, a township of Abbeville co., S. C. Pop. 2232.

Bordeaux Wines, a general name for several sorts of

French wine produced in the department of Gironde. The red wines of Bordeaux are commonly called claret in the U. S., to which they are largely exported. The average quantity produced annually in the Gironde is about 48,000,000 gallons. Among the best of these wines are the Médoc, which is red, and the Graves, which is white. No French wines except champagne are so largely exported.

Borden (Gail), the inventor of that industrial product known as "condensed milk," was born in Norwich, N. Y., in 1801. In 1829 he removed to Texas, where he was first a U. S. surveyor, then a journalist, and at last collector of the port of Galveston. In 1853 he succeeded in producing condensed milk, after arduous and persevering efforts; and after securing a patent on his invention he began to introduce it in the market. He died Jan. 11, 1874, at Bordenville, Tex., where he had a large factory for the production of concentrated foods. He lived to see his inventions utilized very extensively.

Borden (Simeon), a civil engineer and mechanician, born in Fall River, Mass., Jan. 29, 1798. He was appointed in 1834 director of the geodetic survey of Mass., for which he invented valuable apparatus. He was an engineer in the construction of several railroads. Died Oct. 28, 1856.

Bor'dentown, a city of Burlington co., N. J., on the Delaware River and the Camden and Amboy R. R., 30 miles N. E. of Philadelphia and 6 miles S. E. of Trenton. It is the terminus of the Delaware and Raritan Canal. Its site is about 60 feet above the river. It has 9 churches, 2 colleges, 1 bank, 1 weekly paper, a park, water and gas works, an opera-house, 2 public halls, 3 building associations, 3 Masonic bodies, 2 lodges of Odd Fellows, 3 beneficial societies, 2 councils of American Mechanics, and several foundries and manufactories. Here is a mansion built by Joseph Bonaparte, ex-king of Spain. Pop. of Burlington township, 6041. Ed. of "Register."

Bore, called also **Ea'gre** (perhaps from the sea-jotun Ægir, which see). In estuaries into which large rivers flow, the struggle between the ascending tidal wave and the opposing current of the stream produces the imposing phenomenon of a huge wave, which, like a moving wall of water, advances with great rapidity and a deep roaring noise up the river, often for hundreds of miles, to the limit of tide-water. This is called the *bore*. In the Hoogly River, one of the main mouths of the Ganges, the bore rushes up the river with great impetuosity. In the Chinese river Teintang it rises to thirty feet in height, and travels at the rate of twenty-five miles an hour, sweeping everything before it. In the Amazon River, at the time of the equinoxes, bores of fifteen feet in height follow each other in quick succession, and within the space of 200 miles five such mighty waves may be seen travelling simultaneously up the river. The Indians, imitating the roaring sound of the bore, call it *pororoca*. Arnold Guyot.

Bore, the internal cavity of any kind of firearm, which is more commonly cylindrical, but often furrowed spirally. (See Ordnance, by Capt. R. P. Parrott.)

Borel'li [Lat. *Borellus*], (Giovanni Alfonso), an Italian physician and astronomer, born at Naples Jan. 28, 1608. He is called the founder of the iatro-mathematical school, which proposed to apply mathematics to medicine. He resided for many years in Rome, and was patronized by Queen Christina of Sweden. His most remarkable work is "De Motu Animalium" (1680). Died in Rome Dec. 31, 1679.

Boreman (Arthur Ingraham), born at Waynesburg, Pa., July 24, 1823, settled in West Virginia, where he practised law. He became the first governor of the new State in 1863, and in 1869 was elected to the U. S. Senate.

Bo'rer, a name applied to the larvæ of many insects which feed upon trees and vegetables, in which they eat holes. Their ravages are very great. The peach tree borer is the larva of *Ægeria exitiosa*, a lepidopterous insect; and species kindred to the last named attack the pear tree, the currant bush, and many other useful plants. The locust tree borer is the larva of a coleopterous insect, the *Clytus pictus*, which, with other larvæ, has seriously diminished the supply of this valuable timber tree. The apple tree is especially attacked by the grub of the *Saperda bivittata*. Borers are most easily destroyed by a wire or gouge while they are in their holes; and though many plans have been devised for preventing their ravages, none as yet are very successful.

Borget'to, a town on the island of Sicily, in the province of Palermo, 13 miles W. S. W. of Palermo, is finely situated on a cliff. Pop. 5977.

Borghese (Camillo), Prince, was born at Rome July 19, 1775. He served in the French army in his youth, and married in 1803 Pauline, a sister of Napoleon. He was in 1806 created duke of Guastalla. He sold the Borghese collection of antiquities and artistic treasures to Napoleon for 13,000,000 francs. These had been collected by his father, Marc Antonio. Died April 10, 1832.

Borghe'si (Bartolommeo), Count, an Italian antiquary and numismatist, born at Savignano June 11, 1781. He formed a rich collection of medals and coins, and distinguished himself by his successful efforts to illustrate the military, political, and municipal institutions of ancient Rome. His chief work is "Nuovi Frammenti dei Fasti Consolari Capitolini" (2 vols., 1818–20). Died April 10, 1860.

Bor'gia (Cesare), duc de Valentinois, an infamous Italian cardinal and soldier, was a natural son of Pope Alexander VI. He was raised to the rank of cardinal in 1492, and received from Louis XII. of France the title of duc de Valentinois in 1498. He married a daughter of the king of Navarre in 1499. With the connivance of the pope, his father, he waged with success an aggressive war against several princes of the Romagna who were feudatories of the Roman see. He was guilty of many acts of cruelty and treachery, and procured the death of several persons by poison. He made himself master of the duchy of Urbino, but his prosperity was ruined by the death of Pope Alexander VI. in 1503, and the accession of Julius II., who was an enemy of Cesare Borgia. The latter was arrested and imprisoned in 1504, but he escaped in 1506 and joined the army of the king of Navarre. He was killed in battle Mar. 12 1507. (See Tomasi, "Vita del Duca di Valentino," 1655; "Leben des C. Borgia," Berlin, 1782.)

Borgia (Lucrezia), an Italian woman renowned for beauty, talents, and vices, was a sister of Cesare Borgia, noticed above. She was married in 1493 to Giovanni Sforza, lord of Pesaro, and in 1501 to Alfonso of Este, a son of the duke of Ferrara. She patronized Bembo and other literati, who complimented her in their works. She was accused by contemporaries of incest and poisoning, but several modern writers maintain that the charges against her character are greatly exaggerated. Died in 1520. (See Gilbert, "Lucretia Borgia, Duchess of Ferrara," 2 vols., London, 1869; Gregorovius, "Life of L. Borgia.")

Borgne, a lake or bay in the S. E. part of Louisiana, is 12 miles E. of New Orleans. It is 60 miles long, and 25 miles wide at the broadest part. It communicates with the Gulf of Mexico on the E., and is connected with Lake Pontchartrain by the Rigolets Pass, which is 10 miles long. The lake is surrounded to a great extent by marshes and cane-brakes, separated from it by a narrow ridge of shells. Steamers plying between New Orleans and Mobile traverse this lake.

Bor'go, an Italian word signifying "town" or "castle," occurs as a part of the names of many places in Italy and the Tyrol.

Bor'goo, a kingdom in Central Africa, W. of the Niger, S. of Gourma, E. of the Fellatah country, and N. of the kingdoms Egga and Yarriba. The banks of the Niger are fertile and thickly populated, producing rice, indigo, grain, cotton, yams, lemons, bananas, honey, and game in abundance. The sorghum-fields yield five hundred-fold. The forests are full of elephants of immense size. The population consists of the original inhabitants and Fellatahs and a Mohammedan conquering tribe speaking a language cognate with the Yarriba tongues. The government is an hereditary monarchy.

Bo'rie (Adolph E.), born in Philadelphia in 1809, was educated at the University of Pennsylvania and in Paris. He became a successful merchant of Philadelphia, and in 1862 was one of the founders of the Union League, and was a prominent supporter of the national government throughout the late civil war. He was in 1869 for some time secretary of the navy under President Grant.

Boring, for water, see Artesian Wells, by Prof. E. H. Hilgard, Ph. D.; Cannon-boring, see Gun-making, by Capt. R. P. Parrott; Cylinder-boring, see Machinery.

Borissov', a town of Russia, on the Berezina, in the government of Minsk, 46 miles N. E. of Minsk. Near this place the army of Napoleon suffered a great disaster in its passage of the Berezina in Nov., 1812. Pop. 5233.

Borissoglebsk', a town of Russia, in the government of Tambov, 100 miles E. S. E. of Tambov. Pop. 12,254.

Bor'kum, an island in the North Sea, is at the mouth of the Ems, and 26 miles N. W. of Emden. It belongs to Prussia, is about 6 miles long and 2 miles wide. A lighthouse has been erected on it in lat. 53° 36′ N., lon. 7° 12′ E.

Bor'land (Solon), a general in the Confederate army, and former U. S. Senator from Arkansas, born in Virginia, studied medicine and settled in Arkansas. In the Mexican war he served as major of volunteers, and was taken prisoner. He was elected to the U. S. Senate 1849, appointed U. S. minister to Central America 1853; and it was during

his term that the inhabitants of Greytown committed the act which he resented, and for which the town was destroyed by Com. Hollins, U. S. N., acting under instructions of his government. In April, 1861, and previous to the secession of Arkansas, he organized a force and captured Fort Smith, was appointed brigadier-general in the Confederate army, and died in Texas Jan. 31, 1864.

Bor'mio [Ger. *Worms*], a town of Italy, in the province of Sondrio, is near the Adda, and 32 miles N. E. of Sondrio. It is near the saline baths called Bagni di Bormio, having a temperature of 99° F. Pop. 1630.

Bor'na, a town of Saxony, 15 miles S. S. E. of Leipsic. It has manufactures of woollen cloths and earthenware. Pop. in 1871, 5751.

Bör'ne (Ludwig), a German satirical writer, born of Jewish parents at Frankfort-on-the-Main May 18, 1786, studied at Berlin and Heidelberg, adopted the Protestant faith in 1817, edited the liberal "Wage" and "Zeitschwingen," and published in 1826 his celebrated "Denkrede auf Jean Paul." After 1830 he lived in Paris, was correspondent of the "Allgemeine Zeitung," and edited "La Balance." His "Briefe aus Paris" and other writings on political and æsthetical subjects are eloquent and witty, and display a singularly delicate critical sense, but are marked with bitterness of political feeling. ("Sämmtliche Werke," 12 vols., 1862–63.) Died Feb. 13, 1837. (See biographies of Beurmann, 1841, and Gutzow, 1840, and "Heine über Boerne.")

Bor'nemann (Friedrich Wilhelm Ferdinand), a Prussian jurist and statesman, born at Berlin Mar. 28, 1798, became minister of justice in 1848. He died Jan. 28, 1864, leaving several valuable legal works.

Bor'neo, called by the natives **Poolo-Kalamantin,** an island in the Malay Archipelago, extends from lat. 7° 1′ N. to 4° 10′ S., and from lon. 108° 50′ to 119° 2′ E. Its length is 807 miles, and it is about 700 miles wide. The area is about 289,000 square miles. The interior is traversed by chains of mountains, but has not been much explored by Europeans. Near the N. extremity of the island is a peak called Kinibaloo, which rises 13,680 feet above the sea. The maritime parts of the island are mostly marshes or low plains covered with dense forests. It is probable that a large portion of the interior consists of fertile valleys and plains. The outline is nowhere deeply indented by inlets. It is thought by many that the form of Borneo was formerly similar to that of Celebes, but that the bays have been filled up in the course of time, and now form those marshy districts on the coast so unhealthy to the inhabitants. Borneo is watered by numerous navigable rivers—viz., the Brunai, the Sarâwak, the Pontianak, the Kootai, the Pembuan, the Murong, and others. These mostly enter the sea through extensive deltas, and their mouths are so obstructed that large vessels cannot enter them; but they afford facilities for inland navigation. The climate in the low grounds is hot. The rainy season begins about October, and continues till April, during which period heavy rains fall. In the higher lands of the interior the climate is moderate and healthy. The mountains are chiefly formed of granite, syenite, limestone, and quartz. Among the mineral resources are gold, tin, antimony, zinc, diamonds, iron of fine quality, and coal, which latter is very abundant, and is excellent and easily mined. The principal commercial supply of antimony is at present from Borneo. Diamonds are widely disseminated in the soil, at a depth of several feet. One diamond found in Borneo weighed 367 carats. The vegetation of Borneo is exceedingly luxuriant. Among the forest trees are the teak, the ironwood, the gutta-percha tree, the ebony, the cocoa-palm, and various sago trees. The island produces also cinnamon, camphor, betel, pepper, ginger, cotton, rice, and yams. The forests and jungles are infested with tigers, bears, leopards, buffaloes, and orang-outangs. The elephant also is found here. The population is composed chiefly of four races—Malays, Dyaks, Boogis, and Chinese. The Malays, who mostly occupy the maritime parts of the island, are partly Mohammedans and partly pagans. The Dyaks, who live farther inland, are the aboriginal inhabitants, and are the most numerous of all the races in the island. They are divided into many tribes, and subsist mostly by hunting, fishing, and piracy. "They are not all," says Craufurd, "in an equally abject condition; for while some are mere naked hunters, the majority have fixed abodes, and have made some progress in the useful arts. . . . With respect to religion, they have neither priests nor temples, nor do they pray or fast." The population of the Dutch colonies in 1870 amounted to 1,189,353. Borneo is divided into many separate states, governed by native sultans. Among them are Borneo proper, Pontianak, Sambas, Sarâwak, Matan, Simpang, Sooloo, and Banjermassin. Borneo proper is a level tract which extends along the N. W. coast, and is bounded on the S. E. by a chain of mountains. A large portion of the island is subject to the power of the Dutch, whose chief towns and centres of authority are Pontianak on the W. coast, and Banjermassin on the S. coast. Among the other towns are Borneo, Sambas, Sarâwak, and Succadana.

History.—Borneo was discovered in 1518 by the Portuguese, who formed a settlement at Banjermassin in 1690. The Dutch, who first visited the island in 1598, made a treaty of commerce with the sultan of Sambas in 1609. They erected a fort and a factory at Tatis in 1643, and another at Pontianak in 1778. In 1841, Sir James Brooke, an enterprising Englishman, was appointed rajah of Sarâwak by the sultan of Borneo. He took strenuous measures for the suppression of piracy and the promotion of commerce. The prosperity of Sarâwak increased under his rule, and the British influence has become predominant on the western coast of Borneo. The exports of Sarâwak to Singapore amounted in 1858 to £300,000, and in 1864 (according to C. Brooke), £1,155,201. (See Schwaner, "Borneo," 2 vols., 1853–54; Veth, "Borneo's Westerafdeeling," 2 vols., 1854–56; C. Brooke, "Ten Years in Sarâwak," 2 vols., 1866.)

Revised by A. J. Schem.

Borneo, or **Brunai,** a seaport-town on the N. W. coast of Borneo, and on the river Brunai, about 10 miles from its mouth. It is the capital of the sultan of Borneo proper, and has considerable trade. The houses are built on posts, and canals pass through all the streets. Pop. about 25,000.

Born'holm, an island of Denmark, in the Baltic Sea, 90 miles E. of Zealand, and 25 miles from the southern extremity of Sweden. It is 24 miles long by 18 miles wide, and has an area of 225 square miles. Pop. in 1870, 31,894. The surface is mountainous, and the coasts rocky and dangerous to navigators. A lighthouse has been erected on Cape Hammeren, the most northern point of the island, in lat. 55° 18′ N., lon. 14° 47′ E. The soil in some parts is fertile. Valuable porcelain clay and rock-crystals are found here.

Bornoo', Bornu, or **Bornou** [native *Kanowra*], a state of Central Africa, in the Soodan, is bounded on the N. by the Sahara Desert, on the E. by Lake Tchad, on the S. by Mandara (or Fumbina), and on the W. by Houssa. The surface is mostly level; the soil is fertile, producing maize, millet, rice, cotton, indigo, pulse, etc. Cattle, horses, and sheep form a large part of the riches of the Bornooese. The climate is excessively hot, the thermometer often rising to 105° F. in the shade. The rainy season lasts from October to April. The principal rivers of Bornoo are the Shary and Yeou, which flow into Lake Tchad. A large portion of the country is inundated in the rainy season. Lions, panthers, and other beasts infest the forests, which occur only in the vicinity of the rivers. Minerals are said to be rare in Bornoo. The natives manufacture cotton cloth and coats-of-mail, which they use in warfare. The chief exports were until lately slaves and gold-dust. The dominant race, called Shouas, are of Arab descent and are bigoted Mohammedans.

History.—Bornoo was formerly a part of the kingdom of Kanem, which, founded in the ninth century, rose to its highest point of power in the twelfth. At the end of the fifteenth century, King Ali-Dunamâni founded Bornoo. It attained its greatest power under Edrîss Alaoma (1571–1603), who conquered all the surrounding tribes, and even extended his territory to the shores of the Atlantic. Under his peaceful and extravagant successors the power of Bornoo again declined, until in 1808 it could no longer resist the continued attacks of the Fellatah, who took and destroyed the old capital, Birni. The king then established himself at Kuka. An Arab from Fezzan, however, soon defeated the Fellatah at Ngornu. His son Omar removed the old dynasty, and ascended the throne himself in 1835. Although not as strong and determined against his neighbors as his father, his rule has been extremely beneficial for the country, as he has encouraged trade and industry. He also assisted, as much as was in his power, the European travellers who visited his country, among them Denham, Clapperton, Beurmann, and Rohlfs, the latter of whom says in his account, "No European prince could have assisted a traveller more than Omar, the negro prince of Soudan, assisted me, the white Christian." Chief town, Kuka. Pop. about 5,000,000. A. J. Schem.

Bo'ro Bud'dor, or **Bo'ro Bo'do,** an ancient Booddhistic temple of Java, on the river Probo, 25 miles N. W. of Yugyakarta, believed to be the most elaborate specimen of Booddhist architecture now existing, and to have been built in 1350 A. D. It is a square pyramid, with nine terraces or stories (116 feet high, in all), and 400 feet square at the base, each terrace covered with cells or small houses

for monastics, and the whole covered with profuse carvings.

Borodi'no, a village of Russia, in the government of Moscow, and on the Kolocza River, 70 miles W. S. W. of Moscow. It is celebrated as the scene of a great battle between the army of Napoleon (125,000 strong) and the Russian army, of about 120,000 men, commanded by Gen. Kutusof, Sept. 7, 1812. The French remained masters of the field and claimed the victory, but they lost nearly 30,000 men. The loss of the Russians was still greater; some say 50,000 killed and wounded. The French took Moscow a few days after this battle, which they call the battle of the Moskwa; this is the name of a river near the battle-field.

Bo'ron [Lat. *borium*], (symbol B; equivalent 11; specific gravity about 2), a non-metallic element which Sir Humphry Davy discovered about 1808 by exposing boracic acid to the action of a galvanic battery. Combined with oxygen, it forms boracic acid, and it occurs in nature only in combination with oxygen, generally in the form of that acid or of Borax (which see). Boron is obtained in the form of an olive-brown powder, which is infusible, and has neither taste nor smell. It is not used in the arts in a separate state. It may also be obtained in a graphitoidal form, in six-sided crystals. Crystallized boron is one of the most unalterable and indestructible of all simple substances. Wöhler and Deville have obtained boron by heating in a crucible a mixture of pure dry boracic acid with the metal aluminium, when the latter unites with the oxygen, leaving the boron as minute quadratic octahedral crystals, called boron diamonds. These rival the real diamond in lustre and refractive power, and are scarcely inferior to it in hardness. They scratch glass and the corundum, and resemble diamonds so much that they can scarcely be distinguished by external characters. No acids, pure or mixed, have any effect upon the boron diamond, nor can it be oxidized even when raised to a high temperature.

Borough, bŭr'rŭh, called in Scotland **Burgh** (pron. bŭn'n, almost bŭr'rŭh), in Great Britain and some of the U. S. is a name applied to certain corporate municipalities. Places in England sending burgesses to Parliament are called parliamentary boroughs.

Borough, a township of Beaver co., Pa. Pop. 379.

Borough English is a custom that prevails in some ancient boroughs in England, according to which the youngest son inherits the property within the borough in preference to his elder brothers. A posthumous son is entitled to this privilege, and dispossesses his elder brother.

Borovit'chi, a town of Russia, in the government of Novgorod, on the river Msta, 92 miles E. S. E. of Novgorod. It has an active trade in salt, coal, etc. Pop. 9108.

Borovsk', a town of Russia, in the government of Kalooga, 45 miles S. W. of Moscow. Pop. 8826.

Borrade, a township of Richardson co., Neb. P. 886.

Borrome'an I'slands, a group of four small islands of Northern Italy, in Lago Maggiore. They derive their name from the family of Borromeo. In 1671, Count Borromeo covered them with soil, and converted them from barren rocks into gardens. Their beauty is such that they are sometimes called the "Enchanted Islands." The largest of them is named Isola Madre, and is covered with orange trees and exotic plants. The most celebrated of the group is the Isola Bella, occupied by a beautiful palace of the Borromeo family, and a garden which rises in ten terraces, presenting the form of a truncated pyramid. Many tropical flowers are cultivated here.

Borrome'o [Lat. *Borromæus*], (Carlo), often called **Saint Charles Borromeo,** an illustrious Italian cardinal, born at Arona, on Lago Maggiore, Oct. 2, 1538, was a nephew of Pope Pius IV. He inherited an ample fortune, and was appointed a cardinal and archbishop of Milan in 1560. As legate of the pope he governed Bologna and Ancona with wisdom and moderation. Surrounded as he was with luxury and temptations, he was virtuous, studious, and a patron of literary men. He endeavored to reform the morals of the clergy and monks, and distinguished himself by acts of charity during the prevalence of famine and pestilence (1576). He wrote several religious works (5 vols. fol., Milan, 1747). Died Nov. 3, 1584. He was canonized in 1610. (See Possevino, "Vita di Carlo Borromeo," 1591; Godeau, "Vie de Saint Charles Borromée," 1748; Touron, "Vie de Saint Charles Borromée," 3 vols., 1761; Alban Butler, "Vita di S. C. Borromeo," 1835; Alexandre Martin, "Histoire de la Vie de S. C. Borromée," 1847.)

Bor'row (George), an English author, born at Norwich in Feb., 1803. He became master of several modern languages, for learning which he had remarkable talents. In his youth he associated with the gypsies. As an agent of the British and Foreign Bible Society he travelled through many countries of Europe. He published in 1841 "The Zincali, or an Account of the Gypsies in Spain," and in 1843 "The Bible in Spain, or Journeys, Adventures, and Imprisonment of an Englishman in an attempt to Circulate the Scriptures in the Peninsula," which is a graphic and interesting work. His next work, "Lavengro, the Scholar, the Gypsy, and the Priest" (3 vols., 1851), is regarded as an autobiography. He has also written "Romany Rye" (1857), "Wild Wales" (1862), and many other works.

Bor'rower, one to whom a chattel is loaned without compensation, which is to be returned in a specified time or on demand. (See Bailment.) The word is often used in a popular sense to denote a hirer of money, who pays a compensation for its use. The difference between these two transactions should be carefully noted. In the first signification the borrower agrees to return the specific thing loaned. He is only liable for negligence or the absence of due care. In the second case (loan of money) there is only an agreement to return an equivalent sum. The relation of debtor and creditor is created, and a failure to pay causes the debt to bear interest.

Bor'rowstounness', or **Boness',** a seaport-town of Scotland, in Linlithgowshire, on a low peninsula in the Frith of Forth, 17 miles W. N. W. of Edinburgh. It has a safe harbor, and manufactures of soap, salt, malt, vitriol, and earthenware. Here are coal-mines which extend under the bed of the Forth. Limestone and ironstone are found in the parish, which is traversed by the Roman wall of Antoninus.

Borsa, a town of Hungary, in the county of Marmaros, 50 miles S. E. of Szigeth. Pop. in 1869, 5053.

Borsip'pa [Gr. Βόρσιππα], an ancient city, which according to Strabo was in Babylonia, but there has been much doubt as to its exact situation. Stephanus calls it a city of the Chaldeans. It was probably situated near Babylon. Strabo states that it was sacred to Apollo and Diana. Some modern writers believe that Borsippa is represented by the remarkable mound called Birs-Nimrood, about 5 miles S. W. of Hillah, the site of Babylon proper. (See Babylon and Babel.)

Bor'sod, a county of Hungary, is bounded on the N. by the counties of Torna and Gömör, on the E. by Aba-Ujvar and Szabolcs, and on the S. and W. by Heves. Area, 1370 square miles. The county consists chiefly of vineyards and wooded hills, except in the S. E., which is a plain traversed by several small rivers, while the Theiss forms the eastern boundary. The chief products are fruit, hemp, tobacco, and wine, that of Miskolcz being the best in Hungary. Copper, iron, and coal are found in the mountains. Chief town, Miskolcz. Pop. in 1869, 195,037.

Bory de Saint-Vincent (Jean Baptiste George Marie), Baron, an eminent French naturalist and traveller, born at Agen in 1780. He explored the island of Mauritius about 1800, and published a "Voyage among the African Islands" (3 vols., 1804). He afterwards served as a captain in the army at Austerlitz and other battles, and became an exile in 1815. With the aid of Van Mons he edited at Brussels the "Annales des Sciences Physiques," 8 vols. He had the chief command of a scientific expedition which the French government sent to Algeria in 1839. Died Dec. 22, 1846. (See Héricart de Thury, "Notice sur le Baron Bory de Saint-Vincent," 1848.)

Bos (gen. *bovis*), the Latin for an "ox" or "cow," is the systematic name for the genus of ruminant animals which comprises the ox, buffalo, etc. (See Bovidæ and Ox.)

Bos, Bosch, or **Bosco** (Hieron), a Dutch painter and engraver, born at Bois-le-Duc about 1470. Among his favorite subjects were spectres, demons, and incantations. He also painted some scriptural pieces. His picture of the "Crucifixion" is in the Escurial, in Spain. Died about 1530,

Bo'sa, a seaport-town of the island of Sardinia, is on the W. coast, at the mouth of the Termo, in the province of Cagliari, 30 miles S. of Sassari. Its harbor is safe, but admits only small vessels. It is the seat of a bishop, and has a cathedral, an old castle, and several churches. Wine, oil, and grain are exported. Pop. 6329.

Bosca'wen, a post-township of Merrimack co., N. H., contains the village of Boscawen, which is on the Merrimack and on the Northern R. R., 10 miles N. N. W. of Concord. It has manufactures of furniture, lumber, leather, shoes, and brick. Pop. 1637.

Boscawen (Edward), an English admiral, a son of Viscount Falmouth, was born Aug. 19, 1711. He served with distinction under Anson at Cape Finisterre, May, 1747, and commanded an expedition to the East Indies in 1748. He became a vice-admiral of the blue in 1756, was sent

to North America, and gained several victories over the French in 1758. In Aug., 1759, he defeated the French fleet in the Bay of Lagos. He received for this service an annual pension of £3000. Died Jan. 10, 1761. (See CAMPBELL, "Lives of the British Admirals.")

Bosch-Bok [Dutch for "bush-buck"], the *Tragelaphus sylvaticus*, a South African antelope, which is almost always found in thick underbrush which is not easily penetrated by man. When surprised in the open country it is easily caught, and is prized for its fine venison. It is about four or five feet long, and has a voice like the barking of a dog. Several other African antelopes have this name.

Bosch-vark [Dutch for "bush-pig"], a wild hog of

Bosch-Vark, or Guinea Hog.

Southern and Western Africa, in size and in habits much resembling the common hog. It has long pointed ears, a long tail, and is of a dull red color, with white marks. It goes in herds, and the stroke of the boar's tusks is much dreaded. It is the *Potamochœrus Africanus*.

Bos'cobel, a post-village and township of Grant co., Wis. The village is on the Wisconsin River and on the Milwaukee and St. Paul R. R., 70 miles W. of Madison. It has a national bank and one weekly newspaper. Pop. 1509; of township, 1650.

Bos'covich (RUGGIERO GIUSEPPE), F. R. S., an astronomer and natural philosopher, born at Ragusa, in Dalmatia, May 18, 1701. He entered the order of Jesuits in 1725, and became professor of mathematics and philosophy in the Roman College in 1740. He was one of the first on the Continent who adopted the Newtonian philosophy. His Latin poem "On the Eclipses of the Sun and Moon" (1764) was much admired. He wrote various scientific works, among which we notice "Philosophiæ Naturalis Theoria" (1758) and "Opera Pertinentia ad Opticam et Astronomiam" (5 vols., 1785). The latter is a collection of treatises on optics and astronomy. He died at Milan Feb. 12, 1787. (See FABRONI, "Vitæ Italorum doctrina excellentium;" RICCA, "Elogio storico dell' Abate R. G. Boscovich," 1789.)

Bo'shart, a township of Marshall co., Ala. Pop. 464.

Bo'sio (FRANÇOIS JOSEPH), BARON, an eminent sculptor, born at Monaco Mar. 19, 1767. He worked in Paris, and was patronized by Napoleon I., for whom he executed busts of Josephine and her daughter Hortense; also the bas-reliefs of the column of the Place Vendôme. Among his masterpieces are the "Hyacinth" in the Luxembourg, "Cupid Darting Arrows," and the "Nymph Salmacis." His works are remarkable for grace and harmony. He was a member of the French Institute. Died July 29, 1845.

Bos'na-Serai', or **Sarajevo** (anc. *Tiberiopolis*), a town of European Turkey, capital of the province of Bosnia, is beautifully situated on the Migliazza, 115 miles S. W. of Belgrade. It is an important centre of commerce, and is the dépôt of the caravan trade between Salonica and Yánina. It is adorned with 150 mosques and churches, the domes, minarets, and spires of which give it an Oriental aspect. Here is a palace built by Mahomet II. The town is defended by a citadel, and has manufactures of cutlery, jewelry, woollen goods, and leather. Pop. about 45,000.

Bos'nia, a province forming the N. W. extremity of Turkey in Europe, is bounded on the N. by the river Save, on the E. by the Drin, on the S. by Albania, and on the W. by Austria. Area, 26,874 square miles. The surface is for the most part mountainous, and the Dinaric Alps extend along the western border. Some peaks of this range rise about 7000 feet above the level of the sea. The largest rivers, besides the Save, are the Bosna, the Verbas, the Narenta, and the Drin (or Drina). The mountain-slopes are covered with forests of oak, beech, chestnut, and other trees. The soil of the plains and valleys is fertile, and produces good crops of maize, wheat, hemp, and various fruits. Bosnia is rich in coal, iron, lead, and other metals, but the mines are not worked to a great extent. This province has few manufactures except firearms, sabres, and knives. The population is a mixture of Bosnians, Croats, Morlaks, Turks, Illyrians, Jews, gypsies, etc., the majority being of the Slavic race. The Bosnians, who are the most numerous, are partly Mohammedans and partly members of the Greek and Roman Catholic churches. They are brave, honest, and industrious, but cruel and rapacious. The Morlaks live mostly in the Herzegovina, and are Christians. In ancient times this province was part of Pannonia. It was annexed to the Ottoman empire by conquest in 1522. Capital, Bosna-Serai. Pop. in 1867, 1,100,000.

Bos'phorus, or **Bos'porus** [Gr. Βόσπορος, *i. e.* the "ox-passage," because cattle could swim it], the ancient name of the strait which connects the Black Sea (Pontus Euxinus) with the Sea of Mármora (Propontis), and forms part of the boundary between Europe and Asia. It is about 16 miles long, and varies in width from a half mile to two miles. The Bosphorus is deep, and flows between high shores and cliffs, which present much picturesque scenery, the beauty of which is enhanced by many ancient ruins. Constantinople stands at the S. W. end of the Bosphorus, which is sometimes called the Strait of Constantinople. It was also called the Thracian Bosphorus, to distinguish it from the Cimmerian Bosphorus, the modern name of which is the Strait of Yenikale.

Bos'phorus, Cimme'rian [Gr. Βόσπορος Κιμμέριος], the ancient name of the Strait of Yenikale (or Strait of Kaffa), which connects the Black Sea with the Sea of Azoff (Palus Mæotis). The width of the narrowest part is about 3½ miles. On the W. side of it was a Milesian colony and the city of Panticapæum, which was the capital of a kingdom founded by the Archæanactidæ in 480 B. C. This kingdom endured several centuries under various dynasties, whose dominions were on both sides of the strait.

Bosque, a county in N. Central Texas. Area, 905 square miles. It is bounded on the N. E. by the Brazos River, and intersected by the Bosque River. The surface is undulating, and partly covered with forests; the soil is based on limestone, and is fertile. Cotton and corn are the chief crops. Wool is also raised. Capital, Meridian. Pop. 4981.

Bosque River, Texas, rises in Erath co., flows southeastward through Bosque co., and enters the Brazos at or near Waco. Its length is estimated at 100 miles.

Bosquet (PIERRE FRANÇOIS JOSEPH), a French general, born at Pau Nov. 8, 1810. He served in many campaigns in Algeria, became a general of brigade in 1848, and a general of division in 1853. In the Crimean war he commanded a division at Alma, and rendered important services at Inkermann 1854, for which he received the thanks of the British Parliament. He was disabled by a wound at the siege of Sebastopol, Sept., 1855, and became a senator and marshal of France in 1856. Died Feb. 5, 1861.

Boss [Fr. *bosse*], a stud or knob; a protuberant ornament of silver, ivory, or other material used on harness, shields, etc.; a projecting ornament at the intersection of the ribs of ceilings or vaulted roofs.

Boss, in mediæval architecture, was a term applied to a piece of stone, usually carved in a fanciful manner, which covers the intersection of a series of arches. It is commonly finished with a flower or a human masque, and is one of the most characteristic specimens of mediæval decoration.

Bossage, a French word used in architecture, denotes a stone in a building which is left projecting and rough, to be finally wrought into a sculptural decoration; also rustic work, consisting of stones which advance beyond the nave or level of the building.

Bossi (LUIGI), an Italian antiquary and historian, born at Milan Feb. 28, 1785. He was appointed prefect of the archives of the kingdom of Italy by Napoleon. Among his numerous works are a "History of Italy" (19 vols., 1819–23) and an "Introduction to the Study of the Arts of

Design." Died April 10, 1835. (See G. B. Carta, "Cenni biografici intorno al Cavaliere L. Bossi." 1835.)

Bossier, a parish of Louisiana, bordering on Arkansas. Area, 1000 square miles. It is bounded on the E. by Bayou Dauchite, and on the W. by the Red River. Lake Bistineau forms the S. E. boundary of this parish, which also contains Lake Bodeau. Cotton, corn, and wool are raised. Capital, Bellevue. Pop. 12,675.

Bossuet (Jacques Bénigne), D. D., a celebrated French pulpit orator and theologian, born at Dijon Sept. 27, 1627. He entered in 1642 the College of Navarre in Paris, where he studied Greek, Latin, philosophy, and theology. In 1652 he was ordained a priest, received the degree of doctor, and became canon of Metz. Having become renowned as a pulpit orator, he was appointed to preach the Advent sermons before the king and court in 1661. In the ensuing years he preached in many churches of Paris, and converted Marshal Turenne to the Catholic communion. He was appointed bishop of Condom in 1669, and preceptor to the dauphin in 1670. He defended his Church against the Protestants in an eloquent work entitled "Exposition of the Doctrine of the Catholic Church on Subjects of Controversy" (1671). In 1671 he was admitted into the French Academy. For the instruction of the dauphin he wrote a "Discourse on Universal History" (1681). He became bishop of Meaux in 1681, and was the author of four articles which were adopted by an assembly of French clergy in 1682, and which secured the liberties of the Gallican Church against papal aggression. His capital polemical work against the Protestants is his "History of the Variations of the Protestant Churches" ("Histoire des Variations des Églises Protestantes," 2 vols., 1688). He was involved in a controversy with Fénelon, whom he censured for his defence of Madame Guyon and her quietism. He was the chief French champion of the Catholic Church in that age. He died April 12, 1704. Among his most admired compositions are funeral orations on the prince of Condé (1687), on the duchess of Orleans (1670), and other eminent persons. A good edition of his complete works was published at Paris in 59 vols., 1825. (See D'Alembert, "Éloge de Bossuet;" M. de Bausset, "Histoire de Bossuet," 4 vols., 1814.)

Bossut (Charles), a French geometer, born near Lyons Aug. 11, 1730, was a friend of Fontenelle. He was admitted into the Academy of Sciences in 1768. Among his works are a "Treatise on Mechanics and Dynamics" (1763), a "Complete Course of Mathematics" (7 vols., 1795–1801), and an "Essay on the General History of Mathematics" (2 vols., 1802). He published an edition of Pascal's works. Died Jan. 14, 1814. (See Delambre, "Éloge de Bossut.")

Bostan', Al (*i. e.* the "garden"), a town of Asiatic Turkey, pashalic of Marash, is in a plain and on the river Sihun, near the northern base of Mount Taurus, 32 miles N. N. E. of Marash. It has several mosques, and a trade in wheat. Pop. about 8000. Here the Egyptian sultan Bibars defeated the united Turks and Mongolians in a great battle on April 16, 1277.

Bos'tick's, a township of Pickens co., Ala. Pop. 479.

Bos'ton, an ancient borough and seaport of England, in Lincolnshire, is on both sides of the river Witham. It is on the Great Northern Railway, 107 miles by rail N. of London. Vessels of 300 tons can ascend the river to this place, which is supposed to be identical with Icanhoe, where Saint Botolph founded an abbey in 654 A. D. About 1200, Boston was one of the chief seaports of England. Here is the parish church of St. Botolph, built in 1309, which is 245 feet long, and has a tower 290 feet high, surmounted by a lantern which is visible nearly forty miles at sea. Boston has manufactures of canvas, iron, brass, ropes, hats, leather, etc. Pop. 15,576.

Boston, an important commercial city, the capital of Massachusetts, and the most populous city of New England, is finely situated on the W. side of Massachusetts Bay, at the mouth of Charles River: lat. 42° 21′ 27.6″ N., lon. 71° 3′ 30″ W. It is 232 miles by railroad N. E. of New York, 200 miles E. by S. of Albany, and 44 miles N. N. E. of Providence. It is the seat of justice of Suffolk county. The site of Boston proper, formerly a small peninsula, the surface of which was uneven, and the highest point about 138 feet above the level of the sea, now in 1874 contains about 19,150 acres, a large portion of the territory having been obtained recently by annexation. The former isthmus, known as The Neck, has recently been greatly changed, large areas having been filled up on both sides, and covered with buildings. The city includes, besides Boston proper, South Boston and East Boston (which latter occupies an island nearly 2 miles long, and is about 600 yards from Boston proper), Roxbury (annexed to Boston in 1868), Dorchester (annexed in 1870), and Charlestown, West Roxbury, and Brighton (annexed in 1874); and is about thirteen miles in length, and eight or more in width. It has about 360 miles of streets, a large part of which are paved or macadamized. Several bridges across Charles River connect the city with large suburbs named Chelsea, Everett, East Cambridge, and Cambridgeport. The Warren and the Charles River bridges, leading northward to Charlestown, are respectively 1390 and 1503 feet long; the bridges to Cambridgeport, East Cambridge, Chelsea, and Everett are much longer. The different railroads which converge to this city have other bridges constructed expressly for their accommodation. Washington and Tremont streets are much frequented thoroughfares. The city has one fine park, called Boston Common, which comprises nearly fifty acres, and adjoining it there is a large Public Garden, in which is a fine equestrian statue of Washington, executed by Ball; also a statue of Everett, by Story, and other works of the fine arts.

Boston has a spacious and excellent harbor, sheltered from the sea by two peninsulas and numerous small islands, and defended by Forts Warren, Winthrop, and Independence. The area of the harbor included between Point Shirley and Point Allerton, which are 4 miles apart, is estimated at 75 square miles, about half of which affords good anchorage-ground for the largest ships. The wharves and docks are constructed on a scale of uncommon magnitude. Long Wharf extends into the harbor about 1800 feet, and is lined with spacious warehouses.

Public Buildings, etc.—The State-house occupies a commanding site on Beacon Hill, fronting Boston Common. The view obtained from its cupola is said to be unsurpassed by anything in the U. S., comprising all parts of the city and the harbor, with a multitude of beautiful islands. Faneuil Hall, called the "Cradle of Liberty," derives interest from its historical associations, and has long been used as a place for public meetings. It was presented to the citizens of Boston by Peter Faneuil in 1742, and is 110 feet long and 80 wide. The custom-house is a granite edifice surmounted by a dome, with a foundation formed by 3000 piles. It cost $1,000,000 or more. A new city-hall, built of granite,

The City Hall.

was completed about 1866. Among the other public edifices are the Merchants' Exchange, which is 250 feet long, and has a front of Quincy granite, with four pilasters, each a single stone forty-five feet high; the Masonic Temple, Massachusetts Horticultural Hall, Quincy Market, City Hospital, Massachusetts General Hospital, the Public Library, Odd Fellows' Hall, court-house, United States court-house, post-office, Old State-house, jail, and those of the reformatory institutions, the State prison at Charlestown, and the Music Hall, one of the finest concert halls in the U. S. This hall is furnished with an organ which has nearly 6000 pipes, and cost $60,000. Among the best hotels of Boston are the Tremont House, the Revere House on Bowdoin Square, the Parker House, the American House, St. James, the Commonwealth, the Waverley House, and Young's Hotel. The Bunker Hill Monument is now within the city limits. The principal railroads that terminate here are the Boston and Albany, the Boston and Maine, the Eastern R. R., the Old Colony and Newport

R. R., the Boston and Providence R. R., the Fitchburg R. R., the Boston Lowell and Nashua R. R., and the Boston Hartford and Erie. The navy-yard is situated in Charlestown district; it was established in 1798, and is one of the most extensive in the U. S. Among the scenes of historic interest in Boston may be mentioned Breed's and Bunker's Hills; Faneuil Hall; Dorchester Heights, an important point in the siege of Boston by the provincial troops during the early part of the Revolution; Fort Independence, on Castle Island, long known as "Castle William," and once the principal seaward defence of the town, though at present Fort Warren, on George's Island, and other defensive works are of much more importance.

The manufactures of Boston are varied and important, including furniture, machinery of all kinds, shipbuilding, oil and sugar refining, leather-dressing, the making of clothing, jewelry, chemicals, boots and shoes, iron and brass castings, etc. It is an important centre of the boot and shoe and leather trade, of the wool business, and of the sale of domestic and foreign dry goods. It does a heavy business in exporting grain, flour, ice, and provisions. Its ancient India and China trade, destroyed by the civil war, has been partly restored.

Churches, Institutions, etc.—This city contains 171 or more churches, of which 29 are Unitarian and 30 Orthodox Congregational, 26 Methodist, 27 Baptist, 20 Episcopal, 4 Jewish, 6 Presbyterian, 22 Roman Catholic, and 6 Universalist. Boston is distinguished among American cities for the number and excellence of its literary and scientific institutions. The Boston Athenæum, on Beacon street, is richly endowed, and occupies a building that cost $136,000, besides the cost of the ground, which was $55,000. It has a library of about 100,000 volumes, with a gallery of paintings and another of sculpture. The American Academy of Arts and Sciences, founded here in 1780, has a good library. The Boston Public Library, founded in 1852, and opened in its present building in 1858, fronts on Boston Common, is free to every citizen, and is one of the

The State Capitol.

largest in the Union. The original cost of it was $363,633. It contains about 275,000 volumes, and has branches in most of the city districts. The Massachusetts Institute of Technology, a school of industrial science, situated near the Public Garden, is a very flourishing institution, and one of the best of its class in the U. S. It has seven courses of study, each of four years—to wit, mechanical engineering, civil and topographical engineering, geology and mining engineering, building and architecture, chemistry, science and literature, and natural history. There is also a free course of instruction in practical design and working draughts for both sexes. The institute is crowded with pupils, and it is proposed to erect additional buildings. Among the other important literary and scientific institutions are the Massachusetts Historical Society, the Massachusetts Horticultural Society, the Medical College, connected with Harvard College, and the Lowell Institute, founded by John Lowell, who bequeathed a legacy of $250,000 to maintain free lectures on chemistry, physics, etc.; the Boston College (Roman Catholic) and the Boston University (Methodist Episcopal), connected with which is a homœopathic medical college.

Boston has a well-organized system of graded public schools, consisting of primary, grammar, and high schools. The head-masters of the high schools receive a salary of $4000 per annum, and the masters of the grammar schools receive $3200. The number of the public schools since the annexation of the neighboring municipalities amounts to about 464. The principal daily papers issued here are the "Daily Advertiser," the "Boston Post," the "Boston Traveller," the "Herald," the "Boston Journal," the "Boston News," the "Boston Transcript," and the "Boston Globe." Among the benevolent institutions are the Massachusetts General Hospital, which is built of granite, and is liberally endowed; the McLean Asylum for the Insane, which is at Somerville, two miles N. W. of Boston; the Perkins Institution and Massachusetts Asylum for the Blind; Home for Aged Men, Home for Aged and Indigent Women, and the City Hospital, completed in 1864 at a cost of about $400,000; a homœopathic hospital, a woman's hospital, a

consumptives' home (homœopathic), a farm school on Thompson's Island, and numerous other charities.

Commerce, Banks, etc.—In foreign commerce Boston is considered as the second city of the U. S. Its enterprise in this department extends to almost every nation on the globe, and its trade is steadily increasing. The value of the foreign imports received here in 1871 was stated to be $62,000,000. The value of exports, which in 1870 was only $12,000,000, amounted in 1871 to $19,000,000. The whole number of arrivals in 1871, including coasting vessels, was about 10,000. Among the chief articles of export are fish and ice. The quantity of ice exported in 1864 was 104,354 tons. Boston has sixty national banks, with a capital of $49,000,000, and nineteen savings banks. It is supplied with good water from Sudbury River and Cochituate Lake, which is nearly 20 miles W. of the city, and Mystic Lake in the towns of Arlington and Winchester. It is divided into twenty-one wards. Steamships of the Cunard line depart from this port to Liverpool once a week or oftener.

History.—Boston was founded in 1630, and the site was originally called Shawmut. The first settlers gave it the name of Tremont (or "Trimountaine," because one of its high hills had three points or summits). Benjamin Franklin was born here in 1706. In Mar., 1770, occurred a conflict between some British soldiers and the populace, several of whom were killed. This was called the "Boston Massacre." Among the memorable events in the history of this place was the battle of Bunker Hill (situated in Charlestown district) June 17, 1775, after which the British army occupied Boston until Mar., 1776. They were then compelled by the American army to evacuate it. Boston was incorporated as a city in 1822. Pop. in 1800, 24,937; in 1820, 43,298; in 1830, 61,391; in 1840, 93,383; in 1850, 136,881; in 1860, 177,840; and in 1870, 250,526; in 1874, about 320,000; besides which the suburbs contain more than 100,000.

On the evening of the 9th of Nov., 1872, a conflagration broke out in a large five-story granite building at the corner of Summer and Kingston streets. This building was surmounted by a mansard roof. The prevalence of the horse-disease caused a delay in bringing fire-engines to the spot. A strong N. W. wind prevailed at the time, and soon blew with great intensity, causing the fire to spread at an uncontrollable rate. The intense heat of the conflagration, together with the height of the buildings, rendered it impossible for the steam fire-engines to render effective service. The spread of the conflagration was promoted by the great number of wooden roofs, covered with slate only. The locality of the fire was occupied to a great extent by wholesale warehouses of the best class, many of them structures of great cost and architectural excellence. Granite walls were disintegrated by the intense heat. Fire-engines soon began to arrive from other cities, but their most persistent and systematic efforts for the time proved unavailing. At two o'clock on the morning of Sunday, Nov. 10, attempts were made to stop the conflagration by the blowing up of buildings by gunpowder. This process was not considered successful in hindering the progress of the flames. The steam fire-engines worked with efficiency, and by two o'clock on Sunday afternoon the progress of the fire had ceased, after having burned over sixty-five acres of ground, and destroying 776 buildings, 709 of which were of brick or stone. These buildings were assessed at a valuation of $13,591,900, probably about half their market value. The number of dwellings destroyed was only sixty. The chief loss fell upon the shoe, leather, and wool interests, and the heavy trade of Boston in these commodities was for a time almost annihilated. The loss of personal property was estimated at $60,000,000, of which a large part was sustained by insurance companies. Only fourteen lives are known to have been lost.

On the 30th of May, 1873, another fire broke out in Bumstead court, in a great furniture warehouse, destroying property worth $1,500,000, including the Globe Theatre, Chickering's piano-forte warerooms, and a large number of stores on both sides of Washington street.

Besides the "Back Bay lands," above alluded to, and other tracts of made land which have been added to the original peninsula of Boston, it is proposed to fill a large tract of the shoal water known as "South Boston Flats," the material for the work being chiefly obtained by dredging the harbor to the minimum depth of twenty-three feet. The newly-made land is to be covered with a deep layer of clean gravel. It is also proposed to construct tidal reservoirs on the Mystic River, N. W. of Boston, so as to preserve the scouring effect of the tides in preserving the depth of the channels leading to the harbor. The harbor itself is one of the best on the coast. Its entrance is marked by four lighthouses, one on Minot's Ledge, lat. 42° 16′ 09″ N., lon. 70° 45′ 14″ W., a granite tower 100 feet high, showing a fixed white light of the second class.

The Boston light, on Little Brewster Island, is a stone tower 80 feet high, showing a flashing white light of the second class, 98 feet above the sea. The Narrows light on the Great Brewster, and the Long Island Head lighthouse, an iron structure, are of smaller size, though of hardly less importance. The islands to the eastward are of the greatest importance, as they give safety to shipping within the harbor during the prevalence of easterly winds. The destructive action of the sea upon these islands has been very remarkable, but their eastern shores are now protected by heavy sea-walls. These important public works for the preservation and extension of the commerce of Boston are due not alone to the action of the general government, but largely to that of the State and municipal authorities. NATH. B. SHURTLEFF, *Ex-Mayor.*

Boston, a township of Franklin co., Ark. Pop. 289.

Boston, a township of Newton co., Ark. Pop. 109.

Boston, a township of Wayne co., Ind. Pop. 894.

Boston, a township of Ionia co., Mich. Pop. 1947.

Boston, a post-township of Erie co., N. Y. Pop. 1633.

Boston, a township of Summit co., O. Pop. 1142.

Boston, a township of Darlington co., S. C. Pop. 1913.

Boston, a post-village, capital of Bowie co., Tex., 65 miles N. of Marshall. It has a good high school and a female academy. Pop. 273.

Boston (THOMAS), a Scottish Presbyterian minister, born at Dunse, Berwickshire, Mar. 17, 1676, began to preach at Ettrick in 1707, and acquired much popularity as a preacher and a writer. Among his works are a "Body of Divinity," "Human Nature in its Fourfold State" (1720), and "The Crook in the Lot." Died May 20, 1732. His sentiments and peculiar modes of expression are said to have colored the style of Scottish preaching more than those of any other Calvinistic writer. (See his "Autobiography.")

Boston Corners, a post-village, and station of the New York and Harlem R. R., 100 miles from New York. It was formerly a part of Berkshire co., Mass., but being nearly inaccessible from that State on account of a steep mountain-ridge, it became for a time the resort of ruffians, prize-fighters, etc. In 1853 it was ceded to New York, and is now a part of Ancram township, Columbia co., N. Y.

Boston School System. (See SCHOOL SYSTEM OF BOSTON, by HON. JOHN D. PHILBRICK.)

Bos'tra, or **Bots'rah,** sometimes called **Boz'rah,** formerly a great city of Arabia, now in ruins, in an oasis of the Syrian desert, about 75 miles S. of Damascus, and about 40 miles E. of the Jordan. It was in the southern part of the district of Auranitis, the modern Hauran, of which it was the capital in the Middle Ages. It was beautified by Trajan, who made it the capital of the Roman province of Arabia about 105 A. D. The Roman emperor Philip gave it the title of *Metropolis,* probably because it was his native place. It was described as a great and populous city about 300 A. D. The important ruins of Bostra are described by Burckhardt in his "Travels," and Robinson in his "Biblical Researches," vol. iii. *Bostra,* though sometimes called *Bozrah,* must not be confounded with the Idumean city of that name. (See BOZRAH.)

Bost'wick (Rev. DAVID), born at New Milford, Conn., Jan. 8, 1721, taught in the academy at Newark, N. J., and entered the Presbyterian ministry and became distinguished for eloquence. He was a pastor at Jamaica, L. I., and in New York City. He published several works, of which the best known was a defence of infant baptism. Died Nov. 12, 1763.

Bostwick (Mrs. HELEN LOUISE), born in 1826 at Charlestown, N. H. Her father was Dr. Putnam Barrou. She removed in her youth to Bucyrus, O., became a contributor to periodical literature, and published a volume of poems called "Buds, Blossoms, and Berries."

Bos'well (JAMES) **of Auchinleck,** a famous Scottish biographer, born at Edinburgh Oct. 29, 1740. He studied law, and in 1763 became acquainted with Dr. Johnson, of whom he was a devoted admirer. Having visited Corsica, and espoused with ardor the cause of Paoli, he published an "Account of Corsica" (1768). In 1773 he was chosen a member of the literary club established by Dr. Johnson in London. He diligently noted and recorded the sayings, opinions, and actions of Dr. Johnson, of whom he was an intimate associate. His "Life of Samuel Johnson" (2 vols., 1791) is a remarkable and, in many respects, an admirable biography. Boswell was eccentric, and noted for his vanity. Died May 19, 1795. (See MACAULAY'S review of Boswell's "Life of Johnson" in the "Edinburgh Review" for 1831.)

Boswel'lia (named in honor of John Boswell, a physician), a genus of trees of the order Amyridaceæ, natives of India, Persia, and Arabia. The flowers have five petals

and a crenelated granular disk. The fruit is a triangular capsule with three valves, three cells, and one seed in each cell. The number of known species is small. The *Boswellia thurifera* (or *serrata*) is a large tree with pinnate leaves, each of which has about ten pairs of hairy, serrate leaflets and one odd leaflet. It has small pink flowers in axillary racemes. This tree yields the fragrant resin called *olibanum*, which is believed to be identical with the frankincense of the ancients. (See OLIBANUM.)

Bos'worth, a market-town of England, in Leicestershire, on an eminence 10 miles W. of Leicester. On a moor near this town was fought in Aug., 1485, the battle of Bosworth, or Bosworth Field, in which Richard III. was defeated and killed. This battle terminated the civil war of the Roses, and raised Henry VII. to the throne.

Bosworth (JOSEPH), D. D., F. R. S., an English philologist, born in Derbyshire in 1788. He graduated at Leyden, and received the degree of D. D. at Trinity College, Cambridge. In 1817 he became vicar of Horwood Parva, in Buckinghamshire. He devoted much time to the study of Anglo-Saxon, and published, besides other works, a "Dictionary of the Anglo-Saxon Language" (1838), which is indispensable to the thorough student of English. He resided ten years (1830–40) in Holland as British chaplain.

Böszörmeny, a town of Hungary, in the county of Szabolcz, 16 miles N. N. W. of Debreczin. Pop. 19,208.

Botanic Gardens are collections of growing plants, made for the purpose of instruction or for scientific observation. Of late, they have also been very serviceable in introducing useful and ornamental plants from foreign countries. The Kew Gardens in England and the Jardin des Plantes in France are among the most celebrated botanical gardens in the world. In the U. S., the garden connected with the Department of Agriculture at Washington promises to become highly useful in bringing new plants into cultivation. There is also a successful botanic garden connected with Harvard College at Cambridge, Mass. The Missouri Botanic Garden at St. Louis was founded by Henry Shaw.

Bot'any [from the Gr. *βοτάνη*, a "plant;" Fr. *botanique;* Ger. *Bota'nik*] is the natural history of the vegetable kingdom—*i. e.*, the science that treats of plants. For the present purpose there is no need to draw out the distinctions between the two kingdoms of organic nature, animal and vegetable, for their ordinary representatives would never be confounded. But the task, when attempted, is by no means a light one; indeed, a complete definition, discriminating the lowest forms of plants from the lowest animals, is still a desideratum, if not an impossibility. (See on this subject the article PLANT.) Probably the best general definition of plants, and that which brings prominently into view their nature and office, is this: they are those beings which derive their sustenance from the mineral kingdom, namely, from the earth and air. They only are capable of converting earth and air into nourishment. Plants create the food upon which animals live. Their office in the economy of nature is to transform lifeless mineral materials into living matter, or into matter capable of supporting or composing the corporeal structure of a living being. Animals take that which plants have prepared for them, transform it more or less, incorporate it into structures which manifest powers and vitality of a higher order; but they originate no organic matter.

The several departments of botany relate to the different kinds of inquiry which may be made respecting plants. They all fall under two primary divisions—namely, *structural* or *biological botany*, and *systematic botany*, with certain subsidiary inquiries.

I. *Structural or Biological Botany* includes all inquiries into the organic structure, life, growth, action, and propagation of plants. The structure and the functions may be regarded separately, although practically they are best treated in connection. As to the first, pure *structural botany* is sometimes denominated *organography*—*i. e.*, the study of the organs or members of plants. The study of the organs as compared with each other—as, for instance, of the different forms which leaf, stem, etc. may exhibit in the same plant or in different plants—has taken the name of *morphology* (the doctrine of forms or shapes)—a department or mode of treatment of the subject which in modern times has greatly enhanced the interest of botany. The morphological study of abnormal parts or monstrosities takes the name of *teratology*. The organs of plants in the most general sense are their obvious parts or members, such as leaf, stem, and root, flower, fruit, and seed. But each of these is made up of parts, and the parts themselves are complex: the minuter parts or organic elements of plants, which compose the obvious members, are in the stricter sense the plants' organs. Their investigation takes the name of *vegetable anatomy*, or *histology*. The study of the actions of these organs, whether of the obvious members or of their minute components (which, indeed, are the parts that act), is the province of *physiological botany* or *vegetable physiology*. These are the principal departments of structural and biological botany. The leading facts and the leading ideas which the botanist of the present day has to consider under these several divisions, so far as they may be clearly stated in a very brief compass, are as follows:

1. *Structural Botany* proper, including *Morphology*.—The natural history both of the vegetable and animal kingdoms in modern times is studied upon a morphological basis. The minds which have dominated and shaped vegetable morphology are those of Linnæus, Goethe, Robert Brown, and De Candolle, to which several more recent names might be added.

As a proper representative of an animal would be some species of the highest grade, rather than a polyp or an infusory animalcule, so for the plant the higher grade must be taken as a pattern. The following exposition therefore takes into account, in the first instance, ordinary plants only, such as our herbs, shrubs, and trees. These spring from seed; they take root; they develop a stem, on which they display leaves; and they develop flowers, the end of which is the production of seed. The root avoids the light, grows downward, fixes the plant to the soil, and ordinarily ramifies in it. The stem rises into the light, develops leaves at definite points of its surface, is at its summit capable of extending farther and farther, until finally it bears a blossom or a cluster of blossoms, which end it. Stems take root; if they did not do so, our power of multiplying plants would be very much diminished. Some stems will strike root into the ground freely and surely whenever placed in favorable condition for it—namely, when screened from light and supplied with moisture and a fitting temperature. Most stems can be made to do so; hence propagation by laying, by slips or cuttings, etc. A stem consists of a series of what, in a loose way—although as to many plants (reeds, grasses, etc.) a very natural and correct way—of speaking, may be called joints; there is a point or portion from which leaves (one or more) are or may be developed; this is a *node*. Between one node and another above or below it—a space of variable length, according to the amount of growth—no leaves can be produced: this intervening naked portion is an *internode*. A stem is made up of a series of nodes and internodes. The apex of a stem is theoretically supposed to be, and generally actually is, so long as it lives, a *bud;* that is, a growing point, consisting actually and potentially of nodes and internodes. The growth of the stem, as to length, is by the development of the internodes in succession, beginning with the lowest and oldest; this growth separating the nodes more or less according to the amount of lengthening, and so spacing apart the leaves they bear. This growth of the stem, accordingly, consists—1, of the formation of new parts at the apex of the old; 2, of the lengthening of the successive internodes. The length any internode may attain is very variable, but each one when it begins to grow usually acquires the length it may attain rather rapidly, and when its tissues are matured is incapable of any farther extension in length, leaving the stem to be carried up by the development in their turn of the younger internodes above it. Stems usually grow and rest by stages. The bud is the undeveloped apex of a stem, whether in a growing or resting state. Winter-buds, as they are termed, are formed in summer or autumn, remain quiescent through the winter until the coming spring, and then develop. The larger and best-developed ones are provided with scales, which their nodes bear in place of leaves, and they sometimes contain, already formed, all the nodes, internodes, and leaves they are to develop the coming season, already discernible, although rudimentary. From such buds there are all gradations down to those which are hardly or not at all apparent until they begin to grow.

Branching takes place by the production of side-buds, and these, as a rule, are produced only on the nodes; that is, as each joint of the stem, when formed, ends with a bud (the terminal bud) which is to carry on the stem yet higher, so it also produces or may produce side or lateral buds also. There is a definite place on the node for such buds to arise (*i. e.*, in the angle formed by the leaf with the stem, on the upper side): this angle is called the *axil* (arm-pit), and buds springing from thence are said to be axillary. Axillary buds develop into branches. As a rule, there is only one to each leaf.

Arrangement of Leaves (*Phyllotaxy*) *and Branches.*—That of the latter depends upon the former. Leaves are symmetrically disposed upon the stem. A plant, no less than an animal, is symmetrical. Leaves are either single on each node—*i. e.*, they follow one after another (are *alternate*)—or else there is a pair, or more than a pair, upon each node. When a pair only, they stand always upon exactly opposite sides of the stem (are said to be *opposite*); when

three, four, or any other number, they divide the circle equally—that is, they stand as far apart from each other as possible in the circle. A circle of three or more leaves, etc. is called a *whorl* or *verticil;* such leaves are said to be *whorled*. Evidently, opposite leaves present merely the simplest case of whorled leaves, a whorl of two leaves. The pairs or whorls of leaves follow each other in a fixed order: each pair stands over the intervals of the pair next below, and the leaves of the whorl of three or other number correspond to the intervals of those of the whorl above and below. In the alternate arrangement the single leaves succeed one another in a definite order, maintaining a complete symmetry. Each leaf projects from the stem at a fixed angle with that which precedes and that which follows it, which is uniform for the species, but different in different species. In the simplest case the second leaf is on exactly the opposite side of the stem from the first—of course higher up; the third leaf on the opposite side from the second, and therefore vertically over the first; so the leaves are in two vertical ranks: the angular divergence—*i. e.*, the angle which successive leaves make—is one-half the circumference of the stem. Other plants have the angular divergence one-third—*i. e.*, the second leaf is placed one-third round the stem: the third is one-third round from that, completing a cycle of three, and bringing the fourth over the first, the fifth over the second, and so on—that is, disposing the leaves in three vertical ranks. A line traced on the stem through the base or attachment of the successive leaves forms a spiral: each turn, from one leaf round to the one above which is placed directly over it, is termed a *cycle*. Alternate leaves are never in four ranks, but they are very commonly in five. In that case the angular divergence, or portion of the circle between any two successive leaves, is two fifths of the circumference, and the spiral line ascends through two whole turns round the stem in completing the five vertical ranks of leaves, and bringing the sixth over the first. These several modes of arrangement may be designated by the fractions $\frac{1}{2}$, $\frac{1}{3}$, $\frac{2}{5}$, which measure the angular divergence of the successive leaves in the spiral. The denominators likewise express the number of vertical ranks, and the numerators the number of turns round the stem in completing a cycle. An obvious relation of these fractions to each other is, that the sum of the numerators of the first two fractions is the numerator of the third, and the sum of the denominators is the denominator of the third fraction. Now, the indication thus suggested is carried out in fact when alternate leaves occur in more than five vertical ranks: for the next higher number of vertical ranks is eight, and their angular divergence is three-eighths of the circumference; and the next is in thirteen vertical ranks, with a divergence of five-thirteenths of the circumference, and so on: that is, the actual arrangements are expressed by the series of fractions, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{2}{5}$, $\frac{3}{8}$, $\frac{5}{13}$, $\frac{8}{21}$, and so on. The subject is capable of very interesting mathematical development. These are all modes of equable distribution of foliage on an axis; and the meaning of them appears in some degree evident when it is understood that the work of vegetation is done by the foliage under the light of the sun; so that there is an advantage in having as large an amount of foliage as possible within a given space, and most fully displayed to the light. The study of the arrangement of leaves is termed *phyllotaxy*, which is the Greek for leaf-arrangement.

Metamorphoses of Leaves and Stems.—The most fertile ideas in morphological botany are those which, indistinctly sketched by Linnæus and afterwards by Wolff, were first well developed by the poet-philosopher Goethe, and since perfected by various minds. These ideas are best expressed in the following propositions: Every plant of the higher grade (high enough to exemplify the plan of vegetation) is built up of a succession of joints of stem and leaves, of which the embryo just developed from the seed, with its primary stemlet and seed-leaves (*cotyledons*, one, two, or rarely more, as the case may be), is the archetype and the parent. All subsequent development consists of repetitions of this. The primary stemlet, at the outset of germination, sends out a root from its lower end, which is often the origin of the whole root of the plant; but any succeeding joint of the stem may equally send out roots, and commonly does so when favorably situated—*i. e.*, when supplied with moisture and excluded from light. The successive joints of stem, with the leaves they bear and any roots they may send downward, build up the plant, as it were, in a series of generations, the greater part of which are capable of independent propagation (as cuttings, layers, etc.), or else they make a part of the common life and structure of the vegetable. A plant, therefore, is to be likened to a coral structure or to other compound polyps which construct a polypidom, rather than to an animal of the higher grade and complete individuality, such as a horse or a man. But the plant constitutes a sort of corporate whole: it may be likened to an organized community, in which "all members have not the same office," but some are turned to one account, some to another. The morphological botanist's view is, that, root excepted, the plant's organs are all constituted of stem and leaf, and all on the plan which is displayed by the plantlet at the beginning of its growth. The cotyledons, which compose the principal bulk of any large embryo, and which develop in germination into the seed leaves in the convolvulus, gourd, and the like, and do the work of leaves upon being raised above the ground by the lengthening of the stemlet (or first internode) beneath them, are equally discerned in those of the bean, although so much thicker, hardly turning green, and never becoming foliaceous: here the seed leaves are made a storehouse of nourishment: in a pea and an acorn they are still more gorged, so as to be hemispherical, and never attempt any foliaceous development, but simply feed abundantly the bud between them (*plumule*), so that the succeeding joints of stem and their leaves develop the more rapidly and vigorously. So, again, where winter-buds are formed, their scales represent leaves relegated to the function of protection. Lilac buds in their development show this well, in the gradual and complete transition from the outermost bud scales, which fall off unchanged, to the ordinary leaves. In the scales of bulbs the botanist sees leaves, or the bases of leaves which are foliaceous above ground, converted into reservoirs of nourishing matter, and when this is exhausted the thinned and dried outermost scales serve for protection. Leaves of barberry develop as spines; those of pea, cobæa, and the like, convert a part of their leaflets into tendrils for climbing, while those of maurandia, lophospermum, etc. make their leaf-stalks, and those of clematis their partial leaf-stalks, serve as tendrils for climbing, the blade of the leaf remaining unchanged as foliage. In other cases (probably in gourds and squashes) a whole leaf becomes tendril.

Equally may stem or branches assume any of these forms and functions. Tendrils of the grapevine and of the passion-flower are stems or branches: so are thorns of hawthorn, pear, honey-locust, etc.; the green rind of the stem of cactuses, or flattened leaflike expansions in many of them and in various other plants, take the function of foliage; tubers (such as potatoes), root-stocks (as of iris, sweet-flag, ginger, etc.), are portions of stem used as reservoirs of nourishment, just as the thickened roots are in radish, turnip, carrot, etc.

Returning to leaves and to the ultimate development in the blossom as the inflorescence is approached, manifest leaves not rarely exchange the green of vegetation for the brighter hues and delicate texture of floral-leaves, as in painted-cup, calla, Poinsettia, etc. And in the leaves of the flower themselves every one recognizes the appropriateness of the term when the outer circle (*calyx*) is green, as is commonly the case, and hardly less so for the inner circle (*corolla*), although its members (*petals*) are of delicate texture and of other hues than green. The evidence of gradual transition from leaves outside of the flower (*bracts*), through those of the calyx to those of the corolla, does not always stop there. In water-lilies and some other flowers the inner petals pass by degrees into stamens, and so supply one of the clews which lead the botanist to his inference that even the interior organs of the flower equally answer to leaves. Cultivated flowers confirm this inference when by becoming "double" (to use the florist's term) they turn, some the stamens only, some both stamens and pistils, into floral-leaves or petals, or, in some monstrosities, turn them all into a rosette of green leaves. Finally, the arrangement of the parts of the flower, of whatever shape or character, conforms to that of leaves on a stem; *i. e.*, they follow the laws of phyllotaxy, already described—are either in circles, and the members of the successive circles alternating with each other (decussating) after the manner of whorls of leaves, or in cycles according to the spiral or alternate arrangement of leaves. And the arrangement of the blossoms themselves upon the stem, or in their clusters, conforms precisely to that of buds: flowers, like leaf-buds, are terminal or axillary. A flower is, as all lines of evidence go to prove, a sort of bud with its leaves developed and the internodes undeveloped or nearly so—with its leaves developed in peculiar forms, not always greatly different from foliage in the outer parts, but very different in form and in office as respects the inner and essential organs. In the language of morphology, leaves, sepals, petals, stamens, etc. are *homologous* organs, just as the fore leg of a dog, the wing of a bat or bird, the flipper of the whale, etc. are homologous with the arm of a man.

The Parts of the Flower need to be briefly specified before its morphology can be completed. Here, again, the botanist places before his mind a pattern flower—one complete in its parts and free from complications or disguises. A complete flower of this sort has two kinds of organs—1, *Envelopes* or leafy parts, "the leaves of the blossom," and

these in two circles; the outer circle is the *calyx*, oftener than otherwise green and leaflike; the leaves or pieces of the calyx are named *sepals;* the inner, of delicate texture, and almost always of other color than green, is the *corolla;* its pieces or leaves are petals. 2, *Essential organs* within the last; these are of two sorts, and at least in two circles; the exterior sort are the *stamens*, the interior, occupying the centre, are *pistils.* These two essential organs conspire to the production of seed. The stamens are the fertilizing organs. Each consists of a *filament*, usually a slender body which may be likened to the stalk of a leaf; it is the stalk of the other and only essential part—namely, the *anther.* The anther is a two-celled sac, commonly opening at maturity by a slit from top to bottom of each cell or compartment of the sac. In an anther the botanist thinks he discovers the blade of the leaf in a peculiar guise; in the two cells or compartments, standing side by side, he sees the right and left half of the blade; in the solid part that usually connects them, the midrib of the blade; and the interior, instead of the green pulp of foliage, contains a powdery matter, commonly of yellow color, composed of minute grains. This powder is named *pollen;* its production is the essential thing: it is discharged by the opening of the anther, and its office is to fertilize the pistil, or rather the important contents of the pistil. A pistil, complete and simple, consists of three parts—1, the *ovary* at the base, the cell or closed cavity of which contains one or more *ovules*, the bodies which after fertilization become seeds; 2, the *style*, a column or narrowed prolongation of the summit of the ovary; 3, the *stigma*, which is sometimes a knob at the apex of the style, sometimes a mere point, or a line running down one side of it; it is always destitute of the epidermis or skin which covers the rest of the plant, and has either a roughened or a glutinous or a moist surface, to which pollen may adhere. The ovary is an essential part, as it contains the ovules or future seeds; the stigma also, for the application of the pollen to it is requisite to the maturation of the ovules into seeds; the style is sometimes wanting, as the stigma may as well be borne upon the apex of the ovary. A simple pistil is conceived by the botanist to answer to a leaf with its edges brought together and united so as to form a closed sac (the ovary), the outer surface of which is the lower surface of the leaf, the lining its upper surface; and the ovules are borne on some part of the line (*suture*) which represents the united edges of the leaf, or on some enlargement of this line (*placenta*). The style is a prolongation of the apex of this ideal leaf, with margins, as we may suppose, rolled in; the stigma answers to some portion of leaf-margin or apex denuded, and sometimes enlarged for the readier lodgment of pollen.

To this idea and type of a flower, which is simply and completely realized in some, and incompletely so in others, the botanist refers all flowers he meets with; and he explains all deviations from it, and all disguises of it, in accordance with the laws that govern the arrangement, combinations, etc. of stem and leaves. For example: when the calyx or corolla occurs as a cup or tube, he sees in it a congenital coalescence, or union by their adjacent edges, of the leaves of a whorl or cycle; when these parts cohere below with the surface of the ovary, he recognizes an adnation of contiguous whorls. When the petals, stamens, or other parts are numerous, this augmentation means that additional whorls or cycles (as the case may be) of metamorphosed leaves of that order have developed. When these organs are fewer than the numerical plan of the flower indicates, the botanist perceives that some of the members of a cycle have failed to be produced—are *suppressed*, as he would say—and he generally may detect either the rudiments or vestiges of the missing organs, or the vacant places which they should occupy—*i. e.*, which the symmetry of the blossom calls for.

There is not only a general plan of flowers, but a particular plan for those of each natural order, and a still more special plan for the flowers of the same genus or kind; and so one flower of a group helps to interpret the others—the more regular and complete ones throw light upon the irregular, incomplete, or unsymmetrical ones, by which the botanist sees through their disguises.

So in the fruit, which is the ovary and its contents matured, the morphological botanist sees either single leaves or whorls of leaves, either separate or combined, either free from other parts or congenitally united with them, either still retaining or resuming somewhat of foliaceous character, as in a legume or pea-pod, or hardened, as in a nut, or thickened and softened throughout, as in a berry, or with an inner stratum hardened to form the stone, and the outer stratum softened to form the sapid pulp or flesh of a peach or cherry. In an apple it is seen that the principal edible portion of the fruit consists of calyx; in a strawberry, of axis or the end of flower-stalk upon which the ovaries were borne; and so on.

The pistils, or the carpels of which a pistil is composed, end the morphological series, and in the seed—or rather in the embryo formed in the seed—the series begins anew. Some would see in the ovule, and consequently in the seed, a bud, developed usually on the margin of the carpellary leaf, and point to bryophyllum and other plants, whose leaves are apt to develop leaf-buds upon their edges. In that view the kernel of the ovule answers to axis, and its coats to leaves. The other, and perhaps the better, view is, that ovules are special appendages or transformed lobes of leaves consecrated to the reproduction of the species.

The lower grades of plants would require to have their structure and morphology separately explained, for which space is lacking; they will be treated under the heads, Ferns, Mosses, Lichens, Fungi, Algæ (Seaweed), etc. Suffice it to say, that the general plan of vegetation, by stem, and leaves symmetrically arranged upon it, prevails in the higher orders of the lower grade of plants, such as ferns and mosses; that stem and leaves begin to be fused into a common foliaceous expansion in liverworts; that all distinction of this sort vanishes in lichens and algæ, and still more in fungi, which in all their multifarious diversity have nothing which in any sense answers to foliage, root, etc.

As to organs of reproduction, the greatest simplification of the flower occurs in coniferous plants (pines, cypress, yew, etc.) and in the allied Cycas family. In these the female flower is reduced to the pistillary leaf or carpel, and that is open; style and stigma are done away with, and the pollen falls directly upon the mouth of the ovules to fertilize them. Sometimes, as in yew, the whole apparatus is reduced to a naked ovule. Such are termed *gymnospermous* plants—*i. e.*, naked-seeded; and in contradistinction those of the ordinary sort with ovules in a closed ovary, and therefore seeds in a pericarp (inside a fruit), are *angiospermous.* But what distinguishes completely the lower grade of plants from the higher is a total change of type as to reproduction. From ferns downward, flowers (and their result, seeds) disappear. Their reproductive organs are analogous to flowers and seeds, but not homologous with them—not of the same type. In common language we say that while ordinary plants are flowering, those of the lower grade are flowerless. Linnæus gave the technical term of *phænogamous* or *phanerogamous* to plants which produce flowers (stamens and pistils), and *cryptogamous* to those (such as ferns, mosses, lichens, algæ, and fungi) which, as the appellation denotes, have no obvious stamens and pistils. His name implied that there were organs answering in function to stamens and pistils, although concealed at least from his view. And the correctness of his surmise is now confirmed. Cryptogamous plants possess organs which act as stamens and pistils, as microscopical researches have shown. The result, however, is not a seed containing an embryo, but a much more simple body, called a spore, which by germination grows into a new plant. The apparatus for producing spores differs so widely in different orders of cryptogamous plants that it must be separately studied in each. To understand them requires a knowledge of

II. *Vegetable Anatomy* or *Histology.*—The space here devoted to morphological botany demands the curtailment of the other departments. The history of vegetable anatomy is that of microscopical research. The leading facts are, that plants are built up of parts or integers, all essentially of one nature, however diverse in form, of which a good general idea may be obtained by likening the integers to the bricks of an edifice, supposing the bricks to be hollow and various in shape. These organic components of plants are called *cells.* They consist of a wall of solid vegetable matter, circumscribing a closed cavity, which, while the cell is alive, contains some living vegetable matter, either solid or liquid. Or, going back to the beginning, a vegetable cell (not very appropriately so named) is or was a mass of plastic vegetable matter, mostly of minute size, which encases itself with a wall or shell, this wall remaining permanent, although the living parts within may have disappeared. A plant, such as an oak tree, began its existence, in an ovule of the parent, as a single cell of this sort. The whole subsequent growth came from this; the capital fact being that the living vegetable cell has the power of multiplication. As it grows it is capable of dividing into two, and these again into two, and so on. There are plants (chiefly aquatic) of the simplest possible structure, which consist of but one cell; for as the cell multiplies by successive divisions into two, these separate and thus become so many individuals. There are plants which consist of a single row of such cells developing in a chain, and remaining adherent at least for a time; or of a plane of cells, dividing as they grow in two directions. But in all the higher plants the cells build up a structure composed mostly of distinct organs (stem, leaves, roots); and the cells themselves develop in various shapes, some round or polygonal, some lengthened into tubes, some with thin and delicate

walls (as in the pith and green bark), some with thicker or even very thick walls (as in wood, in the stone of a cherry, etc.). Woody fibres, bast of bark, ducts, and all the anatomical elements of a tree or herb, consist entirely of cells or of combinations of them, all of the same type and origin, however diverse in form, texture, etc. These are variously combined, arranged, and modified, composing the particular anatomy of roots, stems, and leaves. In the stems of flowering plants the distribution of the woody portion (wood-cells with ducts, etc.) is upon two plans—one, that of common wood, which is in concentric layers around a pith and within a separable bark, and a new layer is every year added outside of that of the year before; this is the *exogenous* stem, or outside-grower: the other, that of palms and the like, has no annual layers, but the wood is in separate bundles, interspersed in the pithy or cellular part, without apparent order, throughout the whole diameter, but more accumulated towards the circumference: as the newer wood or new bundles were thought to be added towards the centre, this stem was named *endogenous*—*i. e.*, an inside-grower.

In the leaves, the arrangement of the woody portion forming their framework (ribs, veins, nerves, etc.) which supports the green pulp or cellular portion, equally follows two plans. In one, the leaves are *reticulated* or *netted-veined*—*i. e.*, the finer divisions of the framework branch off from a central rib, or from one or more pairs of lateral ribs also, and their subdivisions, or some of them, unite (anastomose or inosculate) with other divisions to form a network of veins; this occurs in plants with exogenous stems, and only those, with some exceptions. In the other plan, which is characteristic of plants with endogenous stems, but not absolutely so, the leaves are *parallel-veined*—*i. e.*, the framework is composed of simple and parallel veins (formerly called nerves), proceeding unbranched from the base of the blade to the apex, or else from a midrib to the margins. These differences are turned to much account in descriptive botany.

III. *Physiological Botany*, or *Vegetable Physiology*, which is concerned with the actions or functions of plants considered as organisms, is a wide subject, which may be treated under an independent head. The portion which relates to nutrition connects itself with vegetable chemistry. The action of the roots in absorbing, of the stem in conveying, and of the leaves in digesting or assimilating, the materials upon which vegetables live, the use of assimilated matter in growth, the expenditure of some of it in doing work, are leading topics. The most fundamental idea in all vegetable physiology is, that plants create all organic matter, and consequently provide all the food upon which animals live. The function of vegetation is the assimilation of mineral matter—earth, air, and water, chiefly the two latter—into organic matter, which is alone capable of composing the living structure of vegetables and animals. Animals appropriate this, but produce none. Plants do this all-important work only in their green parts and under the light of the sun. Under the solar radiance they decompose carbonic acid and water, with the liberation of oxygen gas (therefore purifying or renovating the atmosphere for the breathing of animals); and they transform what they retain into permanent plant-structure—that is, into cell-walls, or else into equivalent substance of which cell-walls may be made (such as starch, sugar, and the like). They also convert these same mineral elements, along with some form of combined nitrogen (ammonia, nitrates, etc.), into proteine or protoplasm, which makes up the vitally-active part of living plant-cells, and is the source of, and essentially identical with, the flesh of animals.

And here a most important idea, of recent conception and demonstration, is brought into view—namely, that vegetable matter, produced under the influence of the sun, whether as plant-fabric (wood, etc.) or as prepared material of which fabric may be made (starch, sugar, oil, fibrine, etc.), as also the flesh or other fabric of animals derived from these, is to be regarded as matter in a state of energy; and energy is the power to do work. This, which the animal derives from the food supplied by the vegetable, the vegetable has stored up in the matter which the sun's rays, acting upon the living plant, have brought into this state of energy.

In the function of reproduction, the mode in which the pollen acts in fertilizing the ovules and originating the embryo in the seed; the arrangements through which these minute powdery grains are transferred from the anthers in which they originate to the stigma upon which they are to act, and by a growth from thence to the ovule, or, in some cases, the immediate application of pollen to the ovule; the maturation of fruit and seed; the arrangement for the dispersion of the latter; their germination,—these are some of the leading inquiries. Lastly, the vital manifestations as displayed in the movements or changes of direction which plants (no less really than animals) execute—some of them in connection with vegetation and growth, some subservient to reproductive functions—form extremely interesting subjects of physiological inquiry.

IV. *Systematic Botany* comprises all inquiries relative to plants as consisting of *kinds* variously related to one another—*i. e.*, as manifesting resemblances and differences in various degrees. Plants are thus considered as constituting a systematic whole or *vegetable kingdom*. Commonwealth would have been a truer term, for the vegetable creation does not culminate in a head or actual archetype, as does the animal realm in man. There are high and low plants in grade, but no highest and no lowest. The principal departments of this great branch of botanical science are—1, *Taxonomy*, and 2, *Phytography*, or *Descriptive Botany*.

1. *Taxonomy* is the study of the principles of classification, and of the grounds upon which divisions expressive of the diverse grades of resemblance manifested among plants may be made and defined. The fundamental facts in nature upon which classification in natural history is based are these two: 1st. Plants and animals occur in kinds, and are reproduced true to their essential characteristics, from generation to generation; in other words, progeny is like parent. 2d. The numerous kinds exhibit unequal and very various degrees of resemblance, some being very similar, others widely dissimilar. Upon the first rests the idea of *species*; upon the second, that of genera, orders, classes, etc. Species is the unit in natural history. Individuals occur as links in the chain of generations which have come down from the immemorial past: this "perennial succession of individuals," this *ensemble* of individuals proceeding from a common stock, constitutes a species. Genera, orders, classes, and the like are assemblages of species, of various degrees of likeness, according to the grade. Those species which are most alike are of one genus; for example, red oak, white oak, scarlet oak, live oak, etc. are so many species of the oak genus. Those which concur in a more general resemblance, as being on the same plan of structure in all their important organs, with whatever difference in details, represent an order or family (these terms being synonymous in botany); *e. g.*, the oak genus, with the chestnut, beech, hazel, etc., are of one order. Those which have only a more general resemblance are of one class. Proceeding synthetically, from the species upward, these are *groups*, successively more and more comprehensive. Proceeding analytically from the vegetable kingdom as a whole, distinguishable into parts, they are *divisions*. The sequence of subordination, from general to particular, in all natural history, invariably is—*Class*, *Order*, *Genus*, *Species*.

This sufficed for the earlier naturalists; but in modern times the vast increase in the number of known species, and a more intimate knowledge of their structure, have called for the recognition of more numerous grades. The term *tribe* has been intercalated above genus, and sub-class, sub-order, sub-tribe, sub-genus next under class, order, etc.; the extended scaffolding to be used or not, according as diversities in structure and the numbers of forms to be classified may require.

Although *species* is the recognized unit in natural history classification, no species is represented by absolutely identical individuals. The differences may be slight, apparently casual and evanescent; or they may be more remarkable, inexplicable by any known causes or conditions, and more enduring. Some species are much disposed to vary; some maintain a general uniformity. Even the branches from the same stem may vary, and when variations or "sports" of this character arise, they incline to be perpetuated in the offshoots. Bud variations, however, are not common; the offshoot for the most part strictly reproduces the parent stock. Most varieties originate from seed. Here the result of all observation leads to the conclusion that there are two opposed tendencies in every sexual reproduction: 1. That of the progeny to be like the parent or parents in all respects: this ordinarily obtains such full mastery as to have established the fundamental proposition that the species reproduces itself; which, more strictly analyzed, means that individuals reproduce their like. 2. The second is the tendency to be unlike the parents by varying in some minor particulars, to strike out something new and peculiar. The law of inheritance generally prevails, but the tendency to individualize manifests itself strongly now and then in certain and minor particulars, and sets up a variety. Unimportant as this may be in wild plants, and in any single step, it becomes of the highest practical consequence in horticulture, agriculture, and stock-breeding, in which all depends upon favoring, strengthening, and preserving varieties. Varieties of recent origination are seldom directly perpetuable by seed, although they are so by buds (offshoots, layering, grafting, etc.); the tendency of the offspring to inherit the

peculiarities of the parent being likely to be overborne by the ancestral tendency—*i. e.*, the disposition to take after grandparents, great-grandparents, etc. Also, in uncontrolled nature, the cross-breeding with individuals of the unvaried stock is almost sure to obliterate the incipient variation. The variation is preserved and led on, under man's care, by close-breeding in the first instance, and by selecting for seed only those of the progeny that inherit most of the peculiarity; then again selecting from the best of these, and so on for a few generations. In this way the force of *atavism*, or taking after ancestors, is weakened or evaded: for the new generation is far more likely to take after its immediate parents, grandparents, and great-grandparents when all are similar, than after a remoter ancestry, the parental and the grandparental (or atavic) forces now acting in the same line. In this way varieties, which at first would come true only by bud-propagation, are developed into *races*, or varieties of greater fixity, which come true from seed. Races in plants are naturally most important in annuals and biennials, which are capable of perpetuation only by seed. There are perhaps no annuals or biennials in cultivation which refuse to diverge into races.

Moreover, nearly related species may often, but not in all cases, be cross fertilized, and so their peculiarities mixed in the progeny, which takes after both parents; this gives rise to *hybrids*. These are of transient existence, except when perpetuated from buds—first, because they are commonly sterile *per se;* secondly, because they are liable to be fertilized by the pollen of one or the other parent, and so brought back to that type; thirdly, because even when fertile *per se*, the progeny in a generation or two returns, some to one and some to the other parental type by a disseverance of the mixed characters, one part inheriting only the peculiarities of the male, the other only those of the female, parent of the hybrid.

Races and varieties, of whatever sort or degree of fixity, have been regarded as of economical importance only, but merely perplexing to the systematist. Recently, however, they have assumed a new interest in the eyes of the philosophical naturalist through the investigations and reasonings of Mr. Darwin, which tend to the conclusion that varieties are incipient species, and cognate species only varieties of greater divergence or fixity—offshoots of higher antiquity from a common stock. To many of the leading naturalists of the present day, even those who do not recognize the agency of "natural selection" as the operative cause, the terms relationship, affinity, consanguinity, and the like, by which the resemblance of one species or one genus to another has always been denoted, are no longer regarded as metaphors, but rather as unconscious expressions of the idea that the resemblances are a consequence of community of descent.

The Methods of Classification, by which the principles of taxonomy have been applied to the systematic arrangement of the species of plants, may here be considered only so far as concerns—1. The system which gave the great impulse to botany in the later half of the eighteenth century, and prevailed through the earlier part of the nineteenth; 2. The system which has now taken its place, and under which the science is attaining a truly philosophical development. The first, the artificial sexual system of Linnæus, was entirely the work of this pre-eminent naturalist; to the second, the natural system, he made early and important contributions, and commended the work to his successors. The two great ends of a classification of the vegetable kingdom are—1, to exhibit the relationships which subsist among plants, and bind them into a systematic whole; therefore to arrange them in such order, and under such successive grades, that each species and each group of species shall stand next to those which it most resembles in all or in the most important respects—*i. e.*, in a system which shall express (so far as we can discover and express in terms) the plan of nature, or, more worthily, the plan of the Creator in the vegetable world; 2, to enable a learner readily to ascertain the name, place in the system, and an account of all that is known of any particular species. Those two ends should be subserved by one and the same classification. In the last century this was not practicable. So Linnæus contrived the system which bears his name as a temporary but much-needed expedient to subserve the latter purpose. He named it an *artificial system*, because in its classes and orders it did not attempt to express all or the more important relationships of plants, but only those which could most conveniently be used for a practical purpose. He named it the *sexual system*, because he founded it upon the stamens and pistils, of which he had just completed the proof that they were the sexual apparatus; and he saw, with instinctive sagacity, that agreement or similarity in the organs and method of reproduction would furnish the best characters for classification. Linnæus accordingly arranged the vegetable kingdom under twenty-four classes, characterized mainly by the stamens, as follows:

- Plants having
  - stamens and pistils manifest,
    - both found in the same flower,
      - the stamens separate from the pistils,
        - unconnected with each other, and
          - of equal length:
            - Stamens 1 ..... 1. Monandria.
            - " 2 ..... 2. Diandria.
            - " 3 ..... 3. Triandria.
            - " 4 ..... 4. Tetrandria.
            - " 5 ..... 5. Pentandria.
            - " 6 ..... 6. Hexandria.
            - " 7 ..... 7. Heptandria.
            - " 8 ..... 8. Octandria.
            - " 9 ..... 9. Enneandria.
            - " 10 ..... 10. Decandria.
            - " 11–19 ..... 11. Dodecandria.
            - " 20 or more, adherent to the calyx ..... 12. Icosandria.
            - " 20 or more, not adherent to the calyx ..... 13. Polyandria.
          - of unequal length:
            - two long and two short stamens ..... 14. Didynamia.
            - four long and two short stamens ..... 15. Tetradynamia.
        - connected with each other
          - by their filaments in a single set ..... 16. Monadelphia.
          - by their filaments in two sets ..... 17. Diadelphia.
          - by their filaments in more than two sets ..... 18. Polyadelphia.
          - by their anthers ..... 19. Syngenesia.
      - the stamens adherent to the pistil ..... 20. Gynandria.
    - in separate flowers
      - in the same individuals ..... 21. Monœcia.
      - in different individuals ..... 22. Dioecia.
      - some of the flowers perfect, others separated, in the same, or two or three different individuals ..... 23. Polygamia.
  - the stamens and pistils (concealed) represented only by analogues ..... 24. Cryptogamia.

The orders were founded upon some considerations respecting the pistils, their number, or the number of their styles in compound pistils—*e. g.*, *Monogynia*, with one, *Digynia*, with two, and so on; and upon divers other considerations in the other classes, which there is not space here to specify. The interest of this artificial classification is now only historical, except that it has firmly established many names and terms in the science with which the botanist has to be familiar.

The *natural system*, of which the endeavor is to arrange all plants according to their true relationships, has now been so far perfected that it is, on the whole, as easy for practical as it is indispensable for all thoroughly scientific use. Its first development as a complete system was by the Jussieus, uncle and nephew, in the last century. Towards its perfection many have contributed in the present century: the two names most eminently and intimately associated with it are those of Robert Brown and A. P. De Candolle. It recognizes, first of all, two great series of plants, a higher and a lower grade; the higher comprising the whole twenty-three Linnæan artificial classes (above presented); that is, all plants which are sexually propagated through stamens and pistils (in other words, bear flowers), which result in seeds, of which the essential thing is that they contain an embryo, as stated in another part of this article. These are *phænogamous*, or more popularly *flowering plants*. The

lower series, comprising the Linnæan class *cryptogamia*, has sexual propagation effected through organs which are only analogous in functions to stamens and pistils, resulting (as already explained) in *spores*, instead of seeds: these are *cryptogamous* or *flowerless plants*. The primary divisions or classes of the two series can here be presented only in the following tabular form:

Ser. I. Flowering or Phenogamous Plants, with	Exogenous growth and a dicotyledonous embryo.	Class I. Exogens, or Dicotyledons.	
		Seeds in a pericarp.	Subclass 1. *Angiosperms.*
		Seeds naked.	" 2. *Gymnosperms.*
	Endogenous growth and a monocotyledonous embryo.	" II. Endogens, Monocotyledons.	
Ser. II. Flowerless or Cryptogamous Plants, with	a distinct axis, or stem and foliage, containing	woody and vascular tissue.	Class III. Acrogens.
		cellular tissue only.	" IV. Anophytes.
	no distinction of stem and foliage, but all confounded in a thallus.		" V. Thallophytes.

Under these come the *natural orders* or *families* (between one and two hundred in number when most comprehensively treated); under these *sub-orders*, *tribes*, etc., whenever such have to be recognized; and finally the *genera* and *species*.

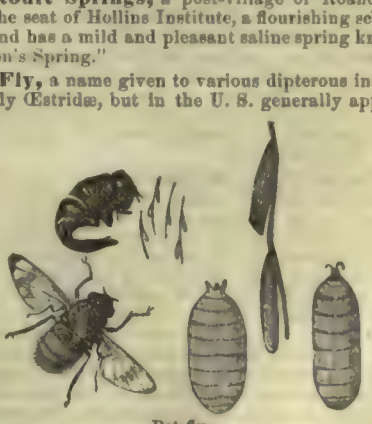
V. *Phytography*, or *Special Descriptive Botany*, is the carrying out of the principles of classification in the actual arrangement and characterization of these great divisions, of the orders under them, of the genera and species, etc.; and the application of names to each according to certain fixed rules. This introduces *Glossology* (a better word than the mongrel one, because half Latin and half Greek, *terminology*), which prescribes the system upon which substantive names are given to the organs and parts of plants, and adjective terms to their modifications and forms, making a technical language through which plants and their several parts may be compared and described with an exactness and brevity not otherwise possible. Also *Nomenclature*, which prescribes the rules for giving names to the plants themselves and to the groups which they compose.

The *binomial system* of nomenclature—which was one of the happiest hits of Linnæus, and of a value which those only can rightly estimate who are aware of the inconveniences suffered by the ante Linnæan botanists in their endeavors to get on without it—has established for each plant a double name—namely, that of its genus and that of its species. A genus bears a name of one word, a substantive—*e. g.*, *Quercus*, the oak genus, *Lilium*, the lily genus. Genera and generic names, in the modern sense, date back as far as Tournefort (A. D. 1700). The specific name was the invention of Linnæus (say 1750), who first distinguished the phrase or descriptive character of a species from its name, making the latter consist of a single word, preferably an adjective: *e. g.*, *Quercus alba*, for white oak, *Quercus rubra*, for red oak. The generic name answers to our surname, as Brown or Jones: the specific to the baptismal name, as John and James. If a *variety* has to be designated, its name will be appended to that of the species—*e. g.*, *Quercus coccinea* (scarlet oak), variety *tinctoria*, for the quercitron oak. Names of groups higher than genera are in the nominative plural, and are mostly formed by an extension of the name of a principal genus. For instance, *Rosa*, the rose genus, gives its name *Roseæ* to the rose tribe, and of *Rosaceæ* to the rose family. This is a short expression for *Plantæ Rosaceæ*—*i. e.*, rosaceous plants.

Agricultural Botany, *Medical Botany*, and the like, signify so much of systematic botany as applies to agriculture, medicine, etc.

Palæontological or *Fossil Botany* is the systematic and structural botany, as far as it can be made out from fossil remains, of the vegetation of former ages. Its lessons, although fragmentary, are of the highest interest, as showing that a vegetation predominantly of the lower grades alone existed in the earlier geological eras; that gymnospermous plants long preceded angiospermous exogens: that the latter were apparently not introduced until the cretaceous period; and that our existing genera largely originated in tertiary times, and were then represented by species, some of them peculiar, but many much resembling, and some obviously identical with, those of the present day. So that it may be inferred that the actual flora of the United States originated in the cretaceous and tertiary periods, and has come down to the present day with change indeed, but with a continuity of type which argues genetic transmission. (See Fossil Botany.)

Geographical Botany—the study of the relations of plants to the earth, considered in reference to the natural distribution of the species over its surface, and the causes of that distribution—connects the science of botany with physical geography and climatology; also with geology as it proceeds; and it becomes apparent that the present distribution of species is only to be explained, or clearly conceived, by a study of the changes which the earth's surface and its climates have undergone since the types of the actual vegetation came into existence. So that geographical and fossil botany are co-related as modern is to ancient history. Asa Gray.



Bot'any Bay, a bay of Australia, in New South Wales, which was discovered by Capt. Cook in 1770, and named by him with reference to the great number of new plants found there. It is 5 miles S. of Sydney, in lat. 34° 2′ S., and lon. 151° 13′ E. A colony of British convicts was planted here in 1787, and was removed to Port Jackson in 1788, but the penal colony long continued to retain the name of Botany Bay.

Bot'etourt, a county of the W. part of Virginia. Area, 550 square miles. It is bounded on the S. E. by the Blue Ridge, and is traversed by several ridges of the Alleghanies, which are separated by fertile valleys. It is intersected by the James River, and also drained by Craig's Creek. The James River Canal connects this county with Richmond. Grain and tobacco are the chief crops. Flour is manufactured. Iron ore abounds. The Peaks of Otter are near its S. E. border. Capital, Fincastle. Pop. 11,329.

Botetourt (Norborne **Berkeley**), Lord, was born in England about 1734. He was appointed royal governor of Virginia in 1768, and dissolved the assembly of burgesses in 1769 because they passed a remonstrance against some acts of the British Parliament. Died Oct. 15, 1770.

Botetourt Springs, a post-village of Roanoke co., Va., is the seat of Hollins Institute, a flourishing school for ladies, and has a mild and pleasant saline spring known as "Johnson's Spring."

Bot-Fly, a name given to various dipterous insects of the family Œstridæ, but in the U. S. generally applied to

Bot-fly.

the horse bot-fly, *Gastrophilus equi*. The fly lays her eggs upon the hairs of the horse, and after laying her eggs almost immediately dies. The eggs, conveyed to the horse's stomach, are hatched, and the larvæ are provided with mouth-hooks by which they hang on to the coats of the stomach. In about a year's time they are discharged with the excrement, and in one month they are changed into perfect flies. When very numerous there is reason to believe that bots are very injurious to the horse; but there is some dispute among horse-breeders as to the extent of the injury done by them.

Both (Jan), a Flemish painter, was born at Utrecht in 1610. He was a pupil of Bloemaert, and worked in Italy. He excelled in landscapes, and represented the atmospheric effects of Italy with much fidelity. Died in 1651.

Bo'thie [Gaelic *bothag*, a "hut"], the name applied in Scotland to a sort of barrack or large temporary structure for the lodging of farm-laborers, stone-cutters, and others. There are also bothies where women are lodged. The bothie system is considered by the best classes in Scotland as a national disgrace, for the moral results of the plan have been deplorable.

Both'nia [Sw. *Botten*], a name formerly given to a country of Northern Europe, which belonged to Sweden, and was situated on both sides of the Gulf of Bothnia. The eastern portion is now comprised in Finland, and the western forms the Swedish provinces of Piteå and Umeå.

Bothnia, Gulf of, the northern portion of the Baltic Sea, extends from Torneå southward to the island of Aland, and is about 400 miles long. Its width varies from 60 to 130 miles. It is bounded on the E. by Finland and on the W. by Sweden. Its greatest depth is about fifty fathoms. The navigation of it is rendered difficult by many small islands and sand-banks near the shores. The gulf is usually frozen in winter, so that sledges can cross it.

Bothrioceph'alus [from the Gr. *βοθρίον*, a "little pit," and *κεφαλή*, the "head," named from the depressions on each side of its head], a genus of cestoid intestinal worms, once supposed to be identical with the *Tænia*, or common tapeworm. It inhabits the bodies of the salmon, stickleback, and other fishes, as well as human beings. Two species occur in man, *Bothriocephalus latus* and *Bothriocephalus cordatus*. The former is common only in Russia, Sweden, Norway, Lapland, Finland, Poland, and Switzerland. It is from six to twenty feet in length, composed of numerous flat and wide segments, and an elongated, compressed, obtuse head. The mouth is small, with a longitudinal depression extending from it on each side. Like the *Tænia*, it is hermaphrodite, and besides discharging ova multiplies by segmentation, the fragments or *proglottides* being discharged with the fæces of the animal in which it lives. Probably this parasite is introduced into the human body not only from fish eaten as food, but in drinking water from lakes and rivers. Near the Gulf of Bothnia scarcely a family is free from it, but a few leagues from the coast and main water-courses it almost disappears. *Bothriocephalus cordatus* has been found to inhabit the human intestines only in North Greenland. In that country it is quite common in dogs. It is about a foot in length, and receives its name from the cordate or heart-shaped head. (*Cobbold, Proceedings of the Zoological Society*, London, 1862.) The means of destroying or expelling the "broad tapeworm," as this parasite is sometimes called, are the same as in the case of *Tænia*. (See TAPEWORM.)

Both'well, a county in the S. W. part of Ontario (Canada), is intersected by the Great Western Railway, and bounded on the W. by the St. Clair River, and on the S. E. by Lake Erie. Large quantities of petroleum are produced. Area, 547 square miles. Pop. in 1871, 20,701.

Bothwell, a post-town of Zone township, Bothwell co., Ontario (Canada), on the Great Western Railway, 23 miles S. W. of Chatham. It has numerous petroleum-wells, and a trade in cattle, grain, and lumber, the latter being extensively manufactured here. It has one weekly paper. Pop. about 1500.

Bothwell (JAMES **Hepburn**), EARL OF, a profligate and audacious Scottish courtier, was born about 1526. He inherited the title and large estate of the earl his father in 1556. In 1562 he was imprisoned for a conspiracy to seize the queen's person, but he escaped to France, after which he was outlawed. He returned in 1565, and became an enemy of Regent Murray and a favorite adviser of Queen Mary. The murder of Lord Darnley (1567) is generally imputed to him. He was indicted for this crime, but as he came to court with 4000 followers, he was acquitted. In April, 1567, many nobles signed a bond or document in which they commended Bothwell as a fit husband to the queen, whom he carried to Dunbar Castle. He married her in May of the same year. A strong party soon took arms against Bothwell, who fled to Denmark, where he was imprisoned. Died in 1576. (See BURTON, "History of Scotland," vol. iv.; ROBERTSON, "History of Scotland.")

Botocu'does, or **Aymo'res,** a native tribe of Brazil. They live in the forests on the Rio Doce, along the boundary of the provinces of Espirito Santo and Minas Geraes, and are said to resemble the Chinese. They are brave but treacherous, and have caused the government considerable trouble. They number about 4000, and are rapidly dying out. They pierce the lower lip and insert a block of wood in the hole.

Botoshan', or **Bootosha'ni,** a town in Roumania, on the Schiska, 60 miles N. W. of Jassy, carries on a considerable trade with Germany in cattle, wine, wool, tobacco, etc. Pop. in 1860, 27,147.

Bo Tree, or **Pee'pul,** the *Ficus religiosa* or sacred fig tree of Hindostan and Ceylon, a species of tree which is greatly venerated by the followers of Vishnu (who was born under this tree), and especially by the Booddhists. It is a large tree, whose sap abounds in caoutchouc, and which yields a small edible fig, not much valued. Great amounts of lac are gathered from its branches, for it is one of the favorite abodes of the lac insect. The famous bo tree of Anarajapoora in Ceylon is believed, on apparently good grounds, to have been planted in 288 B. C.

Botrych'ium [from the Gr. *βότρυς*, a "bunch of grapes," the name referring to the appearance of the fruitful fronds], a genus of ferns, having the spore-cases distinct, sub-globose, clustered, and on one side of a pinnated rachis, 2-valved, without any elastic ring and opening transversely. The *Botrychium Virginicum* is remarkable for its wide geographical distribution. It abounds in the U. S. and in the Himalaya Mountains, and is found in Norway, Australia, Mexico, and many other countries. It is boiled and eaten in some countries.

Botryoi'dal [from the Gr. *βότρυς*, a "bunch of grapes," and *εἶδος*, a "form"], a term used in mineralogy, and applied to substances the surface of which consists of a group of clustered globular prominences which resemble grapes in form. Examples of such formation are often seen in chalcedony and hæmatite.

Botrytis. See MILDEW.

Bot'ta (ANNE CHARLOTTE LYNCH), an American poetess, born at Bennington, Vt. She was married to Vincenzo Botta in 1855. She published a volume of poems in 1849 and a "Hand-book of Universal Literature" in 1860.

Botta (CARLO GIUSEPPE GUGLIELMO), M. D., an eminent Italian historian, born at San Giorgio, in Piedmont, Nov. 6, 1766. He studied medicine, and served as surgeon in the French army in 1795–96. In 1803 he was elected to the French legislative body. He published in 1809 a "History of the American War of Independence," and in 1825 a "History of the Nations of Italy from Constantine to Napoleon," 3 vols. His most important works are a "History of Italy from 1789 to 1814" ("Storia d'Italia dal 1789 al 1814," 4 vols., 1824), and his "Continuation of Guicciardini's History of Italy to 1789" (10 vols., 1832). He died in Paris Aug. 10, 1837. (See F. BECCHI, "Elogia storico di C. Botta," 1839.)

Botta (PAUL ÉMILE), a distinguished archæologist and traveller, a son of the preceding, was born in 1794. He entered the service of Mehemet Ali of Egypt as a physician about 1830, and became French consul at Alexandria. Having visited Arabia in 1837, he published in French a "Narrative of a Journey to Yemen, etc." (1844). He was next sent as consul to Mosul, and in 1843 began to excavate the mound at Khorsâbâd on the Tigris for monuments of ancient Assyria, and there discovered a palace with statues and cuneiform inscriptions. With the aid of Letronne, Burnouf, and the artist Flandrin, he published a magnificent work entitled "Monuments of Nineveh, discovered and described by M. Botta, with designs by Flandrin" (5 vols. folio, 1847–50).

Botta (VINCENZO), PH. D., born near Turin, Italy, Nov. 11, 1818, became professor of philosophy at Cuneo, and afterwards at Turin; a member of the parliament in 1849; in 1850 inspected the educational system of Germany, and in 1853 that of the U. S., and became professor of Italian literature in the University of the City of New York. Among his works are a "Life of Cavour," "Dante as Philosopher, Patriot, and Poet," and a history of modern philosophy in Italy.

Bött'ger, written **Bött'cher,** or **Böt'tiger** (JOHANN FRIEDRICH), a German alchemist noted as the inventor of Meissen porcelain, was born at Schleiz Feb. 4, 1682. He spent much time and money in the search for the philosopher's stone. Died Mar. 13, 1719.

Botticel'li (SANDRO), an early Italian painter of the Tuscan school (1447–1515), was the most eminent of the scholars of Filippo Lippi. He was the first who treated mythological subjects, and excelled his predecessors in movement and drapery.

Böt'tiger, or **Boettiger** (KARL AUGUST), a German archæologist and *littérateur*, born at Reichenbach, in Saxony, June 8, 1760. He was a friend of Goethe, Schiller, and Herder, with whom he associated at Weimar. He edited several journals, and published many antiquarian treatises. Died Nov. 17, 1835. A collection of his essays, called "Kleine Schriften," appeared in 3 vols., 1838.

Bot'tle [Fr. *bouteille*; Sp. *botilla*, the diminutive of *bota*, a "leather bag for carrying liquids"], a vessel for holding liquids, usually made of glass or earthenware. The bottles mentioned in the Bible were made of the skins of animals, and such vessels are still used for carrying water in Asia and Africa. In Spain, wine-bottles made of goats' skins are used at the present time. The glass used in the manufacture of common bottles is of a coarse quality. The process by which they are formed is briefly as follows: A long iron tube is dipped into the melted glass, a portion of which adheres to the end of the tube. After this material

is partially cooled, the glass-blower puts the end of the tube, with the portion of the glass adhering, into a mould, and blows into the tube, which he holds in a vertical position. It is then passed from the hands of the blower, and is finished by several other workmen.

Bottle Gourd (*Lagenaria*), a genus of plants of the order Cucurbitaceæ, is nearly allied to the genus *Cucurbita*, in which it was formerly included. The *Lagenaria vulgaris*, or common bottle gourd, is a native of India, but is cultivated in many warm climates. It is a climbing annual, having white flowers, and a large bottle-shaped fruit with a hard rind, which is called a *calabash*, and is used for holding or dipping water. This fruit is sometimes several feet long. Some varieties of *Lagenaria* have an edible pulp, which is an important article of food to the poorer Arabs.

Bottle-nose Whale, sometimes called **Bottlehead** (*Hyperoodon hidens*), a cetaceous mammal of the family Physeteridæ. It inhabits the North Atlantic and sometimes ascends rivers. It seldom exceeds twenty feet in length. The name of Bottle-nose Whale is sometimes applied to another mammal, the *Delphinus Tursio*, a dolphin which inhabits the North Sea.

Bottom Heat, a term applied in horticulture to the temperature communicated to certain soils, either by fermenting and decomposing substances placed underneath them, for which purpose leaves, fresh dung, and the refuse bark of the tanyard are often used, or by means of flues or hot water apparatus. The system is applied to the cultivation of pineapples, grapes, melons, cucumbers, and other plants grown in hot-houses, pits, or frames. It is one of the most important agents in the artificial cultivation of tender plants of whatever kind, whether flower or fruit-bearing.

Bot'tomry [from *bottom*, a part of the ship being put for the whole], the act of lending money on the pledge of a ship or on the bottom of a ship. It may be considered under the following divisions: 1, the nature of the contract; 2, its form; 3, by whom made; 4, the mode of its enforcement.

1. *The Nature of the Contract.*—It is a maritime contract, and in the nature of a wager. The substance of the contract is, that if the ship returns the loan is to be repaid with interest. If it is lost in the course of navigation, the debt is discharged, though the borrower may have abundant means for repayment. The principal of the loan being thus put at risk, the case does not come within the operation of the usury laws. Large interest is sometimes exacted —15 or 20 per cent., or even a larger rate. The proper court, however, has power, in extreme cases of excessive interest, to grant relief. Should the ship deviate from her voyage and be lost, the lender would not take that risk upon himself, but the borrower would still be liable. So if the ship be lost by the wrongful act of the borrower or the master, instead of the perils of the sea. It has been decided that the doctrine of constructive loss which applies in insurance law does not extend to a bottomry loan. This loan is not within the act of Congress, which requires mortgages and conveyances of vessels to be registered for the purpose of giving notice to subsequent grantors or to creditors. Should the ship return, the loan becomes due, and the principal and maritime interest together form a new principal, on which ordinary interest will be calculated until payment. A bottomry loan is strictly on the ship. A corresponding loan on the cargo is termed *respondentia*. It is governed by rules closely resembling those applicable to bottomry. A bottomry loan has this marked peculiarity, applicable, however, to other maritime liens: that where there are two or more in succession, the latest may have the preference, as it may be the price of the safety of the ship. In liens created regularly upon property on land it is a well-known general rule that the earliest has the preference.

2. *The Form of the Transaction.*—There is usually executed a bottomry bond. This is not, however, absolutely essential. The courts do not look so much at the technical forms as at the intent of the parties. Even if there were a sale intended as a security for a loan, evidence to show the true nature of the transaction could be adduced, and it would be enforced accordingly.

3. *By Whom Given.*—A bottomry bond may be executed either by the owner or the master of the ship in the owner's absence. The owner can execute it, in general, whenever he sees fit, so long as the transaction is in its nature maritime. A master of a ship, on the other hand, is governed by special rules. His leading duty is to navigate the ship, not to pledge nor to sell it. These latter powers are conferred upon him in extraordinary emergencies, where the exigencies require it. The lender must be prepared to show that the case is one which justifies the loan, such as stress of weather, necessity of repairs, and the like. Due measures must be taken to communicate with the owner where such communication is feasible. At the present time the telegraph must be resorted to where it is accessible. The power of the master may in like manner in extraordinary cases extend to a pledge, or even a sale, of the cargo. The general test of his authority in all these cases is that he must exercise the diligence of a prudent owner, and that there must be an apparent necessity for the pledge or sale.

4. *Enforcement.*—A bottomry bond is enforceable in a court of admiralty—in this country in the district courts of the U. S. A proceeding is instituted against the ship, or, in technical language, *in rem*. If necessary, the ship may be sold, and the claim paid out of its proceeds. The borrower is also personally responsible. The lien of seamen for subsequent wages is superior to that of the bottomry lender. Should the latter, in order to preserve his own claim, discharge that of the seamen, he could have a lien upon the proceeds of the ship for his reimbursement, as well as a personal claim against the owners; or, in other words, he would be allowed to stand in the place of the seamen.

It may be added that if a ship, having incurred a bottomry loan, does not set out on her intended voyage, the property will not have incurred any maritime risk, and consequently the maritime interest cannot be exacted, but only ordinary interest. T. W. Dwight.

Botts (John Minor), an American statesman, born at Dumfries, Prince William co., Va., Sept. 16, 1802. He was elected to Congress as a Whig in 1839, and re-elected several times. In 1844 he supported Mr. Clay for the presidency. He opposed the repeal of the Missouri Compromise in 1854, was a firm adherent of the Union during the civil war, and afterwards favored the Republican party. He wrote "The Great Rebellion" (1866). Died Jan. 8, 1869.

Bot'zen, or **Bozen** [It. *Bolzano*], a trading town of the Austrian Tyrol, at the junction of the river Talf with the Eisach, 33 miles by rail N. N. E. of Trent. It is situated in a hilly or mountainous district, is well built, and contains a gymnasium, a Gothic cathedral, and a castle; also manufactures of silk, linen, hosiery, etc. It has four annual fairs, and is an entrepôt of the trade between Italy, Germany, and Switzerland. Pop. in 1869, 9357.

Bouchardat (Apollinaire), a French pharmaceutist, born about 1810, commenced young the study of medicine and pharmacy at Paris, and became professor of hygiene in 1852. His most important works are "Recherches sur la Vegetation" (1846), and elementary treatises on applied chemistry, physical science, materia medica, therapeutics, agricultural economy, and several original treatises on wine and wine-culture.

Bou'cher (Jonathan), an English philologist, born in Cumberland in 1738. He removed to Virginia in 1756, became rector of a parish church, and was a royalist in the Revolution. He returned to England in 1775, and compiled a "Glossary of Archaic and Provincial Words." Died April 27, 1804.

Boucher de Perthes (Jacques), a French archæologist and naturalist, born at Rethel Sept. 10, 1788. His principal works are "The Creation" (5 vols., 1839–41) and "Celtic and Antediluvian Antiquities" (1847). He is regarded as the founder of the science of archæo-geology. Died Aug. 9, 1868.

Boucherie (Auguste), a French chemist, born in Sept., 1801, invented a method of preserving wood. He employed sulphate of copper.

Bouches-du-Rhône, a department in the S. E. part of France, was formerly included in Provence. Its area is 1971 square miles. It is bounded on the N. by the Durance, which separates it from Vaucluse, on the E. by Var, on the S. by the Mediterranean, and on the W. by Gard. It is intersected by the Rhone, which enters the sea by several mouths, and forms a delta called the "Ile de la Camargue." The surface in the E. part is hilly, and is elsewhere diversified by plains, heaths, forests, and saline lakes. The grapevine and olive flourish here, and large numbers of silkworms and sheep are raised in this department. Among its public works are several canals, a railway connecting Marseilles with Lyons, and an aqueduct, fifty miles long, from the Durance to Marseilles, which is the capital. It has manufactures of cloth, hats, perfumes, wine, brandy, soap, olive oil, and chemical products. It is divided into 3 arrondissements, 27 cantons, and 107 communes. Pop. in 1872, 554,911.

Bouchette (Joseph) was born in Canada in 1774. In 1790 he entered the surveyor-general's office for British America, and afterwards served in the volunteers and in the navy of the lakes. In 1804 he became surveyor-general. He served against the U. S. in the war of 1812. As surveyor-general he was afterwards employed in establishing the southern boundary of Canada. He published (1816) a

topographical and geographical description of Canada, "The British Dominions in North America" (1831), and a "Topographical Dictionary of Lower Canada" (1832). Died at Montreal April 9, 1841.

Boucicault (DION) was born in Dublin, Ireland, Dec. 26, 1822, and was educated by his guardian, Dr. Dionysius Lardner, and at the London University. His first successful play was "London Assurance," which he wrote in conjunction with John Brougham, and which was acted in 1841 at Covent Garden, London. He was married to Miss Agnes Robertson, came to America in 1853, and remained till 1860, when he returned to London, and brought out, at the Adelphi Theatre, his first, and still famous, Irish play, "The Colleen Bawn." This is founded on Gerald Griffin's novel of "The Collegians." In 1861 was produced at the same theatre his play of "The Octoroon," which vigorously illustrated, and by implication denounced, the evils of slavery in the Southern U. S. He remained in England till 1872, and during these twelve years he furnished to the London stage the following plays: 1862, "Dot," "The Life of an Actress," "The Phantom," "The Relief of Lucknow;" 1863, "The Trial of Effie Deans;" 1864, "The Streets of London;" 1865, "Arrah-Na-Pogue," "Rip Van Winkle," "The Parish Clerk" (the latter, written for Joseph Jefferson, was not acted in London); 1866, "The Flying Scud," "Hunted Down," "The Long Strike:" 1867, "How She Loves Him!" "Foul Play" (written in collaboration with the novelist Charles Reade); 1868, "After Dark;" 1869, "Lost at Sea," "Formosa," "Presumptive Evidence;" 1870, "The Rapparee," "Jezebel;" 1871, "Elsie," "Kerry;" 1872, "Babil and Bijou." In the autumn of 1872 he appeared at Booth's Theatre, New York, as Shaun in "Arrah-Na-Pogue." In 1873 he produced, at Booth's Theatre, his beautiful Irish play of "Daddy O'Dowd;" at Wallack's Theatre, his "Mora" and his "Mimi;" and at the Union Square Theatre, his "Led Astray." On Dec. 25, 1873, he opened, in conjunction with Mr. William Stuart, the New Park Theatre, on Broadway, near Twenty-second street, New York. Among his earlier works, prior to his first visit to America, were "Old Heads and Young Hearts," "The Irish Heiress," "The Willow Copse," "The Corsican Brothers," "Faust and Marguerite," and "The Vampire." The dramas of Boucicault are seldom, if ever, original in plot, but they are often original, and sometimes superlatively good, in action, treatment of incidents, and brightness of dialogue. His melodramas excel those of the earlier school—which they have superseded—in vitality of subject, lifelike character, human interest, and pointed colloquy. The elevation of this class of stage literature is directly traceable to his influence. He has also been the means of great improvement and elevation to the Irish drama, having replaced the "ranting, roaring Irishman," with stuffed stick and black bottle, by genuine men of the Emerald Isle, such as Diogenes in "How She Loves Him!" Johnny Reilly in "The Long Strike," Myles-na-Coppaleen, Shaun the Post, Kerry, and Daddy O'Dowd. As an actor, Mr. Boucicault's best successes have been won in personating eccentric characters, such as Mantilini, and rustic old Irishmen, such as Daddy O'Dowd. He will be remembered, however, for his Grinaldi and his Vampire. He will also be remembered for having made dramatic authorship a remunerative profession to dramatic authors in England. This he did by asserting, maintaining, and finally establishing the principle that among theatrical attractions the play should be made predominant, and should be suitably recompensed. The change in practice that ensued may be inferred from the fact that whereas, in the earlier part of his career, Mr. Boucicault received but £60 for his "Corsican Brothers," he obtained, in 1866, for his "Flying Scud," £6500. Boucicault was educated as an architect and civil engineer. As a manager he established a theatre in Washington, D. C., in 1858; reconstructed the Metropolitan Theatre, New York, and converted it into the Winter Garden in 1859; and remodelled Astley's Circus and built the Westminster Theatre—both in London—in 1862. He is the author of numerous newspaper essays and letters on dramatic subjects, and of an unpublished work on the stage and kindred themes, called "The Master of the Revels."

WILLIAM WINTER, *of the "N. Y. Tribune."*

Bouck'ville, a post-village of Madison township, Madison co., N. Y., on the New York and Oswego Midland R. R., 15 miles S. W. of Clinton. It has considerable manufactures of lumber, cheese, and vinegar, and a distillery of cider-brandy.

Bou'dinot (ELIAS), LL.D., an American patriot, born in Philadelphia May 2, 1740. He practised law in New Jersey, and supported the popular cause in the Revolution. He was chosen a delegate to the Continental Congress in 1777, was a member of Congress (1789–95), and was director of the Mint at Philadelphia from 1796 to 1805. In 1816 he became the first president of the American Bible Society. He wrote several works, and gave large sums of money for charitable purposes. His wife was a sister of Richard Stockton. He died Oct. 24, 1821.

Boudoir, a small cabinet or private apartment, usually near the bed-chamber, designed as a place of retirement for the mistress of the house, who sometimes receives there her intimate friends. Boudoirs became fashionable in France in the reign of Louis XIV.

Boufflers, de (LOUIS FRANÇOIS), DUKE, a famous French general, born Jan. 10, 1644. He served under Turenne and Catinat, distinguished himself at Steenkerke in 1692, and became a marshal of France in 1693. He commanded at Namur when it was besieged by William III. of England in 1695, and defended Lille with success in 1708 against Prince Eugène. He commanded a wing at Malplaquet (1709), from which he made a masterly retreat. Died Aug. 20, 1711. (See "Vie du Maréchal de Boufflers," Lille, 1852.)

Bougainville, de (LOUIS ANTOINE), a famous French navigator, born in Paris Nov. 11, 1729. He was aide-de-camp to Montcalm in America in 1756, and served with distinction in Germany in 1761. He performed a voyage round the world in 1767–69, and discovered several islands in the South Sea, being the first Frenchman who circumnavigated the globe, and he published in 1771 a narrative of that voyage. During the American Revolution he had a high command in several naval battles between the French and English. Died Aug. 31, 1811.

Bought Note, a memorandum given by a broker who effects a sale to the purchaser, in which he is notified that the property therein described has been bought for him of the seller, the price and terms being stated. A similar memorandum given to the seller is called the sold note. According to some authorities, the bought note is given to the seller, and the sold note to the buyer. As a general rule, the notes must correspond, or there will be no contract.

Bough'ton (GEORGE H.), a painter of great merit, born in Norfolk, England, in 1836, removed to Albany, N. Y. After a few years' residence in America, he returned to England. His works, chiefly landscapes and genre pictures, are marked by delicacy of execution and tenderness of sentiment.

Bougie, boo'zhee' [a French word signifying a "wax candle," so called because sometimes made of waxed linen], a slender surgical instrument designed to be introduced into the male urethra. It is usually made of gum-elastic or gutta-percha, but may be made of other flexible substances. Bougies are often medicated, but more commonly they are designed to act mechanically upon a contracted passage. Bougies are sometimes made of a larger size for the rectum or for the œsophagus.

Bouguer (PIERRE), a French mathematician and natural philosopher, born in Brittany Feb. 16, 1698. He published in 1729 an "Essay on Optics and the Gradation of Light," and was associated in 1736 with La Condamine in an expedition to Peru for the purpose of measuring a degree of the meridian, in which they spent several years. He published the results of this operation in an important work entitled "Theory of the Figure of the Earth" (1749). He wrote other works, and invented the heliometer. Died Aug. 15, 1758.

Bouillon, de (GODEFROI). See GODFREY OF BOUILLON.

Boul'den, a township of Linn co., Ia. Pop. 937.

Boul'der, or **Bowlder,** a large mass or fragment of rock lying on or near the surface of the ground, and found at a distance from the place of its origin and from the formation to which it belongs. Boulders are usually rounded by attrition. In many cases they have been transported hundreds of miles by the action of icebergs or glaciers. Large masses of Scandinavian rocks are scattered over the plains of Denmark and Northern Germany. The pedestal of the statue of Peter the Great at St. Petersburg was hewn out of an erratic granite boulder forty-two feet long, twenty-seven feet broad, and twenty-one feet high. In the Western States occur many granite boulders which probably came from Canada. They abound along the coast of New England, where they are so large as to form a prominent feature in the landscape. The famous Plymouth Rock is a boulder of syenite. (See DRIFT.)

Boul'der, a county in the N. part of Colorado. Area, 900 square miles. It is drained by Boulder and Saint Vrain's creeks. It is bounded on the W. by a range of the Rocky Mountains which separates it from the Middle Park. The soil is fertile. Grain, hay, and butter are produced. Gold, silver, iron, and coal abound here. Capital, Boulder. Pop. 1939.

Boulder, a post-village, capital of the above county.

on Boulder Creek, near the E. base of the Rocky Mountains, 25 miles N. W. of Denver. The celebrated Caribou silver and the Gold Hill gold-mines are in the immediate vicinity. It is a popular resort for excursionists. It has one weekly newspaper. Pop. 343.

Ed. "Boulder County News."

Boulder Clay. See Geology, by Prof. J. W. Dawson, LL.D., F. R. S.

Bou'le [Gr. *βουλή*, a "council"], the name of the ancient Athenian senate, instituted by Solon as a check on the *ecclesia* (*ἐκκλησία*), which was an assembly of the whole people. The boule was at first composed of 400 members, but Cleisthenes increased the number to 500 when he divided the Athenians into ten tribes. The number was subsequently raised to 600. All freeborn Athenian citizens above thirty years of age were eligible to this council.

Boulevard', a French word corresponding to the English "bulwark" or "rampart," was applied to the fortifications erected around many towns in Europe. In France and Germany these defensive works have been generally levelled and converted into public promenades or avenues lined with trees. The boulevards of Paris are celebrated for their beauty, and are mostly curvilinear. The Inner Boulevards form a magnificent central thoroughfare, lined on each side by a double row of trees, under which is a wide and elevated pathway, and bordered by elegant shops and structures, the whole presenting a scene of gayety and splendor which no other capital can equal. The Italian Boulevard is a fashionable promenade.

Boulogne, a town of France, department of the Seine, is on the right bank of the river Seine, 5 miles W. of Paris, from which it is separated by the Bois de Boulogne (which see). A fine stone bridge connects it with the ruined palace of St. Cloud. It is surrounded by beautiful scenery. Pop. 17,343.

Boulogne, or Boulogne-sur-Mer, a seaport of France, department of Pas-de-Calais, is on the English Channel, at the mouth of the Lianne, 158 miles by rail N. N. W. of Paris and 27 miles by rail S. W. of Calais; lat. 50° 44′ N., lon. 1° 37′ E. The railway which connects Calais with Amiens passes through it. It is divided into two parts—the upper and lower town, from the former of which the English coast is visible. The upper town has beautiful promenades, an old Gothic cathedral, a hôtel de ville, and an episcopal palace. The lower town is newer, more regular, and more populous. It contains a hospital, a theatre, a museum, a public library, and an exchange. Boulogne derives much of its prosperity from English residents and visitors, who are very numerous. Steamers ply twice a day between this port and Folkestone. The harbor will admit large vessels during high water. Here are manufactures of linen and woollen goods, sailcloth, cordage, bottles, etc. It occupies the site of the ancient *Gesoriacum*, which after the time of Constantine the Great was called *Bononia Oceanensis*. Several centuries later the name was changed to *Bolonia*. At this place Napoleon assembled in 1804 an army of 180,000 men and a flotilla of 2400 transports for the invasion of England. To commemorate this design, which, however, was never executed, a column 164 feet high was erected. Pop. 40,251.

Boulogne (Étienne Antoine), an eloquent French prelate, born Dec. 26, 1747, edited during the Revolution the "Annales religieuses," which was several times suppressed and revived with altered title. Under the empire he, as bishop of Troyes, was imprisoned with two other bishops for declaring that the emperor had no authority to confine a bishop without the approval of the pope. He was made an archbishop in 1822. His works appeared in 1826–28, 8 vols. Died May 13, 1825.

Boul'ton (Matthew), an English inventor, born at Birmingham Sept. 3, 1728. He was noted for his energy and enterprise as a manufacturer, and he became a friend and partner of James Watt. He established at Soho, near Birmingham, a manufactory of steam-engines in 1765. Boulton invented an improved apparatus for coining money and a new mode of inlaying steel. He was a man of generous disposition. Died Aug. 17, 1809. (See "Life of M. Boulton," Birmingham, 1809.)

Bou-Maza (Si Mohammed ben Abdallah, *surnamed*), an Arab chief, born about 1820, followed for three years the austere life of a dervish, and then, proclaiming that he was an emissary of Heaven, he stirred up the Kabyles, the warlike inhabitants of Dahra in Algiers, preached extermination to Christians, and waged war upon the allies of France, Hadj-Achmed and Sidi-Darribi. He surrendered after a protracted conflict with Gen. Herbillon, Jan. 13, 1847, and was conveyed to Paris. He afterwards entered the service of the Porte, and attained the rank of colonel.

Boul'ware, a township of Gasconade co., Mo. P. 983.

Bound, or **Bound'ary,** a limit; the line which includes the whole of any object or space; also a leap, a spring, a rebound. The term "boundary" is applied to the limit line of demarcation which separates one state or country from another, and which is sometimes an imaginary line, sometimes a river, sea, or other natural barrier. In the mensuration and description of real estate, "bound" is used to denote the utmost limits of land by which the same is known and can be described, being in this sense synonymous with abuttals.

Bound, or **Bownd** (Nicolas), D. D., a clergyman of the Church of England at Norton, in Suffolk, who died in 1607. He published in 1595 (enlarged edition in 1606) his famous work, "Sabbathum Veteris et Novi Testamenti," in which the Puritan doctrine of the Lord's Day was for the first time broadly and prominently asserted.

Bound Bai'liff, in England, is a sheriff's officer whose duty it is to discover and arrest debtors. (See Bailiff.)

Bound Brook, a post-village of Bridgewater township, Somerset co., N. J., on the Central R. R. of New Jersey, 31 miles W. S. W. of New York. It is pleasantly situated on the Raritan River and the Delaware and Raritan Canal. It has five churches and important manufactures. Its trade in lumber is very extensive. Pop. 556.

Boun'ty [from the Fr. *bonté*, "goodness," "kindness"], a premium given by government to foster some branch of industry, or encourage enterprises which are believed to be of national importance and conducive to the public interests. The British government formerly gave bounties to encourage the herring-fisheries and the exportation of grain and Irish linen, and for other purposes. The modern political economists reject this factitious method of fostering commerce, agriculture, etc., and argue that it promotes a misdirection of capital, talent, and industry. The impolicy of giving bounties for such purposes appears to be now generally admitted. They are often given, particularly in new countries, for the destruction of ferocious animals, as wolves, bears, etc. Some of the U. S. give bounties for tree-planting. Subsidies to steamship companies and land grants to railways are common in the U. S.

A bounty in money is also often given to induce men to enlist in the army and navy. The amount of this money varies according to the exigency and the difficulty of obtaining recruits. In 1812 the British government offered a nominal bounty of £23 17*s.* 6*d.*, but this was subject to large deductions and drawbacks. The bounty given in Great Britain at present is about one pound sterling. In the American civil war the recruits of the Union army received in some cases a bounty of $500 or more. Many of these recruits deserted soon after they had received the bounty; these were called "bounty-jumpers."

Bouquet (Henry). See Appendix.

Bouquetin, or Ibex of the Alps (*Capra ibex*), [Ger. *Steinbock*], a species of wild goat formerly found on the Alps, and which ascends to the limit of perpetual snow. It is larger than the common goat, and has large horns which curve backward. The horns of the male are sometimes twenty inches long or more. It has no beard except a few hairs in winter. The color of the hair is mostly brown. This animal feeds on shrubs, lichens, and the scanty herbage which is found on the confines of vegetation. It has an extraordinary power of bounding from crag to crag, and of climbing precipices which are almost perpendicular. The bouquetin can be tamed if it is taken young, and it will breed with the common goat. The bouquetin is now extinct in the Alps, except possibly near Cormayeur. There are still probably 40 or 50 on the mountains S. of the Dora Baltea. The bouquetin is preserved as royal game.

Bourbaki (Charles Denis Sauter), a French general, born April 22, 1816, took part in the wars in the Crimea and in Italy, and in the German-French war of 1870 he commanded the imperial guards before Metz. After the deposition of Napoleon he organized the Army of the North, then commanded in the E. of France, unsuccessfully; attempted suicide, and gave up the command to Clinchant, who crossed the Swiss frontier with 84,000 men, Feb. 1, 1871.

Bourbon, called also **Ile de la Réunion,** or **Ile Bonaparte,** an island and French Colony in the Indian Ocean, belongs to the Mascarene group, and is about 100 miles S. W. of Mauritius; lat. 20° 51′ 43″ S., lon. 55° 30′ 16″ E. It is 38 miles long, 28 miles wide, and has an area of 956 square miles. Pop. in 1867, 209,688. It is volcanic, and is traversed by a mountain-chain the direction of which is N. and S. This mountain-range, of which one peak rises 10,000 feet above the sea, divides the island into two portions, differing in climate and productions. The Piton de Fournaise, 7200 feet high, is an active volcano, the eruptions of which occur on an average at least twice a year. The soil in some parts is very fertile, and the scenery is gener-

ally extremely beautiful. The climate was formerly healthy, but Europeans now suffer much from typhoid fever and dysentery. The mean annual temperature is about 77° F. It is often visited by terrific hurricanes, which demolish houses and tear up trees by the roots. The chief articles of export are sugar, coffee, and dyewoods. Maize, rice, and tobacco are also cultivated. The island has no good harbors, and the coast is consequently dangerous. In one year (1843–44) eleven large vessels were wrecked here. Capital, St. Denis. This island was discovered in 1545 by the Portuguese, and was occupied by the French in 1649.

Bourbon, a county of Kansas, bordering on Missouri. Area, 625 square miles. It is drained by the Little Osage and Marmaton rivers. The surface is undulating or nearly level; the soil is fertile. Cattle, grain, tobacco, and wool are produced. Excellent coal abounds. A large portion of the county is prairie. It is intersected by the Missouri River Fort Scott and Gulf and the Missouri Kansas and Texas R. Rs. Capital, Fort Scott. Pop. 15,076.

Bourbon, a county of the N. central part of Kentucky. Area, 300 square miles. It is bounded on the N. E. by the South Licking River and drained by several creeks. The surface is undulating; the soil is calcareous and very fertile. This county forms part of the "Blue-grass region," called "the garden of Kentucky." Live-stock, grain, and wool are staple products. This county gives its name to a celebrated brand of whisky. It has several mineral springs, and is intersected by the Kentucky Central R. R. Capital, Paris. Pop. 14,863.

Bourbon, a township of Douglas co., Ill. Pop. 1457.

Bourbon, a post-village of Marshall co., Ind., on the Pittsburg Fort Wayne and Chicago R. R., 53 miles from Fort Wayne, and 95 from Chicago. It contains 2 churches, 1 academy, 1 graded school, 2 saw-mills, 1 large wagon manufactory and several smaller ones, 1 steam furniture manufactory, and 1 on a less extensive scale, a large flouring mill, several extensive boot and shoe manufactories, and various other mechanical enterprises; one literary society with a library. The surrounding country is very fertile, abounding in valuable timber, such as walnut, poplar, oak, maple, beech, etc. It has one weekly newspaper; is the seat of Salem College. Pop. 874; of township, 2794.

I. Mattingly, Ed. "Bourbon Mirror."

Bourbon, a township of Boone co., Mo. Pop. 2384.

Bourbon, a township of Callaway co., Mo. Pop. 1590.

Bourbon, the name of a celebrated French royal family which reigned over France from 1589 to 1792, and from 1815 to 1848. A prince of the Bourbon dynasty also obtained the throne of Spain in 1700, and another that of Naples and Sicily in 1735. The Bourbons derive their name from the castle of Bourbon, which was built in the thirteenth century, and was situated in the old province of Bourbonnais, 16 miles W. of Moulins. The heiress of the seignory was married in 1272 to Robert, a younger son of King Louis IX. The seignory was erected into a duchy, and Louis, a son of Robert, became about 1327 the first duke of Bourbon. He died in 1341, and was succeeded by his son Pierre, who was killed at Poitiers in 1356. Louis, a son of Pierre, became the third duke of Bourbon. He was one of the most powerful vassals of the crown of France, and made large additions to the duchy by his marriages. Died in 1410. His son Jean, born in 1381, was the fourth duke. He was taken prisoner by the English at Agincourt, and detained until his death (1434). He was succeeded by his son Charles, born in 1401. He died in 1456, leaving a son Jean, who became the sixth duke of Bourbon and constable of France. (See Bourbon, de, Charles.)

Among the collateral branches of the Bourbon family were those of Vendôme, Condé, Montpensier, Orléans, Conti, and Soissons. Antoine de Bourbon, duke of Vendôme, became by marriage king of Navarre. His son, Henry of Navarre, was the first French king of the house of Bourbon, and began to reign as Henry IV. in 1589. He had two sons, Louis XIII. and Gaston, duke of Orleans; a daughter, Elizabeth, who was married to Philip IV. of Spain, and Henrietta, who became the queen of Charles I. of England. Louis XIII., who died in 1643, left two sons, Louis XIV. and Philip, duke of Orleans, who was the ancestor of King Louis Philippe. The dauphin, the eldest son of Louis XIV., died in 1711, leaving three sons—1, Louis, duke of Burgundy; 2, Philip, duke of Anjou, who became king of Spain as Philip V.; 3, Charles, duke of Berry. Louis of Burgundy, who died in 1712, was the father of Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715. Louis XV. had one son, Louis, who died before his father, leaving three sons, who all reigned successively—namely, Louis XVI., Louis XVIII., and Charles X. Louis XVI. left one son, who by the royalists was recognized as Louis XVII., but perished as a child during the French Revolution. As the circumstances of his death remained unknown, many adventurers claimed to be Louis XVII. Louis XVIII. had no issue. Charles X. had two sons—Louis Antoine, who died without issue in 1844; and Charles Ferdinand, duke of Berry. His only son, Henri, duke of Bordeaux, now styled Count de Chambord, is the heir to the throne, according to the Legitimists, who give him the title of Henry V. (See Chambord.)

The House of Orleans is called the younger branch of the royal family of Bourbon, and is descended from Philip of Orleans, a younger brother of Louis XIV. His son Philip was regent of France during the minority of Louis XV., and left a son, Louis Philippe, duke of Orleans. This last was the grandfather of the duke of Orleans who figured in the Revolution as Citizen Egalité. His eldest son, Louis Philippe, became king of the French in 1830. This king had five sons—the duke of Orleans, the duke of Nemours, the prince de Joinville, the duke of Aumale, and the duke of Montpensier. The count of Paris, the son of the eldest of these five, is regarded as the heir to the throne by the Orleanist party.

Philip, duke of Anjou, who was placed on the throne of Spain in 1700, was the founder of a Spanish dynasty, which reigned in Spain until the dethronement of Queen Isabella in 1868. He was also the ancestor of the Bourbon dynasties of Naples and Parma. Francis II., who was dethroned in Sept., 1860, was the last Bourbon monarch of Naples (or the Two Sicilies). The Bourbons have also ceased to reign in Parma, which was annexed to the kingdom of Italy in 1860. (See Achaintre, "Histoire Chronologique et Généalogique de la Maison Royale de Bourbon," 2 vols., 1825; Coxe, "Memoirs of the Kings of Spain of the House of Bourbon," 3 vols., 1813.)

Revised by A. J. Schem.

Bourbon, de (Charles), Duc, usually styled Constable Bourbon (Connétable de Bourbon), a famous French general, born Feb. 17, 1489, was a son of Gilbert Bourbon, count of Montpensier. He married the heiress of the duke of Bourbon, and became the owner of the vast estates of both branches of the Bourbons. He was appointed constable of France in 1515, and was one of the generals who gained a victory at Marignano in that year. He was very popular with the soldiers. The mother of Francis I. was enamored of him, but her overtures having been rejected, she became his enemy. At her instigation, the estates which he had acquired by marriage were seized by the king. Bourbon deeply resented this injury, renounced his allegiance to the king of France in 1523, and became the ally of the emperor Charles V., for whose service he raised about 6000 Germans. He contributed largely to the victory which the imperial army gained over the French at Pavía in 1525. It appears that he was distrusted by Charles V., who neglected to pay Bourbon's German mercenaries, and these consequently became mutinous. He resolved to quit the service of Charles V., and in order to satisfy his troops with spoils of conquest he conducted a daring enterprise against Rome, in which he displayed great military talents. His army took Rome by assault May 5, 1527, but he was killed as he mounted the wall. (See Robertson, "History of Charles V.;" Brantôme, "Vies des grands Capitaines.")

Bourbonnais, a township of Kankakee co., Ill. Pop. 2068.

Bourbon-Vendée, or **Napoleon Vendée,** a town of France, capital of the department of La Vendée, on the river Yon, 48 miles by rail S. of Nantes. It has a college, a normal school, town-hall, and hospital. Pop. 8710.

Bourdaloue (Louis), an excellent French pulpit orator, born at Bourges Aug. 20, 1632. He entered the order of Jesuits in 1648, and became professor of rhetoric and philosophy. In 1669 he removed to Paris, where he preached for many years, and was often heard by Louis XIV., who expressed a high opinion of his sermons. He was distinguished for the dignity of his manner, the wisdom of his thoughts, and the earnestness of his piety. His style of eloquence was less inflated and more simple than that which then prevailed in France. He was a general favorite with the common people, as well as the learned and higher classes. Died in Paris May 13, 1704. His sermons were published in 16 vols., 1707–34. (See Prigny, "Vie de Bourdaloue," 1705; Villenave, "Notice sur Bourdaloue," 1812; J. Labouderie, "Notice sur Bourdaloue," 1825.)

Bourdoin, a township of Texas co., Mo. Pop. 316.

Bourdon [a French word signifying "staff"], in music, is applied to the humming sound produced by blowing through a long hollow staff. Hence the name of the apparatus in organs, stringed instruments, etc. by which the deep sound is made.

Bourgelat (Claude), a French physician and writer, noted as the founder of veterinary schools in France, was born at Lyons Mar. 17, 1712. He wrote on materia medica, farriery, contagious diseases, etc. In 1762 he founded a veterinary school at Lyons. Died Jan. 3, 1779.

Bourg-en-Bresse, a town of France, capital of the department of Ain, is pleasantly situated on the Reyssouse, 57 miles by rail N. N. E. of Lyons. Several railways connect it with Lyons, Mâcon, and Besançon. It is well built, has a college, a museum, a large hospital, and a public library of about 20,000 volumes. Here are manufactures of linens, cotton stuffs, hosiery, etc. Pop. 13,733.

Bourgeois, a French word signifying a citizen or resident of a city; a commoner, as distinguished from a nobleman; a civilian, as distinguished from a soldier. A citizen of the state or republic is called *citoyen*.

Bourgeois, the name of a type used in printing. It is one size larger than brevier, and one size smaller than long primer. (See Type.)

Bourgeoisie, a French term, which is also much used in English, defined in dictionaries as "citizens," "citizenship," "commonalty." It is applied to the great middle class of French society, composed mostly of merchants, manufacturers, master mechanics, lawyers, etc., who live in towns and cities. They are inferior in rank to the aristocracy, and superior to the peasantry and to the *prolétaires* of the towns.

Bourges (anc. *Avaricum*, afterwards *Bituriges*), a city of France, near its centre, capital of the department of Cher, is situated in a fertile plain at the confluence of the Auron and the Eure, 146 miles by rail S. of Paris. It is connected by railway with Paris, Orleans, Moulins, and other cities. It was enclosed by ramparts, which have been converted into promenades or boulevards bordered with chestnut and walnut trees. The streets are crooked and the houses mostly antique. Bourges has a college, a normal school, a public library of about 25,000 volumes, a fine hôtel de ville, and a magnificent Gothic cathedral, which is considered one of the finest in Europe. It is the see of an archbishop. This town was formerly the seat of a celebrated university. It has manufactures of cutlery, woollen stuffs, etc. *Avaricum*, which occupied this site, was a very ancient town, and was the capital of Celtic Gaul about 500 B. C. It was the chief town of the Bituriges in the time of Julius Cæsar, who besieged and took it in 52 B. C., after which it became the capital of the Roman province of Aquitania. During the Middle Ages seven councils of the Church were held here, and in 1438 the Pragmatic Sanction of the Gallican Church was established here. Pop. 30,819.

Bourgoing, de (Jean François), Baron, an accomplished and amiable French diplomatist, born Nov. 20, 1748, was ambassador at different courts. During a nine years' residence in Spain he wrote a thorough book upon that country, "Nouveau voyage en Espagne, etc." (3 vols., 1789–1808). Died July 20, 1811.

Bourignon (Antoinette), a Flemish visionary religionist, born at Lille Jan. 13, 1616, entered a convent in her youth, and professed that she had received special revelations. Having left the convent and renounced Catholicism, she travelled in foreign countries, wrote several religious works, and gained many converts to her sect, especially in Scotland. She was an eloquent speaker and writer. Died Oct. 30, 1680. (See a "Life of Antoinette Bourignon," prefixed to her works, 21 vols., 1676–84.)

Bourmont, de (Louis Auguste Victor), Comte de Ghaisne, a French general, born in Anjou Sept. 2, 1773, was a royalist in the Revolution. He fought against the republic in 1794–96, and entered the service of Napoleon about 1809. Having served with distinction in Russia, he was raised to the rank of lieutenant-general in 1814. During the Hundred Days, 1815, he deserted Louis XVIII. and Napoleon by turns. He became minister of war in 1829, and commander-in-chief of the army sent against Algiers in 1830. He conquered Algiers, and was rewarded in July, 1830, with the bâton of a marshal of France. Being devoted to Charles X., he was deprived of his command by the revolution of 1830, and went into exile. Died Oct. 27, 1846. (See De Lansac, "Notice sur le Comte de Bourmont," 1847.)

Bourne (Hugh), an English preacher, born in Staffordshire April 3, 1772, was one of the founders of the sect of Primitive Methodists. He was "cut off" from the Wesleyan connection in 1808 for holding camp-meetings, before which he was a zealous layman of that denomination. His new sect was organized in 1810. He visited Ireland and the U. S. Died Oct. 11, 1852.

Bourne (Vincent), an English scholar and elegant Latin poet, was born about 1698. He was an usher of Westminster School. He wrote several short original Latin poems, which are remarkably graceful, and produced Latin versions of English ballads, which are wonderfully felicitous. Cowper translated some of his original Latin poems. Died Dec. 2, 1747.

Bourneville, a post-village of Twin township, Ross co., O. Pop. 208.

Bour'nonite, or **Endellionite,** a triple sulphide of copper, antimony, and lead, is composed of 41.8 per cent. of lead, 26 of antimony, 19.4 of sulphur, and 12.8 of copper. It occurs in crystals and massive.

Bournouse, or **Burnouse,** bor-noos', the Arabic name of a garment worn in Algeria and other parts of Northern Africa. It is a large woollen mantle, worn above the other clothing of the natives, and has a hood which is used to cover the head in rainy weather. It has been adopted by the Spaniards, who call it *albornoz*.

Bourrienne, de (Louis Antoine Fauvelet), a French diplomatist, born at Sens July 9, 1769. He was a fellow-student and friend of Bonaparte at the school of Brienne. They met at Paris in 1792, and renewed their intimacy. In 1796 Bourrienne became private secretary to General Bonaparte, whom he followed to Egypt. In 1804 he was sent as minister to Hamburg, but he was accused of peculation, and was recalled in 1811. Having deserted Napoleon in 1814, he was appointed minister of state by Louis XVIII. in 1815. He published an interesting work entitled "Memoirs of Bourrienne" (10 vols., 1829–31), which is an important contribution to the history of Napoleon. Died Feb. 7, 1834. (See Boulay de la Meurthe, "Bourrienne et ses Erreurs," 2 vols., 1830.)

Bourse. See Exchange.

Boussingault (Jean Baptiste Joseph Dieudonné), a French chemist, born in Paris Feb. 2, 1802, became a member of the Institute in 1839. He was an officer under Bolivar in South America in his youth. He co-operated with Dumas in experiments to determine the composition of the atmosphere. In 1844 he published a valuable work entitled a "Treatise on Rural Economy" (2 vols.). He was a moderate republican member of the National Assembly in 1848.

Boussu-sur-Haine, a town in Belgium, on the Haine, in the province of Hainaut. It has machine-works and breweries. Pop. 6638.

Boustrophe'don [from the Gr. βοῦς, an "ox," and στρέφω, to "turn"], a word used to describe a mode of writing practised by the ancient Greeks until about 450 B. C. —namely, in alternate lines from right to left and from left to right, as fields are ploughed in furrows, having an alternate direction.

Bou'terwek (Friedrich), a German philosopher and critic, born near Goslar, in Hanover, April 15, 1766. He wrote several poems and a romance called "Count Donamar" (3 vols., 1791). He became extraordinary professor of philosophy at Göttingen in 1797, and ordinary professor in 1802. He published several works on philosophy and a "Treatise on Æsthetics" (1806). His reputation is founded on his excellent "History of Modern Poetry and Eloquence" (12 vols., 1801–19). Died Aug. 9, 1828. (See J. F. Blumenbach, "Memoria F. Bouterwekii," 1832.)

Bout'well (George Sewall), LL.D., an American lawyer and statesman, born in Brookline, Mass., Jan. 28, 1818. His education was partly obtained in the public schools and by a course of thorough private study. He taught school in his youth, was admitted to the bar at the age of twenty-eight, and in 1851 and 1852 was chosen governor of Massachusetts. He was long a member of the Massachusetts board of education, of which he was secretary for five years. He organized the internal revenue department of the U. S. government, and in 1862 became its first commissioner. He was a member of Congress from Massachusetts 1863–69, and secretary of the treasury 1869–73, under President Grant. In 1873 he was chosen U. S. Senator from Massachusetts, in place of Hon. Henry Wilson, Vice-President of the U. S.

Bouvar'dia (named in honor of Bouvard, physician of Louis XIII.), a genus of plants of the natural order Cinchonaceæ, is allied to the trees from which Peruvian bark is obtained. The corolla is tubular, 4-lobed, and has four stamens included in it. The fruit is a capsule, 2-celled. The species of this genus are natives of Mexico. The *Bouvardia triphylla* is cultivated in gardens for its beautiful scarlet flowers.

Bouvet (François Joseph Francisque), a French publicist, born Aug. 15, 1799, has supported by his writings the liberal party. He was editor of the "Revue Independante" and "Reveil de l'Ain," in which he developed

his ideas concerning universal peace. He has written "Du Principe de l'autorité en France, et de la limite des pouvoirs; conciliation des partis" (1839), "Du Pape" (1863), and "Le problème européen."

Bouvier' (Hannah M.), born in Philadelphia in 1811, the only daughter of Judge John Bouvier, published "Familiar Astronomy" (1857), a work which won the praise of Sir John Herschel, Lord Rosse, Hind, Airy, De Morgan, and many other eminent astronomers of Europe and the U. S.

Bouvier (John), a jurist and writer, born in the French department of Gard in 1787. He emigrated to the U. S. in 1802, and practised law in Philadelphia. In 1838 he became a judge of the criminal court in that city. He published a "Law Dictionary" (1839), which has had a great success, and "Institutes of American Law" (4 vols., 1851). Died Nov. 18, 1851.

Bovia'num, an ancient city of Italy, founded by the Samnites on or near the site of the modern Bojano, was surrounded by high mountains. According to Livy, it was a wealthy and powerful city. It was besieged and taken by the Romans in 311 B. C. In the second Punic war it was several times the head-quarters of the Roman army. During the Social war it was the capital of the confederates.

Bov'idæ [from the Lat. *bos*, gen. *bo'vis*, an "ox"], a family of ruminating animals, comprises the ox, bison, buffalo, yak, zebu, etc. The Bovidæ are all large and gregarious animals, and they generally have unbranched horns. This family is usually regarded as equal in extent to the Linnæan genus *Bos*. Indigenous species of Bovidæ are found in Asia, Africa, Europe, and North America. They have eight cutting teeth in the lower jaw, and no cutting teeth in the upper, which is furnished with a fibrous and elastic pad. They also have twelve grinders (molar teeth) on each jaw. The exact number of species of Bovidæ has not been ascertained. They are all valuable to man for their flesh, tallow, hides, horns, etc., and several species besides the ox have been domesticated. (See Arnee, Bison, Buffalo, Ox, Urus, Yak, and Zebu.)

Bovi'na, a post-township of Delaware co., N. Y. Pop. 1022.

Bovina, a township of Outagamie co., Wis. Pop. 437.

Bovi'no (anc. *Vibinum*), a fortified town of Italy, in the province of Foggia, 14 miles S. S. W. of Foggia. It has a cathedral and several churches. The imperialists defeated the Spaniards here in 1734. Pop. 6415.

Bow, in nautical language, is the fore part of a ship. In the plural the bows are the two sides of the fore extremity of the vessel, as the starboard and larboard bows. The different shapes of these are distinguished by the terms a narrow or lean bow, and a broad or bluff bow.

Bow, in music, the instrument by which the strings of a violin and some other instruments are set in vibration. It consists of a stick of elastic wood, on which horsehairs are stretched.

Bow [Lat. *arcus*], a weapon used in war and hunting to propel arrows, is made of wood or other elastic substance, and is bent by a string fastened to each end. It is generally used by savages, but among civilized nations its use as a military weapon has been superseded by firearms. Bows have been constructed of various materials; besides different kinds of elastic wood, steel has sometimes, and horn frequently, been employed, particularly in ancient times. (See Arbalest, Archery, Arrow.)

Bow, a post-township of Merrimack co., N. H. P. 745.

Bow'den, a township of Clay co., Ala. Pop. 274.

Bow'dich (Thomas Edward), an English linguist and traveller, born at Bristol in 1790. Having visited Ashantee in 1816, he published a "Mission to Ashantee" (1819). He undertook an exploring expedition into the interior of Africa in 1822, but he died of fever on the river Gambia near its mouth Jan. 10, 1824.

Bow'ditch (Nathaniel), LL.D., F. R. S., an eminent American mathematician, born at Salem, Mass., Mar. 26, 1773. He made several long voyages as an officer or supercargo of a merchant-vessel, and learned Greek and Latin without a teacher. He published a valuable work called "The Practical Navigator," and a good translation of Laplace's "Mécanique Céleste," with an ample commentary (4 vols. 4to, 1829–38). This was highly commended by the English "Quarterly Review" for July, 1832. He was a fellow of the Royal Society of London, and a member of a large number of the learned societies of Europe and America. Died Mar. 16, 1838. (See a "Memoir of N. Bowditch," by his son, N. I. Bowditch, 1839.)

Bowditch (Nathaniel Ingersoll), born at Salem, Mass., Jan. 17, 1805, graduated at Harvard in 1822. He was called to the bar in Boston in 1825, but became a conveyancer, acquiring great reputation for accuracy and industry. He wrote much for periodicals, and published a "Memoir of N. Bowditch" (1840), a "History of the Massachusetts General Hospital" (1851), and "Suffolk Surnames." Died April 16, 1861.

Bow'doin, a post-township of Sagadahoc co., Me. Pop. 1345.

Bowdoin (James), LL.D., an American governor, born at Boston Aug. 8, 1727, graduated at Harvard in 1745. He was president of the convention which in 1778 formed the constitution of Massachusetts, was chosen governor of that State in 1785, and again in 1786. He suppressed Shay's rebellion in 1786. Died Nov. 6, 1790.

Bowdoin (James), a son of the preceding, was born in Boston Sept. 22, 1752. He graduated at Harvard in 1771. He was sent in 1805 on a mission to Spain, to procure the cession of Florida to the U. S., and to obtain indemnity for injuries to American commerce. He was a benefactor of Bowdoin College. Died Oct. 11, 1811.

Bowdoin (bō'den) **College,** the oldest college in Maine, was founded in 1802 at Brunswick, Cumberland co., on the Androscoggin River, about 4 miles from the Atlantic Ocean. It was named in honor of James Bowdoin, governor of Massachusetts, whose son James gave to the college 1000 acres of land, over £1000 sterling, and a valuable library and collection of paintings. The college was also liberally endowed by the State. The college library has about 17,500 volumes, and the other libraries connected with the college have nearly as many more. Connected with this flourishing college is a medical school, founded in 1820. The number of graduates, including those of the medical school, amounted (June, 1872) to 2747. Much attention is paid to physical education; instruction is also given in military science.

Bow'doinham, a post-township and village of Sagadahoc co., Me., on the W. side of the Kennebec River. The village is on the Augusta division of the Maine Central R. R., 38 miles N. E. of Portland. It has been noted for shipbuilding. It has four churches, a national bank, and manufactures of lumber. Pop. 1804.

Bow'don, a post-village of Carroll co., Ga. It is the seat of Bowdon College (not denominational), a flourishing institution with an able faculty. Pop. of village, 350.

Bow'dre, a township of Douglas co., Ill. Pop. 1313.

Bow'en, a township of Madison co., Ark. Pop. 1023.

Bowen, a township of Colleton co., S. C. Pop. 1467.

Bowen (Francis), LL.D., an American writer, born at Charlestown, Mass., Sept. 8, 1811, graduated at Harvard in 1833. He edited the "North American Review" about eleven years (1843–54), and became in 1853 professor of natural religion, moral philosophy, etc. at Harvard University. He has been an ardent defender of the philosophical views of Locke and Berkeley, and a warm opponent of those of Kant, Fichte, and Cousin. Among his works are Lives of Baron Steuben, James Otis, and Benjamin Lincoln in Sparks's "American Biography," and a treatise on Political Economy.

Bowen (Rt. Rev. Nathaniel), D. D., born in Boston, Mass., June 29, 1779, graduated at Charleston College, S. C., in 1794, held pastorates in Protestant Episcopal churches at Providence, R. I., Charleston, S. C., and New York City. In 1818 he was consecrated bishop of South Carolina. Died Aug. 25, 1839. He wrote "Christian Consolation" (1831), "Private Prayers" (1837), and two volumes of his sermons were published.

Bow'ensburg, a post-village of Hancock co., Ill.

Bow'er, a shady recess; a shelter or arbor in a garden, formed of boughs of trees overarched or intertwined; also a private apartment in ancient castles or mansions, used by ladies as a parlor and a sleeping-chamber.

Bower, in certain games of cards, is the name of the knave or jack of trumps; this word comes from the Ger. *Bauer*, a "clown" or "peasant."

Bower (Archibald), a Scottish writer of Roman Catholic parentage, was born at Dundee in 1686, joined the Jesuits, became a Protestant, rejoined the Jesuits, and again became a Protestant. His "History of the Popes," in seven quarto volumes (1748–66), is characterized by great partisan bitterness. He died in 1766.

Bower Bank Plantation, a township of Piscataquis co., Me. (In 1860 the act of incorporation was repealed.) Pop. 83.

Bower-bird, a name given to certain Australian birds of the starling family, remarkable for their making bower-like erections, adorning them with gay feathers, rags, bones, shells, and other brightly-colored objects. These bowers

are not nests. The use made of them by the birds is imperfectly understood; their structure has been carefully examined, and specimens of them deposited in the British Museum. The bowers of the satin bower-bird (*Ptilonorhynchus holosericeus*) are built in trees. The base is an extensive platform of sticks, on the centre of which the bower is built of flexible twigs. It is chiefly at and near the entrance that the shells, feathers, etc. are placed. The bowers of the spotted bower-bird (*Chlamydera maculata*) are longer and more avenue-like than those of the satin bower-bird; they are placed upon the ground, and beautifully lined with grasses.

Bow'ers (Theodore S.), an American officer, born in Pennsylvania about 1832. A printer by trade, he subsequently edited a paper in Illinois, but laying aside his pen he entered the service in Oct., 1861, as a private in the 48th Illinois volunteers, was promoted to be first lieutenant Mar., 1862, made aide-de-camp to Gen. Grant April, 1862, and appointed captain and aide-de-camp Nov., 1862, judge-advocate, with the rank of major, Feb., 1863, and, after the surrender of Vicksburg, assistant adjutant-general of volunteers, with the rank of lieutenant-colonel. On the 29th of July, 1864, he was commissioned a captain and assistant quartermaster in the regular army, and later, Jan., 1865, a major and assistant adjutant-general. He served continuously, in the field and afterwards at Washington, on the staff of Gen. Grant, from April, 1862, to Mar. 6, 1866, when he was accidentally killed by being thrown under a train at Garrison's Station, N. Y. Brevet lieutenant-colonel, colonel, and brigadier-general U. S. A. for gallant and meritorious services during the war.

G. C. Simmons, *Clerk Board of Eng'rs.*

Bow'ie, a county which forms the N. E. extremity of Texas, bordering on Arkansas. Area, 862 square miles. It is bounded on the N. by the Red River, and on the S. by the Sulphur Fork of Red River. It is extensively covered with pine forests. The soil is fertile, and adapted to cotton, wheat, and maize. Good iron ore and lignite abound. There are numerous mineral springs. Stock-raising is carried on. Capital, Boston. Pop. 4684.

Bowie, a township of Chicot co., Ark. Pop. 207.

Bowie (A.) was born and educated in South Carolina, but spent the greater part of his life in Talladega, Ala., where for six years he presided on the chancery bench. In 1845 he retired from public life, retaining only his position as a trustee of the State University. He was a distinguished member of the Baptist Church. In politics he was allied with the State Rights Democracy. In society he excelled by his great conversational powers.

Bowie Knife, an American weapon, common in the Southern U. S., invented by Col. Bowie of Texas. It is a sharp-pointed knife having a single edge, and is usually carried in a sheath. The blade is sometimes ten inches long or more. Its use is less frequent than in former times.

Bow'ing, an act of reverence or of worship, common in the Roman Catholic, the Oriental, and the Anglican churches. In the repetition of the creeds it is customary to bow whenever the name of Jesus Christ occurs; and the practice is said by some to be commanded by Phil. ii. 10—"that at the name of Jesus every knee should bow;" an expression regarded by many as figurative. In some rites it is customary to face the E. during the recital of the creeds; and it is certain that bowing towards the E. was common in ancient churches. In Roman Catholic and in some Anglican parishes it is customary to bow towards the altar when entering and leaving church.

Bow'lan, a township of Shannon co., Mo. Pop. 156.

Bowles (Samuel), an American journalist, born at Springfield, Mass., Feb. 9, 1826. Since 1844 he has been the principal conductor of the "Springfield Republican," one of the most successful journals in the U. S. He has published "Across the Continent" (1865), "The Switzerland of America" (1869), and other works.

Bow-line of a ship is a rope fastened near the middle of the perpendicular edge of the square sails by three or four subordinate ropes called bridles. It serves to tighten the edge of the sail during an unfavorable wind.

Bow'ling, or **Bowls,** a game of skill, played upon a square piece of ground or "bowling green." Each player casts his ball or *bowl* (which is usually not a perfect sphere) at a smaller ball or *jack*, the object being to leave the bowl as near as possible to the jack. There are several forms of this game, which our narrow limits will not allow us to describe particularly.

Bow'ling, a township of Rock Island co., Ill. P. 952.

Bowling (William Kendall), M. D. See Appendix.

Bowling Alley, a long narrow structure made for playing the game of skittles, commonly called in America Nine-pins or Ten-pins (which see).

Bowling Green, a post-township of Fayette co., Ill. Pop. 1097.

Bowling Green, a post-village, capital of Clay co., Ind., on Eel River, 60 miles W. S. W. of Indianapolis. It has one weekly newspaper. Pop. 606.

Wm. Travis, Pub. "Weekly Archives."

Bowling Green, the capital of Warren co., Ky., is on Barren River and the Louisville and Nashville R. R., 113 miles S. by W. of Louisville and 72 miles from Nashville. It is at the head of navigation, and has an active trade in pork, tobacco, etc. Here are several mills and factories. Small steamboats navigate the river. It has two weekly newspapers. Pop. 4574.

Bowling Green, a township of Chariton co., Mo. Pop. 1496.

Bowling Green, a post-village, capital of Pike co., Mo., is on the Missouri division of the Chicago and Alton R. R., 12 miles S. W. of Louisiana, where that railroad meets the Mississippi River. It has one weekly newspaper. Pop. 599.

Bowling Green, a township of Licking co., O. Pop. 1042.

Bowling Green, a township of Marion co., O. P. 903.

Bowling Green, a post-village of Centre and Plain townships, capital of Wood co., O. It has one weekly newspaper. Pop. 906.

Bowling Green, a post-village, capital of Caroline co., Va., 45 miles N. of Richmond. Pop. of Bowling Green township, 4765.

Bow'man, a township of Sullivan co., Mo. Pop. 581.

Bowman (Alexander H.), an American officer, born May 15, 1803, at Wilkesbarre, Pa., graduated at West Point in 1825, lieutenant-colonel of engineers Mar. 3, 1863. He served as assistant professor at the Military Academy 1825–26, in building defences and improving rivers and harbors on the Gulf of Mexico 1826–34, in constructing Memphis and St. Francis military road 1834–39, improvement of Cumberland and Tennessee rivers 1834–38, defences of Charleston harbor, S. C., 1838–53, as instructor of practical military engineering at the Military Academy 1851–52, in charge of improvement of Charleston harbor 1852–53, chief engineer U. S. treasury department and treasury building extension 1853–61, member of lighthouse board 1857–59, superintendent of Military Academy 1861–64, and member of engineer boards 1847–65. Died Nov. 11, 1865, at Wilkesbarre, Pa., aged sixty-two.

George W. Cullum, *U. S. Army.*

Bowman (Thomas), D. D., born in Berwick, Pa., in 1819, graduated at Dickinson College in 1837. He became, in 1859, president of the Indiana Asbury University, which position he still held when he was elected a bishop of the Methodist Episcopal Church in 1872.

Bowman (Samuel), D. D., born at Wilkesbarre, Pa., May 21, 1800, studied law, but became a deacon of the Protestant Episcopal Church in 1823, and a priest in 1824. He was long settled in Lancaster, Pa. In 1847 he was chosen bishop of Indiana, but declined, and afterwards refused the nomination for provisional bishop of New York. In 1858 he was chosen assistant bishop of Pennsylvania. He was greatly beloved by his people, and was very active in his parochial and episcopal duties. Died Aug. 3, 1861.

Bow'manville, a port of entry of Durham co., Ontario (Canada), in Darlington township, has an excellent harbor on Lake Ontario, and is on the Grand Trunk Railway, 43 miles N. E. of Toronto. It has good water-power, and manufactures of lumber, hoop skirts, furniture, and castings. It is visited by daily steamers during the season of navigation, and has a bank and three weekly papers. Pop. about 3000.

Bowne, a post-township of Kent co., Mich. Pop. 1275.

Bow'ring (Sir John), an English author and linguist, was born at Exeter Oct. 17, 1792. He was an intimate friend of Jeremy Bentham, and was well versed in modern languages, especially the Slavonic. In 1825 he became editor of the "Westminster Review." He collected and translated into verse the ancient and popular poems of almost all the countries of Europe. In 1835 he was elected to Parliament, in 1854 became governor of Hong-Kong, China, and received the honor of knighthood. In 1859 he retired on a pension. Among his works is "The Kingdom and People of Siam" (2 vols., 1857). He wrote a description of his visit to the Philippine Islands (1860). He also wrote some excellent hymns. Died Nov. 22, 1872.

Bow'sprit, a large boom or spar which projects over the stem or bow of a ship. It serves to support the fore-

mast, which is fastened to it by large stays or ropes; also to carry sail forward, as a means of counteracting the effect of the after sails and keeping the ship well balanced. In many cases the bowsprit rises at an angle of about 45°. It supports the jib and flying-jibbooms.

Bow'string Hemp, the fibre of the *Sanseviera Zeylanica*, a plant of the order Liliaceæ and tribe Hemerocalleæ, a native of the East Indies. The Hindoo name is *moorva*. This fibre, which is white, silky, and elastic, is used to make bowstrings. A similar fibre is obtained from the leaves of *Sanseviera Roxburghiana*, a perennial Indian plant which has leaves about three feet long, and from other Asiatic and African species.

Bowtown Plantation, a township of Somerset co., Me. Pop. 14.

Box (*Buxus*), a genus of evergreen shrubs or small trees of the natural order Euphorbiaceæ, with opposite leaves entire at the margins. It has male and female flowers growing on the same plant. The male flower is a perianth with four stamens, and the female flower is a perianth with an ovary surmounted by three styles. The most important species is the *Buxus sempervirens* (common box), which is a native of Europe and Asia, has oval, shining, and deep-green leaves, and is remarkable for its compact habit of growth. In Southern Europe it grows twenty feet high or more. A variety called dwarf box, which is only two or three feet high, is extensively cultivated in gardens, and is used to form edgings of flower-beds and gravel-walks, being reduced by clipping to the height of a few inches. The wood of the box, which is very hard, heavy, compact, and fine-grained, is the best of all materials for wood-engraving, and is highly prized by turners. It is also commonly used to make flutes and other wind instruments. It is of a pale yellow color, admits of a beautiful polish, and is not liable to be worm-eaten. Large quantities of boxwood are exported from Spain and Turkey.

Box, a township of Cedar co., Mo. Pop. 1307.

Box'borough, a post-township of Middlesex co., Mass. Pop. 338.

Box Elder, or **Ash-leaved Maple,** a small tree of the order Sapindaceæ, the *Negundo aceroides*, which grows from Florida to Pennsylvania and westward, especially along the banks of streams. It is very beautiful, and is one of the characteristic trees of the far West. In Minnesota, Nebraska, etc. it is tapped, like the sugar-maple, for its sap, which affords sugar of good quality.

Box Elder, a county which forms the N. W. extremity of Utah, bordering on Idaho and Nevada. It is intersected by Bear River, and bounded on the E. by the Wasatch Mountains. The northern half of Great Salt Lake is included in this county. Grain and wool are raised. The Central Pacific R. R. passes through the county. Capital, Brigham City. Pop. 4855.

Box'ford, a post-township of Essex co., Mass., on the Newburyport and Danvers R. R. Pop. 847.

Box'hauling is a mode of turning a ship when the swell of the sea renders tacking impossible, or when the ship is so near the shore that there is not room for veering. The operation is effected by a peculiar management of the helm and the sails.

Boxing. See Pugilism.

Boxing the Compass, a nautical phrase, means a recital or enumeration of the several points, half points, and quarter points of the mariner's compass in their proper order.

Box'tel, a village of Holland, in North Brabant, on the river Dommel, 6 miles S. of Bois-le-Duc. The river flows through the streets and affords passage for boats. Fine diaper is manufactured here. Pop. 4221.

Box-tortoise, or **Lock-tortoise,** popular names of

Box-Tortoise.

the *Cistuda Virginica* and *Cistuda Blandingii*, tortoises of the U. S., characterized by the division of the plastron into two parts by a crosswise division, united, however, by a ligament which serves as a hinge on which the parts of the plastron turn, thus enabling the animal to shut himself entirely up in his shell. These tortoises are very timid and of gentle disposition. Their legs are longer and their speed greater than is usual among tortoises.

Boya'ca, one of the U. S. of Colombia, is bounded on the N. E. and E. by Venezuela, on the S. and S. W. by Cundinamarca, and on the N. W. by Santander. Area, 32,800 square miles. While in the W. the state is exceedingly mountainous, the E. consists of a hot, dry plain. Copper and precious stones are found in the mountains. Capital, Tunja. Pop. in 1870, 482,874.

Boyaca, a village of Colombia, in the department of its own name, is 5 miles S. W. of Tunja. Here Bolivar gained over the Spaniards, Aug. 7, 1819, a victory which secured the independence of Colombia.

Boy'ar [from a word signifying "battle"], a title given in ancient Russia to those who distinguished themselves in war. This afterwards came to be the title of the nobility, who under the grand duke of Moscow formed an aristocracy whose powers differed according to the character of the monarch, but which were so considerable that even Ivan the Terrible in his ukases added to the words "The czar has commanded," also "The boyars have approved." The last boyar died in 1750.

Boyau (a French word signifying "bowel" or "gut"), in military engineering, is a winding or serpentine trench, dug to form a path or communication between the different armed trenches of a siege-work, and to prevent them from being enfiladed.

Boy Bishop. During the Middle Ages the custom grew up of allowing the choristers of cathedrals to choose yearly one of their number to act the part of a bishop. The practice was permitted probably from the same motives which suffered the mummeries of the Abbot of Unreason (a graphic account of which may be found in Sir W. Scott's romance of "The Monastery"). If the boy bishop died within his short period of office, he was buried in his episcopal robes. A tomb with the effigy of a boy so clothed may be seen in Salisbury Cathedral.

Boyce (James Petigru), D. D., LL.D., born Jan. 11, 1827, at Charleston, S. C., graduated at Brown University in 1847, studied theology at Princeton, N. J., pastor of a Baptist church at Greenville, S. C., 1851–55, professor of theology in Furman University, Greenville, S. C., 1855–58, professor of theology in the Southern Baptist Theological Seminary (formerly Greenville, S. C., now Louisville, Ky.) 1858 to the present time (1873). He has published several sermons, addresses, and articles, which have largely contributed to mould the opinions of the Southern Baptists, and holds, as president of the Southern Baptist Convention, a position of commanding influence.

Boyd, a county of Kentucky, bordering on West Virginia. Area, 225 square miles. It is bounded on the N. E. by the Ohio River, and on the E. by the Big Sandy. The surface is hilly. Grain, tobacco, and wool are raised. Iron ore, coal, pig iron, and lumber are largely exported. Capital, Catlettsburg. Pop. 8573.

Boyd, a township of Transylvania co., N. C. Pop. 448.

Boyd (Andrew Kennedy Hutchison), D. D., born in Nov., 1825, the son of the incumbent of Auchinleck, Ayr, was educated at King's College, London, and at Glasgow. He became rector of St. Andrew's. Under the name of "Country Parson" he has published contemplative essays and sermons.

Boyd (John Parker), an American general, born in Newburyport, Mass., Dec. 21, 1764, entered the U. S. army as ensign in 1786. A spirit of adventure led him to India in 1789, where he obtained a command in the Mahratta service, and rose to the rank of commander. He returned to the U. S. in 1808, and was commissioned colonel of the Fourth U. S. Infantry. In the war with Great Britain he was a brigadier-general, distinguished himself at Tippecanoe, at the capture of Fort George, Canada, and Chrysler's Field; disbanded in 1815. In 1830, President Jackson appointed him naval officer of the port of Boston, Mass. Died Oct. 4, 1830.

Boyd (Linn), an American statesman, born at Nashville, Tenn., Nov. 22, 1800, was a member of Congress from Kentucky for twenty years, being first elected in 1835. During his last term he served as Speaker of the House of Representatives. Died Dec. 18, 1859.

Boy'dell (John), an English engraver and patron of art, born Jan. 19, 1719, became a printseller in London, and

amassed a large fortune. He promoted the improvement of British art by his liberal patronage of native engravers and painters. He employed Opie, Reynolds, Northcote, West, and other painters to illustrate Shakspeare's works. The result was the "Shakspeare Gallery," from which was engraved a volume of admirable plates (1803). He was lord mayor in 1790. Died Dec. 11, 1804.

Boy'den (Seth), born at Foxboro', Mass., Nov. 17, 1788, went into the leather manufacture in Newark, N. J., in 1813, began the making of patent leather in 1819, invented a process for making spelter and a machine for leather splitting. In 1826 he made the first malleable cast iron. He also discovered a process for making Russia sheet iron, invented an excellent doming-machine for hat bodies, and built the first successful locomotive with cylinders outside. It is also claimed that he produced the first daguerreotype in the U. S., but the claim is also made for others. Died Mar. 31, 1870.

Boyd'ton, a town of Mecklenburg co., Va., and one of the most flourishing towns of its size in the State. It contains the residences of the county officers, a bank, newspaper-office, two tobacco warehouses, tobacco factory, furniture factory, saw and grist mills, an excellent hotel, and numerous stores, workshops, fine schools and churches, etc. The lands around are of superior quality. Boydton has a daily mail and a passenger service in connection with the Richmond and Danville R. R., *viâ* Barnesville. A railroad is now constructing which will pass within a few miles. Pop. 261; of township, 4708.

Ed. "Southside Virginian."

Boy'er, a township of Crawford co., Ia. Pop. 135.

Boyer, a township of Harrison co., Ia. Pop. 589.

Boyer (Alexis), a French surgeon, born Mar. 1, 1757, was the son of a tailor, and acquired his profession under great drawbacks. He was surgeon to Napoleon I. and chirurgical professor of the university. His main works are "Traité complet d'anatomie" (4 vols., 1797–99) and "Traité des maladies chirurgicales et des operations qui leur conviennent" (8 vols., 1814–22). Died Nov. 25, 1833.

Boyer (Jean Pierre), a president of Hayti, was born at Port-au-Prince Feb. 28, 1776, and was a mulatto. He entered the French army in his youth, and as an officer in the army of Pétion fought against Christophe. On the death of Pétion he was elected president of the republic in 1818. By partiality to the mulattoes and arbitrary measures he offended the negroes, who revolted in 1842 and expelled him from the island. He died in Paris July 9, 1850.

Boy'ertown, a post-village of Colebrookdale township, Berks co., Pa., about 18 miles E. of Reading. It has one weekly newspaper. Pop. 690.

Boy'kins, a village of Southampton co., Va., in a township of the same name, on the Seaboard and Roanoke R. R., 26 miles from Portsmouth. Pop. of township, 2292.

Boyle, a county in Central Kentucky, in the "blue-grass region." Area, 180 square miles. It is bounded on the N. E. by Dick's River, and also drained by the sources of Salt River. The soil is based on limestone, and is deep and very fertile. Grain, tobacco, wool, and live-stock are extensively raised. The county is intersected by a branch of the Louisville and Nashville R. R. Capital, Danville. Pop. 9515.

Boyle (John Alexander), a Methodist Episcopal preacher, born at Baltimore, Md., May 13, 1816, removed to Philadelphia in youth, entered the ministry in 1839, but was twice compelled by ill-health to relinquish his chosen profession. He became a lawyer, and afterwards an editor in Elk co., Pa. In 1861 he became a captain and afterwards a major of Pennsylvania volunteers, served with great honor in Virginia and Tennessee, and was killed at the battle of Chattanooga, Oct. 29, 1863.

Boyle (Robert), a celebrated experimental philosopher, born at Lismore, in Ireland, Jan. 25, 1626, was the seventh son of Richard, the first earl of Cork. He was educated at Eton and Geneva. He took no part in political contests, but devoted himself to the cultivation of science, especially chemistry and natural philosophy. He became a resident of Oxford in 1654, and was one of the founders of the Royal Society. To qualify himself to defend the Christian religion, he learned the Hebrew and Greek languages. He improved the air-pump, and made important discoveries in pneumatics. Among his works are a "Disquisition on Final Causes," a "Discourse of Things above Reason," "Excellency of Theology," and "Hydrostatical Paradoxes." He declined a peerage which was offered to him repeatedly. He was remarkable for his benevolence and charity. By his last will he endowed the Boyle Lectures (which see). He died in London Dec. 30, 1691. His complete works were published by Dr. Birch in 5 vols. fol., 1744.

Boyle Lectures were so called from Robert Boyle, who bequeathed an annual salary to be paid to some clergyman for preaching eight sermons in a year in order "to prove the truth of the Christian religion against Atheists, Deists, Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves." The first person selected to preach the "Boyle Lectures" was the celebrated Richard Bentley (1691), who directed his arguments against Atheism. In 1739 three volumes of the lectures were published, and nearly 60 volumes since then. The "Boyle Lectures" are still maintained.

Boyle's Law is a statement of the fact that "the volume of a gas is inversely as the pressure;" that is to say, if we double the pressure upon a gas we reduce its volume to one-half; if we make the pressure three times what it was at first, the bulk of the gas is reduced to one-third. More commonly called Mariotte's Law (which see).

Boyl'ston, a post-twp. of Worcester co., Mass. P. 800.

Boylston, a township of Oswego co., N. Y. Pop. 1053.

Boylston (Zabdiel), F. R. S., an American physician, born at Brookline, Mass., in 1680, was the first who practised inoculation for the smallpox in America. Died Mar. 1, 1766.

Boyne, the most important river in the E. of Ireland, rises in the Bog of Allen, flows north-eastward through Kildare, King's county, Meath, and Louth, and enters the Irish Sea after a course of 65 miles. Many ruins of monasteries and castles occur on its banks. An obelisk 150 feet high, nearly 3 miles from Drogheda, commemorates the great battle of the Boyne, in which William III. defeated James II., July 1, 1690.

Boyn'ton, a post-township of Tazewell co., Ill. P. 820.

Boynton (Edward C.), born in Vermont, graduated at West Point in 1846. He entered the artillery, was severely wounded at Churubusco, and was brevetted captain; was assistant professor of chemistry, etc. at West Point (1848–55), professor of chemistry, etc. in the University of Mississippi (1856–61), and was brevetted major in 1865. He published a "History of West Point" (1863) and a "History of the U. S. Navy."

Bozeman, a post-village, capital of Gallatin co., Montana, on an affluent of the Gallatin Fork of Missouri River, 100 miles S. S. E. of Helena, and 70 miles S. W. of the National Park on the survey of the Northern Pacific R. R. It has a national bank, one weekly paper, and immense deposits of coal. Pop. 168; of township, 574.

Joseph Wright, Ed. "Avant Courier."

Boz'rah, an ancient city of Idumæa (Edom), often mentioned in the Bible. (See Genesis xxxvi.; Isaiah xxxiv. and liii.) It was situated to the S. W. of the Dead Sea, about halfway between the latter and Petra. Its site is probably occupied by the modern *Buseireh*, a poor village consisting of about fifty wretched huts. No ancient ruins are visible.

Bozrah, a post-village and township of New London co., Conn., on the Yantic River, about 35 miles E. S. E. of Hartford. Total pop. 984.

Boz'zaris, or **Bot'zaris** (Marco), a famous Greek patriot, born at Suli, in Albania, about 1790. He enlisted in the French army about 1808, and served several campaigns. When the Greeks took arms against the Turks in 1820, Bozzaris became the leader of a band of Suliotes, and gained several victories. He defended Missolonghi against the Turks in 1822. Aug. 20, 1823, he attacked and defeated a superior force at Carpenisi, near the ground where the battle of Platæa was fought, but he was killed in the action.

Bra, a town of Italy, province of Cuneo, on the river Stura, 38 miles S. S. E. of Turin. It has manufactures of silk and metal-foundries; also a trade in grain, cattle, and wine. Pop. 9125.

Brabançons, a class of mercenary soldiers chiefly from Brabant, whence they took their name. They served principally in the armies of England and France from the eleventh to the thirteenth centuries. They had little discipline, and were not much better than robbers.

Brabant', a former duchy of the Low Countries. In the sixth century it was conquered by the Franks. During the Middle Ages it changed masters very often, until in the fifteenth century it came to the House of Habsburg. Charles V. left it to his son, Philip II., under whom the province revolted, but only the northern part succeeded in gaining its independence, and joined the Netherlands in 1648, while South Brabant remained with the Spanish-Austrian line until 1714, when it passed into the possession of the imperial line of Austria. It was conquered by the French in 1794, and divided into two provinces, and in

1810 Napoleon also conquered the Dutch part of Brabant. In the treaty of Paris of 1814 Brabant became a part of the Netherlands, and was divided into the provinces of North Brabant, Antwerp, and South Brabant. In consequence of the Belgian revolution of 1830, Antwerp and South Brabant came to Belgium, while North Brabant remained with Holland. The inhabitants in the N. are Dutch, in the centre, Flemish, and in the S., Walloons. The boundary-line between the Germanic and French idioms runs S. of Brussels, past the villages of Braine l'Alleud, Waterloo, Wavre, and Sodoigne.

Brabant, North, a province of Holland, is bounded on the N. by the river Meuse (or Maas), Holland, and Gelderland, on the E. by Limburg, on the S. by Belgium, and on the W. by Zeeland. Area, 1980 square miles. Capital, Bois-le-Duc. It is drained by the Dommel, the Aa, and the Lintel. The surface is flat; the soil is generally fertile. The province is deficient in minerals and timber. Many cattle and sheep are raised here. It has manufactures of cotton, linen, and woollen goods. Pop. in 1870, 440,302.

Brabant, South, a province of Belgium, is bounded on the N. by Antwerp, on the E. by Limburg and Liege, on the S. by Namur and Hainaut, and on the W. by East Flanders. The area is 1268 square miles. Capital, Brussels. The principal rivers are the Dyle, Demer, and Senne. The surface is partly hilly and partly level; the soil is generally fertile and highly cultivated. This province contains extensive forests, mines of iron, and quarries of stone. It is intersected by several railways and canals. It has important manufactures of cotton and woollen fabrics, fine lace, hats, leather, jewelry, fine linens, ribbons, paper, machinery, etc. This is one of the most densely peopled districts in Europe. Pop. in 1870, 879,814.

Brace (Charles Loring), an American philanthropist and writer, born at Litchfield, Conn., June 19, 1826, graduated at Yale in 1846. Having travelled in Europe, he published "Home-Life in Germany" (1853), "Races of the Old World" (1863), and other works. He was the principal founder of the Children's Aid Society of New York.

Brace (Julia), a blind deaf-mute, was born near Hartford, Conn., in 1806. When she was four years old she lost by sickness both sight and hearing, and not long after forgot all the words she had previously learned. (See an interesting notice of her in Dunglison's "Physiology," vol. ii. p. 160.)

Bracebridge, a post-village of Victoria co., Ontario (Canada), in the Muskoka region and in Macaulay township, on the Muskoka River, 195 miles from Lindsay, the county-town. It is visited by steamboats, except in winter, and has one weekly paper. Pop. about 200.

Bracelet [from *bras* (Lat. *brachium*), an "arm"], an ornament worn around the arm at or near the wrist. These ornaments have been worn by every nation, savage or civilized, from the earliest ages. They are mentioned in Genesis as worn by both women and men. The Medes and Persians were remarkable for their love of gold ornaments and jewelry. They wore bracelets, armlets, earrings, and pearl necklaces. The ancient Greek ladies wore bracelets and armlets of various materials and forms. They generally passed round the arm several times.

Braceville, a post-village of Grundy co., Ill., in a township of the same name, on the Chicago and Alton R. R., 61 miles S. S. W. of Chicago. Pop. 1188.

Braceville, a post-township of Trumbull co., O. P. 954.

Bra'chial [from the Lat. *brachium*, the "arm"] **Ar'tery,** the main artery of the arm; a continuation of the axillary, as the latter is of the subclavian trunk. The brachial vessel lies upon the inside of the *humerus* or arm-bone, just back of the biceps muscle; near the elbow it passes forward and divides into the radial and ulnar arteries. Before this, it gives off four smaller branches. The position of the brachial artery makes it quite practicable to compress it firmly against the bone in case of serious bleeding from a wound of the arm, fore arm, or hand.

Brachiop'oda (plu.), [from the Gr. βραχίων, the "arm," and πούς, ποδός, the "foot," alluding to their two long fringed and coiled arms], or **Palliobranchia'ta,** a class of marine bivalve, molluscoid organisms which have symmetrical dorsal and ventral valves; the former of which (according to the general opinion of observers) is usually much the smaller, being free and imperforate, but according to E. S. Morse the so-called dorsal valve is really ventral. The valves articulate by two curved teeth developed from the border of the larger valve. Brachiopods are among the most ancient of fossil organisms, the *Lingula* being found from the Cambrian to the existing fauna. Brachiopods have also the greatest range of climate and depth. Morse considers them closely related to Vermes.

Brachis'tochrone [from the Gr. βράχιστος, "shortest," and χρόνος, "time"], the plane curve down which a material particle must fall in order to pass in the shortest possible time from the upper to the lower of two given points not in the same vertical line. It is the common cycloid. The problem of the brachistochrone is celebrated in the history of mathematics. It was first proposed by John Bernoulli in 1696, and was solved by Sir Isaac Newton and James Bernoulli. It is often called "the curve of quickest descent."

Brach'vogel (Emil Albert), a German novelist and dramatist, born at Breslau April 29, 1824. Among his principal works are the novels entitled "A New Falstaff" (1862), "Beaumarchais" (1864), "The German Michael" (1868), and "Narcissus," a drama.

Brachycephalic. See Dolichocephalic.

Brachyp'teræ, or **Brachypteres** [from the Gr. βραχύς, "short," and πτερόν, a "wing"], that section of the web-footed birds in which the wings are so short and the feet so far back as to compel the birds to assume an erect posture when on land. They are aquatic, and excel in diving, so that the name divers is sometimes used as equivalent to Brachypteræ; but that name is also frequently applied to other birds, especially to the genus *Colymbus*. The auks, puffins, penguins, grebes, and guillemots are among the Brachypteræ.

Brachyu'ra [from the Gr. βραχύς, "short," and οὐρά, a "tail"], a tribe of decapodous crustaceans which takes its name from the post-abdominal segment, which is short and folded beneath the trunk. (See Crab.)

Brack'en, a county of Kentucky, separated from Ohio by the Ohio River. Area, 200 square miles. It is drained by the North Fork of Licking River. The surface is hilly. The soil is calcareous and productive. Tobacco, grain, and wool are the chief products. Capital, Brookville. Pop. 11,409.

Brack'enridge (Henry M.), a judge and writer, born at Pittsburg, Pa., May 11, 1786. He held judgeships in Louisiana and Florida, and was U. S. commissioner to the South American republics (1817–19). Among his numerous writings are a "Voyage to South America" (1820) and "Recollections of Persons and Places in the West" (second edition, 1869). He was elected to Congress from Pennsylvania in 1840. Died Jan. 18, 1871.

Brackenridge (Hugh Henry), the father of the preceding, was born in Scotland in 1748. He emigrated to the U. S. in childhood, graduated at Princeton in 1771, and became a judge of the supreme court of Pennsylvania in 1799. He wrote a satirical work called "Modern Chivalry, or Adventures of Captain Farrago" (1792). Died June 25, 1816.

Brack'et, an ornamental projection in the shape of a console standing isolated on the face of a wall, and used to support a statue, bust, or other work of art. Brackets may be either of wood or stone, and they are sometimes elaborately carved. The term bracket is applied to a piece of wood or metal employed to support a shelf or gallery. Also one of two marks [ ] used in printing to enclose a word, remark, explanation, etc. When a word in a classical work is included in brackets it implies that the word so enclosed does not properly belong to the original text, but has been either introduced by a mistake of the copyist, or has been inserted to supply an omission, correction, or explanation.

Brack'ett (Albert Gallatin), an American officer, born in Cherry Valley, N. Y., Feb. 14, 1829. He served during the Mexican war as first lieutenant Fourth Indiana Volunteers, appointed captain Second U. S. Cavalry Mar., 1855, engaged principally on frontier duty and against hostile Indians in Texas prior to 1861, when, on Twiggs's surrender, he effected his escape, and was in command of cavalry at Blackburn's Ford, Va., July 18, 1861, commissioned colonel Ninth Illinois Volunteer Cavalry Aug., 1861, and served during the civil war in the Western and Southwestern armies. He was promoted to be major First Cavalry U. S. A. July 17, 1862, and lieutenant-colonel Second Cavalry June 9, 1868. Since the close of the war he has been in command of various departments, and actively engaged in operating against hostile Indians. He is author of "Lane's Brigade in Mexico" and "History of the U. S. Cavalry." G. C. Simmons, *Clerk Board of Eng'rs.*

Brackett (Edwin E.), an American sculptor, born at Vassalborough, Me., Oct. 1, 1819. His works are principally portrait-busts.

Brackett (Walter M.), a brother of the preceding, born at Unity, Me., June 14, 1823. He has won a high reputation as a painter. His specialty is the painting of fish.

Brack'lesham Beds, a group of fossiliferous strata,

in the middle eocene formation, overlying the London clay series, in England. On the coast of Hampshire they are 500 feet thick.

Bract [from the Lat. *bractea*, a "thin plate"], a floral leaf or an altered leaf, placed at the base of a flower on the outside of the calyx. It is a leaf from the axil of which a flower or floral axis is produced, instead of an ordinary leaf-bud or branch, and is regarded as the first attempt made by the leaves to change into floral organs. The bract is sometimes large and brightly colored. In several species of *Arum* it constitutes the large enveloping-leaf called a spathe. An involucre is a collection of bracts arranged in a whorl.

Brac'ton, de (Henry), a distinguished English jurist and writer on law, lived during the reign of Henry III. His principal work, entitled "De Consuetudinibus et Legibus Angliæ," is a complete treatise on jurisprudence and legislation. He was an arch-deacon (1263–64), and a judge in eyre in 1265. Died probably in 1267.

Brad'burn (Samuel), the son of a soldier, was born at Gibraltar Oct. 5, 1751. He became a local Wesleyan preacher at Chester, England, in 1773, and an itinerant in 1784. He was very eloquent, and was throughout his life extremely popular and influential. Died July 24, 1816.

Brad'bury (William B.), composer of sacred music, born at York, Me., in 1816, and residing from 1836 till his death (Jan. 7, 1868) in or near New York. He published (sometimes in conjunction with other authors) numerous books for the use of choirs and Sunday-schools, the most celebrated of which are "The Shawm," "The Jubilee," "The Temple Choir," "The Cantata of Esther," "The Golden Chain," and "Fresh Laurels." The sale of the last two books (designed for Sunday-schools) was immense.

Bradbury Isle, a township of Hancock co., Me. Pop. 6.

Brad'dock, a borough of Alleghany co., Pa. Pop. 1290.

Braddock (Edward), an English general, born about 1715. He commanded in a war against the French and Indians in North America. As he was marching to attack Fort Duquesne he was surprised by the Indians near Pittsburg, and was defeated and mortally wounded. Died July 13, 1755.

Brad'don (Mary Elizabeth), a popular English novelist, born in London in 1837. Among her works are "Lady Audley's Secret" (1862), "Aurora Floyd," "Eleanor's Victory," "Henry Dunbar," and "Rupert Godwin."

Brad'ford, an important manufacturing town of England, in the West Riding of Yorkshire, is on a small branch of the Aire and on the Leeds Railway, 9 miles by rail W. of Leeds. It is situated at the meeting of three vales, and is built of stone. It returns two members to Parliament. Among the principal buildings are a handsome exchange, an elegant public hall, the parish church, erected in the reign of Henry VI., and a cloth-hall. The Saltaire alpaca and mohair mills, which are three miles from Bradford, are said to be the most splendid manufactories in England. Bradford is the chief seat in England of the manufacture of worsted fabrics, alpaca, mohair, etc. Broadcloths and cotton goods are also made here. Mines of coal and iron are worked in this vicinity. The value of the goods exported from this town to the U. S. in 1868 amounted to about $12,000,000. Baptist, Independent, and Wesleyan colleges are near this city. Pop. in 1871, 145,827.

Bradford, a county in the N. E. of Florida. Area, 940 square miles. The surface is but little elevated above the sea. It is intersected by the Florida R. R. Grain and live-stock, with some rice and cotton, are raised. Capital, Lake Butler. Pop. 3671.

Bradford, a county of Pennsylvania, bordering on New York. Area, 1170 square miles. It is intersected by the North Branch of the Susquehanna River, and also drained by the Tioga River and several creeks. The surface is hilly, and extensively covered with forests of pine, sugar-maple, and other trees. Sandstone underlies the greater part of the county, which also contains beds of bituminous coal, which, with lumber, is among the chief articles of export. Cattle, grain, hay, and dairy products are largely raised. It is intersected by the Williamsport and Elmira R. R., and by another railroad, connecting Wilkesbarre with Waverley. Capital, Towanda. Pop. 53,204.

Bradford, a post-village of Simcoe co., Ontario (Canada), on the Northern Railway, 41 miles N. of Toronto. It has a weekly paper. Pop. in 1871, 1130.

Bradford, a township of Lee co., Ill. Pop. 1086.

Bradford, a post-village and township of Chickasaw co., Ia., about 30 miles N. of Cedar Falls. Pop. 2076.

Bradford, a post-village of Stark co., Ill. Pop. 280.

Bradford, a post-township of Penobscot co., Me. Pop. 1487.

Bradford, a post-village and township of Essex co., Mass. The village is on the S. bank of the Merrimack River, and on the Boston and Maine R. R., 32 miles N. of Boston, at the junction of the Newburyport R. R. A bridge across the river connects it with Haverhill. It is the seat of Bradford Female Academy, and has manufactures of shoes, etc. Pop. 2014.

Bradford, a post-township of Merrimack co., N. H. It has manufactures of lumber and leather. Pop. 1081.

Bradford, a post-township of Steuben co., N. Y. Pop. 1080.

Bradford, a post-village of Newberry township, Miami co., O. Pop. 166.

Bradford, a village of Adams township, Darke co., O. Pop. 243.

Bradford, a township of Clearfield co., Pa. Pop. 1172.

Bradford, a post-township of McKean co., Pa. Pop. 1446.

Bradford, a post-village in Bradford township, Orange co., Vt., on the Connecticut River and on the Connecticut and Passumpsic Rivers R. R., 29 miles S. E. of Montpelier. It has an academy, a savings bank, and manufactures of paper, casks, sash and blinds, machinery, woollen goods, etc. It has two weekly newspapers. Total pop. 1492.

Bradford, a township of Rock co., Wis. Pop. 1006.

Bradford (Rev. Alden), LL.D., was born in Duxbury, Mass., Nov. 19, 1765, and graduated at Harvard in 1786, and was a tutor there 1791–93; was successively a Congregational minister in Wiscasset (now in Maine), a clerk of the Massachusetts supreme court, a bookseller, secretary of state for Massachusetts (1812–24), and a journalist. He published numerous historical, biographical, and antiquarian books and papers. Died Oct. 26, 1843.

Bradford (Alexander Warfield), LL.D., born in Albany, N. Y., in 1815, graduated at Union College, became a prominent lawyer of New York, being especially well versed in the civil law. He was surrogate of New York 1848–51, and for a time was one of the editors of the "Protestant Churchman." He published several volumes, mostly of legal reports. Died Nov. 5, 1867.

Bradford, Earls of, and Viscounts Newport (1815, in the United Kingdom), Barons Bradford (1794, in Great Britain), and baronets (1660), a prominent family of Great Britain.—Orlando George Charles Bridgeman, the third earl, was born April 24, 1819, and succeeded his father in 1865. He was member of Parliament for South Shropshire 1842–65.

Bradford (John), an English Protestant martyr and a popular preacher, was born at Manchester about 1500. He became a chaplain to Edward VI., and after the accession of Mary was burned at the stake July 1, 1555. (See William Stevens, "Life of John Bradford," 1832.)

Bradford (Joseph M.), U. S. N., born Nov. 4, 1824, in Sumner co., Tenn., entered the navy as a midshipman Jan. 10, 1840, became a passed midshipman in 1846, a lieutenant in 1855, a lieutenant-commander in 1862, a commander in 1866, and a captain in 1871. From Nov., 1863, to June, 1865, he served as fleet-captain of the South Atlantic blockading squadron, during which period he was frequently in battle. Rear-Admiral Dahlgren, in his "general order" of June 16, 1865, speaking of the services of the officers of his staff, says: "First is Fleet-Captain Joseph M. Bradford. Perhaps no one but a commander-in-chief can rightly understand the many and never-ceasing cares imposed by the proper discharge of the duties of this office, especially in war and in a command so large as this has been, to say nothing of the abnegation of all opportunity of personal distinction which such a position demands. I shall never think but with great pleasure and satisfaction of the excellent service which this gentleman has rendered, and the never-failing energy and ability with which he has discharged his many onerous duties." Died at Norfolk, Va., April 14, 1872. Foxhall A. Parker, U. S. N.

Bradford (William), one of the Pilgrim Fathers, was born in Yorkshire, England, in Mar., 1588. He emigrated to New England in the Mayflower in 1620, and was elected governor of Plymouth Colony in 1621. Having been re-elected annually, he held the office till his death except five years, when he declined the election. A patent or charter for the colony was granted in 1630 to William Bradford, his heirs and associates. Died May 9, 1657. He left a "History of Plymouth Colony," which was printed in 1856.

Bradford (William), an American lawyer, born in Philadelphia Sept. 14, 1755, graduated at Princeton in 1772, served as an officer in the war of the Revolution. He was appointed attorney-general of the U. S. by Washington in 1794. Died Aug. 23, 1795.

Bradford (William), a distinguished American painter, born in 1827 at New Bedford, Mass. His best pictures are scenes from the Northern Atlantic coast. He was formerly a merchant of Fairhaven, Mass. He is of Quaker stock, and is now (1874) a resident of New York City.

Bradford (William H.), a Presbyterian minister and journalist, was born in Aug., 1814, at Cooperstown, N. Y., studied law, and afterwards theology. After serving two years as pastor of a church at Berkshire, N. Y., he became assistant editor of the "New York Evangelist," acting a part of the time as its sole editor. Here he remained seventeen years. He was an accomplished writer and scholar. Died April 1, 1861.

Bradford Clay, the middle member of the upper division of the lower oolite, occurring at Bradford, near Bath, England. It extends only a few miles, and is never more than fifty or sixty feet thick. It is remarkable for the abundance of a peculiar fossil, the *Apiocrinites Parkinsonii*. The surface of the calcareous rock on which the clay rests is encrusted with a pavement formed by the bases of this crinoid.

Bradford, Great, a market-town of England, in the county of Wilts, on the river Avon, and on the Kennet and Avon Canal, 10 miles by rail E. S. E. of Bath. It has a fine old church, and manufactures of broadcloth, kerseymeres, and india-rubber goods. Pop. in 1871, 8032.

Bradford Springs, a post-township of Sumter co., S. C. Pop. 1142.

Brad'ish (Luther), LL.D., was born in Cummington, Mass., Sept. 15, 1783, and graduated at Williams in 1804. He studied law, and was employed as a government agent in affairs relating to Levantine commerce. He settled in Franklin co., N. Y., became prominent in State politics, was lieutenant-governor (1829–43), and under Fillmore was assistant U. S. treasurer at New York. He was prominent in religious, educational, and other charitable and benevolent enterprises. Died Aug. 30, 1863.

Brad'laugh (Charles), an eminent English atheist and republican, was born in Hoxton, London, Sept. 26, 1833. Owing to the extreme poverty of his parents, he ceased attending school before he was eleven years old. He developed an early taste for politics, for at the age of fifteen he appeared as an orator before street audiences during the political turmoils of 1847–48. The origin of his atheistical opinions dates from the same period. Studying to fit himself for a Sunday-school exhibition before the bishop of London, he became skeptical, and declared his inability to reconcile the Thirty-nine Articles with the Four Gospels. His father, influenced by the clergy, gave him three days in which to alter his opinions, on penalty of losing his situation. He accepted the penalty, and quitted the situation and his home for ever. For a year he earned an inadequate support by selling coals on commission, and then, becoming slightly involved in debt, he enlisted in the service of the East India Company, where he remained until a small legacy enabled him to purchase his discharge. He now secured a clerkship in a solicitor's office in London, and entered at once upon his life-career of a political and atheistical writer and speaker. In 1858–59 he gained considerable notoriety by editing a journal called the "Investigator," which was soon suspended for want of capital. He was now well known under the appropriate name of "Iconoclast," which he signed to all of his writings, and was met with the fiercest opposition on all sides. A year later the journal which he now edits, the "National Reformer," was established, and in the conduct of this his reputation for ability was greatly increased. By persistently attacking every opponent he could reach with his voice or pen, his fame as a debater and popular orator steadily grew until he reached the high position of political power which he now occupies. Systematic attempts were made to suppress his journal, but their only effect was to increase its circulation. His sympathies for the oppressed were not confined to his own country. When Italy was fighting for freedom he raised by his own exertions one hundred guineas and sent them to Garibaldi. He visited Ireland, conferred with the advocates of "home rule," and raised his voice in their justification. In 1868 he was a candidate for Parliament in Northampton, and after a canvass of extraordinary excitement with five opponents he succeeded in polling 1086 votes in a constituency of over 9300. In the following year an attempt was made by the Gladstone ministry to suppress his journal because he refused to have it licensed. He argued his own case, and won a brilliant victory. Since then he has pursued his course unmolested. The "Reformer" claims a circulation of 7000. Like himself, in politics it is republican, in religion atheistic, in social economy Malthusian, after the standard of the late John Stuart Mill. Mr. Bradlaugh's republicanism is simply an advanced type of that to which thousands of his countrymen are irresistibly advancing. It assumes that the "right to deal with the throne is inalienably vested in the English people, to be exercised by them through their representatives in Parliament;" argues that the House of Brunswick occupies it only from the acts of Settlement and Union, and seeks the repeal of those acts after the abdication or demise of the present monarch. It aspires to a commonwealth after the American model, to be attained as peaceably as possible. Mr. Bradlaugh's personal popularity is very great. Sir Charles Dilke said of him in 1873 that he had the largest personal following of any man in England. In the autumn of 1873, Mr. Bradlaugh visited the U. S., and delivered lectures in most of the prominent cities. His reception in all cases was hearty and cordial—notably so in New York and Boston. At his lecture in the latter city Wendell Phillips presided, and introduced him to an immense audience, and Charles Sumner and William Lloyd Garrison sat upon the platform. His subjects were "Republicanism in England," "The Irish Question," and "English Workingmen." While lacking the polish of the perfect orator, Mr. Bradlaugh's manner has much of that personal magnetism which enables a man to be a leader of his fellows. The want of modulation in his strong, vibrating voice, and the absence of grace in his tall, powerful figure, are fully compensated for in the compact and skilful arrangement of his thoughts, and the unmistakable earnestness and sincerity of his manner.

J. B. Bishop, *of the "N. Y. Tribune."*

Brad'lee (Caleb Davis), a Unitarian minister and author, born at Boston, Mass., Feb. 24, 1831, graduated at Harvard in 1852, was pastor of the Allen street church, Cambridge, Mass., 1854–57, and since 1864 has been pastor of the church of the Good Samaritan in Boston. He has published occasional sermons and many contributions to periodical literature, and is a member of various literary and historical associations.

Brad'ley, a county in the S. S. E. of Arkansas. Area, 958 square miles. It is traversed by the Saline River, and bounded on the W. by Moro River. The soil is adapted to cotton and maize. Tobacco and wool are also raised. Timber, marl, gypsum, and lignite abound. The county is traversed by the Mississippi Ouachita and Red River R. R. Capital, Warren. Pop. 8646.

Bradley, a county of East Tennessee, bordering on Georgia. Area, 400 square miles. It is bounded on the N. E. by the Hiawassee River. The surface is partly mountainous; the soil is mostly fertile, and well supplied with timber. It is a part of the beautiful valley of East Tennessee. Grain, tobacco, and wool are raised. It is intersected by the East Tennessee Virginia and Georgia R. R. Capital, Cleveland. Pop. 11,652.

Bradley, a post-village of Jackson co., Ill., in a township of the same name, 15 miles from Murfreesboro'. Pop. 1297.

Bradley, a township of Penobscot co., Me. It has manufactures of lumber and shingles. Pop. 866.

Bradley (Edward), better known as "Cuthbert Bede," an English novelist and humorist, born in 1827, was educated at Durham University, entered the Anglican ministry, and received a number of church preferments. He is the author of many volumes of prose and verse, chiefly novels, of which his first venture, "Verdant Green," is the best known. He has contributed largely to periodical literature.

Bradley (James), D.D., F. R. S., an eminent English astronomer, born at Sherborne, in Gloucestershire, in 1692, excelled as an observer and as a theorist. He graduated at Oxford, was ordained as a priest, and obtained several livings, but resigned them when he became Savilian professor of astronomy at Oxford in 1721. In 1727 he announced the important discovery of the aberration of light, which serves to demonstrate the earth's motion around the sun. In 1741 he was appointed astronomer-royal, and began to make observations at Greenwich. His next discovery was that the inclination of the earth's axis to the ecliptic is not constant, a fact which explained the precession of the equinoxes and the nutation of the earth's axis. This discovery forms an important epoch in astronomy. He died July 13, 1762, leaving in manuscript thirteen volumes of observations, which were published in 1798–1805. (See "Biographia Britannica.")

Bradley (Joseph P.), LL.D., associate justice of the U. S. Supreme Court, was born at Berne, Albany co., N. Y., Mar. 14, 1813, graduated at Rutgers College, New Brunswick, N. J., with honors, in 1836, was admitted to the bar in 1839 at Newark, N. J., where he has since resided. He married in 1844 a daughter of Chief-Justice Hornblower. Besides his labors in every branch of his profession, he has devoted much attention to mathematics and the study of

law as a science, extending his researches to the civil law —researches which have been of great service in his judicial duties in Louisiana and Texas. Engaged in many important causes in the State and U. S. courts, he has never taken a very active part in politics. He was formerly a Whig, warmly sustained the national cause in the civil war, headed the electoral ticket for Grant in 1868, and has ranked as a moderate Republican. He was appointed to the bench of the U. S. Supreme Court Mar. 21, 1870. He received the degree of LL.D. from Lafayette College in 1859.

Bradley (Joshua), a Baptist minister and educator, was born July 5, 1773, at Randolph, Mass., and graduated at Brown University in 1799. He was ordained at Newport, R. I., in 1801. Mr. Bradley became a kind of traveling missionary, chiefly in the Western States, residing for short times at many places, and establishing great numbers of churches, schools, and colleges. He died at St. Paul, Minn., in 1855.

Bradley (Stephen Row), LL.D., born at Wallingford, Conn., Oct. 20, 1754, graduated at Yale in 1775, and served as an officer of the Revolutionary war for some time. In 1779 he removed to Vermont, where he was an able and active public officer, representing that State in the U. S. Senate (1791–95, 1801–13). He possessed marked ability, but was eccentric in his manners. He was a friend of Ethan Allen. Died at Walpole, N. H., Dec. 16, 1830.

Bradley (William Czar), LL.D., a son of S. R. Bradley (an able lawyer of Vermont), was born at Westminster, Vt., Mar. 23, 1782, and graduated at Yale. He was elected to Congress in 1813, 1817, 1823, and 1825, and held several other important offices. Died Mar. 3, 1867.

Brad'shaw, a township of Greene co., Ark. Pop. 535.

Bradshaw (John), the most prominent of the famous English regicides. He was born in Cheshire, probably in 1602, became in 1627 a barrister, chief-justice of Chester in 1647, a commissioner of the great seal in 1646, sergeant-at-law in 1648, and was in 1649 president of the High Court which condemned Charles I. He conducted that cause with unfeeling sternness and severity, but with dignity, and probably with a conscientious desire to do justice to the king and the country. He afterwards opposed Cromwell's ambitious designs, and was removed from his chief-justiceship, but still later held various important positions. He died in 1659. At the Restoration his body was exhumed from Westminster Abbey, gibbeted, and then beheaded.

Brad'street (Anne), wife of Gov. Simon Bradstreet, and daughter of Gov. Thomas Dudley, was born in England in 1612. She published a volume of poems, which won her the titles of "the tenth muse" and "the morning star of American poetry." These poems and her other writings have been several times reprinted (the last and best edition in 1867), and some of them are not without merit. Died Sept. 16, 1672.

Bradstreet (Simon), colonial governor of Massachusetts, was born at Horbling, Lincolnshire, England, in 1603. He studied at Cambridge, and was for a time the steward of the countess of Warwick. He came to Salem, Mass., in 1630, as an assistant judge, was one of the founders of Cambridge and Andover, and resided also at Ipswich and Boston. Besides holding other important positions, he was governor (1679–86 and 1689–92). Died Mar. 27, 1697.

Brad'wardine (Thomas), a distinguished English prelate and scholastic theologian, called the Profound Doctor, was born in 1290. He became confessor to Edward III., and afterwards archbishop of Canterbury. His principal work, "De causa Dei adversus Pelagium," is a masterly argument for the doctrine of Augustine. He was an able mathematician of Oxford University. Died Aug. 26, 1349, of the plague.

Bra'dy, a post-village of Kalamazoo co., Mich., on the Peninsular Railway where it is crossed by the Grand Rapids and Indiana R. R., 68 miles S. W. of Lansing. Pop. of Brady township, 1382.

Brady, a township of Saginaw co., Mich. Pop. 471.

Brady, a township of Williams co., O. Pop. 1681.

Brady, a township of Butler co., Pa. Pop. 600.

Brady, a township of Clarion co., Pa. Pop. 263.

Brady, a township of Clearfield co., Pa. Pop. 2009.

Brady, a township of Huntingdon co., Pa. Pop. 904.

Brady, a township of Lycoming co., Pa. Pop. 394.

Brady (Hugh), an American general, born in Northumberland co., Pa., in 1768. He served under Wayne in 1792, and won distinction by his bravery at the battle of Chippewa, 1812. He was a relative of Capt. Samuel Brady, a famous Indian fighter. Died April 15, 1851.

Brady (James Topham), an American lawyer and politician, born in New York City April 9, 1815, was a prominent leader of the "War Democrats" during the civil war. He held a very high position as a lawyer, and was greatly beloved in private life. His literary tastes were fine and well cultivated. Died Feb. 9, 1869.

Brady (Nicholas), D. D., born at Bandon, Ireland, Oct. 28, 1659, was educated at Oxford and Dublin, sided with King William against James II., and in consequence was made chaplain to the king. He received several English church preferments, but is best known for his share in the metrical version of the Psalms, which he made in conjunction with Nahum Tate (1652–1715), the poet-laureate. Tate and Brady's Psalms, though justly ridiculed for their clumsiness, quaintness, and bombast, have some noble passages. Brady also published a "Translation of the Æneid" (4 vols., 8vo, 1726). He died May 20, 1726.

Brady (William Maziere), D. D., was born in Dublin, Ireland, in 1825, of a prominent family, and graduated at Trinity College with honor. Entering the Irish State Church, he received lucrative appointments, which he hazarded, and in part lost, by his many bold and able attacks upon the Church establishment to which he himself belonged. He was one of the foremost leaders of the movement which resulted in the disestablishment of the Irish Church. He is the author of several works, chiefly upon the ecclesiastical history and antiquities of Ireland and Great Britain.

Brady's Bend, a post-village of Armstrong co., Pa., on the Alleghany River and the Alleghany Valley R. R., 68 miles N. N. E. of Pittsburg. Pop. of township, 3619.

Bra'ga (anc. *Bracara Augusta*), a town of Portugal, capital of the province of Minho, is on an eminence near the river Cavado, 39 miles N. N. E. of Oporto. It is the seat of an archbishop. It has a fine Gothic cathedral and a college. Braga is enclosed by old walls and defended by a castle. Here are manufactures of linen, cutlery, firearms, jewelry, etc. It is a very ancient town, and has ruins of a Roman temple and amphitheatre. It was the capital of Lusitania after the latter had been conquered by the Suevi. Its archbishop is titular primate of Portugal. Church councils were held at Braga in 563, 572, and 672 A. D. Pop. in 1863, 19,514.

Bragan'za, a fortified town of Portugal, province of Tras-os-Montes, situated on a small stream 35 miles N. W. of Mirandi. It has a citadel, a college, and a castle partly ruined, which was the seat of the dukes of Braganza. It is the seat of a Catholic bishop. The name of the reigning family of Portugal and Brazil, the House of Braganza, is derived from this town. It has manufactures of velvet and other silk fabrics. Pop. 5111.

Braganza, or **Caite',** a seaport-town of Brazil, province of Pará, on the river Caite, near its mouth, 106 miles E. N. E. of Pará. It has a trade in sugar.

Bragan'za, or **Bragança,** the name of the royal family of Portugal and the imperial family of Brazil, which is descended from Affonso, duke of Braganza, a natural son of John I., king of Portugal. He died in 1461. The first member of this family that became king of Portugal was the eighth duke, who began to reign as John IV. in 1640. The first emperor of Brazil was Dom Pedro I., the eldest son of King John VI.

Brag'don (C. P.), a distinguished Methodist Episcopal preacher, was born at Acton, Me., Sept. 9, 1808, entered the ministry in 1834, and labored with great zeal and success in Maine, New York State, and Illinois. He was distinguished for the power and effectiveness of his preaching. Died at Evanston, Ill., Jan. 8, 1861.

Bragdon (Edmund Erastus Eastman), D. D., an eminent Methodist Episcopal divine and educator, was born at Acton, Me., Dec. 8, 1812, and graduated at the Wesleyan University, Middletown, Conn., in 1841. With the exception of three years in the pastorate, one year of which was in New York City, his life was devoted to the cause of education. He held professorships of ancient languages in the Ohio University, Athens, O., in the Indiana Asbury University at Greencastle, and in Genesee College, Lima, N. Y. He was a faithful and successful instructor, and a man of devout life. Died Mar. 20, 1862.

Bragg (Braxton), an American officer, born in 1817 in Warren co., N. C., graduated at West Point in 1837, and became captain June 18, 1846, in the Third Artillery. Served at seaboard posts 1837–45, in Florida war 1837–38 and 1838–42, in removing Cherokees to the West 1838, in military occupation of Texas 1845–46, in war with Mexico 1846–48, engaged at Fort Brown (brevet captain), Monterey (brevet major), and Buena Vista (brevet lieutenant-colonel), and on frontier duty 1849–55. On his resignation, Jan. 3, 1856, he became sugar-planter at Thibodeaux, La., 1856–61, and commissioner of public works for Louisiana

1859–61. In the civil war he was in command of the forces of the Southern army at Pensacola operating against Fort Pickens 1861, of Second Corps at Shiloh 1862, being promoted to general on the death of Gen. A. S. Johnston; movement against Buell to Kentucky 1862, from which he was compelled to retire after defeat at Perrysville; after a brief arrest opposed Rosecrans at Chickamauga 1863, relieved from command Dec. 2, 1863, for loss of Mission Ridge, and led a small force from North Carolina to Georgia in 1864. Became chief engineer of Alabama of improvements in Mobile harbor. Died Sept. 27, 1876.

GEORGE W. CULLUM, *U. S. Army.*

Bragg (JOHN) was a brother of Braxton and Thomas Bragg. In 1836 he settled in Mobile, Ala. In 1842 he was appointed judge of the tenth circuit, and in 1851 he was elected to Congress. He served but one term, then retiring from public employments to take care of his large planting interests.

Bragg (THOMAS), a brother of Braxton Bragg, born at Warrenton, N. C., Nov. 9, 1810, was admitted to the bar in 1831, was governor of North Carolina 1854–58, U. S. Senator 1859–61, and attorney-general in Jefferson Davis's cabinet 1861–63. Died Jan. 21, 1872.

Braggado'cio, a township of Pemiscot co., Mo. P. 90.

Bragg's Store, a post-twp. of Lowndes co., Ala. P. 1035.

Bra'gi, written also **Braga** and **Brage** [derivation very uncertain], in Scandinavian mythology, a son of Odin, was the god of eloquence and poetry. He is represented as an old man with a long beard. His wife Iduna keeps the apples of immortality, which bestow immortal youth on those that partake of them. This myth probably has allusion to the power of poetry to confer immortality.

Bra'he (TYCHO), the celebrated Danish astronomer, was born in 1546 at Knudstrup, in Skaane, which at that time was a province of Denmark. The king, Frederic II., gave him the island of Huena, where he built the finest observatory (Uranienborg) which ever had been erected in Europe. He enriched the science of astronomy very much, partly by his very numerous observations, partly by inventing new instruments. He formed a catalogue of 777 stars, increased by his pupil, Kepler, to 1000 from the records which he left behind, and his recorded observations of the planet Mars furnished to the same distinguished successor the material from which he deduced his famous "Laws." He entered the University of Copenhagen in 1559, and was destined for the law, but his attention was diverted to astronomy by the eclipse of the sun in Aug., 1560. In 1562 he was sent to Leipsic to pursue his studies. An uncle who died in 1565 left him an estate. Having passed several years in Augsburg, he returned to his native country in 1570. He rejected the Copernican system, which in his time was not supported by the conclusive evidence we now have in its favor. In fact, Tycho's theory, which made the sun move round the earth, and all the other planets round the sun, explained all the phenomena then known equally well with that of Copernicus. After the death of his royal patron in 1588, he was first neglected, and then so persecuted by the court that he emigrated to Germany in 1597, and was induced by the emperor Rudolph to settle at Prague, where he died Oct. 13, 1601. He published, besides other works, "Astronomiæ Instauratæ Progymnasmata" (1587–89). "As a practical astronomer," says Sir David Brewster, "Tycho has not been surpassed by any observer of ancient or modern times. The splendor and number of his instruments, the ingenuity which he exhibited in inventing new ones, and his skill and assiduity as an observer, have given a character to his labors and a value to his observations which will be appreciated to the latest posterity."

Brahilof', or **Brailoff'** [Turk. *Ibraïla*], a fortified town of Wallachia, on the left bank of the Danube, about 100 miles from its mouth and 102 miles N. E. of Bucharest. Large quantities of grain and other produce are shipped at this place, which is the chief port of Wallachia. Pop. 15,767.

Brăhm, written also **Brahme** (but pronounced in one syllable), in the Hindoo mythology, the name of the eternal, self-existent Spirit, whom Manu describes as follows: "He whom the mind alone can perceive, whose essence eludes the external organs, who has no visible parts, who exists from eternity—even He, the soul of all beings, whom no being can comprehend." His image is the external universe. His attributes or powers took a personal form in BRAHMA, VISHNU, and SIVA (which see). "Of that infinite, incomprehensible, self-existent Spirit no representation is made, to his direct and immediate honor no temples rise; nor dare a Hindoo address to him the effusions of his soul, otherwise than by the mediation of a personified attribute, or through the intervention of a priest." (MOOR'S "Hindu Pantheon.") The Hindoos make no images of Brahm, but the devout Brahmans meditate with silent and unspeakable awe on his mysterious attributes.

Brăh'mâ, a Sanscrit term which literally signifies "worship" or "prayer," but now used as the name of one of the great Hindoo deities, called the "Creator," but who is in fact the personification of the creative power of BRAHM (which see). Brahma, though regarded as the first of the gods, is much less worshipped by the Hindoos than either Vishnu or Siva. The votaries of the last-named gods are stimulated by hope and fear. (See VISHNU and SIVA.) But the votaries of Brahma may be said to be actuated only by the feeble principle of gratitude. Accordingly, there are no temples and no rites exclusively dedicated to Brahma, though his images are occasionally found in the temples of the other gods. The all-producing earth being the most remarkable of the external types of creation, earth is taken as the symbol of Brahma, as water is the symbol of Vishnu, and fire that of Siva. The pictures of Brahma are commonly of a reddish hue, this being the usual color of the earth. Viewed in another relation, Brahma represents matter, while Vishnu represents spirit, and Siva time. (See MOOR, "Hindu Pantheon.")

Brah'manism, the name given to the religious system founded by the Brahmans of India. Scarcely any trace of Brahmanism is discoverable in the Vêdas, the oldest writings of the Hindoos. We first find it developed in a work of somewhat uncertain date entitled the "Institutes of Manu" (or Menu), which was probably composed between 600 and 900 years before the Christian era. The deities of the Vêdas are such as would naturally have been suggested by the phenomena or objects of external nature, such, for example, as the heavens, called Varuna (Uranus), Mitra, the Sun, Fire (Agni, Ignis), and so on. The greatest and most powerful of the Vêdic divinities is Indra (perhaps allied to the Latin *imber*), the god of the atmosphere, of clouds, and of storms, and hence the Thunderer, corresponding in this respect to the Jupiter of the classic, and to Thor of the Northern, mythology. But in the Brahmanical system all these deities of nature retire into the background, and are replaced by the great gods (the *Dii majores*), such as Brahma, Vishnu, and Siva, with their consorts (*saktis*), their various avatars, etc.

In the primitive ages the head of each family among the Aryas (see ARYA) appears to have acted as priest, sacrificing to the gods in his own name; but as the people receded from their primitive simplicity, they employed professional priests, who were believed to understand the wishes of the gods, and to know how their favor could best be propitiated. Having thus become a necessary element in the community, the priestly class soon established themselves as the dominant power in the state; and in order to secure the position which they had thus acquired, they founded the distinctions of CASTE (which see).

The doctrine of "emanation," as it is called—with its associated doctrine of transmigration—may be said to form the philosophical basis of the Brahmanical system. According to this doctrine, BRAHM (which see) is the centre and source of all the various beings of the universe, these being nothing more than emanations from him; and as He is the source whence all things have been evolved, so all things will ultimately return to him, and be absorbed into the essence of the Self-existent. This final absorption is regarded by the Hindoo as his salvation. His aversion to activity or excitement makes the notion of complete repose necessary to his ideal of perfect felicity. Hence the final aim of all the efforts of the devout Hindoo is to bring his transmigrations to an end, that his individual existence may cease, and his soul be completely swallowed up in Brahm. The same general doctrine, with some modifications, forms also the basis of Booddhism.

One of the most remarkable features of the Brahmanical system is the great importance which it attaches to the performance of penance and prayer. According to the Christian and Hebrew Scriptures, prayer and sacrifice are of no avail if they are not acceptable to God. But the Brahmans teach that persevering prayer, if made in due form, though prompted by the most unworthy motives, can, especially when it is combined with penance and sacrifice, compel the gods to accede to the wishes of the suppliant. (See MOOR, "Hindu Pantheon;" Prof. H. H. WILSON, "Essays on the Religion of the Hindus;" "Institutes of Menu," translated by Sir W. JONES.) J. THOMAS.

Brahmapoo'tra, written also **Burrampooter** (anc. *Dyardanes* or *Œdanes*), a great river of Asia, rises in Thibet, on the N. side of the Himalaya Mountains. It flows nearly eastward to the E. extremity of Bootan, thence turns southward, and breaks through the Himalayas into Assam. Its general direction is nearly W. S W. until it passes through Assam and enters Bengal. It flows southward through Bengal, and enters the Bay of Bengal close

to the mouth of the Ganges. It is connected with the Ganges not only by a common delta, but by a large branch or channel called the Jena, which leaves the Brahmapootra about lat. 25° N. Its entire course is estimated at 1700 miles. It inundates the level tracts of Bengal from April to September, and is said to discharge into the sea more water than the Ganges. The violence of its current and its tidal bore render navigation difficult.

Brahmapootra Fowl. See POULTRY.

Brah'mo So'maj (*i. e.* "worshipping assembly") is the name of a society of Theists in India. Founded in 1830 by Rammohun Roy, it increased in numbers and activity after 1842, under the leadership of Debendro Nath Tagore, who succeeded in emancipating it from Vedantism. In 1859 a new impulse was given to it by the ability and enthusiasm of Keshub Chunder Sen, who effected the separation of those who were willing to abolish caste in their communion, as the "Brahmo Somaj of India." The more conservative members remained in the Somaj or Church of Calcutta. The whole number of Brahmos is probably not more than 1000. Many of them are young Hindoos educated at the English colleges. The first building for public worship of the progressive Brahmos was opened at Calcutta in 1869. In 1873 there were only 143 Brahmos registered in Calcutta, and only 40 in Bombay.

Keshub Chunder Sen, in his sermons and published tracts, avows a belief in the unity of God, in immediate revelation, in the necessity of a new birth, in the immortality of the soul, and in the efficacy of prayer. His morality is pure, and he inculcates reverence for the character of Jesus Christ, but repudiates the doctrines of his divinity, mediation, and atonement as taught in the New Testament. This "Unitarian Theism" is said to resemble the theological rationalism of Theodore Parker. (See "Six Months in India," by MISS CARPENTER; "Hours of Work and Play," by MISS F. P. COBBE; an article in the "Contemporary Review" on "Indian Theism," etc., 1869; Dr. JARDIN'S paper in "Proceedings of the Allahâbâd Conference," 1872.)

Braid'wood, a post-village of Reed township, Will co., Ill., on the Chicago and Alton R. R., 58 miles from Chicago. It has two weekly newspapers and a national bank.

Brain [Gr. *ἐγκέφαλος*; Lat. *cerebrum*; Fr. *cerveau* or *cervelle*; Ger. *Gehirn*], the *encephalon* or contents of the head; the material instrument of thought, impulse, and perception in man and the higher animals. Only vertebrates have a true brain; in others ganglia or nerve-centres exist; but, in the view of anatomists, the "cephalic ganglia" of insects and other invertebrate animals are not strictly homologous with the brain.

The *amphioxus* is the only brainless vertebrate; it is a small oceanic fish, exceptional in many respects of structure. There is an ascent in the endowment of brain from the fishes, batrachians, reptiles, birds and lower mammals, until the culmination is reached in man. The proportion, by weight, of the encephalon to the whole body is in fishes on the average (according to Leuret) about as 1 to 5668; in reptiles, 1 to 1321; birds, 1 to 212; mammals, 1 to 186; in man, 1 to 36. The elephant has the largest brain, in actual weight, of all animals, sometimes reaching nine or ten pounds; next is that of the whale, about five pounds. The heaviest human brains have never weighed so much as this. Yet the proportion of weight of the brain to the whole body in the elephant is as 1 to 500. In some small animals and birds the proportion is relatively larger; as in the marmoset, 1 to 22; field-mouse, 1 to 31; linnet and canary-bird, 1 to 20; and blue-headed tit, 1 to 12. But it must be remembered that the *kind* of brain varies also; and the sensori-motor portions at the base of the brain are of much greater relative size in the lower animals than in man. There is an obvious connection between the degree of cerebral development in the different groups of animals and their intelligence; and the human brain is greatly superior to any other in its endowment. As Huxley has pointed out, the difference in the *structure* of the brains of men and of the higher apes is not very marked, and the disparity in *size* is less than between the highest and the lowest of the quadrumana. But the gap is evidently a very wide one; as Professor Huxley admits that an average European child of four years old has a brain twice as large as an adult gorilla, whose weight is perhaps four times as great. *Cephalization* is a term applied by Professor Dana to the predominance of the head and its prehensile appendages, by which the higher are distinguished from the lower animals; and of which the erect position and large, evenly-balanced head of man furnish the only perfect exemplification.

The typical *encephalon* of vertebrate animals may be regarded as constituted mainly of the following parts, in varying proportions: olfactory ganglia, cerebral hemispheres, optic lobes, and cerebellum, besides the *medulla oblongata*, which, as its name implies, is the continuation of the spinal axis within the skull. In fishes, those parts which (in a rudimentary manner) represent the cerebral hemispheres are generally no larger than the optic lobes; a condition to which, at a certain stage of development, the brain of the human embryo presents a near though not exact resemblance. In reptiles and batrachia, there is not much advancement, but the cerebral hemispheres are larger and the cerebellum smaller. Birds have a considerable increase in the size of the hemispheres, which, in them, cover the olfactory ganglia in front and the optic lobes behind; the cerebellum in them is large. To each of these the embryonic human brain has, at certain stages, a general resemblance.

Mammals present great diversity, from the smooth-brained (Lissencephala of Owen) Monotremata, Marsupialia, and Rodentia, up through the other groups to the highly-convoluted (Gyrencephala) and otherwise complex brains of the anthropoid apes, as the gorilla and chimpanzee. In mammals only do we find the large transverse commissure (connecting band) called the *corpus callosum*, between the hemispheres; and in the lowest of them, as the duck-billed platypus of Australia, it is wanting. In the higher apes, as well as in man, the cerebral hemispheres roof over and conceal, when looked at from above, the cerebellum behind, as well as the olfactory bulbs in front; but in the lowest Quadrumana (as the lemurs) the cerebellum is uncovered, and the surface of the cerebrum is almost devoid of convolutions.

Of the different lobes into which the cerebral hemispheres are imperfectly divided, the last to appear in the ascent from lower to higher groups of vertebrates, and the last to be developed in the growth of the human embryo, is the posterior lobe. This is among the facts which suggest a different hypothesis concerning the relative functions of the anterior, middle, and posterior lobes from that which is generally entertained.

An adult man's brain weighs, on the average, 48 ounces; a woman's, 44 ounces; yet, as Tiedemann (Philadelphia translation, 1836) observes, since the female body is lighter than the male, there is no inferiority in the *relative* size of the brain.

In capacity, the largest human brain of 900 measured (R. Wagner) was that of a woman, 115 cubic inches; the smallest adult male's, 62 cubic inches. Morton, however ("Crania Americana," p. 132), mentions a skull of the Inca Peruvian race, 60 cubic inches. The Hindoos probably have the smallest skulls of all known races. The following table is from Morton:

RACES.	No. of skulls.	Mean capacity.	Largest.	Smallest.
Caucasian, . .	52	87	109	75
Mongolian, . .	10	83	93	69
Malay, ...	18	81	89	64
American, . .	147	82	100	60
Ethiopian, . .	29	78	94	65

The human brain is enveloped, within the skull, by three membranes—the outer, fibrous, *dura mater*; the middle,

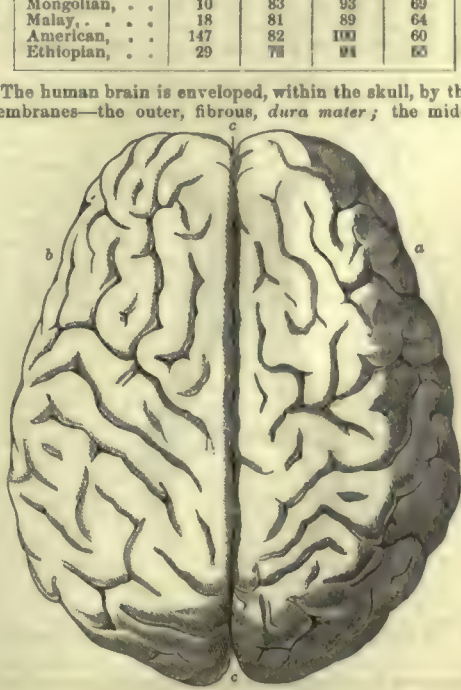


Fig. 1. Brain viewed from above.

serous, *arachnoid*; the inner, *pia mater*, consisting of small blood-vessels, with connective tissue between them. As usually described, the parts of the encephalon are, the *cerebrum*, *cerebellum*, *medulla oblongata*, and *pons varolii*.

The cerebrum is composed of the right (Fig. 1, *a*) and left (*b*) hemispheres, partially separated by the longitudinal fissure (*c c*). The convolutions on the two sides do not correspond (unless in a few principal forms) with each other; nor are they the same in different subjects. The fissure of Sylvius (Fig. 2, *a a*), on each side, separates (partly) the anterior from the middle lobe. On the surface of the hemispheres, gray (cineritious) vesicular nerve-substance predominates, although thin alternating layers of white substance exist in the convolutions. The central mass of the cerebrum is mainly composed of white, fibrous nerve-substance.

Laying the brain over so as to examine its base, the *cerebellum* (Fig. 2, *b b*), *pons varolii* (*c*), and *medulla oblongata* (*d*) are seen posteriorly. The relative positions of these parts

Fig. 2. The base of the Brain.

can be understood by the aid of the figure. In front of these the cranial nerves. They are commonly enumerated in the order of their emergence from the brain, as the 1st (most anterior), olfactory nerve; 2d, optic; 3d, motor oculi, etc.

To inspect the interior of the brain, it should be placed upon its base and sliced away above the *corpus callosum*, (Fig. 3, *a*) which bridges transversely the two hemispheres.

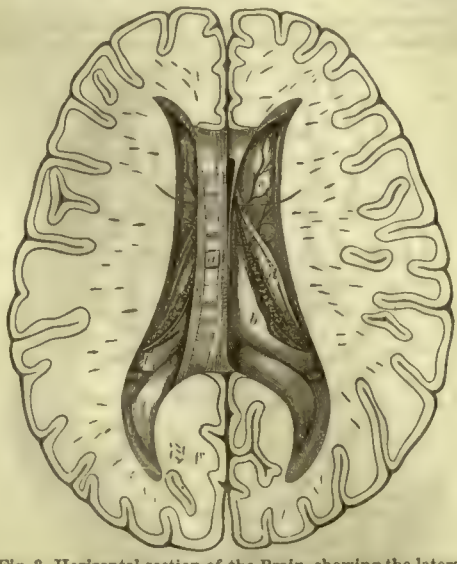

Fig. 3. Horizontal section of the Brain, showing the lateral ventricles.

The lateral ventricles (*b b*) may be thus exposed, and other parts, the technical names of which would cumber the memory of the general reader, especially as the particular uses of all of them have not yet been clearly determined. The figure will suffice to locate some of them.

The most important parts of the floor of the ventricles are the *corpora striata* (*c*) and the *thalami* (*d* and Fig. 4, *a a*). The former (one on each side) are anterior, the latter posterior. Both are rounded masses, partly of gray and partly of white nerve substance.

Connected with the thalami on each side by commissural filaments, and lying between the cerebrum and cerebellum,

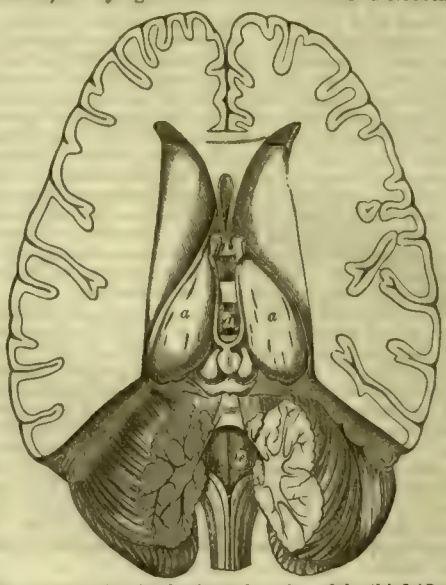

Fig. 4. Brain, showing horizontal section of the third (*d*) and fourth (*e*) ventricles.

are the (four) *tubercula quadrigemina*, which correspond nearly with the optic lobes of birds, reptiles, and fishes. The optic nerves principally terminate in them.

The *cerebellum* (*c*) is much smaller than the *cerebrum*, and lies behind and below it; they are separated by the membranous *tentorium*. The cerebellum consists of a right and a left hemisphere, with a fissure between them, interrupted by commissural connections. The outer portions of these hemispheres are arranged in nearly parallel delicate *lamellæ* or layers of gray nerve-matter. When a vertical section is made, we see an arborescent internal structure of white nerve-substance enclosed in the gray; this is called the *arbor vitæ* by anatomists. The *pons varolii* is principally composed of bands of transverse filaments, connecting the hemispheres of the cerebellum. The *crura cerebri* are bundles of white substance diverging from the pons varolii into the hemispheres of the cerebrum, widening as they pass forward.

The *medulla oblongata* (*f*) is a pyramidal mass of nerve-substance, continuous with the spinal marrow, as well as connected with the cerebrum and cerebellum. It is divisible on each side into four portions. The anterior of these, *corpora pyramidalia*, are composed of bundles of white nerve-fibres, which *decussate*—*i. e.*, cross each other, a little below the *pons*. They are connected with the antero-lateral columns of the spinal cord, and their crossing explains some facts in connection with one-sided motor palsy. The *posterior pyramids* are continuous with the posterior tracts of the spinal cord. The other portions of the *medulla oblongata* are called *corpora olivaria* and *corpora restiformia*. (For a more detailed description, the reader is referred to works on special anatomy.)

The *functions* of the brain, except as regards the general fact of its serving as the instrument of mental action, including perception, thought, emotion, and will, constitute a difficult subject of study, whose investigation has not yet been completed. We can give here only those views upon which physiologists are most nearly agreed. (For the consideration of some others, see PHRENOLOGY.)

The *medulla oblongata*, besides fibres of a commissural nature, is believed by most inquirers (Brown-Séquard excepted) to contain the ganglionic centre, under the control of which, through reflex action, are performed the movements connected with breathing and swallowing. A serious injury to it is always fatal, by interruption of respiration.

The *cerebellum* (believed by Gall to be the seat of the organ of amativeness or sexual propensity) has, since the inquiries and experiments of Flourens, been generally thought to have the office of harmonizing or co-ordinating

voluntary movements. Animals which climb, as the ape and the bear, have a larger cerebellum than those of simple locomotion, as the dog and the hog. Among birds, those of rapid and varied flight, as the swallow and many birds of prey, have it larger than the heavily-flying pheasant family, of which the barn-fowl is an example. Possibly the cerebellum may be the seat of the "muscular sense" of some physiologists. It is an unexplained fact that it has often been found considerably altered in persons who have died insane. Some recent investigations of Doctor S. Weir Mitchell of Philadelphia appear to throw doubt in the way of the acceptance of the *co-ordinative* theory concerning the cerebellum. He found that in animals which survived the entire removal of the cerebellum, although the order and balance of locomotor actions was lost for a considerable time, it was finally restored. Doctor Mitchell suggests, therefore, that the cerebellum cannot be the *exclusive* centre of muscular co-ordination, however it may share this office with other parts of the cerebro-spinal axis, but that it may be a great reservoir for accumulation of motor force.

The *corpora striata* are probably connected with the direct emanation of the motor impulses, upon which voluntary actions depend.

The *thalami* (formerly called *nervorum opticorum*) appear to be the ultimate *termini* of the nervous filaments which bring from the spinal cord impressions of common sensation or touch. These, with the *corpora striata*, the *tubercular quadrigemina*, and other central masses at the base of the brain, constitute the group of *sensori-motor ganglia*, believed by Carpenter and others to be the immediate seat of consciousness and will. Sensori-motor actions are those in which motion is guided by sensation, through the medium of this ganglionic apparatus. The importance of such guidance is easily illustrated by many familiar actions. We walk by sight; if one closes his eyes, his steps become uncertain. So, every one speaks or sings by aid of his hearing; the phrase "a good ear for music" is justifiable. One born deaf is also mute, from lack of this guidance. A blind person learns to substitute the use of the senses of touch and hearing for sight, but some guidance by sensation must always be had. All confused or unusual impressions make action difficult or irregular, as when one endeavors, without practice, to walk a narrow plank at a great height from the ground.

The cerebral hemispheres are, by universal consent, regarded as the material organs of intellect and of the emotions. Commonly it is believed that the anterior portion of the brain (the "gray matter" of its convolutions) is the seat of intellectual activity; the emotions, if separately located at all—which Carpenter disputes—being connected with the middle and posterior lobes. Yet the order of development, compared with the successive periods of maturing of the impulses and the reasoning powers, would point rather to the posterior lobes as being the organs of intellect.

The nature of the relation between mind and brain is a topic of endless controversy. (See MATERIALISM and MENTAL PHILOSOPHY.) Certain propositions may be here advanced, as open to very little question at the present time: 1. The two hemispheres of the brain, under normal conditions, act as one. We are not conscious of anything but unity in our mental activity. 2. Yet the brain is probably, in relation to our faculties, a multiple organ. This is shown by the partial consciousness of dreaming and somnambulism; partial insanity or monomania; limited disturbance of mental or moral powers after certain injuries; and the special gifts of mind so different in different individuals, recognized under the name of genius. 3. Reflex action, as pointed out first by Dr. Laycock, affects the brain, as well as the lower nervous centres. Emotional actions, excited by the presence of particular objects or impressions, exemplify this. 4. Mental action, intellectual as well as emotional, is often truly automatic or involuntary. The will (as all psychologists recognize) controls thought and feeling only by the directing and selective power of attention, by which one, rather than another, kind of impression or ratiocination acquires momentum and continuance. Great mental capacity is, indeed, often combined with deficiency of will, as in such striking examples as Mozart and S. T. Coleridge. 5. There is reason to believe, as Doctor Carpenter has shown, that mental activity may sometimes be unconscious—the "unconscious cerebration" of authors. During sound sleep, for instance, most persons are able to awake at a determined time. When we have forgotten a once-familiar name or number, our attention being withdrawn from the search, it frequently comes back unsought. Many other facts may receive the same kind of explanation. (See "Human Physiology," by W. B. CARPENTER, M. D., chapters on the "Nervous System.")

HENRY HARTSHORNE.

Brain'ard (JOHN GARDINER CALKINS), an American poet of merit, born at New London, Conn., Oct. 21, 1796. He graduated at Yale in 1814. He published a volume of poems in 1825, and was for six years editor of the "Connecticut Mirror." Died Sept. 26, 1828. (See "Memoir of Brainard," prefixed to his works, by J. G. WHITTIER, 1832.)

Brainard (LAWRENCE L.), a prominent citizen and business-man of St. Albans, Vt., born about 1794, was several times candidate for governor, and was U. S. Senator from Vermont 1854–55. Died May 9, 1870.

Brain Coral, a name of various corals of the order Madreporaria and family Maeandrinidæ, especially applied to the *Maandrina cerebriformis*, which grows in warm seas, and takes its name from the fact that its surface has convolutions shaped somewhat like those of the human brain.

Braine (DANIEL L.), U. S. N., born May 18, 1829, in the city of New York, entered the navy as a midshipman May 30, 1846, became a passed midshipman in 1852, a lieutenant in 1858, a lieutenant-commander in 1862, and a commander in 1866. In 1861–62 he commanded the steamer Monticello, taking part in the engagement with the battery at Sewell's Point, near Norfolk, Va., May 19, 1861, and in the capture of Forts Hatteras and Clark, N. C., Oct. 5 of the same year. He was frequently under the fire of Forts Fisher and Caswell while blockading the port of Wilmington, and participated in both the Fort Fisher fights, and in the capture of Fort Anderson on the 19th of Feb., 1865. For the "cool performance" of his duty in these battles Braine was recommended for promotion by Rear-Admiral Porter in his "commendatory despatch" of Jan. 28, 1865. FOXHALL A. PARKER, U. S. N.

Braine-l'Alleud, a town of Belgium, in Brabant. It has cotton-factories. Pop. 5578.

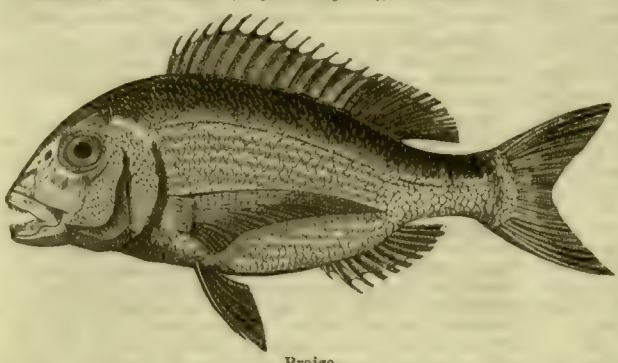
Braine-le-Comte, a town of Belgium, in the province of Hainault, on the railway from Brussels to Valenciennes, 20 miles by rail N. N. E. of Mons. It has a church built about the year 1300, also cotton-mills and dyeworks. Fine flax is raised in the vicinity. Pop. 6464.

Brain'erd, a post-village of Crow Wing co., Minn., on the Northern Pacific R. R. where it crosses the Mississippi River, 115 miles W. S. W. of Duluth. It has one weekly newspaper.

Brainerd (DAVID), an American missionary, born at Haddam, Conn., April 20, 1718. He entered Yale College in 1739, but was expelled in 1742 for a very trivial offence. In 1743 he began his famous labors among the Indians in a village about halfway between Stockbridge, Mass., and Albany, N. Y. The year following he went among the Delawares in Pennsylvania, and afterwards to Crosweeksung in New Jersey, where he had his most signal success. In the summer of 1747 he returned to Massachusetts in broken health, and died at Northampton Oct. 9, 1747. Jonathan Edwards, to whose daughter he was engaged to be married, and at whose house he died, published a memoir of him in 1749. A new (and now the standard) edition of this, with his journals, was published by Rev. Sereno E. Dwight in 1822.

Brainerd (JOHN), a younger brother of the preceding, was born at Haddam, Conn., Feb. 28, 1720, graduated at Yale College in 1746, and was for a time missionary among the Indians in New Jersey. In 1757 he was settled at Newark, and in 1777 at Deerfield, N. J., where he died Mar. 17, 1781. (See his "Life," by Rev. THOMAS BRAINERD, 1865.)

Brainerd (THOMAS), D.D., of the same stock as the above, was born at Weston, N. Y., June 17, 1804, graduated at Hamilton College and at Andover Theological Seminary in 1831. From 1831 to 1833 he was pastor of the Fourth Presbyterian church in Cincinnati, O., from 1833 to 1836 edited the "Cincinnati Journal" and "Youth's Magazine," and from 1837 till his death at Scranton, Pa., Aug. 21, 1866, was pastor of the Pine Street church, Philadelphia. He was an accomplished and able writer. Besides various sermons and pamphlets, he published in 1865 the "Life of John Brainerd," referred to above.



Brain Fever is a popular name for acute cephalic meningitis (see MENINGITIS), a dangerous disease, characterized in its earlier stages by very high fever and intense headache, usually followed by delirium and death. Inflammation of the brain itself (encephalitis) is less common, but is even more fatal than the former. It is not easy to discriminate between the two during life. Cold applications to the head and mild but persistent derivative treatment are generally indicated.

Brain'tree, a post-township and village of Norfolk co., Mass. The village is on the Old Colony and Newport R. R., 10 miles S. of Boston. Here are manufactures of machinery, woollen goods, boots and shoes, paper, tacks, cordage, etc. Pop. of township, 3948.

Braintree, a post-township of Orange co., Vt., 25 miles S. of Montpelier. It has three churches, and manufactures of lumber. Pop. 1066.

Brain'trim, a township of Wyoming co., Pa. P. 620.

Braize, or **Becker** (*Pagrus vulgaris*), a sea-fish of

Braize.

Europe, represented in American Atlantic waters by the big porgy or soup (*Pagrus argyrops*), which is prized both for the table and for its oil.

Brake, a term with various significations; it sometimes denotes a thicket, a place overgrown with shrubs, brambles, or ferns. In the U. S. a thicket of canes is called a "canebrake."

BRAKE is a name applied, especially in America, to plants of the order Filices. The more correct name is FERN (which see, by PROF. D. C. EATON, LL.B.).

BRAKE, an instrument used to break flax or hemp; the hand or lever by which a pump is worked; a large harrow used in agriculture; a sharp bit or snaffle (of a bridle).

BRAKE, a machine attached to the wheels of heavy carriages and railroad cars, which, when pressed against the wheels, retards or stops their motion by friction. Patents have been obtained in the U. S. for numerous machines or inventions for this purpose. Among these are "steam carbrakes," in the use of which the friction is produced by steam-power, and the engineer of a locomotive applies the brakes by the turning of a cock; and the "Westinghouse air-brake," now extensively used.

Bra'ma, a genus of fishes of the family Chætodontidæ, having the body very deep and compressed, a single elongated dorsal fin, and a forked tail, the points of which are widely divergent. The *Brama raii*, sometimes called *bream*, is common in the Mediterranean, and is highly esteemed for food.

Bra'mah (JOSEPH), an English machinist and inventor, born in Yorkshire April 13, 1749. He carried on business in London, and gained distinction by numerous and valuable inventions, among which are a safety lock, a hydrostatic press, and improvements in fire-engines and steam-engines. Died Dec. 9, 1814.

Bramah's Press. See HYDROSTATIC PRESS.

Braman'te (DONATO LAZZARI), a celebrated Italian architect and painter, born near Urbino in 1444, was a relative of Raphael. He studied and worked at Milan from 1476 to 1499, and afterwards removed to Rome, where he was patronized by Pope Julius II. He designed the vast galleries which connect the Vatican with the palace of Belvedere. He was the first architect of St. Peter's church, which he began to build in 1506. Only a small portion of his design had been realized when he died in 1514, and the succeeding architects deviated from the original plan. (See VASARI, "Lives of the Painters;" PUNGILEONI, "Memoria intorno alla Vita di Donato Bramante," 1837.)

Bram'bling, Bram'blefinch, or **Mountain Finch** (*Fringilla montifringilla*), a small bird nearly allied to the chaffinch, than which it is rather larger. The predominant colors of the upper parts are black and brown, with white bands on the wings. The belly is white, and some of the wing-coverts are yellow. It breeds in the northern parts of Sweden and Norway, and visits England, Italy, and other countries as a winter bird of passage.

Bramp'ton, a post-village, capital of Peel co., Ontario, on the Grand Trunk Railway, 21 miles W. of Toronto, has manufactures of flour, farming implements, pumps, etc., and a large trade. It has two weekly papers. Pop. in 1871, 2090.

Bran, the husk or outer covering of wheat, which in the process of flouring is separated from the fine flour. In 100 parts of bran there are of water, 13.1; albumen, 19.3; oil, 4.7; husk (with a little starch), 55.6; ash or saline matter, 7.3. Calico-printers use bran and warm water to remove coloring-matter from those parts of their goods which are not mordanted. Bran and the flour united—*i. e.* unbolted wheat flour—make a good bread, which is considered more digestible than that made of fine white flour.

Branch [Fr. *branche;* Lat. *ramus*], a limb of a tree or plant; a bough, or division of the stem or trunk; a ramification; any member or part of a body or system; a distinct article or section, as a branch of science or education. In geography several streams which unite to form a river are called its branches. The term "branch" is also applied to an individual of a family descending in a collateral line; any descendant of a common parent. In botany each branch originates in a leaf-bud, which is produced at a node of the stem or of an already existing branch. The arrangement of the branches as alternate or opposite corresponds to the relative position of the leaves.

Branch, a county of Michigan, bordering on Indiana. Area, 528 square miles. It is traversed by the St. Joseph River and is drained by several creeks. The surface is diversified by forests, oak-openings, and small lakes; the soil is a fertile sandy loam. Cattle, grain, and wool are staple products. Iron ore is found. It is intersected by the Michigan Southern R. R. Capital, Coldwater. Pop. 26,226.

Branch, a township of Stanislaus co., Cal. Pop. 787.

Branch, a township of Schuylkill co., Pa. Pop. 1200.

Branch (JOHN), born at Halifax, N. C., Nov. 4, 1782, graduated at the University of North Carolina in 1801, became a lawyer, was made a judge of the superior court, governor of North Carolina (1817–20), U. S. Senator (1823–29), secretary of the navy (1829–31), member of Congress (1831–33), governor of Florida Territory (1844–45), besides holding other important offices. Died at Edgefield, N. C., Jan. 4, 1863.

Branch (LAWRENCE O'BRIEN), son of the preceding, born in Halifax co., N. C., in 1820, graduated at Princeton in 1838, was a Democratic Representative in Congress from 1855 to 1861. He was made a brigadier-general in the Confederate army in 1861, and was killed at Antietam in 1862.

Branch'burg, a twp. of Somerset co., N. J. Pop. 1251.

Branchiop'oda [from the Gr. *βράγχια*, the "gills," and *πούς, ποδός*, a "foot"], an order of entomostracous crustaceans, deriving their name from the peculiarity of having the gills, which are numerous, attached to the feet. They are small, many of them almost microscopic, and abound in stagnant fresh waters. A few are found in salt water. Some are known by the name of water-fleas; the genera *Cyclops* and *Cypris* may be mentioned, the former on account of its frequency in stagnant waters, the latter because its fossil shells are abundant. Western North America abounds in species; Eastern North America has none.

Branch'port, a station on the Raritan and Delaware Bay R. R., in Ocean township, Monmouth co., N. J., 1 mile N. of Long Branch. It has a fine bay, a coasting-trade in lumber and oysters, and has many summer residences.

Branchport, a post-village of Jerusalem township, Yates co., N. Y., at the head of the W. arm of Keuka Lake. It has five churches.

Branch'ville, a township of St. Clair co., Ala. Pop. 1419.

Branchville, a post-village of Orangeburg co., S. C., in a township of the same name, on the South Carolina R. R., 75 miles E. S. E. of Augusta. Pop. 1339.

Brand, a burning piece of wood, or a stick of wood partly burned; a sword (this use of the word is obsolete except in poetry); a thunderbolt; a mark made by burning with a hot iron on a criminal or on a cask, etc.; a stigma. (See BRANDING.) The term brand is applied in England to some diseases of plants, especially of cereal grains, which are also called blight, bunt, mildew, rust, or smut. These diseases are caused by minute parasitic vegetation. Perhaps the most common application of this term is to a peculiar spotted and burnt appearance of leaves and bark, the cause of which is probably not known.

Brande (WILLIAM THOMAS), F. R. S., an English chemist, born in London in 1788. He lectured with success on chemistry at the Royal Institution, and filled for many years an important office in the Mint. Among his works are a valuable "Dictionary of Science, Literature, and Art" (1842) and a "Manual of Chemistry." Died in 1866.

Brand'enburg, the most important province of Prussia, and that which formed the nucleus of the Prussian kingdom. It corresponds nearly to the old Mark of Bran-

denburg, and has an area of 15,402 square miles. It is mostly a level plain which has but little elevation above the sea. It contains numerous lakes, is intersected by the Oder, and also drained by the Warthe, the Spree, the Havel, and the Elbe, which latter forms part of its W. boundary. The soil is sandy and moderately fertile. The province is traversed by several canals and railways. It has extensive manufactures of cotton, wool, linen, silk, paper, leather, sugar, etc. The chief towns are Berlin, Potsdam, Königsberg, and Frankfort-on-the-Oder. The inhabitants are mostly Protestants. It is divided into two regencies (Regierungsbegirke) and thirty-three circles. This country was conquered by Charlemagne in 789 A. D. The first margrave of Brandenburg was Albert the Bear, who is called the founder of the House of Brandenburg. He began to reign in 1134. Early in the fifteenth century the margrave became an elector of the German empire, and took the title of elector of Brandenburg. Frederick William, who became elector in 1640, added the duchy of Prussia and part of Pomerania to his dominions, and his son took the title of king of Prussia in 1701. Pop. in 1871, 2,863,461.

Brandenburg (anc. *Brennaborch* or *Brennabor*), a town of Prussia, in the above province, is situated on both sides of the river Havel, and on the Berlin and Magdeburg Railway, 38 miles by rail W. S. W. of Berlin. It is enclosed by walls, and divided by the river into the old and new town, between which, on an island, is a quarter called "Venice," containing a castle and a mediæval cathedral. The town has a ritter akademie, a gymnasium, a realschule, and a public library; also manufactures of woollen and linen goods, hosiery, paper, leather, etc. Pop. in 1871, 25,828.

Brandenburg, a post-village, capital of Meade co., Ky., is on the Ohio River and on a high bluff, 40 miles below Louisville. Pop. 427.

Brandenburg, New, a walled town of Mecklenburg-Strelitz, is situated near the N. end of Tollensee, 18 miles N. N. E. of Strelitz and 53 miles W. N. W. of Stettin. It has wide and regular streets, and is said to be the most beautiful town in Mecklenburg-Strelitz. It has a grand-ducal palace, and manufactures of cotton and woollen goods, damasks, paper, and chemical products. Pop. in 1871, 7245.

Brand'ing, a mode of punishment formerly practised in England, by burning the face or hand of an offender with a hot iron. This penalty was inflicted in the case of all clergiable offences (see BENEFIT OF CLERGY), but it was abolished by an act of Parliament in 1822. Branding is now obsolete except in the case of deserters from the army, who are marked with the letter D, not by a hot iron, but by ink or gunpowder. By the Mutiny act of 1858 it is enacted that the court-martial, in addition to any other punishment, may order the offender to be marked on the left side, two inches below the armpit, with the letter D, such letter to be not less than one inch long.

Bran'dis (CHRISTIAN AUGUST), professor at Bonn University, born at Hildesheim, in Hanover, Feb. 15, 1790, was the son of Joachim Dietrich Brandis, a celebrated physician. He edited, with Emmanuel Bekker, a critical edition of Aristotle. He was the secretary of King Otho in Greece. His main work was a history of the Greek and Roman philosophies (2 vols., 1835–44; the third volume appeared in 1860–66) and a "History of the Development of Greek Philosophy" (2 vols., 1862–64). Died July 24, 1867.

Bran'don, a township of Jackson co., Ia. Pop. 1103.

Brandon, a post-township of Oakland co., Mich. Pop. 1284.

Brandon, the capital of Rankin co., Miss., on the Vicksburg and Meridian R. R., 13 miles E. of Jackson, contains twenty-one stores, a large hotel, a bank, a large female college, five churches, and one newspaper. It is surrounded by numerous mineral wells, limestone and marl-beds. Pop. 756.

A. J. FRANTZ, ED. OF "BRANDON REPUBLICAN."

Brandon, a township of Franklin co., N. Y. P. 692.

Brandon, a post-village of Rutland co., Vt., is in Brandon township, near Otter Creek, on the Vermont Central R. R. (Rutland division), 16 miles N. N. W. of Rutland. It has a newspaper, a graded academy, two parks, two national banks, five churches, twenty-five stores, two hotels, and manufactures of Howe scales, iron castings, carriages, flour, lime, lumber, paint, marble, pill-boxes, spools, and tassel-moulds. The township contains also the village of Forestdale. Pop. of the township, 3571.

A. N. MERCHANT, PUB. OF "UNION."

Brandon, a post-township of Prince George co., Va. Pop. 1600.

Brandon, a post-village of Fond du Lac co., Wis. It has one weekly newspaper.

Brandt, a post-village of Bethel township, Miami co., O. Pop. 240.

Bran'dy [Ger. *Branntwein* (*i. e.* "burnt wine"); Fr. *eau de vie*] is the liquid obtained by distilling the fermented juice of the grape. It is generally manufactured from white and pale red wines. White wine yields a richer brandy than red wine, as it contains more of the essential oil of grapes, to which the flavor of the brandy is due. The peculiarities of the wine pass to a certain extent to the brandy. Wines which taste of the soil communicate the same taste, the *goût de terre*, to the brandy distilled from them. Wines of Selleul in Dauphiny yield a brandy having the odor and taste of Florentine iris; those in St. Pierre in Vivarais give a spirit which smells of violet. The stronger the wine the greater the yield. The wines of the S. of Europe, being richest in alcohol, yield the most brandy. The usual yield is from 100 to 150 gallons from 1000 gallons of wine. The best brandy, that distilled in the department of Charente, known as *cognac* and *armagnac* (names of towns), is made from very choice wines. Inferior brandies are distilled from dark-red wines of France, Spain, and Portugal, also from the fermented *marc* or refuse of the grape, and from the lees of wine and the scrapings of the casks. The catawba brandy, made from the lees of catawba wine in Ohio, is a very good brandy, though it has the peculiar flavor of this wine. The brandy distilled from catawba marc has an unpleasant taste, and contains much fusel oil. The wines of California yield brandy abundantly and of good quality. Various other liquors are known as brandies, such as "cider brandy" or "apple jack," distilled from cider or from the "pomace" or refuse ground apples from the cider-press. This, when new, is a harsh, fiery liquor, but is much improved by age. "Peach brandy" is extensively made from the pulp of ripe peaches in some of the Southern States.

Fresh brandy is colorless, and remains so in glass vessels. The sherry-wine color which brandy generally exhibits is either derived from the cask or from burnt sugar purposely added. Brandy is almost pure alcohol and water, the percentage of alcohol varying from 48 to 56 per cent. It has an agreeable vinous, aromatic odor, and a peculiar well-known taste. Its specific gravity is from 0.902 to 0.941. Besides alcohol and water it contains the volatile oil of the wine, a little acetic acid, acetic ether, aldehyde, etc., together with the coloring-matter and tannic acid derived from the cask.

Brandy for medical use should be free from disagreeable odor and taste, and should be at least four years old. The advantage of keeping brandy a few years in the cask is due to the oxidation and removal of the ranker fusel oils, and to the precipitation of possible traces of copper or lead derived from the still by the tannic acid of the cask.

The greater part of the brandy and cognac of commerce is made from alcohol derived from Indian corn,—rectified and deodorized whisky. This is diluted to proof, 50 per cent., and flavored with acetic ether, œnanthic ether, oil of grapes, argol, and tannin, and colored with burnt sugar. It is improved by the addition of a little real brandy, and by keeping it a few years in the cask. The following recipe for cognac brandy is taken from the circular of a New York firm, whose business is to supply the necessary materials to the manufacturers of wines and liquors: "To 40 gallons of cologne spirit, double distilled and free from odor, and reduced to proof with distilled water, add ½ ounce of our best cognac oil, distilled from grapes, 1½ pints burnt-sugar coloring, and ¼ ounce of tannin." At the prices charged for the materials this choice brandy would cost the compounder $1.25 per gallon, and would sell at from $10 to $25.

Brandy is an esteemed cordial and stomachic. It is frequently given in the sinking stages of low fevers and to convalescents, and to check diarrhœa.

C. F. CHANDLER.

Brandy Station, a post-village of Culpeper co., Va., on the Orange Alexandria and Manassas R. R., 56 miles S. W. of Alexandria, the scene of conflicts between the Federal and Confederate forces on the 9th of June and 11th of Oct., 1863.

Bran'dywine, a hundred of New Castle co., Del. It is the seat of Brandywine College. Pop. 3180.

Brandywine, a township of Hancock co., Ind. Pop. 1061.

Brandywine, a township of Shelby co., Ind. Pop. 1224.

Brandywine Creek is formed by the East and West branches, which unite in Chester co., Pa. It flows southeastward into the State of Delaware, and enters the Chris-

tiana Creek near Wilmington. It furnishes water-power for numerous mills. On its banks, in Chester county, the British general Howe defeated Washington Sept. 11, 1777.

Bran'ford, a borough of New Haven co., Conn., in Branford township, on Long Island Sound and on the New Haven and New London R. R., 8 miles E. S. E. of New Haven. It has three churches, a foundry, etc. The harbor will admit vessels of 300 tons. It is a place of summer resort. It has various manufactures, and is the seat of an academy. Pop. of township, 2488.

Branks, an instrument formerly used in England and Scotland for the punishment of scolding women. It was of various forms, but consisted essentially of a bridle of iron or leather, to which was attached a piece of iron which held the tongue firmly. It is asserted that in some obscure places in England its use came down to quite recent times.

Bran'nan (John Milton), an American officer, born in 1819 in the District of Columbia, graduated at West Point in 1841, major First Artillery Aug. 1, 1863, and Sept. 28, 1861, brigadier-general U. S. volunteers. He served at seaboard posts 1841–73, in suppressing Canada border disturbances 1841–42, in the war with Mexico 1846–48, engaged at Vera Cruz, Cerro Gordo, La Hoya, Contreras, and Churubusco (brevet captain), and the city of Mexico (severely wounded at Belen Gate), as adjutant First Artillery 1847–54, in Florida hostilities 1856–58. In the civil war he served in command of the department of Key West, Fla., 1862, in the department of the South 1862–63, engaged on expedition to St. John's River, Fla. (brevet lieutenant-colonel), at Pocotaligo, S. C., and several minor actions, in Tennessee campaign 1863, engaged at Hoover's Gap, Tullahoma, Elk River, and Chickamauga (brevet colonel), as chief of artillery department of the Cumberland 1863–65, engaged at Missionary Ridge, in the various operations of the Atlanta campaign 1864 (brevet brigadier-general), in command of the district of Savannah, and temporarily of department of Georgia 1865–66. Brevet major-general Mar. 13, 1865, for meritorious services in the field.

George W. Cullum.

Brant, a county in the S. part of Ontario (Canada). Area, 416 square miles. It is intersected by Grand River and the Grand Trunk R. R. The staple productions are lumber, wool, potatoes, maple-sugar, butter, and cheese. Capital, Brantford. Pop. 32,259.

Brant, a township of Saginaw co., Mich. Pop. 331.

Brant, a post-township of Erie co., N. Y., on Lake Erie. Pop. 1359.

Brant. See Barnacle Goose.

Brant (Joseph Thayendanega), an Indian Mohawk chief, born in 1742, fought in the British army against the Americans in the war of the Revolution. He published the Gospel of Mark in Mohawk. Died Nov. 24, 1807. (See W. L. Stone, "Life of Brant," 1838.)

Brant (Sebastian), a German poet, born at Strasburg in 1458. He was appointed an imperial councillor by the emperor Maximilian. He wrote a satirical poem entitled "Das Narrenschiff" ("The Ship of Fools," 1494). Died May 10, 1520.

Brant'ford, a town of Ontario (Dominion of Canada), the capital of Brant county, is on Grand River and the Grand Trunk Railway, 24 miles W. S. W. of Hamilton and 84 miles S. E. of Goderich. The river, an affluent of Lake Erie, is navigable to Brantford, which has an active trade. Here are large machine-shops and engine-houses of the railway company, and manufactures of brass and iron castings, farming-implements, etc. The county buildings are substantial. There is an orphans' home for girls and a widows' home supported by the charitable. Brantford has two weekly newspapers. Pop. in 1871, 8107.

Brant'ley (William Theophilus), D. D., born May 1, 1816, at Beaufort, S. C., educated at Brown University, pastor of the First Baptist church at Augusta, Ga., 1840–48, professor of belles-lettres and evidences of Christianity in the University of Georgia 1848–56, pastor in Philadelphia 1856–61, Atlanta, Ga., 1861–71, and of the Seventh Baptist church of Baltimore since 1871.

Brantôme (Pierre de Bourdeilles), a French historian, born of a noble family at Périgord about 1540. He served in the army in several campaigns, and gained the favor of Charles IX., at whose court he passed some years. He wrote "Les Vies des Hommes Illustres et grands Capitaines, etc.," a work of high reputation. His style is charming, vivacious, *naïf*, abounding in ingenious turns, and sometimes rising to eloquence. Died July 15, 1614.

Brashear (Walter), M. D. See Appendix.

Bra'shear City, a town and port of entry of St. Mary's parish, La., on the Atchafalaya River, 80 miles from New Orleans, is the southern terminus of Morgan's Louisiana and Texas R. R., and is connected with Galveston and other Texas ports by Morgan's line of iron steamships; it is connected with Havana and Mexican ports by a line of iron steamers. Its port may be entered by vessels drawing 15 feet. It is connected with the Têche country by a daily line of steamboats, and has one of the best harbors in the State. It has a resident collector of customs, and is destined to be one of the largest commercial towns in the State outside of New Orleans. It was captured from the Union forces by Gen. Dick Taylor in 1863, with a large quantity of military stores. It has one weekly newspaper. Pop. 776.

W. B. Merchant, Ed. "News."

Brash'er, a township of St. Lawrence co., N. Y., contains the post-village of Brasher Falls (pop. 450), which is on the St. Regis River, 36 miles by rail E. of Ogdensburg. It has important manufactures of lumber, pumps, and agricultural tools. Brasher Iron-works, a post-village, has a furnace and other shops. Pop. 250. Bog-iron ore is obtained in this township. Pop. of township, 3342.

Bras'idas [Gr. Βρασίδας], an eminent Spartan general in the Peloponnesian war, which began in 431 B. C. He relieved Megara in 424, and gained several victories over the Athenians. He was killed in 422 B. C. at Amphipolis, where he was opposed to the Athenian general Cleon. His memory was long honored by annual sacrifices. Plato compared him to Achilles.

Brass [Lat. *æs*, gen. *æris;* Fr. *airain*], an important alloy of copper and zinc extensively used for a great variety of purposes in the arts, on account of the ease of working and its acceptable color. It is made (1) by fusing copper and zinc in crucibles, placing the latter below; considerable of the zinc is lost during the operation, owing to its volatility; (2) by heating copper in grains or sheets with oxide of zinc and charcoal; (3) the ancient method, by heating copper with calamine, a native ore of zinc, and charcoal. Different varieties of brass, adapted to special uses, are obtained by varying the proportions of the component metals. Common brass for ordinary purposes, which is cast in moulds and finished by turning and filing, contains about 70 parts of copper and 30 of zinc. *Muntz* or *yellow metal*, which is rolled into sheets and used for sheathing ships, contains from 50 to 63 parts of copper and 37 to 50 of zinc. *Tombac, pinchbeck, prince's metal, Mannheim gold, mosaic gold, similar,* etc., contain 80 parts or more of copper to 20 or less of zinc. A little lead diminishes the ductility, while tin increases the hardness of brass. Articles of brass are cleaned by immersion in aqua fortis (nitric acid), and lacquered with shell-lac in alcohol. Brass is harder than copper, is malleable and ductile, and can be readily cast, rolled, stamped, and turned in the lathe. Next to iron in its different forms, it is the most important metal used in the arts.

C. F. Chandler.

Bras'sarts, or Bras'sards, jointed plates of steel which in plate-armor protected the upper part of the arms, and united the shoulder and elbowpieces. The ancient name of them was *brachiale*. When the front of the arm only was shielded the pieces were called demi-brassarts.

Brasses, Monumental, are either plates or inlaid figures of brass or latten, which occur in old churches of Europe, generally designed to represent the figure and the heraldic honors of the dead. Monumental brasses were often wrought with fine artistic taste. This ancient practice, which had become nearly obsolete, has been lately revived.

Brasseur de Bourbourg (Charles Étienne), a French priest, born Sept. 8, 1814, travelled extensively in North and Central America, and published, as the result of his travels, "Histoire de Canada" (2 vols., 1851), "Histoire des nations civilisées du Mexique et de l'Amérique Centrale" (4 vols., 1857–59), "Gramatica de la lengua Quiche" (1862), and other works.

Brass'field's, a township of Granville co., N. C. Pop. 3015.

Bras'sica, a genus of herbaceous plants of the order Cruciferæ, distinguished by a round and tapering 2-valved pod (*silique*), globose seeds in one row in each valve, and conduplicate cotyledons. The species of this genus, which comprises the cabbage, cauliflower, broccoli, turnip, rape, etc., are natives of the temperate and cold regions of Europe and Asia. The species just named are extensively cultivated in gardens and fields. (See Cabbage and Turnip.)

Brass'town, a township of Clay co., N. C. Pop. 395.

Brat'tice, in mining engineering, is a term applied to a partition of iron plate and other fit material which divides the great general shaft into two chambers, which serve as up-cast and down-cast shafts for ventilation.

Brattleboro', a p.-v. of Windham co., Vt., on the Connecticut River, at the junction of the Vt. Valley and the Vt.

and Mass. R. Rs., 60 miles N. of Springfield, Mass. It has 7 churches, 3 weekly papers, and 1 monthly, 3 national and 2 savings-banks; is the seat of the Vt. Asylum for the Insane, and the trade centre of South eastern Vt. The Estey Cottage Organ-Works is the leading manufacturing industry. West Brattleboro', also a p.-v., has an academy for the young. The town is noted for its beautiful natural scenery. Pop. 4933; valuation in 1877, $2,346,968; number of polls, 1357. ED. OF "THE VERMONT PHŒNIX."

Brat'ton, a township of Mifflin co., Pa. Pop. 852.

Brauns'berg, a walled town of Prussia, in the province of Prussia, on the river Passarge, about 35 miles S. W. of Königsberg. It has manufactures of woollen and linen goods, and an active trade in grain, timber, etc. Pop. in 1871, 10,471.

Bra'vo (NICOLAS), a Mexican general, born about 1792, fought against the Spaniards in several campaigns. He was elected vice-president of Mexico in 1824, revolted against Vittoria in 1827, and was defeated. He officiated as the executive chief and substitute of Santa Anna in the absence of the latter, from Oct., 1842, to Mar., 1843. Died April 22, 1854.

Bra'vo-Muri'llo (JUAN), a Spanish statesman, born in June, 1803, became in 1847 minister of justice, then of public instruction and of the finances. In 1851 he became the head of a new cabinet, in which position he followed a reactionary policy. In April, 1868, he again became president of the cabinet. On the expulsion of the queen he followed her to Bayonne. Died in Jan., 1873.

Braw'ley, a township of Scott co., Ark. Pop. 183.

Brawn, the flesh of a boar, or the animal itself; the fleshy, protuberant muscular part of a man or animal; bulk, muscular strength; sometimes the arm; also a preparation of meat made of the head and belly of a young pig, with the addition of ox feet to render it gelatinous. The whole is rolled up tight in sheet tin and boiled for four or five hours. The moisture is then pressed out, and after it has stood about ten hours, the meat is put into cold salted water and is ready for use.

Brax'ton, a county of West Virginia. Area, 646 square miles. It is intersected by the Elk and Little Kanawha rivers. The surface is hilly, and extensively covered with forests; the soil is mostly fertile. Grain and wool are the staple products. Coal, iron, and salt are found. Capital, Braxton Court-house. Pop. 6480.

Braxton, a township of Colleton co., S. C. Pop. 1971.

Braxton (CARTER), an American planter, born in Newington, Va., Sept. 10, 1736. He graduated at William and Mary College in 1756. He was elected to the Continental Congress in 1775, and signed the Declaration of Independence. Died Oct. 10, 1797.

Braxton Court House, or **Sutton,** a post-village, capital of Braxton co., W. Va., on Elk River.

Brazeau, a township of Perry co., Mo. Pop. 2281.

Brazen Sea, a great bowl of cast metal, probably of copper or bronze, which stood in the priests' court in Solomon's temple. (1 Kings vii. 23–26; Josephus's "Antiquities," viii. 3, 5.) Its purpose was to hold water for the ablutions of the priests. The brazen sea stood upon twelve oxen, the latter facing outward. The exact shape and size of the brazen sea are not known, but the best commentators think its contents exceeded 11,000 wine gallons.

Brazen Serpent, the name of a copper or bronze figure of a serpent erected by Moses during the journey of the Israelites from Egypt to the land of promise, for the miraculous cure of those who had been bitten by venomous serpents. This brazen serpent became an object of superstitious worship among the Israelites, and was consequently destroyed by Hezekiah. In accordance with John iii. 14, the brazen serpent is regarded as a type of Christ.

Brazil', an empire, and the only monarchy on the continent of America, occupying almost one-half of South America, extends from Cape Orange, in lat. 4° 23′ N., to the S. point of the peninsula of Mirim, in lat. 33° 44′ S., and from the most eastern point on the coast near Olinda, in lat. 34° 40′ W., to the most western part of the course of the river Javari, in 73° 15′ W. It is bounded on the N. by Colombia, Venezuela, British, Dutch, and French Guiana, on the N. E. and E. by the Atlantic, on the S. and W. by Uruguay, Paraguay, the Argentine Republic, Bolivia, Peru, and Ecuador. Area, estimated at 3,252,900 square miles.

Face of the Country, Mountains, etc.—Brazil may be divided into three different regions—the low coast, a tableland with an elevation of from 2000 to 2500 feet, and a large plain, watered by the Amazon and its tributaries, and having very little declination. Beginning in the S. of the empire, the first mountain-range we meet with is the Serra do Mar, extending along the coast to lat. 26° 30′ S., here separates into two branches, which enclose the valley of the Uruguay. The Serra de Mantiqueira, extending from lat. 20½° to 23° S., may be regarded as the central chain of the empire. This chain, mostly in the provinces of Minas Geraes and Goyaz, contains the highest elevations in Brazil. The northern continuation, under the name of Serra do Espinhaço, runs parallel to the coast in an almost N. direction. Parallel to this chain, and enclosing with it the valley of the Rio San Francisco, the Serra da Tabatinga runs from lat. 20° to 11° 20′ S. Among its branches, the Serra Pinuhy and the Serra Ibiapaba in the E. almost extend to the ocean, while its western branch terminates on the Tocantins River. In about lat. 16⅔° S. the Pyrenees Mountains connect the Serra da Tabatinga with the Cordillera Grande, running parallel to it. The low chains along the southern branches of the Amazon (the Araguay, Xingu, Topayos, and Madeira) are all connected with each other at their southern extremity. The theory formerly held, that these chains running parallel to the Andes belonged to their system, has been shown to be erroneous, as the Brazilian highlands decline towards, and, as in the provinces of Matto Grosso, are separated by, extensive plains from the Andes.

Rivers and Lakes.—Among the rivers, the Amazon is the most important, and at first, like all its tributaries, flows northward. Upon its entrance into Brazil it flows eastward, and keeps this direction throughout its entire course. Its first important tributary on the right bank is the Rio Madeira, and then the Topayos and the Xingu. On the left bank we find the Rio Negro, coming from Colombia. Near the Amazon, the Tocantins or Para, formed by the junction of the Araguay and the true Tocantins, empties into the Atlantic. We next find the Maranhão, which flows through the province of the same name, and empties into the Bay of San Luis after a course of 650 miles. On the E. coast the Rio San Francisco, forming the boundary between the provinces of Sergipe and Pernambuco, empties into the ocean after a course of 1480 miles. Numerous smaller rivers rise on the mountains running parallel to the coast, and empty into the Atlantic. Among these the most important are the Rio Grande de Belmonte, the Rio Doce, the San João de Parahiba, and the Rio Grande do Sul, which connects Lakes Patos and Mirim. Among the rivers rising in Brazil, but having the larger part of their course in other states, are the Rio Paraná, the Paraguay, and the Uruguay. There are numerous small lakes in the plains, but none of any great extent. The Laguna dos Patos and Lake Mirim, both in the province of Rio Grande do Sul, in the extreme S. of the empire, are the most important. Steam navigation has been successfully established on the Brazilian rivers.

Geology and Mineralogy.—Nearly all the geological formations are represented in Brazil. In the highlands of the interior is a large area of granitic and other metamorphic rocks, with extensive basins of Devonian and carboniferous strata. These reach down the Tocantins and Xingu to near their mouths, and form the southern margin of the valley of the Amazon. The valley itself is occupied by tertiary rocks. At Rio and along much of the coast granitic rocks prevail, but near Pernambuco are extensive areas of cretaceous deposits, with many of the chalk fossils of Europe. In the caves of Brazil are found the bones of many large animals now extinct (*Megatherium, Machairodus,* etc.). The mineral wealth of Brazil includes gold, silver, iron, and diamonds and other precious stones. To these may be added the euclase, beautiful crystals of iron-glance, crystallized talc, rock-crystals with adhering topazes, as well as topaz-crystals with included rock-crystals, and kyanite. Beautiful red-lead spar or chromate of lead occurs, and beds of iron-glance over 1000 feet thick are found in some places. Among the gold-mines first discovered in Brazil were those of Jaraguá. The whole amount of gold produced is less than a fourth of what it was a hundred years ago. Coal is found on the Amazon.

Brasil is perhaps richer in diamonds than any other country in the world. The most noted mines are those of the Serra do Frio. The diamonds were first found in this district about 1730 by a colony of miners from Villa do Principe, 60 miles to the S. E. of Tejuco. While employed at this place in search of gold they frequently met with little shining stones, which at first they threw away. But one of the overseers, suspecting that they might be of value, transmitted specimens to the governor, who sent them to Lisbon, and they were pronounced genuine diamonds. The diamonds have hitherto been found in the beds of rivers, and are washed from the sand in a manner similar to that practised in washing gold. A diamond was found in the Rio Abaste in 1791 which weighs 138½ carats; another, worth £45,000, was found in 1847. In 1852 rich mines were discovered in the province of Minas Geraes. Net-

withstanding the immense wealth of Brazil in these two minerals, neither of them has proved so profitable as her agricultural productions. In one year and a half the exports of sugar and coffee amounted to more than the value of all the diamonds found in eighty years. (See C. F. HARTT, "Geology and Physical Geography of Brazil.")

Climate.—In such an extensive region as Brazil both the climate and soil must, of course, vary greatly according to the locality. But these variations are by no means so large as under corresponding latitudes of the northern hemisphere. In the northern provinces of Ceará, Pernambuco, and their neighborhood, sometimes no rain falls at all for two or three years at a time. A famine ensues, cattle and other animals die of thirst, and numbers of the inhabitants of starvation. This, however, is a rare exception, as most of the northern provinces are subject to heavy rains, while in the S. the climate is healthy and settled. Over all Brazil, December, January, and February are the hottest months—June, July, and August the coolest. A great advantage of Brazil over the rest of the tropics is, that a foreigner may without fear enjoy the gifts of nature. Most of the European diseases are unknown here, while the yellow fever, with very few exceptions, is not known in Brazil.

Vegetable Productions.—Brazil is probably not surpassed by any other country in the world in natural fertility; comparatively little attention, however, is given to agriculture, and the growth of vegetation is so rank in some places as seriously to impede agricultural labor. It is estimated that less than one-hundredth part of the soil is under cultivation, and this portion is almost entirely limited to the vicinity of the coast, and to the N. E. part of the empire, where the soil seems peculiarly well adapted to the production of coffee, sugar, and maize. The pastures are of immense extent, and are covered with herds of horned cattle. The most useful plants are the sugar-cane, coffee, cotton, cacao, rice, tobacco, maize, manioc, beans, bananas, ipecacuanha, ginger, yams, lemons, oranges, figs, etc. Sugar and coffee are the staple products. Manioc (the plant which produces the tapioca) is native of Brazil, and its farina is used as meal by almost every household. It is said to produce six times as much nutriment to the acre as wheat. No part of the world can excel Brazil in the extent and luxuriance of her forests. Many of the largest trees bear brilliant blossoms, others are clothed with a drapery of epiphytes and climbing plants. Many trees of the largest size stand so close together that it is impossible to clear a passage between them. The cocoanut-palm grows near the sea-shore, and the *Bertholletia* is met with in many localities. The kernels of this tree are exported in great quantities, and are called Brazil nuts. Another productive tree of Brazil found in the Amazonian forests is the caoutchouc (*Siphonia elastica*), which grows to the height of forty or fifty feet without branches. A peculiar characteristic of Brazilian vegetation is the large number of species of myrtaceous trees which fill the air with perfume; other trees are the purga das Paulistas (*Anda Gomezii*), the seeds of which yield a tasteless oil, more powerfully cathartic than castor oil; the Brazil-wood, the rosewood, fustic, mahogany, and others well adapted to shipbuilding. The inhabitants of Brazil distinguish the different kinds of forests and woods by particular names. There are the Matos Virgens, or the virgin forests, such as those along the whole maritime cordillera; the Catingas, consisting for the most part of low deciduous trees; the Carascos, close-growing shrubs; and the Capiveira, being such wooded tracts as are formed by small trees and shrubs springing up where virgin forests have been cleared away.

The flowers of Brazil are no less extraordinary than its other vegetable products, there being the greatest abundance of them, representing every variety of color. Some of the crops come to maturity in Brazil very quickly. The common garden pea has, it is said, been sown and gathered in the neighborhood of Rio within twenty-one days.

Animals.—The chief domestic animals of Brazil are horned cattle and horses; the numbers of both are immense. The greater part of them live in a wild state; those in the countries S. of the parallel of 25° S. lat. have multiplied to such an extent that large numbers of them are slaughtered chiefly for their hides, thousands of which are exported annually to Europe and the U. S. The immense number of cattle would afford extensive trade in provisions were not salt so dear on account of the inland carriage in a region wholly destitute of roads. Swine and goats are abundant. Many rapacious animals, such as the puma, the jaguar, and several native Canidæ, as well as sloths and porcupines, are numerous. The peccary is common, also the capybara, a rodent animal. Monkeys and vampire-bats abound. Among the feathered tribes are the humming-bird (found in immense numbers and in great variety); vultures, ducks and geese, toucans, and a great number of large and brilliant species which are peculiar to the country. Among the reptiles are the anaconda, the boa constrictor, the corral snake, the surucucú, and the jararaca; the three last named are venomous and much dreaded by the inhabitants. The insects of Brazil are brilliant, presenting many different shapes and colors; of all, the butterflies are the most beautiful; 700 species have been seen in the environs of the town of Pará alone, while the whole number known in Europe is 390. Some scorpions attain a length of six inches. The bees of this country are mostly stingless. Large numbers of fish, which form a principal part of the subsistence of the inhabitants, are caught in the Amazon and other rivers. Professor Agassiz found in the Amazon alone 1163 new species of fish, which is more than the Mediterranean Sea produces.

Commerce.—Brazil chiefly imports breadstuffs, furniture, paper, linen, liquors, etc., and exports cotton, coffee, sugar, hides, horse-hair, caoutchouc, drugs, gums, diamonds, dyewoods, etc. The total amount of coffee produced in Brazil in 1820 was estimated at 5,312,000 pounds; in 1851 the amount produced was 303,556,960 pounds. In 1869 the imports amounted to 166,000,000 and the exports to 202,000,000 milreis (1 milreis = 54 cents).

Population, Races, etc.—The population of the several provinces of Brazil in 1867, according to Packenham, was as follows:

Provinces.	Population.
Rio de Janeiro	1,370,000
São Paulo	835,000
Santa Catharina	140,000
Paraná	90,000
Rio Grande do Sul	420,000
Espirito Santo	65,000
Bahia	1,400,000
Parahiba do Norte	280,000
Pernambuco	1,250,000
Alagoas	300,000
Sergipe	275,000
Rio Grande do Norte	230,000
Ceará	550,000
Piauhy	232,000
Maranhão	385,000
Pará	320,000
Minas Geraes	1,450,000
Goyaz	151,000
Matto Grosso	46,000
Alto Amazonas	70,000
Total	9,858,000

Of this number, 1,674,000 were slaves. The number of uncivilized Indians is about 200,000. The whites have gradually forced the natives back from the coast into the interior. The latter are mostly peaceable, and civilized to a certain degree. In the N. and in the extreme W. the Indians are still in a savage state, and oppose the advance of the whites. The number of tribes is very large, but it is not improbable that they originally belonged to one family and spoke one language. The most prominent are the Tupi, the Puris, the Guarycurnes in Matto Grosso, the Tapinambas in Bahia, the Taperivas in the N., and the Botocudoes. While the Indians predominate in the N., the negroes are in a majority in the S. But throughout Brazil the different races have mixed considerably. The descendants of whites and Indians are called Mamelucoes, of Indians and negroes, Cafuzoes, and the settled Indians, Caboclos. The white inhabitants consist almost entirely of the descendants of the Portuguese settlers. While the inhabitants of Minas Geraes are farthest advanced in intellectual culture, manufacturing industry is most advanced in Bahia. The inhabitants of Pernambuco are of the true type of a slaveholding aristocracy, while those of Rio Grande do Sul are an independent race of shepherds.

Religion, Government, etc.—The Roman Catholic is the established religion of Brazil, though other religions are tolerated since 1811. The number of Protestants is estimated at 20,000 to 25,000, mostly Germans. English are also found in all the commercial cities. A Presbyterian missionary association has several missionaries here, and publishes a paper. The Catholic Church has 986 parishes and 11 dioceses, which are subordinate to the archbishop of Bahia, the metropolitan and primate of Brazil. The government of the country is an hereditary constitutional monarchy. The legislative power is vested in the general assembly, which consists of two chambers, the senate and the chamber of deputies; the former elected for life, and the latter for four years. The head of the government is the emperor, who belongs to the house of Braganza.

The standing army in time of peace was fixed by the assembly in 1869 at 20,000 men. In 1870 the imperial navy consisted of 89 men-of-war, of which 52 were steamers.

Literature, Education, etc.—Through the enlightened policy of the present emperor, schools have been established in many of the largest towns, where the first rudiments of education are taught. Considerable attention has been paid to the study of the French system. A handsome mu-

seum has been established at Rio Janeiro. There is a school for engineers, a naval college, and several fine libraries. Brazil has two law schools—one in São Paulo, the other in Pernambuco, and two medical schools—at Bahia and Rio Janeiro. In Rio there are also a military academy, a naval academy, etc. Printing-presses are common throughout the empire. The press is free, and over 300 newspapers are published. The official language of the empire, and the language of the inhabitants of European descent, is Portuguese.

History.—Brazil was first discovered on May 3, 1500, by Vincente Yanez Pinçon, who was one of the companions of Columbus. It was subsequently taken possession of by Pedro Alvarez Cabral. Soon after the first discovery of Brazil the Portuguese made numerous settlements in that country, which continued gradually to extend, notwithstanding the jealousies and opposition of the English, Dutch, and Spaniards, who repeatedly attacked and even destroyed some of their settlements. In 1755 a decree was passed by the Portuguese government, declaring all Indians exempt from slavery, which curse in future should rest only on the African race. When Portugal was invaded by the French in 1808, the sovereign of that kingdom, John VI., sailed for Brazil, accompanied by his court. Soon after his arrival he placed the administration on a better footing, threw open the ports to all nations, and improved the condition of the country generally. On the fall of Bonaparte the king raised Brazil to the rank of a kingdom, and assumed the title of king of Portugal, Algarve, and Brazil. A revolution in 1820 forced the king to return to Portugal, and he left Pedro, his eldest son, as regent. In 1822, Dom Pedro, forced by a desire on the part of the Brazilians for complete independence, and not wishing the control of Brazil to go outside of his family, declared Brazil a free and independent state, and assumed the title of emperor, and was recognized by the king of Portugal in 1825. A series of disturbances and general dissatisfaction throughout the empire ended in the abdication of Dom Pedro, who left Brazil April 7, 1831, leaving a son, who was under age, as his successor. The rights of the latter were recognized and protected, and a regency of three persons appointed by the chamber of deputies to conduct the government during his minority. In 1840 the young emperor was declared of age, being then in his fifteenth year, and was crowned July 18, 1841. The early part of his reign was disturbed by a servile insurrection and a war with Buenos Ayres. In 1826, Dom Pedro I. had made a treaty with England for the abolition of the slave-trade. Dom Pedro II. emancipated the slaves of the government in 1866, and in 1871 the legislature provided for the gradual abolition of slavery throughout the entire empire. Brazil, with some aid from the Argentine Republic, carried on a war with Paraguay from 1865 to 1870. This war terminated in complete victory for Brazil. In 1866 an imperial decree opened all the important rivers to the commerce of foreign nations. Ten large steamships navigated the Amazon in 1869, while smaller steamers carried on a trade with Peru and Ecuador. The construction of railways is also rapidly progressing. The first one was made between Rio de Janeiro and Petropolis, and was opened for commerce in 1854. The railway of Dom Pedro II. extends from Rio Janeiro to São Francisco. The Bahia Railway is to unite Bahia to São Francisco. The Pernambuco Railway traverses the province diagonally from Recife, and is to extend to São Francisco. The São Paulo Railway is to connect Santos with Campinas. The aggregate length of Brazilian railroads in 1871 was 503 miles; the aggregate length of telegraph lines, 920 miles, but it has since been doubled.

The public debt of Brazil in 1870 was 581,323,430 milreis, of which sum less than one-fifth was due in foreign countries. The receipts of the revenue for 1869–70 were 77,611,950 milreis, about one-half of which came from import duties. There are also duties on certain exports, and there is a system of internal taxation. The expenses of the government in the years 1869–70 were nearly 71,000,000 milreis, of which 15,000,000 were paid towards the reduction of the public debt. The government pays subsidies to steamboat companies, railroads, and many schools, and owns one railway, that of Dom Pedro II. (See SOUTHEY, "History of Brazil," 3 vols., 1810–19; HANDELMANN, "Geschichte von Brasilien," 1860; WAPPÄUS, in the 7th ed. of Stein and Herschelmann's "Handbuch der Geographie und Statistik," 1871; FLETCHER and KIDDER, "Brazil and the Brazilians," 8th ed., Boston, 1868.)

A. J. SCHEM.

Brazil, a city of Clay co., Ind., on the Terre Haute and Indianapolis R. R., 16 miles E. N. E. of Terre Haute. It is an important centre of the block coal and iron business. It has one weekly paper. There are several blast furnaces and collieries in the vicinity. Pop. 2186; of Brazil township, 2772. ED. OF "MANUFACTURER AND MINER."

Brazil Cabbage, the *Caladium sagittifolium*, a plant of the natural order Araceæ, having arrow-shaped, pointed leaves. It is supposed to be a native of tropical America, but is now in cultivation throughout the tropics; not only the root being used for food, but also the leaves, boiled as greens. Both root and leaves are almost entirely destitute of the acridity so generally characteristic of the order.

Brazil'ian Grass, a popular name of a substance used in the manufacture of hats, sometimes called chip hats. It is not grass, but the leaves of a species of palm (*Chamærops argentea*) which are imported from Cuba.

Brazil-nuts, the seeds of the *Bertholletia excelsa*, a

Brazil-nut.

Brazil-nut: 1, represents the round woody pericarp, about one-fifth the natural diameter of an example of moderate size; 2, one of the nuts or seeds, half the natural length; 3, section of the same.

beautiful tree of the natural order Lecythidaceæ. This tree, which attains a height of 100 feet or more, abounds on the banks of the Orinoco and in the northern parts of Brazil, and bears a round woody pericarp nearly as large as a man's head. This pericarp contains about twenty-four seeds or nuts, which have the form of a triangular prism, and a hard shell enclosing a white kernel, which is very agreeable when fresh, but soon becomes rancid. They yield a large quantity of oil, which is valuable for burning in lamps. Many Brazil nuts are exported from Pará to Europe and the U. S.

Brazil-wood, an important dyewood from the *Cæsalpina crispa*, a tree of the order Leguminosæ. There are

Brazil-wood.

several varieties, known as Pernambuco, Lima, Santa Martha, Sapan or Japan, etc. The wood contains a colorless

principle, *brazilin* ($C_{18}H_{14}O_6$), which changes by oxidation to *brazilein* ($C_{18}H_{14}O_7$), which is the red coloring-matter which gives the wood its value. Pernambuco and Lima wood contain as high as 2.7 per cent. of brazilein, Sapan 1.5, and Santa Martha (also called Peach or Nicaragua) still less. Brazil-wood is very heavy and hard, is pale when freshly cut, but becomes red by exposure to the air. The coloring-matter is soluble in water, but more so in alcohol or ammonia. It is used in dyeing to produce reds with alumina, purples with tin, etc., for coloring wall-paper and for red ink. C. F. Chandler.

Bra'zing, the joining of two or more pieces of metal (iron, copper, German silver, brass, etc.) by means of "hard solder," an alloy of zinc and copper, which is fused and fluxed with borax upon the joint, and forms a hard alloy with the other metals, firmly uniting them.

Braz'law, a town of Russia, in the government of Podolia, 60 miles S. E. of Bar. Pop. 5211.

Brazo'ria, a county in the S. E. of Texas. Area, 1260 square miles. It is bounded on the S. E. by the Gulf of Mexico, and intersected by the Brazos and San Bernard rivers and other navigable streams. The surface is nearly level; the soil is fertile. Cattle, wool, corn, and cotton are raised. A large part of the county is prairie. It is well timbered. It is traversed by the Houston Tap and Brazoria R. R. Capital, Brazoria. Pop. 7527.

Brazoria, a post-village, capital of Brazoria co., Tex., is on the right (W.) bank of the Brazos River, about 30 miles from its mouth, and 60 miles W. S. W. of Galveston. Pop. 725.

Bra'zos, one of the largest rivers of Texas, rises in the high table-land in the N. W. part of the State, and flows first nearly eastward to Baylor. It afterwards pursues a S. E. course for about 200 miles. In the subsequent part of its course the general direction is S. S. E., and it enters the Gulf of Mexico about 40 miles S. W. of Galveston. Its whole length is estimated at 900 miles. In the rainy season, from February to May inclusive, it is navigable for steamboats about 300 miles from its mouth. It flows through forests of live-oak and red cedar.

Brazos, a county in Central Texas. Area, 578 square miles. It is bounded on the E. by the Navasota River, and on the S. W. by the Brazos. The former river unites with the Brazos at the S. E. extremity of the county. The soil is fertile; the surface in part undulating and well timbered. Cattle, corn, cotton, and wool are raised. The county is intersected by the Houston and Texas Central R. R. Capital, Bryan. Pop. 9205.

Bra'zos Santia'go, an inlet and seaport of Texas, in Cameron co., between the N. end of Brazos Island and the S. extremity of Padre Island. It has some trade, but it has a bad and shifting bar. The settlement is on Brazos Island, in lat. 26° 04′ N., lon. 97° 12′ W. A railroad has been constructed to White Ranche, on the Rio Grande. Point Isabel lighthouse on the mainland is a brick tower, with a white flashing light; lat. 26° 04′ 52″ N., lon. 97° 11′ 04″ W. Brazos Island extends southward 10 miles to "Boca Chica," a small outlet of the Rio Grande. The island is a waste of sand.

Breach, as a military term, signifies a gap or opening made by the besiegers in a wall or defensive work of a city or fortress. The operation by which the gap is produced is called *breaching,* and the guns used for this purpose are *breaching batteries.* (See Assault and Bombardment, by Gen. J. G. Barnard, U. S. Army.)

Breach of the Peace, the offence of disturbing the public peace, either by actively or constructively breaking it. Unlawful assemblies, riots, affrays, challenges to fight, and libels are breaches of the peace, and by the common law the offender is indictable. The phrase is sometimes used to distinguish civil from criminal cases, as in the clause of the U. S. Constitution which grants to members of either house of Congress freedom from arrest except in cases of treason, felony, and "breach of the peace." In this connection it seems to include all indictable offences, not only those which are in fact attended with force and violence, but also those which are constructive breaches of the peace of the government, as tending to violate good order.

Bread [Gr. ἄρτος; Lat. *panis;* Fr. *pain;* It. *pane;* Ger. *Brod;* etymology uncertain], the most common kind of prepared food. It is made from the flour or meal of some grain, which is moistened with water, and mixed or kneaded till uniform. It may or may not be *raised* by the development in the mass of carbonic acid or other gas; it is then formed into loaves or cakes, and finally baked before a fire or in an oven.

I. *Bread which is not raised* is often called *unleavened* bread. This may be made from the whole grain by soaking it in water, forming it in the hands, and either drying it in the sun or baking it before a fire. This is the simplest process of bread-making, and is still practised to some extent among savages. Generally, unleavened bread is made from grain which has been pounded or brayed in a mortar or between flat stones, reduced to meal in a mill, or even further reduced to flour. Coarse oat, barley, and pease meals are in Scotland made into bread by simply kneading with water, flavored with salt, and baking before a fire. Wheat bread is made in a similar manner in many localities. The *passover cakes* of the Israelites were thus prepared. In the U. S., especially among the poorer classes in the South, Indian corn meal is thus made into corn bread. From wheat flour, sea biscuit and the various kinds of crackers are prepared.

II. *Raised bread* is bread which is made porous and spongy by the aid of some gas, produced either before or during the baking. This gas may be carbonic acid, either generated by fermentation, produced by the decomposition in the bread of an alkaline bicarbonate, or mingled with the flour in solution in water under pressure. It may be air which is incorporated with the dough during the kneading and expanded during the baking, as in pastry, sponge cake, etc., or it may be carbonate of ammonia, which is vaporized during the baking.

The best bread is made of wheat flour, although the flour of rye, oats, and other grains is used. (See Flour.) Wheat flour owes its superiority to the large percentage of gluten which it contains. This body, when moistened with water, becomes adhesive, elastic, and tenacious, and holds the bubbles of gas formed during the process of raising the loaf, although it be distended to a spongy mass several times the original volume of the dough. The other cereals contain scarcely any gluten; hence it is difficult to make light-raised bread from them. (See Gluten.) The bread from wheat flour is whiter than that of other grains. The composition of the most important kinds of flour and meal is, according to Von Bibra, as follows:

	Wheat Flour.	Rye Meal.	Barley Meal.	Oat Meal.
Water	15.54	14.60	14.00	11.70
Albumen	1.34	1.56	1.20	1.24
Vegetable glue	1.76	2.92	3.60	3.25
Casein	0.37	0.90	1.34	0.15
Fibrin	5.19	7.36	8.24	14.84
Gluten	3.50			
Sugar	2.33	3.46	3.04	2.19
Gum	6.25	4.10	6.33	2.81
Fat	1.07	1.80	2.23	5.67
Starch	63.64	64.28	53.15	58.13
Sand	.....	.....	6.85	

Besides the above constituents the flour and meal contain small but important quantities of potash, soda, lime, magnesia, oxide of iron, chlorine, sulphuric and phosphoric acids, silica, etc., although the larger part of these substances remain in the bran, which is separated by bolting or sifting during the milling of the grain.

1. *Fermented bread* is prepared either with leaven or yeast. Leaven is dough—*i. e.* flour and water—in a state of incipient putrefaction. When flour is moistened with water and placed in a warm situation, spontaneous chemical action begins in the nitrogenous constituents, casein, fibrin, gluten, etc. This change extends later to the sugar, gum, and starch. At one stage of the decomposition the products of vinous fermentation may be detected, alcohol and carbonic acid; at a later stage an acid fermentation supervenes, producing lactic acid. The alcohol, carbonic acid, and lactic acid are formed from sugar, either the small quantity originally contained in the flour, or an additional quantity formed during the decomposition from the gum and starch. (See Fermentation.) The change of sugar in the vinous and lactic acid fermentations is shown in the following formulæ:

$$\underset{\text{Sugar.}}{C_6H_{12}O_6} = \underset{\text{Carbonic acid.}}{2CO_2} + \underset{\text{Alcohol.}}{2C_2H_6O}.$$

$$\underset{\text{Sugar.}}{C_6H_{12}O_6} = \underset{\text{Lactic acid.}}{2C_3H_6O_3}.$$

It is here seen that the transformation from sugar to alcohol and carbonic acid, or to lactic acid, is very simple. Where leaven is used for raising bread, a portion of the dough is set aside at each baking to serve as leaven for the next. The process of making the bread is very simple. The proper quantity of flour is mixed with tepid water, the leaven, and a little salt, the whole being well incorporated by kneading. The mixture is placed in a warm situation and left over night to ferment. If the leaven is in the proper stage of decomposition, it will induce vinous fermentation, producing alcohol and carbonic acid gas; the latter, held by the elastic and tenacious gluten, will expand the mass into a light, porous sponge, which becomes in the oven a palatable loaf. If, however, the leaven be in a more advanced state of decomposition, or if some other

necessary condition fail, instead of alcohol and carbonic acid, lactic acid will be formed, and the dough will not be *raised* by gas, but will be heavy and sour. To avoid this latter result, sal aëratus, bicarbonate of potassa or soda, is added to the dough. This neutralizes the lactic acid as fast as it is formed, and by liberating carbonic acid gas at the same time inflates the sponge and makes it light and porous. Were there any certainty as to the quantity of lactic acid that would be generated, it might be possible to add the proper amount of sal aëratus to neutralize it, but in practice there is generally an excess or a deficiency. In the former case the bread is alkaline, yellow, and disagreeable; in the latter case, sour. Leaven is also liable to communicate a disagreeable taste and odor.

Notwithstanding the difficulty of making good bread with leaven, and the frequent failures in private families, in Paris, where bread-making has reached a high degree of perfection, the bread is raised chiefly by leaven, a little yeast only being added to facilitate the fermentation. According to Prof. Horsford, the following is the common method practised in Paris: At eight o'clock in the evening a mass of paste (leaven or sour dough) is taken, composed of 8 kilogrammes of flour and 4 kilogrammes of water. This is left until six o'clock in the morning, and constitutes the main leaven; 8 kilogrammes more of flour and 4 kilogrammes of water are then added: this forms the first quality of leaven. At two o'clock in the afternoon 16 kilogrammes of flour and 8 of water are added: this is the second quality of leaven. At five o'clock the complete leaven is prepared by adding 100 pounds of flour and 52 kilogrammes of water, mixed with from 200–300 grammes of yeast. At seven o'clock 132 kilogrammes of flour and 68 kilogrammes of water, holding in solution 2 kilogrammes of salt, and mixed with from 300–600 grammes of yeast, are added to the leaven, and made into well-kneaded dough.

With this quantity of paste five or six batches of bread are made in the following manner: 1*st Batch*.—This is composed of half the dough prepared as above, which is moulded and left to rise, and then set in the oven. The bread of this first baking is sour, rather brown, and not particularly light. 2*d Batch*.—The dough remaining of the first batch is mixed with 132 kilogrammes more of flour and 68 kilogrammes of water, mixed with the same proportion of salt and yeast as the preceding batch. Half of this dough forms the second baking, the bread of which is whiter and better than the first. 3*d Batch*.—The same quantity of flour, water, and salt, with 300 grammes of yeast, is again added to the dough, of which half is baked as usual. 4*th Batch*.—Same proceeding as for the third. 5*th Batch*.—This is prepared like the foregoing, and produces what is called fancy bread, the finest quality of any.

The use of leaven is of great antiquity. The usual agent for raising bread in the public bakeries in the U. S. and in many families is yeast, either obtained from some brewery or specially prepared for the purpose. (See YEAST.) The following is a recipe in common use in New England: "Take eight good-sized potatoes, boil, mash fine, pass through a sieve, and work in a cup of flour. Thin to a cream with hot water, and add a tea-spoonful of salt and a table-spoonful of sugar. When cooled to lukewarm, add a cupful of old yeast, and set aside in a warm place. In six hours the yeast will be ready to use. Bottled it will keep for a week. Use a cupful for two loaves of bread." (*My Mother*.)

A very essential element of success in bread-making is thorough kneading. When the bread has risen sufficiently it is baked. There is a loss of about 25 per cent. in baking, chiefly water. In bread raised by fermentation some alcohol is evolved. Liebig estimated that 150,000 gallons of alcohol are thus lost annually in London alone, and 12,000,000 gallons in Germany. Efforts have been made to save it by condensation, but thus far without success.

The carbonic acid which gives lightness to fermented bread is derived chiefly from the small amount of sugar contained in the flour. If wheat is exposed to dampness after harvesting, or if the flour has been exposed to heat and moisture, the albumen which it contains is transformed into diastase (see BEER), which possesses the property of changing starch to dextrine (gum) and sugar. Bread made from such flour is sweet, sticky, heavy, and dark-colored. Several substances have been used to prevent these results. Alum is said to have been extensively used in London; its use being now forbidden by law, lime-water was recommended by Liebig, and is largely used by the Glasgow bakers. Sulphate of copper is a poisonous salt, said to be used in Belgium, $\frac{1}{30000}$ to $\frac{1}{15000}$ being sufficient for the purpose. Mege-Mouriès announced some years since (*Compt. Rend.*, xxxvii., 775; xxxviii., 351, 505; xlii., 1122; xliv., 40, 449; xlvi., 126; xlviii., 431; l., 467) the discovery of a body, "cerealine," found almost wholly in the bran, which possesses properties similar to those of diastase. He devised means for getting rid of this agent, or at least of its effects, and the following method of bread-making bears his name: It is assumed that 100 kilogrammes of wheaten meal have given

72 kil. 750 grammes finest white flour,
15 " 750 " dark groats,
11 " 500 " bran.

1. At six o'clock in the afternoon take 40 litres* of water at 18° R. (72½° F.), add 70 grammes of pure yeast, or 700 grammes common grocer's yeast, and 100 grammes of starch-sugar. (Instead of the yeast and sugar, take, if necessary, 26 grammes of tartaric acid.) The place where the mixture is set aside must be maintained nearly at the temperature of 18° R. 2. The next morning, at six o'clock, the fluid will be saturated with carbonic acid. Stir in the 15 kilogrammes 750 grammes of groats. Fermentation will commence immediately. 3. At two o'clock in the afternoon add 30 litres of water, and pass the whole through a very fine silk or silver-wire sieve, to separate the fine bran. 4. The 70 litres with which the groats have been treated, after passing through the sieve, will be reduced to about 55 litres, with which the 72 kilogrammes 750 grammes of white flour and 700 grammes of salt are to be kneaded into a dough. (The bran is again extracted with 30 litres of water, and the extract employed in the next batch.) 5. The dough is then placed in baking-pans to ferment. 6. When raised, it is placed in the oven.

The baking of bread can be effected at 212° F., but no crust will be formed; to secure the best result a temperature of 350° to 570° F. should be employed. A high heat should be avoided at first, lest a hard crust be formed while the interior of the loaf remains unbaked. 100 pounds of flour yield from 125 to 135 pounds of bread, the increase being due to the water added. The most common faults of wheat bread are due to its being (1) *sour*, from the flour having been partly spoiled, the yeast or leaven having been too old, or the dough having been allowed to stand too long before baking; (2) *bitter*, from excess of yeast or bad yeast; (3) *heavy*, from insufficient kneading, raising, or bad leaven; (4) *mouldy*, from the flour having been kept too long in a damp place.

Graham bread is made from the unbolted meal of wheat, a mixture of bran and flour; it is used by dyspeptics. *Rye bread* is largely used in Northern Europe, and to some extent in the U. S. It is dark-colored, is harder than wheat bread, and has a peculiar taste.

2. *Substitutes for Fermentation*.—Carbonic acid may be developed in the dough by the decomposition of bicarbonate of potassa (sal aëratus) or of bicarbonate of soda by some acid. Sour milk, hydrochloric acid, tartaric acid, bitartrate of potassa (cream of tartar), and the acid phosphate of lime have been used for this purpose. They give rise respectively to lactate, chloride, tartrate, double potassic tartrate (Rochelle salt) of potassium or sodium, or to (in the case of the last mentioned) a mixture of phosphate of lime and soda or potassa. As neither of these agents causes fermentation, none of the elements of the flour are lost, and a greater yield of bread is claimed. This saving is, however, very trifling, as the loss in fermentation is small. The use of the acid phosphate of lime, suggested by Prof. Horsford, is claimed to restore to the flour the phosphates of the wheat which were removed in the bran. The process has been commended by Liebig. One strong recommendation for these "baking-powders" is the fact that bread may be mixed and baked at once, without the delay of several hours which is necessary where fermentation is resorted to. As cream of tartar and acid phosphate of lime do not act on bicarbonate of soda in the absence of water, either of these acid salts may be mixed with the flour, together with the bicarbonate, thus producing what is now extensively sold in the U. S. under the name of "self-raising flour," which is already salted, and merely requires to be mixed with water and baked to produce a palatable loaf. Carbonate of ammonia (sal volatile) is sometimes used alone to raise bread; being very volatile, it is converted into vapor during the baking and raises the loaf to a light sponge. Mr. Dauglish introduced *aërated bread*, which is prepared by kneading flour in a closed vessel with water supersaturated under pressure with carbonic acid gas. On bringing the dough into the air, the carbonic acid gas set free by the removal of the pressure expands it into a sponge. "Sponge cake" is raised by means of air which is incorporated with the flour by first beating eggs to a froth, stirring in the flour, and quickly baking. "Pastry" is made flaky, but not really spongy like bread, by mixing flour and water to a dough, rolling it out into sheets, applying butter liber-

*A litre of water weighs 1000 grammes = 1 kilogramme = 2.2 pounds avoirdupois.

ally, doubling over the sheet, rolling it out again, and again applying butter. These operations are repeated till the dough becomes a sheet of innumerable layers of dough alternating with a thin coating of butter. On exposing this to the heat of the oven, the different layers of dough separate, either from the expansion of the imprisoned air or from steam, and the mass becomes light and flaky.

C. F. CHANDLER.

Breadal'bane, EARLS OF, earls of Holland, viscounts of Tay and Paintland, Lords Glenorchy, Benederaloch, Ormelie, and Wreik (1677, in Scotland), and baronets (1625, in Scotland), a prominent family of Scotland.—GAVIN CAMPBELL, the seventh earl, was born in 1851, and succeeded his father in 1871.

Bread-fruit Tree (*Artocarpus incisa*), an important tree of the order Artocarpaceæ, a native of Southern Asia,

Bread Fruit.

of the islands of the South Pacific and of the Indian Archipelago, now naturalized in some of the West Indies. This tree grows to the height of forty or fifty feet, and has large, glossy, dark-green leaves, which are pinnatifid or deeply divided into pointed lobes. The leaves are sometimes eighteen inches long. The fruit, which is a *sorosis*, is nearly spherical, and is covered with a rough rind, which is marked with small irregularly hexagonal divisions, having each a small prominence in the middle. The fruit sometimes weighs four pounds or more, contains a large portion of starch or fecula, and is a principal part of the food of the natives of the South Sea Islands. The pulp is juicy and yellow when it is fully ripe, but it is in a better condition for eating before it arrives at that stage of maturity. When it is gathered before ripeness and baked, the pulp is white and mealy, very nutritious, and resembles wheat bread. The usual practice is to cut the fruit into three or four slices, and bake them in an oven. Sometimes the people of a village join to make a huge oven—a pit twenty or thirty feet in circumference—in which several hundred bread-fruits are baked at once on heated stones. Baked in this mode, the bread will keep good for several weeks. The tree produces two or three crops in a year. It has been introduced into the West Indies with some success. The timber, which is light and of a rich yellow color, is used in building houses and for other purposes, but if exposed to the weather is not very durable. A sort of cloth is made of the fibrous inner bark. The tree abounds in a glutinous milky juice, which, when boiled with cocoanut oil, is used as a cement and as bird-lime.

Bread-Nut, the fruit of the *Brosimum Alicastrum*, a tree of the order Artocarpaceæ, is a native of Jamaica. It is allied to the bread-fruit. The genus *Brosimum* has male and female flowers on separate trees in globose catkins. Its fruit is a 1-seeded drupe, which is edible, and is used instead of bread after it has been boiled or roasted. The tree has ovate, lanceolate, evergreen leaves, and abounds in a gummy milk.

Break'water. An artificial barrier designed to *break* the force of waves in sea-ports and harbors and thus to protect shipping from damage; but more commonly to *create* a harbor or a secure anchorage where none existed before. Among ancient works the piers of the ancient Piræus and of Rhodes may be denominated Breakwaters, as also similar modern structures projected from the shore and called *piers* or *moles;* but the term *Breakwater* has of late years been considered as more peculiarly appropriate to large insulated aggregations of stone, whether of regular masonry or sunk promiscuously in rough masses, so placed as to form an artificial island across the mouth of an open roadstead, and thereby, in obstructing and breaking the waves of the sea, to convert a dangerous anchorage into a safe and commodious harbor for the reception of ships of war or merchantmen. In this sense of the term the Breakwater of Cherbourg (Fr. "Digue de Cherbourg") was the first work entitled to the name,* and it remains still the *greatest.* It had long formed a favorite project of the French government to establish a great maritime port in this quarter of the kingdom, in order to counterbalance in some measure the great naval station of Portsmouth, situated on the opposite side of the Channel, and the whole coast had been frequently surveyed and examined by the most celebrated engineers for that purpose, but nothing definite was done until the year 1712, when a plan was proposed to the Minister of Marine to construct a detached mole or breakwater, in order to protect the roadstead of Cherbourg. The subject was dropped till 1777 when M. de la Bretonniere, a distinguished naval officer, proposed a plan to construct a detached breakwater, 2000 toises or 12,792 English feet long, having three openings, viz. one in the centre and one at each end: these breakwaters or moles he proposed to make by sinking the hulls of vessels filled with stone, in order to form a nucleus or base for the work in the first instance (similar to the plan which had been adopted at Rochelle by Cardinal Richelieu in the year 1629), and then to cover the hulls of the vessels with loose angular blocks of rubble stone or *pierre perdue,* so as to form one continued breakwater. He proposed this plan of commencing the work because he was fearful that the undercurrents and waves during storms were so strong that it would be impossible for the rubble to lie without some nucleus of the kind to bind it together in the first instance. The objections made to the plan of M. de Bretonniere were, First, that it would require a number of vessels which France could not furnish in ten years. Secondly, that there would be great difficulty in getting a sufficient number of workmen. Thirdly, that although the plan had succeeded very well at Rochelle, yet there was no similarity between the two cases; for whilst at Rochelle there were only from 5 to 6 feet at low water, at Cherbourg there were generally 40 feet, and in some places more, and as the moles at Rochelle were attached to the shore, the difficulties were comparatively trifling to what they would be at Cherbourg, where they would be isolated. Fourthly, that the upper part of the breakwater would be so much exposed that it would not withstand the shock of the waves. Fifthly, that it was not high enough to give sufficient protection to the shipping within.

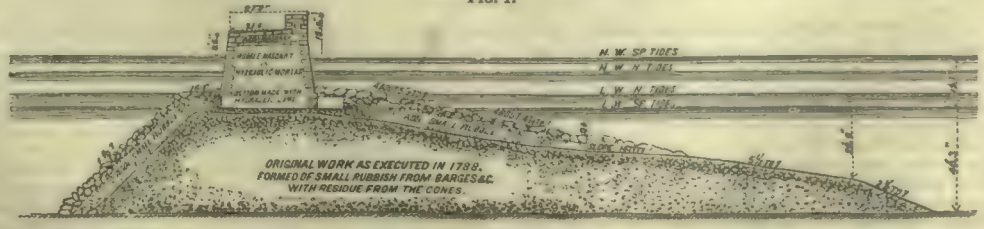
In 1781 the matter was referred by the Minister of Marine to M. de Cessart, an engineer of reputation for hydraulic constructions of this character. M. de Cessart entertained great doubts of the probability of making a continuous mole of such gigantic dimensions, composed only of loose rubble stone, sufficiently strong to be able to withstand the effects of the waves and currents, the more so as the only similar work at Rochelle had failed just after its completion in 1628; he therefore conceived the idea of breaking and destroying the effects of the waves in the first instance by a series of 90 detached cones, made of wood and filled with stone, sunk in the line of the proposed breakwater, touching each other, or at such distance only from each other as would be sufficient to break and disperse the waves without allowing them to pass bodily through between the cones, by which he considered that sufficient tranquillity would be produced within, so as to form a safe and secure roadstead. The plan of M. de Cessart was approved and adopted and himself appointed the Chief Engineer of the work. The cones were proposed to be 142 feet diameter at the base 113 feet diameter at the top, the sides inclining at an angle of 60°, and 65 feet high: the total weight of each was 2,000,885 lbs., and would displace 27,418 cubic feet of water; and in order to give as little resistance as possible, and to render it more buoyant, he proposed to attach to it 68 great casks, 12 feet long and 7 feet diameter: it was calculated that in calm weather it would require 250 men in boats to tow out one of the cones;

*Mr. George Rennie in his letter of Dec. 31, 1835, concerning the proposed Madras Breakwater (Engineering Oct. 18, 1872) enumerates many other ancient and modern works as "breakwaters." It is evident enough, from the tentative process by which the Cherbourg advanced, that no previous work furnished adequate information as to the principles of such constructions and hence that none was entitled to be named with these hereafter described. The numerous "moles" he mentions differ from such breakwaters in many respects besides their connection with the land.

this operation would occupy five or six hours, and the sinking 36 minutes; the depth of water where they were to be sunk was from 6 to 7 fathoms, and the rise of tide at ordinary springs 18 feet, so that the upper part of the cone would be from 8 to 10 feet above high water. Immediately after the caisson was sunk, it was to be filled with stone, viz. rubble to the level of low water and masonry above. Eighteen of these 20 cones were put in place at an expense of about £14,000 each. Their expense and the repeated damage occasioned to them by storms induced the Committee of Direction to abandon the plan of M. de Cessart, notwithstanding his dissent and strong remonstrances against it. No more than eighteen cones were deposited, the last being placed on the 19th of June, 1788, and they subsequently adopted the plan of throwing down nothing but rubble, wholly against the advice of M. de Cessart, who said that the rubble alone would never be able to resist the force of the sea, and that it would be utterly impossible to construct the mole or digue in that manner. Fortunately, however, the advice of M. de Cessart was not taken, and the contrary opinion prevailed.

The foregoing is interesting as showing that the fundamental knowledge of the force and action of waves upon such structures being unknown at that day, how feeble and groping were the efforts to design an efficient breakwater. Says Sir John Rennie,—("Theory and Construction of British and Foreign Harbours") "The well-known principle, that all materials take their angle of repose more or less according to the density, tenacity, and gravity of their component parts, combined with the external forces acting upon them, does not appear to have inspired M. de Cessart with sufficient confidence to trust to the rubble alone; and the moles at Rochelle, which he seems to have studied with great care, did not inspire him with greater confidence, although the small rubble of which they were composed, the steep slope at which the rubble was laid, and the heavy sea to which they were exposed might readily have suggested to him the cause of their failure. It is still more extraordinary (if he doubted the efficiency of the small stones which he employed, weighing only from 30 to 100 lbs. each), that he did not employ blocks of much larger size, as he was doubtless aware that they would be moved with much greater difficulty by the sea; in fact, by the mere inspection of the sea-shore he would have found that within the range of the waves it invariably takes the angle or inclination according to the materials composing its surface; for example, sand lies at an angle of 1° 30′, or 40 to 1; beach, or loose pebbles, at angles of 11° or 8°, or 5 and 7 to 1; and heavier materials at a steeper angle, or almost perpendicular; but, abandoning the simple laws of nature, he went out of his way to invent the expensive unwieldy cones, which were no sooner fixed in their places, than nature, as it were, deriding his feeble efforts, at once destroyed and overturned them."

The cones having been abandoned small rubble continued to be thrown in until 1790 with an inside slope of forty-five degrees, and, outside, one upon three. In 1792 a commission of the French government reported that the digue had hitherto been constructed with small stones only one-fifth of a foot cube each, and that these had undergone considerable alteration as to the form of the mass, to the depth of 16 feet (English) below low water of the lowest tides, so that it was impossible to construct a permanent mole with such small materials; but they found in a small portion, 50 toises long, where blocks of 20 cubic feet had been employed, that they maintained their position tolerably well, and preserved the small blocks within them, although where there were only smaller blocks, they were sensibly damaged and removed, and displaced, *particularly near the cones*, which, although cut down to low water, materially increased the shock or recoil of the waves, while they acted with greater force upon the small loose rubble near them. They therefore came to the unanimous conclusion, that as blocks of from 15 to 20 cubic feet would withstand the effects of the waves, still greater durability would be obtained by employing larger blocks. The question as to the height to which the mole should be carried, in order to ensure the necessary tranquillity within the roadstead, was much more difficult to determine: it was found that the action of the waves was most severe two hours before and two hours after high water, or when the tide had risen about 16 feet; and at such times, during gales of wind, vessels riding within the breakwater suffered great inconvenience, so that it was necessary to raise the breakwater or digue at least to that height; but even this would not ensure sufficient tranquillity to enable boats to communicate from the shore with vessels in the roadstead at all times; and considering that this great advantage would only be obtained by raising it to the height of 9 feet above the level of the highest tides, so as to place it beyond the general reach of the waves, they finally resolved to recommend that it should be carried to that height.



In the year 1802 the work which had at different times been raised nearly its whole length to the level of low water of spring tides, had been lowered by the violence of storms to a depth of from 12 to 15 feet below low water: the inner slope was 1 to 1, or 45°; the exterior 1½ to 1, or 33°, from the bottom to 18 feet above it; and from thence to within 6 feet of low water of spring-tides it had assumed the slope of nearly 8 or 10 to 1, or an angle of 7° and 5°, at which it seemed to be permanent. Such being the state of the work, notwithstanding the employment of larger blocks of stone, great difficulties were anticipated in constructing a battery upon it, which the Government nevertheless determined to do.

For the next six years operations appear to have been confined to the enlargement and raising of the central part of the dike and construction of the battery. Several severe storms occurred in this period doing great damage. The most severe was Feb. 12, 1802, when the sea covered the whole platform of the battery, and the barracks with 60 men were swept away. The mass, properly speaking, of the battery suffered but little, although the pavement was torn up and the blocks were wedged into fresh slopes with great regularity, as if they had been cemented together by the hand of man. The real effect of the storm was generally to consolidate the mass of the work more firmly together. New wooden barracks were erected, and after this repair the battery remained in a good condition throughout the war.

Thereafter until 1830 little was done except to preserve the central battery and to raise the remainder by means of rubble to low water level; but finding it extremely difficult to maintain it in that position, and feeling that, in order to secure the desired tranquillity within the roadstead, it was necessary to raise the superstructure at least from 9 to 10 feet above high water of spring-tides, it was finally resolved, at the recommendation of several engineers, to construct a wall of solid masonry, with almost vertical sides, from low water upwards, upon the top of the rubble base: this upright wall extends from thence up to the full height of 6 feet above the level of high water of spring tides; it is composed of rubble masonry faced with granite ashlar or dressed stone, in horizontal courses from 18 inches to 2 ft. thick, and 3 to 4 ft. wide, set in mortar. This part of the work is 36 feet 3 inches wide at the base, and 29 feet 3 inches wide at the top, the outer slope being ½ to 1, and the inner slope nearly the same: on the outside of this superstructure there is a solid parapet 8 feet 3 inches thick, 6 feet high, and eight feet six inches wide at the top. The exterior base of this wall is founded on a bed of beton or concrete, set in wooden boxes or cases 10 feet long, 6 feet 6 inches wide, and 3 feet 3 inches deep dove-tailed together, and well bedded in and covered with large blocks of rubble stone.

No sooner was this vertical wall raised above the level of high water than it presented such a sudden resistance to the waves, rolling upwards along the rubble slope, that they broke against the face of the vertical wall with the greatest violence, and rising perpendicularly against it,

FIG. 1.

fell down upon the rubble, undermining the base of the vertical wall and threatening to overwhelm it entirely. To obviate this, it became necessary to raise the rubble slope still higher, and to case the surface with large heavy blocks, well wedged together: still this only partially remedied the evil, for, notwithstanding this casing, during

heavy N. W. and N. E. gales at high water the waves beat with such violence against it, that heavy masses of water wash over the top, so as to render it both difficult and dangerous to walk along it, although nearly 10 feet above high water of the highest tides; and it has been proposed (1850) to carry the rubble slope still higher in front of it, also to raise the wall 8 feet higher.

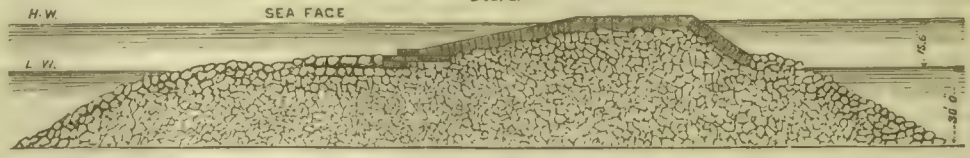
Sir John Rennie from whose great work on Harbours the foregoing is taken draws the following "conclusions":

First. The plan of making the digue or breakwater isolated or detached from the shore is the best, and, if carried into effect with greater judgment, would have been more advantageous to the harbor.

Secondly. The cone system, although ingenious, was inapplicable and failed.

Thirdly. The rubble system for the mass of the work is correct, and if blocks of greater size had been employed, the result would have been more advantageous in economy of time, labor, and materials.

Fourthly. The vertical wall system is inferior to the flat slope.



The history of the Cherbourg Breakwater has been thus given in some detail, since, being the first work of the kind, the experience derived has furnished *data* for subsequent works.

The next great breakwater in order of time and importance is the "Plymouth," intended to render Plymouth Sound a safe roadstead for ships of war. It was recommended by Messrs. Rennie and Whidby as the most practicable and best mode of constructing this great work, to heap together promiscuously large blocks of stone, which were to be sunk in the line of the intended breakwater, leaving them to find their own base,* and take their own position; and it was conceived that stones of the weight of from one and a half to two tons each would be sufficiently large to keep their places, without being rolled about by the tremendous swell which, in stormy weather, is thrown into Plymouth Sound; and thus avoid the inconvenience as well as loss of time and labour which the French had experienced at Cherbourg by throwing down small rubble stones. It was thought, that, in those places where the water was five fathoms or thirty feet deep, the base of the breakwater should not be less than seventy yards broad, and the summit ten yards, at the height of ten feet above the low water of an ordinary spring-tide; in other words, that the dimensions of the breakwater in these places should be forty feet high, thirty feet across the top, and 210 feet wide at the foundation. There are in this work about 900,000 tons of stone of which in blocks

	Tons.
Of one ton each stone, and under	423,904
Of one to three tons each	309,706
Of three to five tons each	150,593
Of five tons and upwards	12,760

The cost of the work was £364,000; a little over eight shillings per ton of stone. More recently the surface above low water has been covered (or "paved") with blocks of stone of great size, of regular dimensions, and closely and smoothly laid. The work has completely answered the expectations of its advocates.

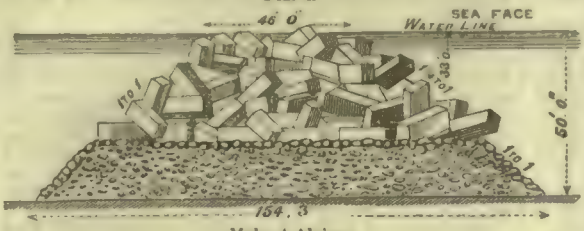
FIG. 2.

The PORTLAND Breakwater, designed to create a harbor of refuge, commenced in 1849, has recently been finished. It commences with a pier projecting from the shore, of 1900 feet in length. Then follows a gap or opening of 400 feet to admit vessels of the largest class, coming from the Southward. Beyond this gap the breakwater proper commences, and extends seaward 6000 feet. The pier is formed by a rubble mound, composed of stone of all sizes, from 6 and 8 tons down to small chippings; and this mound is carried up to a few feet above the level of high water of spring tides. When it has been washed by heavy seas, a trench is excavated within the body of the mound to the level of low water of spring tides, and a wall of masonry erected. The face course is formed by large ashlar blocks, the body of the wall being of heavy rubble work set in mortar made of blue lias lime and pozzuolana. The ashlar face courses up to about 6 feet above high water are of granite, all the remainder of the stone employed being from the quarries in Portland. The sea wall is strengthened by counterforts placed 20 feet apart, and an arch being turned between each, a platform is obtained 15 feet wide, exclusive of footway and parapet. Instead of throwing overboard from vessels, the deposit of stone and other operations were carried on from a timber staging, the rubble stone being conveyed in waggons drawn by locomotive engines, a mode introduced by the late Mr. Rendel, C. E., which proved entirely successful. Guided by results obtained elsewhere, it was decided when the work was commenced to keep all the horizontal timbers of the staging at least 12 feet above high water of the highest tides; and experience proved that this was necessary to ensure safety. The breakwater proper is simply a rubble bank, the material of which it is formed being for the most part the "cap-stone" which covers the valuable Portland stone, but which of itself is valueless, except for this purpose. The rubble, as in the pier, includes stones of all sizes, from large masses down to chips, which latter the action of the water has driven in between the larger blocks until (as is said) they have become united into a compact and almost solid mass.

During the construction the 400 feet opening was bridged

FIG. 3.

Portland Breakwater.



by a staging, which withstood the severest storms. It was designed by Mr. Rendel and consisted of piles formed of creosoted logs. To the lower end a Mitchell screw was attached which was screwed 6 or 8 feet into the clay. These, about 80 feet apart, supported the platform to which of course they were strongly bolted and bound. The cost of this work exceeded £1,000,000.

The works just described illustrate the most common mode of breakwater construction, *i. e.* the "*pierre perdue*," "long slope," or (as we call it) the "rip-rap" system. This is simply the deposit in the sea of a vast amount of loose rubble stone, rising to about the level of high water, allowing it to take its own level and to be acted upon by the sea, until its section assumes the permanent form which this action gives it. The seaward side obeys the laws of ordinary sea-beaches, and forms itself into a long sloping shore, involving the employment of an enormous amount of material before the mound reaches the height to give the required protection. Such a system is only applicable where stone is abundant, and can consequently be deposited at a cheap rate. But stone is not everywhere to be had, especially in large blocks, and experience has shown that unless blocks of considerable magnitude are applied to the upper portions, permanence cannot be ensured. Hence a substitute has been found in large blocks of con-

*It is stated by Mr. Rennie (see latter hereafter) that the original section was triangular with outer slope of 18°.

crete (Fr. *béton*). M. Poirel (see his "*Mémoire sur les Travaux à la Mer*") was the first to introduce this system in the construction of a mole at Algiers, which he constructed at first wholly of blocks of béton of 10 cubic metres, or about 22 tons each, launched into the sea as *pierre perdue*. M. Poirel states that although the profiles "differed somewhat from each other, yet they gave generally for the slopes at which the artificial blocks arranged themselves, a rate of 1 base to 1 perpendicular (45°) for the exterior, and of ½ base to 1 perpendicular (57°) for the interior side." He adds "that it appears, on a comparison of the cubic contents of the mole as given by these profiles, with the account kept of the quantities contained in the blocks immersed, that the interstices are very nearly one-third of the solids; or, which is the same thing, that the voids are equal to one-fourth of the whole mass." In prolonging the mole, since 1847, the French had adopted a cheaper system, by forming the mass from the bottom with blocks of natural stone, which were brought up till the uniform depth of 33 feet under water was attained at slopes of 1 to 1. This method was subsequently employed in forming the new port of La Joliette, at Marseilles; and, more recently, for the jetees forming the artificial harbor of Port Saïd at the entrance to the Suez Canal.

Fig. 4.

Mole at Algiers.

Fig. 5.

Mole of Joliette at Marseilles.

In other situations destitute of suitable stone, another form, the vertical-wall system, is adopted. In this mode the walls are built upright from the bottom, and as all the material below low-water is put in place by diving apparatus, and is of an expensive nature, the cost of a work executed in this way is very great. The Dover breakwater is the most prominent example. It is built up solid from the bottom of the sea, the exterior facing being of ashlar granite blocks, and the hearting of rectangular blocks of concrete, built in the same way as ashlar masonry up to the level of high-water, above which it is filled in with concrete.

Concrete blocks are a costly substitute at best for rough quarry stone (when that is at hand), and with a system of construction which requires each block to be "laid" (under water), the expense must be very great. The Dover Breakwater has cost over £400 per lineal foot.

Fig. 6.

Dover (West) Breakwater.

It has been a subject of discussion whether the "long slope" or the "vertical wall" system were preferable: waves in deep water are chiefly oscillatory in their character, the fluid having little progressive motion in itself, and consequently exerting but little force on objects opposed to it; but when deep sea waves approaching the shore, feel the influence of gradually shoaling depth, they assume an entirely different character, acquire progressive motion, and become waves of *translation*, in which the fluid is carried bodily forward in a horizontal direction, and in consequence it strikes any body opposed to it with great percussive force. Vertical walls, therefore, which rise from the deep water, being only subject to the oscillatory movement of the waves, are least exposed to the destructive effect of storms. The evidence taken before the Royal Commission in 1859 seemed to be conclusive on this point, and the opinions of the Commissioners, as developed in their report, may be considered to have set this subject at rest. But whatever difference of opinion there may still be upon this matter, there can be no question as to the vast saving of material by vertical walls, and of the great economy which would result, provided a simple and easy mode of construction could be adopted. The vertical system has, besides, the great advantage of being applicable in many cases as quays for vessels lying alongside to load and discharge, which may be turned to valuable account both for commercial purposes, and in times of war, for the rapid shipment or debarkation of troops, stores, and other materials. (See Paper by D. Miller, "C. E. and Arch. Journal," 1865.) But it is implied that the wall *springs from deep water; i. e.* fifteen feet at least, the experience at Cherbourg, Alderney, Portland, and Holyhead having shown that the sea did not disturb rubble at a depth of 15 feet below low water; and, hence, there may be a combination of the vertical wall and slope, which is nearly equal to a vertical wall;—as when a nearly perpendicular wall is built upon a rubble mound, as near to the edge of the slope as was consistent with the safety of the foundation; the surface of the mound being 15 feet below low water, and the slope being the natural one of about 1 to 1.

It is to be observed that the vertical construction on the Cherbourg breakwater, instead of springing from great depth, commences at *low-water* mark—an arrangement which we believe is now generally condemned. (The Civil Engineer and Architects' Journal of 1865 furnishes graphic sections of the different works alluded to and of others, as of Cette, La Ciotat, Cassis, Vendres, with interesting discussions as to the form and cost of breakwaters.)

In the construction of a sub-aqueous mass on the "riprap" system, whether for a breakwater or a foundation, a question arises as to the size of the material to be used. The Cherbourg work was first constructed wholly of very small stones; it was subsequently found necessary to cover its more exposed surfaces with large blocks. In the Plymouth, the system at first was to use the largest stones obtainable from the quarries. At Portland and at Holyhead the large and small stones were used promiscuously, even the quarry rubbish being deposited for the purpose of filling up the interstices. The French engineers, on the contrary, considered the best system of employing rubble was not to mix the small with the large blocks. In one of their best constructed moles, that of La Joliette, at Marseilles, this method has been strictly adhered to. The large blocks being only used where required, were not unnecessarily wasted in the heart of the work. Small pieces of stone mixed with large rubble, far from consolidating the work, very often had the effect of allowing the larger masses to be more readily displaced. Stones weighing 5 tons and even 7 tons are thrown out of place by the waves, in consequence of the small stones getting in between them, and keeping them in motion during every storm. If, however, heavy blocks only are employed, so as to remain stationary under the greatest action of the waves, nothing would be gained by the interstices being filled up.

M. Cachin deduces from the experience of Cherbourg, as developed by observations after exposure to the severest tempests, the following facts concerning the natural slopes assumed by the exposed face of the breakwater. Above the highest storm tides the talus assumes a slope of 1 upon 1.8; between extreme high and low water 1 upon 5½; between the level of lowest storm-tides and a plane 5 metres (16½ feet) below this level, 1 upon 3; thence to the bottom 1 upon 1½. Hence it is generally assumed that at three fathoms below low water the force of the waves is insignificant. Hence the nucleus of a breakwater may be constructed to that height of small stones, say of blocks of ¼ ton down to quarry rubbish. Larger stone is required

above this, say from 2 to 5 tons; but if the surface is to be finished with loose blocks, alone, those of the outer coating must be of large dimensions. The French engineers, in the construction of the new mole at Algiers found by experience that blocks of 10 metres cube, or about 22 tons, were requisite to withstand the shock of the waves. At Marseilles and at Cette the beton blocks weighed 25½ tons; but at Cassis, in a more exposed situation, with very deep water outside, and a long stretch of sea, the outer face of the mole required blocks of 20 metres cube; for on trial, blocks of 10 and even of 15 metres cube were found insufficient.

The experience at Cherbourg gives about the same results; a block of beton of 4 metres × 2.25 × 1.40, or 12.60 cubic metres volume and 28,980 kilogrammes weight, lying loosely and exposed, resisted the most violent tempests. M. Cachin estimates the force required to move this stone at 3900 kil. per sq. metre (or 800 lbs. per square foot) of *exposed surface*. At Skerryvore stones of 5 tons were swept over the top of the rock and Mr. Stevenson's Dynamometer measured pressures of 6000 *lbs. per sq. foot*; and this extreme pressure has been confirmed in a few instances elsewhere (see a remarkable instance in the Journal Des Ponts et Chausées April, 1859).

It remains to allude to our own great work, the Delaware Breakwater. This, unlike those of Plymouth and Cherbourg, mainly undertaken in reference to naval aggrandizement of the respective nations, was designed solely for the benefit of trade and commerce and the preservation of life. The need of a *harbor of refuge* near the mouth of the Delaware Bay was early recognized. Commissioners appointed by Congress in 1828 selected Cape Henlopen as the site. They said "the objects to be gained by an artificial harbor in this roadstead are to shelter vessels from the action of the waves caused by the winds blowing from east to northwest round by the north, and also to protect them against injuries arising from floating ice descending from the north-west." Having these objects in view, the commissioners proposed two works—the breakwater proper, to secure the first object; and the ice-breaker, an auxiliary to the breakwater but chiefly to accomplish the second purpose. The first mentioned was designed with a length of 1200 yards. The ice-breaker was designed with a length of 500 yards.

FIG. 7.

As now constructed the length of the breakwater proper is 2589 feet and the ice-breaker nearly 1500 feet long. In designing the work the Commissioners had the two great examples which we have described before them,—Cherbourg and Plymouth—both, originally, on the "rip-rap" system. Adopting that system they copied the slopes from the first but fixed a width on top 8 feet less than that of Plymouth. The great mass of the breakwater consists of blocks ranging from ¼ ton to 3 tons; the seaward slopes being coated with stones of from 1½ to 7½ tons. The *exposure* is by no means so severe, owing to the shoals off the mouth of the bay, as at others we have noticed. Blocks of 6000 lbs. weight have been moved several feet, as in the gale of March, 1843; but the injuries inflicted by the waves have been but slight.

In an official report of the writer when (1853) in charge of this work, occurs the following passage: "I consider the profile and the principles upon which it is based radically vicious. They are to trust to the isolated mass of each block of stone, exposed on the surface, to retain its position, while at the same time an accumulated mass is heaped up twice as great as necessary to resist the total effort of the waves. Though little attention has been paid to the recommendation of the Commissioners as to the arrangement and mass of stone above low water, the breakwater has resisted every storm which has yet spent itself upon it; and if occasionally a block of considerable dimensions has been moved from its place, it has been utterly disconnected from the mass of the work, and generally on unfinished portions over which the sea swept with all its violence."

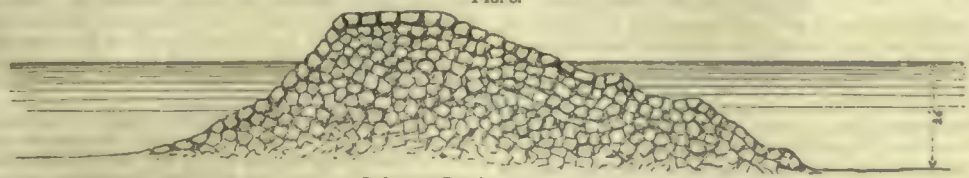
* * * * * * * *

. . . "in the future arrangement of the work I should urge that, from the extreme low water line, the work should consist of dimension stone carefully laid in courses of headers to the sea, having dimensions of at least nine feet in length, and two by three on the head, and that the top should be capped with stone twelve feet in length, covering the whole with such blocks as would, even if isolated, be able to maintain their stability when thus placed lengthwise to the sea."

The method of construction above recommended in 1853 has been sanctioned by the practice at all the more recent works at Holyhead, Portland, Alderney, etc., which have vertical walls starting *from low water*. But not only is wave action developed with all its violence by a sloping surface reaching from low water to 2½ or 3 fathoms but it is these long slopes which render the total rip-rap mass so great. The vertical wall should therefore extend *below* low water to the region of comparative quiescence. The Delaware Breakwater contains 900,000 tons (very nearly) of stone costing (all expenses included) an average of $2.35 per ton. Previous to 1839 when 835,000 tons had been placed the average was $2.27—the average has subsequently been over $4.00. Assuming an average depth of 5 fathoms (30 ft.) and that the "rip-rap" is only raised 15 feet above the bottom, with 30 feet width at top, an inner slope of 1 upon 1 and an outer as gentle as experience might prove to be necessary, the total length, 4000 feet (about), of breakwater and ice-breaker would not, with large allowance for sinking into the sand, consume more than 300,000 tons which, at the earlier rates, would have cost $675,000. A wall with 20 feet base and rising 25 feet with 15 feet width at top built of quarried dimension stone in large blocks may be laid (without mortar), even at present more than doubled prices, at $10 per ton. For a length of 4000 feet there would be needed say 120,000 tons costing $1,200,000, and making the total cost say $1,875,000. The actual cost is officially reported to have been $2,123,505. The vertical-wall construction would, of the two, probably be the least expensive, while, instead of presenting to the violence of wave-action a collection of loose isolated blocks it would, with regularity of shape, possess the strength derived from the union of its elements in mutual support, into an integral mass. It would also serve as a quay wall alongside which vessels could haul, if through damages received at sea, it were necessary to remove portions of cargo or ballast. A recent work, the MANORA BREAKWATER (Scinde, see "Engineering" May 3, 1872), more properly speaking, a "Jetty," is referred to in illustration of the *principle* of construction just sketched and which was contemplated in the report of 1853.

The general principle of that breakwater is that of a bank of rubble stone laid upon the natural bottom and brought up to a level of 15 ft. below low water, but near the shore, where the original depth is less than this, to 10 ft. below low water. Upon this bank of rubble stone a superstructure is raised, consisting of blocks of concrete each 12 ft. × 8 ft. × 4½ ft., and weighing 27 tons, set upon the narrowest side, so that the whole superstructure consists of two blocks in width and three in height, forming a solid wall, with vertical sides 24 ft. wide and 24 ft. high. The blocks are set in place by means of an overhanging crane. (See Fig. 9.)

The peculiar form of structure adopted for the Manora Breakwater has the advantage, under these circumstances, that it does not depend for its strength on bonding or lateral connection of the several blocks as in ordinary masonry. Any security that this bonding may afford while the foundation holds good is at once lost when the foundation yields and the superstructure sinks unequally. In the present case, if the foundation under one block fails, that block and those immediately over it must drop, but those on either side are in no way affected.



"It has been determined, on data based on experience, that the most favorable depth for the foundations of the superstructure is 15 ft. below low water, and for the future the rubble base will be in the first instance kept down to that level so that little or no dredging or excavation by the divers will be required; and if, under these more favorable circumstances, the foundations can be prepared—as it is expected they may be—there is no reason why 300 ft. of breakwater should not be built in each month of the working season."

The "Monsoons" blow with great violence at Manora, and the wave action is described as only somewhat less than at Alderney, but none of the blocks on the sea-side have ever been forced out.

Mr. Rennie in the letter already referred to, after stating that the Plymouth work was "originally designed to be on the triangular system with interior slope of 45° and exterior of 18° or 1 upon 3¼ (by which in 20 ft. depth the base would be 250 ft.) was changed (see section) in consequence of the top having been swept away by the storm of 1829, "thus pointing out the necessity of a further augmentation of the base and a change in the slopes;" so that the base became (in that depth) 350 ft. "The above form has been found to answer most effectually, and to remain undisturbed during the greatest storms. A casing of cut granite has been put over a considerable part of the surface, and the previous filling the interstices between the large stones with quarry rubbish has tended to consolidate the whole into one great mass." Doubtless with "a casing of granite" the "long slope" system may be made stable; but *that* casing, in the case before us, consumes more large dimension stones than the hypothetical wall I have mentioned in connection with the Delaware Breakwater.

A *mean* section (for it is very irregular) of the Delaware Breakwater is given below. In the language of an official report already referred to the "harbor of refuge" which it creates, is in no sense a work "of mere local interest. It was constructed for, and is resorted to by, the floating commerce of the *nation*, and in this light only should it be regarded. It has been the means of saving millions of property and countless lives from destruction; property whose owners or underwriters are as widely distributed as are the merchants and ship-owners of the nation, and lives whose preservation is a duty which a nation owes to humanity." Its utility is best exhibited by the statement that since 1833, 246,011 vessels have taken refuge from storm under its protection, of which 17,307 in the year 1871 alone. "Let a threatening sky foretell the approaching storm, and a few hours will suffice to fill a previously vacant harbor. Let a north-easterly storm continue a day or two, with severity, and the harbor becomes crowded entirely beyond its capacity. The fleet of vessels which now fill it, are seen to come in, in rapid succession, from the seaward; and there is no single fact more capable of impressing on the mind the magnitude of our coasting trade than the great number of vessels which a few hours' time will, under the

Fig. 8.

Delaware Breakwater (section).

above circumstances, congregate at this point." *Jetties*, such as the interesting works at Port Saïd; at the sea termination of the North Sea Canal of Holland; and those recently constructed to form a new mouth to the river channel to Rotterdam and also at the Sulina mouth of the Danube have much in common with breakwaters, but in general their direction, normal to the shore, saves them from the severe exposure of breakwaters. They will be mentioned in the article Harbor; and reference is made to a Report

Fig. 9.

Manora Breakwater.

on the North Sea Canal of Holland, Prof. Papers, Corps of Engineers, No. 22. (Works to be consulted: "Theory and Construction of British and Foreign Harbours," by Sir John Rennie; "La Digue de Cherbourg" (Cachin); "Cours de Construction des Ouvrages Hydrauliques des Ports de Mer" (Minard); "Mémoire sur les Travaux à la Mer" (Poirel); "Civil Engineer and Architects' Journal;" "Annales des Ponts et Chaussées;" "The Engineer;" "Engineering," etc. etc.) J. G. Barnard, *U. S. Army*.

Bream [Fr. *brème*], a name given to several species of fishes. One is a fresh-water fish of the family Cyprinidæ, the *Abramis brama*. It is found in many rivers and lakes of Europe. Several true breams occur in North America. The name sea-bream is given to various European fishes of the genera *Pagellus*, *Cantharus*, *Brama*, etc. Among these are the black bream (*Cantharus griseus*) and the *Pagellus centrodontes*. Bream is also a synonym of the *Pomotis vulgaris*, or sunfish, a fresh-water fish of the U. S., which is remarkable for its beautiful colors, and is esteemed for food. It constructs a curious nest, and is abundant throughout a great part of the U. S.

Breast. See Mammary Glands.

Breast Wheel, in hydraulics, the name given to a water-wheel so placed as to be struck by the stream of water nearly on a level with the axle, the lower quadrant of the circumference on the side opposed to the stream being placed in a race or channel concentric with the wheel, through which the water is conducted in its descent from the higher to the lower level.

Breast'work, in fortification, is a hastily-constructed earthwork, generally without a banquette. It is sufficiently high to afford shelter to the soldiers standing on the level of the ground and firing over the crest. It is usually a pile of earth, but may be formed of gabions, bags of sand, or bales of cotton. It is intermediate in size and importance between a parapet and an *épaulement*.

Breath. See Respiration.

Breath'itt, a county in the E. of Kentucky. Area, 600 square miles. It is intersected by the North and Middle Forks of Kentucky River. The surface is hilly and extensively covered with forests; the soil of the valleys is fertile. Corn and tobacco are the staple crops. Coal and iron ore are found here. Capital, Jackson. Pop. 5672.

Breathitt (John), born near New London, Va., Sept. 9, 1786, removed in youth to Kentucky, where he was a surveyor and teacher, and was admitted to the bar in 1810,

He was a zealous Jacksonian Democrat, and was lieutenant-governor of Kentucky (1828–32) and governor (1832–34). Died at Frankfort, Ky., Feb. 21, 1834.

Bre'ccia, an Italian word applied by geologists to a collection of angular fragments of any hard rock cemented into a compact mass either by carbonate of lime or other natural cement. Rounded fragments under similar circumstances form conglomerate or pudding-stone. The Potomac marble, of which some columns of the Capitol at Washington are made, is a breccia composed of marble, sandstone, etc.

Bre'chin, a town of Scotland, in Forfarshire, on the left bank of the South Esk, 38 miles by rail S. S. W. of Aberdeen. It stands on an abrupt declivity, and some of the streets are very steep. It has a cathedral, part of which was built in the thirteenth century, now used as a parish church. Adjacent to this church is a remarkable round tower eighty-five feet high, and surmounted by a spire of twenty-five feet. Here are manufactures of linens and sail-cloth, bleaching-works, etc. It is the seat of an Anglican bishop. Pop. of Parliamentary borough in 1871, 7933.

Breck (Daniel), LL.D., born at Topsfield, Mass., Feb. 12, 1788, graduated at Dartmouth in 1812, and became a lawyer of Richmond, Ky., in 1814. Besides holding other offices of responsibility, he was for a time judge of the county court, and afterwards of the supreme court of Kentucky. He was a member of Congress (1849–51).

Breck'enridge, a county of Kentucky, bordering on Indiana. Area, 450 square miles. It is bounded on the N. W. by the Ohio River, and on the S. by Rough Creek. The surface is rolling; the soil is based on limestone, and is fertile. Cattle, grain, wool, and tobacco are staple products. Bituminous coal abounds. Sinking Creek in this county passes for five or six miles under the ground, and returns to the surface. Capital, Hardinsburg. Pop. 13,440.

Breckenridge, a township of Jackson co., Ark. Pop. 694.

Breckenridge, a post-village, capital of Summit co., Col., is near the base of the Rocky Mountains, 70 miles W. S. W. of Denver. Rich gold-mines abound here.

Breckenridge, a post-village, capital of Wilkin co., Minn., on the Red River of the North, at the terminus of the St. Paul and Pacific R. R. (main line), 217 miles W. N. W. of St. Paul. Steamers ply between this point and the Manitoba settlements.

Breckenridge, a post-village and township of Caldwell co., Mo. Pop. of village, 515; of township, 1336.

Breckenridge (John), a native of Virginia, born in 1760, removed to Kentucky. He was elected to the U. S. Senate in 1801, and was appointed attorney-general by President Jefferson in 1805. Died Dec. 17, 1806.

Breckenridge (John), D. D., born at Cabell's Dale, Ky., July 4, 1797, graduated at Princeton in 1818, was an eminent Presbyterian preacher, an able polemic writer, and an influential and useful citizen. He was professor of theology at Princeton (1836–38). Died Aug. 4, 1841.

Breckenridge, or **Breckinridge** (John Cabell), a statesman and general, a grandson of John, first noticed above, was born near Lexington, Ky., Jan. 21, 1821. He studied law, which he practised at Lexington, and was elected to Congress by the Democrats in 1851. He was chosen Vice-President of the U. S. in 1856, when James Buchanan was elected President. In 1860 he was nominated for the presidency by the Anti-Douglas Democrats who seceded from the convention that met at Charleston. His competitors were Abraham Lincoln, John Bell, and Stephen Douglas. Breckenridge received seventy-two electoral votes, being supported by all the Southern States except Virginia, Kentucky, Tennessee, and Missouri. Having been elected to the U. S. Senate, he took his seat in Mar., 1861, but he joined the Confederate army in the autumn of that year. He served as major-general at the battle of Stone River, which ended Jan. 2, 1863, and at Chickamauga, Sept. 19 and 20 of that year. In May, 1864, he defeated Gen. Sigel at Newmarket, in Virginia. He became secretary of war at Richmond in Jan., 1865, visited Europe about five months later, and returned to the U. S. in 1868. Died May 17, 1875.

Breckenridge (Robert Jefferson), D. D., LL.D., an eminent Presbyterian minister, born at Cabell's Dale, Ky., Mar. 8, 1800, was an uncle of the preceding. He graduated at Union College in 1819, and practised law in Kentucky eight years (1823–31). Having preached for some years in Baltimore, he removed to Lexington, Ky., in 1847, and became professor of theology at Danville in 1853. He published "Travels in Europe" (1839) and several works on theology. His principal work is in two volumes, "The Knowledge of God, objectively considered" (1857), and "The Knowledge of God, subjectively considered" (1859). He was a loyal friend of the Union in the civil war. Died at Danville, Ky., Dec. 27, 1871.

Breck'inridge (Gen. James), born in Botetourt co., Va., Mar. 7, 1763, was a soldier of the Revolution, graduated at William and Mary College in 1785, and became an eminent Federalist lawyer and a public-spirited citizen of Virginia. He was a member of Congress (1809–17), and co-operated with Jefferson in establishing the University of Virginia. Died in Aug., 1846.

Breckinridge (Robert J., Jr.), M. D. See Appendix.

Breck'nock, a township of Berks co., Pa. Pop. 813.

Brecknock, a township of Lancaster co., Pa. P. 1600.

Brecks'ville, a township of Cuyahoga co., O. P. 1007.

Brec'on, or **Breck'nockshire,** an inland county of South Wales, has an area of 719 square miles. It is bounded on the N. by Radnor, on the E. by England, on the S. by Glamorgan, and on the W. by Caermarthen. The surface is occupied by several mountain-ranges and deep, beautiful, and fertile valleys. The highest point of this county is Brecknock Beacon, which has an altitude of 2862 feet. Old red sandstone underlies the southern and middle parts of the county, and Silurian rocks are found in the N. The chief rivers are the Wye (which forms the N. E. boundary), the Usk, Elan, and Tawe. The staple products are oats, barley, wheat, and cattle. It has extensive iron-works. Capital, Brecon. Pop. in 1871, 59,904.

Brecon, Brecknock, or **Aber-Honddu,** a town of Wales, the capital of the above county, is finely situated in a valley on the river Usk, at the mouth of the Honddu, 38 miles by rail W. S. W. of Hereford. It has beautiful promenades, an old castle, a collegiate church, and a college; also considerable manufactures. Pop. in 1871, 5845.

Breda', a fortified town of Holland, in North Brabant, is situated at the confluence of the navigable rivers Aa and Merk, 16 miles S. S. E. of Dordrecht. It is connected by railway with Antwerp and The Hague. It has a castle built in 1350, a Gothic cathedral, the spire of which is 362 feet high, and a magnetic observatory; also manufactures of linens, carpets, hats, soap, leather, etc. This town can be protected against an invading army by inundating the country around it. It is celebrated as the scene of the "Compromise of Breda," by which the patriots protested against the tyranny of Philip II. in 1566. Pop. in 1868, 15,265.

Bree (Mathieu Ignace), an eminent Flemish historical painter, born at Antwerp Feb. 22, 1773. Among his works are "Rubens dictating his Last Will," and "Van der Werff addressing the Famished Populace during the Siege of Leyden, 1574." Died Dec. 15, 1839.

Breech, the end of a gun which is farthest from the muzzle; the solid part behind the bore. The breech of a cannon is made very massive, to enable it to resist the shock caused by the explosion of the powder.

Breech'ing of a naval gun or carronade is a strong rope by which the recoil of the gun is checked at such a point that the muzzle is brought wholly within the porthole, where the seamen can sponge and reload it. Breeching or breech-band is a part of the harness of a carriage-horse, by means of which he can push the carriage backward or support its pressure in going down hill.

Breech-loading Firearms are those which are loaded by putting the cartridge directly in at the breech, instead of ramming it in at the muzzle. It is said that breech-loading guns were used early in the reign of Henry VI. of England, and it is certain that they were used in Scotland about that time. There are several ancient specimens in the Tower of London. Many attempts to improve this kind of arms have been made, and of late with much success. Among the most celebrated weapons of this character are the Armstrong and Whitworth guns, the Krupp steel guns, the *mitrailleuse,* and among small-arms the needle-gun and the Chassepot, Sharp, Snider, Spencer, Ward-Burton, and Remington rifles. These will each be described under its own name.

Breed, a variety produced in any animal species in consequence of domestication by changes somewhat analogous to those which occur in cultivated plants. The changes originated by breeding (artificial selection) are in some species, as in the dog and pigeon, very marked, producing external, and even structural, differences, which, if they were permanent and originated by natural and unexplained causes, would confessedly be regarded as sufficient to establish difference of species. But the fact that thoroughbred animals, when neglected or allowed to go wild, tend to revert to the original type, and the not less important fact that animals of the most widely different varieties of the same species will (with a few possible exceptions) breed freely with each other, producing fertile young (which is rarely the case

with those of different species), are by many held to show a radical difference between varieties or breeds and species. The study of the variations produced by domestication seems to have suggested to Mr. Darwin his doctrine of the origin of species by natural selection. (See DARWINISM, by Profs. E. L. YOUMANS and J. H. SEELYE.)

Some of the results of artificial selection on animals are truly marvellous. The numerous varieties of the dog and the pigeon have been, to a great extent, produced by design; animals being bred to develop certain desired peculiarities, the principle being that "like produces like," or that certain qualities possessed by the parent may be perpetuated and increased in the offspring. The milk-producing qualities of the Ayrshire cow, the butter-making excellence of the Jersey breed, the long-wooled Cottswold sheep, and the new breeds of easily fattened swine afford illustrations of the industrial importance of this remarkable plasticity or adaptability of the various domestic animals—an adaptability which has only of late been scientifically studied, and the limitations of which are as yet not well known. (See DARWIN, "Domesticated Animals and Cultivated Plants," 1867.) CHAS. W. GREENE.

Breed (WILLIAM P.), D. D., born in 1816, at Greenbush, N. Y., removed in childhood to New York City, graduated in 1843 at the University of New York, and has held Presbyterian pastorates in Steubenville, O. (1847–56), and in Philadelphia. He is the author of numerous religious works, chiefly for the young.

Breeds'ville, a post-village of Columbia township, Van Buren co., Mich. Pop. 255.

Breese (KIDDER RANDOLPH), U. S. N., born April 14, 1831, in Philadelphia, entered the navy as a midshipman Nov. 6, 1846, became a passed midshipman in 1852, a lieutenant-commander in 1862, and a commander in 1866. At the close of 1861 he was placed in command of the third division of Porter's mortar flotilla, and took part in the bombardment of Forts Jackson and St. Philip prior to and during the passage of Farragut's fleet by the forts on its way to the capture of New Orleans, and participated in the attacks on Vicksburg during June and July, 1862. In Oct., 1862, he was appointed to the command of Admiral Porter's flag-ship, the Black Hawk, and in her took part in nearly all the severe engagements on the Mississippi and its tributaries during 1863 and 1864. In Sept., 1864, when Admiral Porter assumed command of the North Atlantic blockading squadron, he selected Breese as his fleet-captain, in which capacity Breese took part in the Fort Fisher fights, and in the fight with Fort Anderson; and in the naval assault on Fort Fisher of Jan. 15, 1865, he commanded the storming party. His services throughout the civil war are thus honorably mentioned by Admiral Porter in his "commendatory despatch" of Jan. 28, 1865: "Lieutenant-Commander K. R. Breese, my fleet-captain, has been with me nearly all the time since the rebellion broke out. In command of a division of the mortar flotilla which opened the way to New Orleans, he made his first record there. In the Mississippi with me for two years, engaged in harassing and dangerous duties, he always acquitted himself to my satisfaction. In charge of the mortars at the siege of Vicksburg, he helped to hasten the surrender of that stronghold. At Fort Fisher he led the boarders in the assault, and though we were not successful in getting into the fort in the face of equal numbers, yet that assault gained the day, as is generally admitted on every side. Our troops obtained a footing without much resistance, and then nobly maintained what they had won. Lieutenant-Commander Breese did all he could to rally his men, and made two or three unsuccessful attempts to regain the parapet; but the marines having failed in their duty to support the gallant officers and sailors who took the lead, he had to retire to a place of safety. He did not, however, leave the ground, but remained under the parapet in a rifle-pit, using a musket until night favored his escape. He is a clever, gallant officer, and I strongly recommend his immediate promotion to a commander."

FOXHALL A. PARKER, U. S. N.

Breese (SAMUEL L.), REAR-ADMIRAL, was born in New York in 1794, entered the navy in 1810, served against Great Britain and Mexico, became captain in 1841, and rear-admiral in 1862. Died Dec. 17, 1870, at Mount Airy, Pa.

Breese (SIDNEY), born at Whitesboro', Oneida co., N. Y., July 15, 1800, graduated at Union College in 1818. In 1821 he was called to the Illinois bar, and attained great distinction, was an officer in the Black Hawk war, U. S. Senator from Illinois (1843–49), and was speaker of the Illinois legislature in 1850. He was made circuit judge in 1835, and again in 1855, becoming chief judge of that bench. He was one of the originators of the Illinois Central R. R.

Brees'port, a post-village of Horseheads township, Chemung co., N. Y. Pop. 292.

Breeze, a soft wind, a gentle gale. *Land and Sea Breezes.*—In a fair day, near the sea-shore, an hour or two after sunrise, a gentle wind begins to blow from the sea towards the land, gradually increasing in force during the day. With the declining sun the sea-breeze loses its power, and dies out before sunset. A lull then ensues, after which a land-breeze sets in from the land towards the sea, and continues all night until before sunrise, when another calm occurs. The cause of these alternate winds is to be found in the fact that the land is more readily heated by the rays of the sun, and more quickly cooled in their absence, than the sea. In an island, for instance, in proportion as the sun rises above the horizon the land becomes warmer than the neighboring sea. Their respective atmospheres participate in these unequal temperatures; the fresh air of the sea rushes from all directions in the form of a *sea-breeze*, which makes itself felt along the whole coast, and the warmer and lighter air of the island will ascend into the atmosphere. During the night it is the reverse. The island loses heat by radiation, and cools quicker than the sea. Its atmosphere having become heavier, flows into that of the sea in the form of a *land-breeze;* and this interchange lasts until the temperature, and consequently the density, of the two atmospheres have again become the same. This is the phenomenon observed almost daily on nearly all the sea-boards.

Mountain-Breezes.—Similar alternate breezes are observed to play between the great mountain-chains and the neighboring plains, as in the Alps. On a fair day strong breezes rush up the valley towards the overheated mountain-slopes, and descend with equal force during the night; for during the day the mountains absorb more heat than the neighboring free atmosphere, and radiate more during the night. (See WINDS, CIRCULATION OF.) ARNOLD GUYOT.

Breitmann, Hans. See LELAND (CHARLES GODFREY).

Brem'en, a free city of Germany, situated on both sides of the river Weser, about 45 miles from the sea and 60 miles S. W. of Hamburg; lat. 53° 4′ 36″ N., lon. 8° 48′ 54″ E. It is divided into the old and the new town, the former of which is on the right bank of the river, and has narrow, crooked streets. The new town, which is connected with the old by two bridges, is more regular. The old ramparts have been levelled and converted into beautiful promenades and pleasure-grounds. The most remarkable edifices are the cathedral, built about 1100; the fine old Gothic town-hall, with a famous wine-cellar; the exchange, the museum, and the observatory of Olbers. Bremen has a large public library, a normal school, a theatre, and a hospital, also manufactures of woollen and cotton goods, paper, starch, and cigars. As a commercial city this is one of the most important of Germany, having an extensive foreign trade, especially with the U. S. It is connected by railway with Hanover, Bremerhafen, and other towns. Vessels drawing seven feet of water can ascend to this point, and large ships stop at Bremerhafen. The trade of Bremen has increased rapidly in the last fifteen years. The chief articles of export are woollen goods, linens, glass, hemp, hides, rags, wooden toys, and wool. The imports consist of cotton, coffee, sugar, rice, tobacco, wines, dyewoods, oil, tea, etc. Shipbuilding is carried on here extensively. The imports in 1858 amounted to £8,232,000, and the exports to about £8,000,000. In 1863 the imports had increased to about £11,190,000, and the value of the exports was nearly £10,000,000. In 1868 the imports amounted to 98,130,000 thalers (about $68,690,000), and the exports to 89,970,000 thalers. The number of emigrants that embarked here was 73,971 in 1867, and 66,433 in 1868. In 1871, 8,513,882 gallons of petroleum were exported from Philadelphia to Bremen. The total produce imported here from the U. S. in 1868 was valued at $23,285,000. Pop. in 1871, 82,950.

Bremen was founded before 788 A. D., and was made a bishopric by Charlemagne. It was one of the chief towns of the Hanseatic League. In 1815 it was admitted into the Germanic confederation by the Congress of Vienna. The government of this city and the territory attached to it (with an area of 74 square miles) is a nominal republic, the total pop. of which in 1871 was 122,565. It is governed by four burgomasters and twenty-four senators, who are elected for life. Bremen is the native place of Heeren and Olbers. A. J. SCHEM.

Bremen, a township of Cook co., Ill. Pop. 1501.

Bremen, a township of Lincoln co., Me. Pop. 797.

Bremen, a post-village of Rush Creek township, Fairfield co., O. Pop. 265.

Bre'mer, a county in N. E. Central Iowa. Area, 430 square miles. It is intersected by the Cedar and Wapsipinicon rivers, and also drained by several creeks. The soil is generally fertile. Grain, cattle, and wool are raised. It

is traversed by a branch of the Illinois Central R. R. Capital, Waverley. Pop. 12,528.

Bremer, a township of Delaware co., Ia. Pop. 821.

Bremer (CHARLES). See APPENDIX.

Bremer (FREDRIKA), a popular Swedish novelist, born at Abo, in Finland, Aug. 17, 1801. She was educated at Stockholm, and became in early youth familiar with German literature. Among her first works was "The Neighbors," a novel (1842), which Mrs. Howitt translated into English. She afterwards produced "The Home" (1843), "The President's Daughters," "Nina," "Brothers and Sisters," and "Hertha" (1856), which were translated into English, French, and German. She visited the U. S. in 1850, and after her return published "The Homes of the New World" (1853). Died Dec. 31, 1866. (See "Life, Letters, and Posthumous Works of Fredrika Bremer," edited by her sister Charlotte, New York, 1868.)

Bre`merha'fen, a town and port of Germany, on the right bank of the Weser, near its mouth, about 35 miles N. N. W. of Bremen. It is a part of the republic of Bremen, and was built by the citizens of Bremen (1827–30) for the accommodation of large ships which cannot ascend the river. It has an outer and inner harbor. Pop. 10,594.

Bre'mond, a post-village of Robertson co., Tex., at the junction of the Houston and Texas Central and the Waco and North-western R. Rs. It is in a beautiful and fertile region, abounding in coal and iron. It has a cotton-seed oil mill.

Bren'ham, a post-village, capital of Washington co., Tex., on a branch of the Houston and Texas Central R. R., 95 miles E. of Austin City. It is in a fertile region adapted to the growth of cotton. It has a seminary for ladies, several manufactories and two weekly newspapers. Pop. 2221.

Bren'ner Pass, the lowest pass in the main chain of the Alps, is on the route between Innspruck and Botzen, and is 4775 feet above the level of the sea. The mountains on each side rise about 7500 feet above the pass, which is open at all seasons of the year. In 1867 a railway was opened through this pass from Innspruck to Botzen, at which point it connects with the railways of Germany and Italy. At the summit of the pass is the small village of Brenner.

Bren'nus [Celtic *bran*, a "chief." *Bran*, as a proper name, is well known both in Cymric and Erse tradition], a famous chief of the Senones, a tribe of ancient Gauls who crossed the Apennines in 390 B. C., invaded the Roman state, and defeated its army. Brennus then captured Rome, except the Capitol, which he besieged for about six months. During this siege he attempted to surprise the garrison by night, but he was repulsed by Manlius, who was awakened by the cackling of some geese. The Romans purchased peace by the payment of one thousand pounds of gold. To increase the price, Brennus is said to have thrown his sword on the scale. (See, on this subject, ARNOLD'S "History of Rome.")

Brennus, a Gallic chief who invaded Greece with a large army about 280 B. C., and ravaged Macedonia and Thessaly. He was defeated at Delphi by the Greeks, who were said to have been aided by an earthquake.

Brenta'no (CLEMENS), a German novelist and dramatist, born at Frankfort-on-the-Main Sept. 9, 1778. He was a brother of Goethe's friend, Bettina von Arnim. He produced dramas entitled "Ponce de Leon" (1804) and "The Foundation of Prague" (1816). Among his admired novels is "The History of Caspar the Brave and the Fair Annerl." In conjunction with Arnim he published the collection of ballads called "Des Knaben Wunderhorn" (1806–08; 2d ed. 1815). Died July 28, 1842.

Brentano (LORENZ), a German jurist, born at Mannheim in 1812. He was actively engaged in the Baden revolution of 1848, and afterwards removed to America, and became in 1860 editor of the "Illinois Staatszeitung" at Chicago. He sold his interest in the "Illinois Staatszeitung" in 1867, and returned to Germany soon after. In 1868 he was elected a presidential elector on the Grant ticket.

Brent'ford, a market-town of England, the capital of Middlesex, is on the Thames, at the mouth of the Brent, 7 miles W. S. W. of London. It is connected with Kew by a bridge across the Thames, has large gin-distilleries, and the works of the West London Water Company. It consists mostly of one long street. Pop. 9521.

Bren'ton, a township of Ford co., Ill. Pop. 1073.

Brenton (SAMUEL), born in 1810 in Gallatin co., Ky., became a Methodist Episcopal preacher in 1830, and subsequently a lawyer. In 1841 he returned to the ministry, but having become disabled by paralysis, he again left the profession. He was a member of Congress from Indiana 1852–57, and at the same time president of Fort Wayne College. Died Mar. 25, 1857.

Brenton (WILLIAM) emigrated to Boston from Hammersmith, England, held important offices in Massachusetts and Rhode Island, where he was several times lieutenant-governor. He was president of Rhode Island (1660–61), and governor (1666–69). Died at Newport in 1674.

Brents'ville, a small village, capital of Prince William co., Va., on the Occoquan Creek, 104 miles N. of Richmond. Pop. of Brentsville township, 937.

Brent'wood, a post-township of Rockingham co., N. H. It has manufactures of paper, leather, lumber, etc. Pop. 895.

Brentwood, a post-village of Williamson co., Tenn., on the railroad between Nashville and Franklin, about 9 miles from each place.

Brenz (JOHANN), [Lat. *Brentius*], a German Reformer, born at Weil, in Swabia, June 24, 1499, was educated at Heidelberg, and became a Protestant under Luther's influence. He was a popular preacher at Halle, but in 1530 had to flee to Stuttgard, to the protection of Duke Ulrich of Würtemberg against Charles V. There he died Sept. 11, 1570. He was a man of great ability, and wrote much, chiefly expository lectures on the Bible. These writings are still highly prized. He taught that the Lord's body is everywhere present, hence his followers are called Ubiquitarians, but in the main his doctrines are those of Luther.

Bres'cia, a province of Italy, is bounded on the N. by the Tyrol, on the E. by Lago di Garda and Verona, on the S. by Cremona, and on the W. by Bergamo. Area, 1784 square miles. The soil is fertile. Silk and wool are among the staple productions. It has manufactures of woollen goods, firearms, and cutlery of superior quality. Capital, Brescia. Pop. in 1871, 450,750.

Brescia (anc. *Brixia*), a handsome city of Italy, in Lombardy, capital of the above province, is pleasantly situated on a wide plain and on the river Garza, 62 miles by rail E. N. E. of Milan. It is on the railway which connects Milan with Venice. It has an old cathedral, a mediæval structure, and a new marble cathedral (Duomo Nuovo) commenced in 1604; also many churches richly adorned with works of art by celebrated masters, an episcopal palace, a college, a good public library, a museum of antiquities, a botanic garden, and a theatre. Here are manufactures of cutlery, silk, linen, and woollen fabrics, paper, and wine. The streets and public squares are adorned with numerous fountains. Brixia was a very ancient town, and was the capital of the Cenomanni, a Gallic tribe. It was plundered by Attila, but soon recovered from this injury. The emperor Otho I. declared it a free city about 936. It was bombarded and taken by the Austrian general Haynau in 1859. Pop. in 1872, 38,906.

Bres'lau, or **Breslaw** [Lat. *Bratislavia;* Polish, *Wraclaw*], a large city of Prussia, the capital of Silesia, is situated on the river Oder, at the mouth of the Ohlau, and on the railway from Berlin to Vienna, 221 miles by rail S. E. of Berlin; lat. (of observatory) 51° 6′ 56.5″ N., lon. 17° 2′ 18″ E. It is, next to Berlin, the most populous city of Prussia. It is divided by the Oder into the old and new towns, which are connected by numerous bridges. The new town has wide and regular streets. It is the seat of a Roman Catholic bishop. The most remarkable edifices are a cathedral founded in the twelfth century, St. Elizabeth's church, the theatre, the Rathhaus, exchange, mint, and university buildings. The university has a library of 350,000 volumes. Breslau contains other public libraries, an observatory, a botanic and zoological garden, four gymnasia, and numerous other schools of different kinds. It has an extensive trade, and is the greatest market for wool in Germany. It has manufactures of woollen, linen, cotton, and silk fabrics, broadcloths, lace, jewelry, soap, earthenware, starch, and ardent spirits. The number of distilleries in it is about 100. Railways extend to Dresden, Posen, Warsaw, and Vienna. Pop. in 1871, 208,025.

Breslau, a thriving post-village of Babylon township, Suffolk co., N. Y., on the South Side R. R. of Long Island, 33 miles E. by S. of Brooklyn. Its inhabitants are mostly Germans.

Brest [Lat. *Brestum*], an important fortified city and seaport of France, department of Finistère, 314 miles W. of Paris, is said to be the strongest military port in France. It is on the N. shore of the Road of Brest, in lat. 48° 23′ N., lon. 4° 29′ W. Its outer harbor is one of the best and most capacious in the world, having ample room for 500 ships of the line. The harbor or road communicates with the ocean by a single channel called the Goulet, which is 1750 yards wide. In the middle of this channel are the Mignan Rocks, which render the entrance of hostile ships very difficult and dangerous. The outer harbor or roadstead is

about 6 miles long, and is defended by powerful batteries. The inner harbor is also secure and spacious. From its natural advantages and the strength of its defensive works, Brest is considered one of the first naval stations of Europe. Here are five large basins, extensive quays, an arsenal, vast magazines, large barracks, and a prison, the Bagne, which can accommodate 4000 convicts. Brest is the western terminus of a railway which extends to Paris *viâ* Rennes and Le Mans. The city is built on the slopes of several hills, and is divided into two parts, which can communicate only by boats. Is is encircled by ramparts, which, being planted with trees, form pleasant promenades. It has a naval school, a medical school, a communal college, besides numerous other schools, a public library, a botanic garden, an observatory, etc. This port has little trade except for the supply of the naval department, and its industry is confined to the equipment of the navy. This place was not of much importance until Cardinal Richelieu commenced in 1631 the fortifications, which were completed by Vauban. A submarine telegraph cable connects this harbor with Duxbury, Mass. Pop. 79,847.

Brest Litowsk', a town of Russia, in the government of Grodno, 92 miles S. of Grodno. It has several factories, and is the seat of a United Armenian bishop. Pop. 22,493.

Bretagne [Lat. *Britannia Minor*], usually called **Brit'tany** by the English, or **Little Brittany,** a former province of France, is an extensive peninsula, bounded on the N. by the English Channel, and on the W. and S. W. by the Atlantic Ocean. It is now comprised in the departments of Finistère, Côtes-du-Nord, Morbihan, Ile-et-Vilaine, and Loire-Inférieure. It was divided into Haute-Bretagne (Upper Brittany), capital, Rennes, and Basse-Bretagne (Lower Brittany), capital, Vannes. Among the other towns are Brest, Quimper, and St. Malo. The surface is partly mountainous, and the scenery wild and beautiful. This province, which in ancient times was called *Armorica*, was settled by the Cymri, a Celtic race to which the ancestors of the Welsh belonged. It contains large tracts of heath nearly uncultivated, and extensive forests. The outline is indented with numerous bays and inlets, which afford facilities for navigation and commerce. Brittany abounds in ancient monuments and cromlechs, which are ascribed to the Druids. The modern Bretons are tenacious of their ancient customs and peculiarities, and are generally Catholics. They are more loyal and devout than the majority of the French. Their language (the Armorican) is peculiar, and closely resembles the Welsh. This region and its people have a special interest for antiquarians. It became subject to the Franks in the time of Charlemagne. In 848 A. D., Nominoé, an Armorican chief, assumed the title of king of Bretagne, and defeated the army of King Charles the Bald. The Normans conquered it in the tenth century.

Geoffroi, count of Rennes, became in 992 the first duke of Bretagne, which continued to be an almost independent feudal duchy until it was annexed to France in 1531. Pop. in 1872, 2,947,348. (See Daru, "Histoire de Bretagne," 1826; Courson, "Histoire des Peuples Bretons, etc.," 1847.)

Brethren. See Plymouth Brethren; also Dunkers and United Brethren.

Brethren and Sisters of the Free Spirit, a sect of extremely pantheistic and immoral semi-monastic enthusiasts, who probably originated in the sect of Almericians, followers of Amalric of Bena, who died in 1209. They suffered much from the severity of the authorities, but became very numerous in Germany, France, and Italy. The sect lasted till about 1450. They were otherwise known as *Homines Intelligentiæ* ("men of understanding"), also as Adamites, Turlupins, Schwestriones, Picards, etc.; and it is believed that the immoral "Adamites" now existing in Bohemia are their descendants.

Brethren of the Christian Schools, an order in the Roman Catholic Church founded in 1679, at Rheims, by the Abbé La Salle, and confirmed in 1725 by Benedict XIII. Its members are not allowed to enter the priesthood. They devote themselves to teaching, and especially to the instruction of the poor, mostly in rudimentary branches, but sometimes in more advanced studies. They are numerous in France, Ireland, Italy, the U. S., and most other countries. They are a branch of the Jesuits.

Brethren of the Common Life [Lat. *Fratres Vitæ Communis*], an association of pious clergymen founded in Holland by Gerhard Groot in 1384. They soon were joined by many laymen, who were associated closely with the priests, but had separate habitations. A semi-monastic discipline was maintained, generally according with the rule of Saint Augustine, without lifelong vows. The order spread to Germany, and "Sisters of the Common Life" afterwards appeared. The Brethren became partly identified with the Canons Regular. Thomas à Kempis, Wessel, and Erasmus were educated by them. Luther and Melanchthon esteemed the brotherhood highly, and many of them became Protestants, others Jesuits, etc., and before 1650 the fraternity was extinct.

Breton, a township of Washington co., Mo. Pop. 2396.

Breton (Jules-Adolphe), a French artist, distinguished for his serious and sympathetic treatment of subjects connected with the rural life of France. He was born at Courrières (Pas-de-Calais). His most important pictures are "Blessing the Wheatfield," 1857, "The Calling Home of the Reapers," 1859, both in the Luxembourg Gallery; "A Girl Guarding Turkeys," 1864; "Young Girls Guarding Cows," 1872. Clarence Cook.

Brett (Philip Milledoler), D. D., born in New York City July 13, 1817, graduated at Rutgers College, New Brunswick, N. J., was ordained to the Dutch Reformed ministry in 1838, held pastorates at Nyack, N. Y., St. Thomas, W. I., and at Mount Pleasant and Tompkinsville, N. Y. He was very influential, and greatly beloved by his denomination. Died of cancer Jan. 14, 1860. A volume of his sermons has been published.

Breu'ghel (Jan), a famous Flemish painter, born at Brussels in 1568, was called Velvet Breughel, in reference to the material of his clothing. He painted landscapes, animals, flowers, and small figures, which are finely finished. Among his chief works are "Adam and Eve in Paradise" and "The Four Elements." The figures of these were painted by Rubens. Died in 1625.

Breughel (Pieter), a Flemish painter, the father of the preceding, was born at Breughel, near Breda. He painted with success village festivals, comic subjects, and the amusements of rustic life. Died in 1569.

Brevard', formerly **St. Lucie,** a county in the S. E. of Florida, is bounded on the E. by the Atlantic Ocean. Area, 5600 square miles. Stock-raising is the chief pursuit. The climate is pleasant and healthful. Corn and rice are raised. It is intersected by the Kissimee River, and includes the greater part of Lake Okechobee, which is about 30 miles in diameter. The surface is generally low and flat. Capital, St. Lucie. Pop. 1216.

Brevard, a post-village, capital of Transylvania co., N. C., in a township of the same name, about 240 miles W. S. W. of Raleigh. Pop. of Brevard township, 784.

Breve, in music, a note formed thus  , or  , or  , and equivalent to two semibreves. The note for a whole bar in modern notation is called a semibreve. The breve is now only used in *à la capella* movements, psalmtunes, and fugues, or at the close of a composition.

Breve, in printing, is a curve marked over a vowel to indicate that it is short, as *ĕ*.

Brevet', a French word signifying a patent, a warrant, a license, a commission, a royal act in writing conferring some privilege or distinction.

Brevet is also a military term used in England and the U. S. In the British army it is a promotion of officers which takes place on such special occasions as a coronation or the termination of a great war. By this promotion the officers obtain an increase of pay, even if they have never served in a campaign. On these occasions lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, and captains receive a promotion of one grade. Each colonel, for instance, becomes a major-general. Officers below the rank of captain are excluded from the benefit of this brevet, which applies to the navy as well as the army, so that commanders become captains, captains become rear-admirals, etc. Besides this general promotion by brevet, there is (in England) brevet rank conferred on individual officers for special services. This does not entitle them to an increase of pay, but only to hold a rank next above that which their commission specifies. This kind of brevet is not used in the navy, and it does not apply in the army to other officers than captains, majors, and lieutenant-colonels. In the army of the U. S. a brevet is a commission giving an officer a nominal rank higher than that for which he receives pay. A brevet major, for instance, only receives the pay of a captain or of a lieutenant. These honorary titles are given for meritorious services.

Bre'viary [Lat. *breviarium* (from *brevis*, "short"); Fr. *bréviaire*], an abridgment or epitome; also a book containing the daily service of the Church of Rome or of the Greek Church. It is so called, probably, because it was abridged from another service-book, called *Plenarium officium*, the "full service." The Roman Catholic Church has several breviaries, some being used in particular dioceses or in special monastic orders, but the *Breviarium Romanum* ("Roman Breviary") is the most generally used, and is

rapidly taking the place of the others throughout the Latin rite, and it has been translated into some of the Eastern rites. It is in four parts: the Psaltery, or psalms for canonical hours, recited daily by all the beneficiary clergy; the *Proprium de Tempore*, for festivals in honor of Christ; the *Proprium de Sanctis*, for festivals of special saints; and the *Commune Sanctorum*, for other days. The Greek Breviary (ὡρολόγιον) or "dial" is used in the Greek Church and the Roman Catholic churches of the Greek rite. (See CANONICAL HOURS and LITURGY.)

Brevier', in typography, a type which is larger than minion and one size less than bourgeois. (See TYPE.)

Brevipen'nes [from the Lat. *brevis*, "short," and *penna*, a "wing"], or **Brevipennates** (*i. e.* "short-winged"], a term applied in the system of Cuvier to that tribe of the order Grallatores which comprises the ostrich, cassowary, emeu, rhea, apteryx, and perhaps the extinct dodo. They have wings so short that they are not fit for flight, but they serve to accelerate the speed with which the birds run on the ground. Some ornithologists give them the name of Struthionidæ, and some rank them among the gallinaceous birds. Their sternum (breast-bone) has no keel or ridge. The gigantic *Dinornis* and some other fossil birds exhibit the characters of the brevipennes. Birds of this tribe flourish only in solitudes and deserts, and are perhaps destined to extinction, as the progress of population is hostile to their increase or existence. (See CURSORES.)

Brew'er, a township of Pike co., Ark. Pop. 597.

Brewer, a post-township and village of Penobscot co., Me., on the Penobscot River, opposite Bangor, with which it is connected by a bridge. It has a savings bank, and important manufactures of lumber, bricks, leather, boots, shoes, harness, carriages, sails, boats, etc. Total pop. 3214.

Brewer (THOMAS M.). See APPENDIX.

Brewer (WILLIAM HENRY), born at Poughkeepsie, N. Y., Sept. 14, 1828, was educated at the scientific school of Yale College and at the universities of Heidelberg and Munich, was professor of chemistry and geology in Washington College, Pa. (1858–60), first assistant in the geological survey of California (1860–64), professor of chemistry in the College of California, and professor of agriculture in the Sheffield Scientific School, New Haven, Conn., since 1864. He has prepared a work on the "Botany of California," and various scientific papers.

Brew'erton, a post-village of Cicero township, Onondaga co., and of Hastings township, Oswego co., N. Y., on both sides of the Oneida River, at the foot of Oneida Lake, and on the Syracuse Northern R. R., 15 miles N. of Syracuse. The old British Fort Brewerton stood on the Oswego side. Pop. in Onondaga co., 322; in Oswego co., 196.

Brewerton (HENRY), LL.D., an American officer, born 1801 at Newburg, N. Y., graduated at West Point 1819, colonel Corps of Engineers April 22, 1864, served as assistant professor at the Military Academy 1819–21, in construction of fortifications 1821–32, Cumberland road 1832–36, improvement of Hudson River 1836–42, building Fort Montgomery, N. Y., 1841–45, superintendent of the Military Academy 1845–52, constructing defences of Baltimore harbor 1852–64, of the Delaware 1862–64, of Point Lookout, Md., 1864–65, and of Hampton Roads 1864–70, improvement of harbors in Maryland 1852–64, and member of engineer and other boards 1839–67. Brevet brigadier-general Mar. 13, 1865, for long, faithful, and meritorious services, and retired from active service Mar. 7, 1867.

GEORGE W. CULLUM, *U. S. Army*.

Brew'erville, a township of Sumter co., Ala. P. 1520.

Brew'ington, a township of Clarendon co., S. C. P. 199.

Brew'ster, a post-township of Barnstable co., Mass., on the Cape Cod R. R., 89 miles from Boston. Pop. 1259.

Brewster (Sir DAVID), LL.D., D. C. L., F. R. S., an eminent British natural philosopher and writer, born at Jedburgh, Scotland, Dec. 11, 1781. He was educated at the University of Edinburgh, and became in 1808 editor of the "Edinburgh Encyclopædia," for which he wrote many articles. He received in 1815 the Copley medal of the Royal Society for an "Essay on the Polarization of Light by Reflection." He invented the kaleidoscope in 1816. In conjunction with Professor Jameson he founded the "Edinburgh Philosophical Journal" in 1819. About this date the Royal Society awarded to him the Rumford gold and silver medals for his discoveries in optics. He was knighted in 1832, and elected in 1849 one of the eight foreign associates of the French Institute, the highest scientific distinction in Europe. Among his works are a "Treatise on Optics" (1831), "More Worlds than One" (1854), and "Memoirs of the Life and Writings of Sir Isaac Newton" (2 vols., 1855). In 1859 he was chosen principal of the University of Edinburgh. His wife was a daughter of Macpherson, the author of Ossian's poems. Died Feb. 10, 1868.

Brewster (JAMES), born about 1785, was a prominent merchant and philanthropist of New Haven, Conn. He founded in that city Brewster Hall, the Franklin Institute, and the Orphan Asylum, and was the active promoter of many benevolent and business enterprises. Died Nov. 22, 1866.

Brewster (WILLIAM), one of the Pilgrims of Plymouth, born at Scrooby, England, in 1566, was educated at Cambridge, entered the public service, became a non-conformist, and in 1607 was imprisoned at Boston, Lincolnshire. He was liberated with great expense and difficulty, and went to Leyden, where he taught English. In 1620 he came to America on the Mayflower's first voyage. He was an elder of the Church, preaching frequently, but never administering the sacraments. Died at Plymouth, greatly venerated, April 16, 1644.

Brewster's Station, a post-village of South-east township, Putnam co., N. Y., on the Harlem R. R., 53 miles from New York. It has two fine mines of magnetic iron ore, one national bank, and one weekly newspaper. Great quantities of milk are sent to market from this point.

Brew'ton, a post-twp. of Escambia co., Ala. P. 1312.

Brezo'wa, a town of Hungary, in the county of Neutra, 19 miles N. W. of Leopoldstadt. It has several tanneries and distilleries. Pop. in 1869, 5886.

Brialmont (ALEXIS HENRI), a distinguished Belgian officer, engineer, and military writer, born May 25, 1821, at Venloo, Province of Limburg, the Netherlands; entered the military school of Brussels in 1839, from which he graduated as *sous-Lieutenant du Genie* (Engineers) in 1843. Entered the staff corps (*d'Etat major*) as Captain, 1855, and passing through successive grades became Colonel, 1868, Chevalier of the Order of Leopold, 1846—officer, 1859, "Commander," 1870, and maj.-gen., Mar. 25, 1874. Member of the Belgian Academy of Sciences of Stockholm in 1865. As an officer of Engineers has participated in the fortification of Antwerp and Diest, and when the present magnificent system of fortifications was decided upon he had the distinguished honor of planning works "unrivalled in Europe in the intelligent application of true principles of art to a great practical example." Colonel Brialmont is now an acknowledged authority on the *modern* art of fortification—his military publications are numerous; among the most important may be named, "*Précis d'Art Militaire*," 1850, 4 vols., 12mo, "*Considerations Politiques et Militaires sur la Belgique*," 1851–52, 3 vols., 8vo, "*Histoire du Duc de Wellington*," 1856–57, 3 vols., 8vo, "*Etudes sur la Defense des Etats et sur la Fortification*," 1863, 3 vols., 8vo, with atlas, "*Etudes sur l'organization des Armées*," 1867, 1 vol., 8vo, "*Traité de Fortification Polygonale*," 1869, 3 vols., 8vo, with atlas, "*La Fortification à Fossés Secs*," 1872, 3 vols., 8vo, with atlas; "*Études sur la Fortification des villes Capitales*" (1873), besides minor works and a great number of pamphlets upon current military or political topics; and he is author of the article on INTRENCHED CAMPS in the present work. J. G. BARNARD, *U. S. Army*.

Brianchon's Theorem, in conic sections, is the reciprocal of Pascal's theorem, and was first discovered by Brianchon. It is thus enunciated: "The three diagonals of every hexagon circumscribed to a conic meet in a point."

Briançon (anc. *Brigantium*), a town of France, in the department of Hautes-Alpes, on the river Durance, 56 miles S. E. of Grenoble, and near the Italian frontier. It is strongly fortified, is the principal French arsenal among the Alps, and is considered almost impregnable. Pop. 3579.

Briansk', a town of Russia, in the government of Orel, on the river Desna, 74 miles W. N. W. of Orel. It has several churches, a cannon-foundry, an imperial building-yard, and a manufactory of small-arms. Pop. 13,881.

Briar Creek, a township of Columbia co., Pa. P. 1077.

Bri'bery [from the Fr. *bribe*, a "piece of bread," or a gift to a beggar], in criminal law, the offence of taking or offering any gift or reward to influence one's behavior in a public office, whether executive or judicial. It is an offence at common law. It also includes the case of influence or attempting to influence, by money, voters at an election to Parliament. The crime may be committed though it turn out that the person whose vote is thus solicited has no right to vote. It is an offence in any case to offer the bribe, though it is not received. The U. S. Constitution brands it as a crime of magnitude by declaring that the President and other civil officers are liable to impeachment for "treason, bribery, and other high crimes and misdemeanors." It is usual to pass statutes in the States extending the cases to which bribery as an offence may be applied, and fixing the punishment.

Brick, a species of artificial stone made by moulding plastic clay into blocks, and burning them. A very inferior quality of bricks is made by simply drying the blocks in the sun. The earths most employed in brickmaking are (1) the plastic clays, composed principally of silica and alumina in varying proportions; (2) the loams or sandy clays; and (3) the marls, which are either sandy, clayey, or calcareous, according as silica in the form of sand, alumina, or carbonate of lime preponderates in the mixture. These brick-clays almost always contain a small percentage of oxide of iron, carbonate of lime, soda, and carbonate of magnesia. The purer clays contain about 1 part of alumina to 2 of silica, with a percentage of water varying greatly among the different clays. They all mix up freely with water in either large or small proportions, and are characterized by a tenacious plasticity. If moulded and baked, they shrink and warp greatly out of shape, and crack. Hence, these rich clays all have to be tempered with sand, ashes, or cinders before they can be used for bricks. Some clays contain too much sand, and are weak and brittle after burning; these must be mixed with the richer clays. From the greatly varying character of the raw material, it results that the methods pursued in brickmaking must vary among different localities. Some clays require but very little change in the natural proportion of their ingredients, and but very little labor to prepare them for moulding into bricks, it being merely necessary to add the requisite quantity of water to render the clay plastic; while others, such as the fire-clays and some of the marls, have to be pulverized by machinery before they can be reduced to a sufficiently plastic condition. The red color of burnt bricks is caused by the presence of a small percentage of oxide of iron, generally the protoxide. When there is more than 10 per cent. of iron oxide present the clay burns to a blue and almost a black color. A large percentage of iron, if lime also or an excess of silica be present, renders the clay fusible. Some clays contain lime and very little or no iron. These burn white, and require a less intense heat than any other clays to produce hard brick, the lime being a flux on the silica. When carbonate of lime, whether as chalk, marl, nodules of calcareous petrifactions, or in any other form, is present in the clay, it is converted into quicklime in burning, and only such portions of it will combine with the silica and alumina as come into actual contact with them. The balance remains quicklime, which will slake when the bricks become wet, and destroy them. Hence clay containing too much carbonate of lime is unfit for bricks. Other clays contain iron and lime with an excess of the latter, in which case the bricks burn to a light dun or a whitish color. Magnesia generally produces a brown color.

The presence of iron pyrites is objectionable, for the burning expels the sulphur, leaving oxide of iron or a basic sulphate, which occupies less volume than the original pyrites, and makes the bricks porous and weak. Vegetable remains, such as roots, grass, etc., should be excluded for a similar reason.

It is impossible to ascertain, by chemical analysis alone, whether or not a given clay or any mixture of two or more clays will make good bricks. The best chemical tests will furnish only a close approximation. The composition of four clays—two suitable for common bricks and two for fire-brick—are given below. Nos. 3 (from Stourbridge, England) and 4 are the fire-brick clays:

	No. 1.	No. 2.	No. 3.	No. 4.
Silica	50.40	49.44	51.80	58.40
Alumina	24.00	34.26	30.40	35.78
Oxide of iron		7.74	4.14	3.02
Carbonate of lime	2.70	1.48	—	
" of magnesia	1.30	5.14	.30	2.72
Water, etc.	21.60	1.94	13.11	
	100.	100.	99.95	99.92

Some of the fire-clays contain as high as 65½ to 66 per cent. of silica, 27½ to 26½ per cent. of alumina, and 5½ to 6 per cent. of oxide of iron, the balance being the alkalies and water.

Fire-bricks are used for lining furnaces, kilns, ovens, etc. subjected to an intense heat that would destroy common bricks or stone. The Stourbridge fire-bricks are noted for their excellence. The clay is dug up and exposed from three to eighteen months, according to the weather, in "spoil heaps," spread over as large an area as practicable, until thoroughly disintegrated by weather and frost; in winter three months will suffice. The clay weighs six tons to seven cubic yards, and some of the spoil heaps contain 10,000 tons. After weathering, the clay is ground in a circular pan under two cylindrical stone rollers, each weighing two and a half to three and a quarter tons, and faced with iron. After grinding, the clay is carried on an endless band to a "riddle" of 4 or 6 meshes to the inch for fire-bricks, 6 to 10 meshes for fine cement clay, and 12 to 14 meshes for glass-house or pot clay. After passing the riddle the clay is tempered with water to a suitable degree of plasticity, and is then passed through a cylindrical cast-iron pug-mill, where it is cut and stirred by revolving helicoidal blades, which force it out through an opening at the bottom in the form of a bar, which is received and carried by an endless band to the moulding shed. The fire-bricks are moulded by hand in the usual manner, dried in artificially heated sheds at a temperature of 60° to 70° F., or by the sun in clear weather. They are burned in circular domed kilns or cupolas called ovens, where they remain from eight to fourteen days, being subject to the intensity of flame or white heat for about four days and three nights. In burning, the heat is slowly increased and gradually lowered, and the burnt contents require seven days to cool. Most of the kilns contain 12,000 bricks—some, exceptionally, 30,000 to 35,000. The chimney-stack is on the outside, and the flame burns with a down draught, descending through holes in the floor. Coal is used for fuel.

Excellent fire-bricks are made in New Jersey at Perth Amboy, Woodbridge, South Amboy, Trenton, and other places in the vicinity. The process of manufacturing is essentially the same as for common bricks. The fire-clays

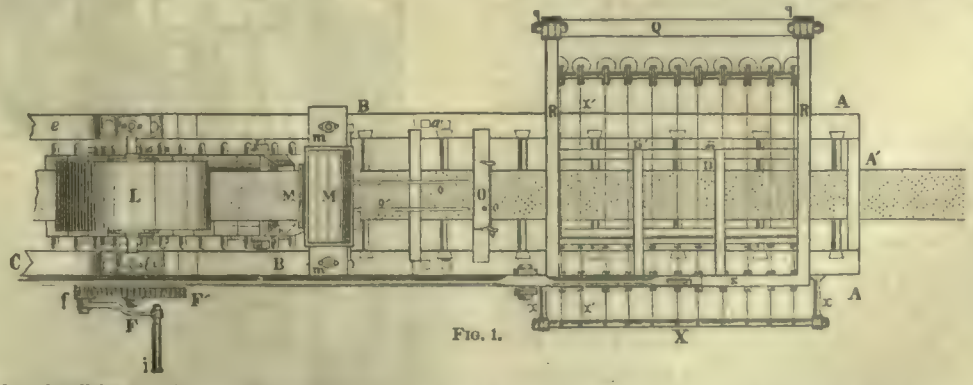


FIG. 1.

of these localities contain generally more alumina and less silica than those of Stourbridge, England, and are therefore richer, the alumina reaching in some cases as high as $37\frac{1}{10}$ to $39\frac{7}{10}$ per cent., with only $43\frac{2}{10}$ to $45\frac{3}{10}$ per cent. of silica. The composition of the bricks consists of about ⅝ raw clay, ⅛ cement, ⅛ kaolin, and ⅛ fine sand. The cement is fire-clay that has been burnt; the kaolin is a clay consisting of very fine sand, mica, and fire-clay, found in the vicinity, and the fine sand is clean coarse, angular-grained quartz, found remarkably pure near by.

Many machines have been employed for making bricks, of which two that have proved to be successful will be described. In the French machine, invented by M. Terrason-Fougères, the frame is composed of two side-pieces A B (Figs. 1 and 3) from sixteen to twenty feet long, framed together as shown in the figures, and mounted on wheels to permit of its being easily moved from place to place. The clay, being previously moistened, is fed to the pug-mill Y (Fig. 3) by means of an endless chain Z, the chain and mill being both operated by a sweep worked by from two to four horses. The clay, on feeding out of the pug-mill, is received upon a plank *k* (Figs. 2 and 3) supported on rods, and sanded to prevent adhesion. The width of the plank is equal, or nearly equal, to the length of the bricks to be made.

Three pairs of rollers D, E, G (Fig. 3) fastened under-

neath the frame give movement and direction to two endless belts H (Fig. 3) by means of a crank and pinion on the shaft E. On each belt is riveted or screwed a series of wooden blocks *h* (Fig. 3) exactly equal in size. Each block has a hole bored in it near the belt, through which the rods pass from side to side. The distance between the two belts can be regulated by sliding the rollers on their shafts, so that the space between the blocks *h* may be adjusted to the length of brick required. In the intervals between D, E, G the belts are supported on friction-rollers *i* (Fig. 3). Motion is given to the belt by means of the teeth *e* (Fig. 2), which take hold of the projecting ends of the rods *h'*.

The endless belts being put in motion, the plank *k*, loaded with clay, is drawn forward under the cylinder L (Figs. 1, 2, 3), which just grazes the top of the blocks *h*. The clay is thus pressed between the plank *k* and the cylinder L, and is prevented from spreading laterally by the blocks *h*. When one plank has advanced sufficiently, another is added, and so on.

The prism of clay, constantly advancing, comes next under the cylinder M (Figs. 1 and 3), which compresses it down to the thickness required, while two wires *n* (Fig. 3), one on each side, cut it to the desired width.

Passing through the die O (Figs. 1 and 3), the prism is brought to its accurate calibre. When working a prism

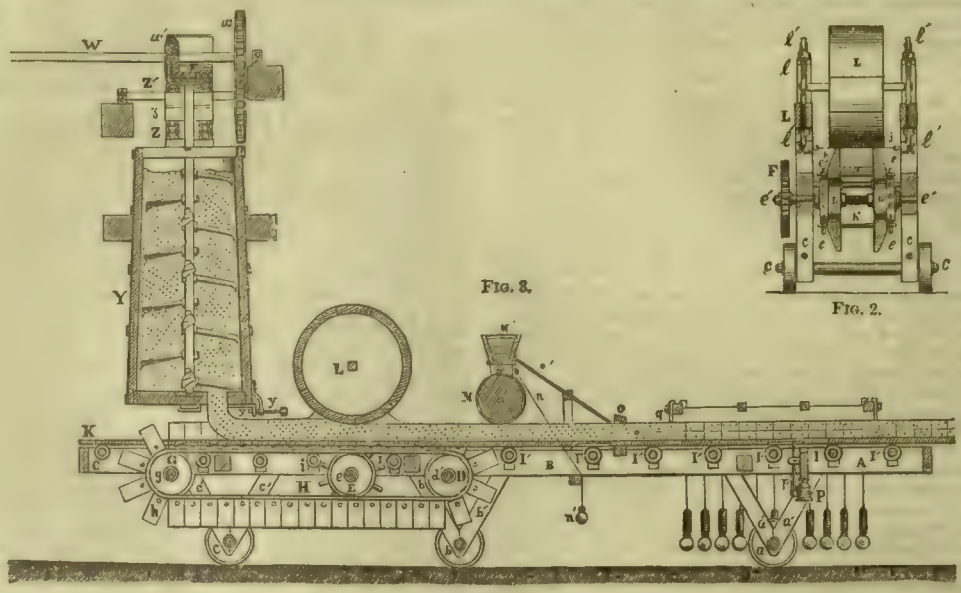

Fig. 3.

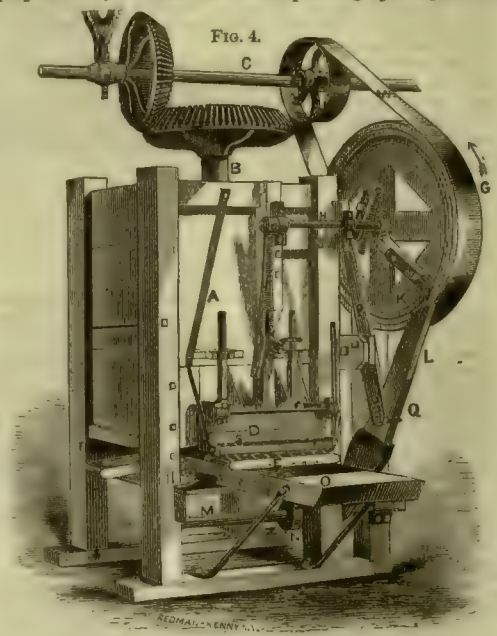
Fig. 2.

two bricks thick the die contains a wire *o* (Fig. 3) which cuts the mass horizontally.

The cylinder L is of wood; a wire *j* (Fig. 2) stretched between its lower surface and the top of the blocks H prevents the clay from adhering to it. The cylinder M is also of wood, but is surfaced with felt, kept constantly moistened. The die O is also supplied with a small stream of water from the same source, at its upper corners, through the tube *o'* (Fig. 3).

When the prism, after passing through the die, has advanced sufficiently far, a small chock upon the plank *k* rings a bell P, upon which the man who is turning the crank stops, and by means of a lever, not shown in the figure, allows the frame R R (Fig. 1) turning on the hinges *q q* to drop, and by means of the wires which it contains to cut off a certain number of bricks of the proper width.

By means of this machine 4800 bricks per hour may be turned out—48,000 per day of ten hours. The actual daily production, however, rarely exceeds 20,000 to 25,000, unless the crank is relieved.



In the drawing the pug-mill is represented as feeding directly into the machine. As, however, the mill can rarely supply the machine fast enough, it is usually detached, and a proper quantity of clay prepared beforehand, and then shoveled on to the machine as required.

The leading type of the machines used at Haverstraw, N. Y., and vicinity for the manufacture of common bricks, where about 2,000,000 per day are made during the working season, is shown in Fig. 4, and is known as the "Vervalen machine." The object of this machine is merely to fill the moulds more rapidly than could be done by hand, and not to produce a pressed brick.

A is a wooden box or tub about 3 feet 4 inches square inside, and from 4 feet 6 inches to 5 feet high, into which the clay to be moulded is cast. B is a vertical iron shaft about 5 inches in diameter, geared with the engine shaft C, which imparts to it a horizontal rotary motion. The lower end of B is provided with a heavy casting, shaped like the letter S, called the *wiper*, which sweeps the clay through a lateral opening in the front side of A into the cast-iron box D.

The shaft B is provided with a number of projecting arms, from fourteen to twenty-two, which clear the sides of the tub by about one inch, and serve to mix the ingredients before they are expelled by the wiper. When, however, the clay is previously mixed by a tempering wheel, these arms are removed, leaving only the wiper, and the tub then serves merely as a hopper. The bottom of the cast-iron box D is provided with six openings, through which the prepared clay is forced into corresponding openings in the

Fig. 4.

mould E. A sort of rectangular piston works up and down in the box D by means of a connecting rod F run by a drum G. A crank at the end of the drum-shaft H communicates a stroke of about seven inches to the piston, which stroke, however, can be diminished at pleasure by shifting the position of a pin at the lower extremity of F. The bottom of the piston does not come nearer than about six inches to the bottom of the box D.

The action of the machine will now be readily under-

stood. The prepared clay is swept by the wiper out of A into D, whence it is expelled by a down stroke of the piston into a mould placed under it. While this mould is being filled an empty one is inserted behind it through the aperture I. The drum G continuing its revolution in the direction of the arrow, a cam K strikes the lever L, throwing it forward, as shown in the figure. It carries with it the shaft M, which by means of a horizontal rod attached to two cranks (one of which is shown partially in the figure at N) and passing behind the empty mould, forces it forward, thrusting out the full one upon the table O, and placing the empty mould in position to be filled. The drum G continuing its revolution, another cam, placed so as to clear the top of the lever L, strikes the upper arm of the lever P, causing it, by means of the projection Q, to return L to its primitive position. A check prevents L from falling too far back. And so on.

Whenever the nature of the materials used admits, the mixture of the ingredients is made by the pug-mill working in the tub. In this case a rectangular pit is prepared directly behind the machine, capable of containing the amount of clay required for a day's work. The clay is placed over night in this pit, and is wet down with a certain amount of water, varying according to the nature of the clay used. In the morning the other ingredients, consisting of sand and anthracite coal-dust, are carted to the pit and roughly mixed by two spaders, who afterwards throw it up into the tub, where the pug-mill completes the mixing.

The proportion of sand used varies according to the quality of the clay and the relative proportions in which the two are found in the bank. It may be taken, on an average, at one-third sand to two-thirds clay. The Haverstraw sand is of excellent quality, and, more than the clay, gives the bricks of this locality their peculiar character. Coal-dust is used in the average proportion of 3 pecks to the 1000 bricks. For burning properly in the kilns, a certain number of what are called *double-coal* bricks is required, in which the proportion is about 5 bushels of dust per 1000 bricks. When mixed in a circular pit by means of a "tempering wheel," the clay and coal-dust are disposed in alternate layers and cut up by the wheel. The sand is then added, and incorporated by the wheel. This operation consumes the entire day.

When the moulds, which are made mostly of cherry or locust wood, and contain six bricks each, are thrust from under the press upon the table, they are placed on trucks and wheeled under the drying shed. The bricks are thrown out upon the flat. When sufficiently dry they are "edged up" by means of an instrument called an *edger*, then "spatted," or tapped with a flat board called a "spatter," to give them a clean edge, and then "hacked up," or placed in long and narrow rows on edge. When dry enough—that is, in one to three days, according to weather—they are built up in "arches," set on edge in the order called "three over one." The arches contain 28,000 to 35,000 bricks each, and are 6 bricks or 4 feet wide, about 44 bricks or 30 feet deep, and from 45 to 55 courses high. Each arch has an opening at the bottom—hence the name—in the centre of its width, in which the wood used in baking is placed. On the outside are placed the "double-coal" bricks, to the number of about 3000 per arch. Bricks containing only the usual proportion of coal would not burn properly at this distance from the fire.

A number of arches, five, ten, or more, are built up contiguously, so as to form a solid mass. The whole is then covered with a dry wall of baked bricks, the lower courses being one brick thick, and the rest half a brick. At the bottom they leave a vacancy between the wall and the face of the arch, which gives a batter to the covering wall, and affords a better draught. Arch-irons or cast-iron frames having an opening of about one square foot are inserted in the openings, and the whole is smeared over with clay. The heap so prepared is called a kiln. This system of burning is pursued rather than that with permanent kilns, on account of the greater number of bricks which may be burned in a given space. At Haverstraw, yards controlling only 200 feet frontage can thus make from 5,000,000 to 6,000,000 bricks per season of 150 working days.

About four cords of wood are used per arch, and the burning requires six days, fires being lit on Monday morning and drawn on Saturday evening. Moulding is usually carried on during the forenoon of each day—about five to six hours—the rest of the day being spent in "hacking up," etc.

The machines above mentioned turn out, in ordinary working, ten moulds or sixty bricks per minute, or 18,000 to 20,000 per forenoon. They require the following plant and help per machine: 25 moulds, 4 trucks, and 8 men. If operated by steam, a machine turning out 18,000 per day requires eight horse-power nominal, high pressure.

The standard of full work in this section is to turn out 1000 bricks per day for every soul employed, from the time the clay is dug till the bricks are loaded in the vessels. Thus, an establishment employing forty hands, all told, should turn out 40,000 bricks per day. The Morand brick-machine, Fig. 5, consists essentially of a pug mill, under which revolves a horizontal iron table, in which there are eight openings or moulds of the size of a brick. The mill mixes the clay, and forces it downward by its helicoidal arms through a slot in the bottom of the mill, thus filling the moulds as they pass under the slot. Each mould then passes under a pressure-plate, which confines the clay on top, while a movable plate, which closes the mould at the bottom, is forced up by passing over a cam. This compresses the plastic brick, forcing out the air and excess of clay through a small hole in the pressure-plate. After passing the pressure-plate the bricks are thrust up to the top of table, and then moved automatically to an endless band, which carries them away. From the band they are loaded upon cars, which convey them into drying-ovens. They go to the kiln the next day. Q. A. GILLMORE, *U. S. Army.*

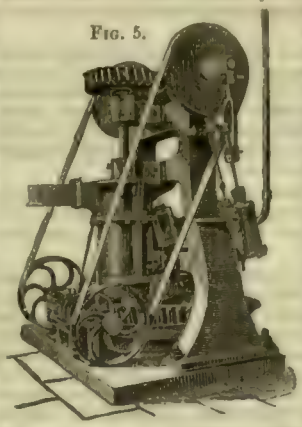


FIG. 5.

Brick, Archæology of. This material has in recent times attracted much archæological interest. The Bible mentions brick as the material of which the tower of Babel was made: "Go to, let us make brick and burn them thoroughly" (Gen. xi. 5); and it is precisely in this region, the valleys of the Euphrates and Tigris, that the most interesting archæological remains of this character are found. The Babylonian bricks were usually burned in a kiln, while those of Nineveh were more frequently sun-dried. We learn also from the Bible that sun-dried bricks were extensively employed in Egypt; and that it was one of the principal employments of the enslaved Israelites to make such bricks, in which straw was mingled with the clay so as to increase the durability of the mass. But Egyptian buildings made of unburnt brick, even without straw, are still standing in good preservation. Some of these buildings are with confidence referred to the remotest periods of history. Similar though scarcely parallel examples of the durability and excellence of unburnt bricks are afforded by the *adobe* buildings of Mexico, New Mexico, and Arizona, many of which were erected by the natives long before the advent of the white race. Adobe buildings erected for public uses in Santa Fé, New Mexico, by the Spanish authorities long before the foundation of the English colonies of North America, are still in use, having stood for more than three centuries with but the most insignificant repairs. This durability, however, both in Egypt and Spanish America, is largely due to the dry weather which prevails in both regions, and is not observed in brick made from inferior clays. The ancient Peruvians made bricks of the greatest excellence, as well as sun-dried bricks of good quality. The Chinese have for ages made excellent bricks, to some of which they give a glazed surface, like that of porcelain. The people of India make bricks—those of some regions finely ornamented, and superior in quality to the bricks of Europe and America. The old ruins of Farther India and Java attest the antiquity of the art of brickmaking in those regions.

But the great discovery of the secret of the cuneiform writing has of late attracted renewed attention to the bricks of Babylon, each of which bears at least the name of some king (notably that of Nebuchadnezzar), the writing having been in most cases made upon the soft clay by a stylus of iron. This practice of marking bricks with some name, as that of the ruler or the manufacturer, has prevailed in other countries, notably in ancient Rome. The Romans made many public and private buildings of brick, often of excellent character; but in some of their subterranean water-courses, recently cleared out, the brick lining has disappeared, leaving a honeycomb of projecting mortar. It has been assumed that Roman brickmaking was derived from that of Greece, in the latter country a very important and extensive industry in ancient times; and the Greeks, it is stated, learned the art of brickmaking from the Egyptians. But if it were necessary to find any such origin for so universal an art in such countries, the Greeks might perhaps be imagined to have acquired it from the Assyrians in Cyprus, for there the two civilizations had a point of contact. CHARLES W. GREENE.

Brick, a township of Ocean co., N. J. Pop. 2724.

Brick Creek, a township of Halifax co., Va. Pop. 5563.

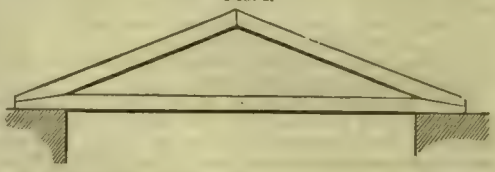
Brick Meeting-House, a post-township of Cecil co., Md. Pop. 1564.

Bricks'burg, a post-village of Brick township, Ocean co., N. J., on the Raritan and Delaware Bay R. R., 44 miles S. by W. of New York. It is a new and thriving settlement, and has manufactures of lumber, sash and blinds, brick, etc. Considerable capital is invested in raising small fruits for market. It has one weekly paper, a ladies' seminary, and a fine public school building.

Bridesburg, a former township of Philadelphia co., Pa., now included within the limits of Philadelphia. It is about 7 miles N. by E. of the State-house. It contains a U. S. arsenal.

Bridewell, a name sometimes given to a house of correction for offenders. This name was originally applied to a well which was dedicated to Saint Bride in London, and a hospital founded on that site by Edward VI. Henry VIII. also built here about 1522 a palace called Bridewell, which Edward VI. gave to the city of London to be used as a workhouse and house of correction "for the strumpet and idle person, for the rioter that consumeth all, and the vagabond that will abide in no place."

Bridge. (*The etymology of the word is obscure; but, according to Richardson, its derivation is believed to imply that which reaches, stretches, or extends;* i. e. *from bank to bank, across a river, from side to side, point to point—anything built, raised, and stretched or extended across.*) If, as defined by Rankine (see ENGINEERING) the engineer "is he who by art and science makes the mechanical properties of matter serve the ends of man," it may further be said that the form of matter which earliest presented the problem of its reduction to subservience to his purposes was the *surfaces of the earth.* To a social being—a member of communities in which civilization has made any advances—paths of communication from place to place are among the earliest felt necessities; and in connection with them the surmounting, by bridges, of the barriers presented by ravines, rivulets, and rivers. In a rude state of society the most obvious and simple bridge is a tree thrown across the stream (if but a rivulet), and hence, says Rankine, "the first man who bridged a torrent with a fallen tree had in him something of the engineer;" putting bridge building among the very first exhibitions of the engineering art. Nor should it be overlooked that from the engineer's art, as exhibited in bridge-building, was derived the title of the Roman high priest; a title transmitted to the Roman *Bishop* and now symbolizing to the faithful of the Roman Church, the successor of St. Peter, the infallible head of the Church of Christ, otherwise styled THE POPE. The word "Pontiff," says Webster, is "said to be derived from *pons,* a bridge, and *facere,* to make, because the first bridge over the Tiber was constructed and consecrated by the high priest."



We have indicated the fallen tree as the rudest and, most probably, the earliest bridge. Singularly the next step in bridge-building seems to have been one which, in its full development, involves the refinements of the constructive art and of the mathematical science. "Another step in advance (Tomlinson's Encya. of the Useful Arts) is to stretch across a river a number of ropes, made of rushes or leathern thongs, secured on the opposite banks between trees and posts, and connected and covered, so as to form a slight bridge. This method is practised in some of the mountainous districts of South America. The ropes are formed of thongs of ox-hide, consisting of several strands, about six or eight inches in thickness, and across these, in a transverse direction, sticks are laid, and these are covered with a flooring of branches of trees. In other cases, an ox-hide rope is extended from one side of the river to the other, and is secured to each bank by means of strong posts. On one side is a kind of wheel, or winch, to straighten or slacken the rope, from which hangs, by a clue at each end, a kind of leathern hammock, capable of holding a man. A rope fastened to either clue, and extended to each side of the river, is used for drawing the hammock to the side intended. A push at its first setting off sends it quickly to the other side. Mules are carried over in this way."

To use these cables in pairs and to suspend from them a flooring is all that is needed to make a suspension bridge. "Such bridges are very numerous in various parts of the world. In China, where the germ of nearly everything connected with the Useful Arts is found, suspension bridges are formed of five parallel chains with links one foot in diameter, on which a loose bamboo flooring is laid. Another form is described as consisting of two parallel chains four feet apart, suspended over stone piers about eight feet high on each bank. The ends of the chains pass back from thence, turn obliquely, and are bedded in the rock, each being fastened round a large stone, which is kept down by a mass of smaller stones laid upon it. A plank about eight inches wide, extending across the river, is suspended from the chains by bands made of roots, of such length that the path is four feet below the chains in the middle of the length of the bridge. The suspending bands are renewed every year, and the planks are loose, so that any part can be prepared separately. The length of one of these bridges is described as being 59 feet. It is only used for foot-passengers; but it is a proper suspension bridge, with a horizontal platform suspended from the main chains."

But to return to the "fallen tree." Instead of "felling" a tree in place, the transition to stretching the trunk of a tree, a "log" or "beam," over a ravine with suitable, however rude, artificial bearing-points, or "abutments," is natural and obvious. As the art of "Carpentry" developed itself, and as a more scientific knowledge of the "Strength of Materials" was acquired—particularly in its applications to the resistance to flexure and stress of beams, the "Timber Bridge" becomes the natural development of the fallen tree. It would soon be discovered that the simple "beam" stretched between two bearing points would receive its *maximum* bending strain at its middle point; that thence, towards each abutment the strain would rapidly diminish. Hence, to get the greatest strength, with the least weight (for *its own weight* is the preponderating cause of strain) the obvious expedient of making the beam thicker in the middle.

Again, the discovery would soon be made that the upper or top fibres of a beam are compressed and those at the bottom extended, while the middle ones are comparatively without strain; and the transition to the truss or framed girder in which the lower or tie-beams, alone, suffer extension—the upper, or brace timbers, are compressed.

FIG. 1.

In applying the above to long spans it becomes necessary that the lower or tie-beam (which may indeed be made up of more than one piece "fished" together) should have points of support intermediate between the two abutments; also that the upper (or *thrust*-bearing pieces) should be stiffened by the application of intermediate bearing points. To meet these requirements the truss assumes more complicated forms, thus:

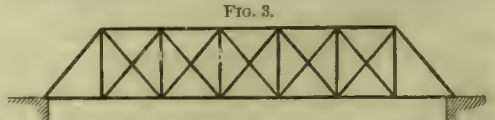


FIG. 2.

The latter figure exhibits nearly the principles of construction of the celebrated bridge over the Rhine at Schaffhausen.

Since, in a bent beam it is found that the top fibres are compressed, the bottom ones extended, while the middle ones, neither compressed nor extended (*longitudinally*) serve to bind the other parts together, an artificial beam on a large scale may be made by uniting the top and bottom longitudinal pieces by a web of diagonals which shall serve the purpose of the middle fibres of the pure beam. This is accomplished in the various kinds of "trusses" in which the upper and lower members are connected by different systems of diagonal bracing combined with vertical ties: as in Fig. 3.

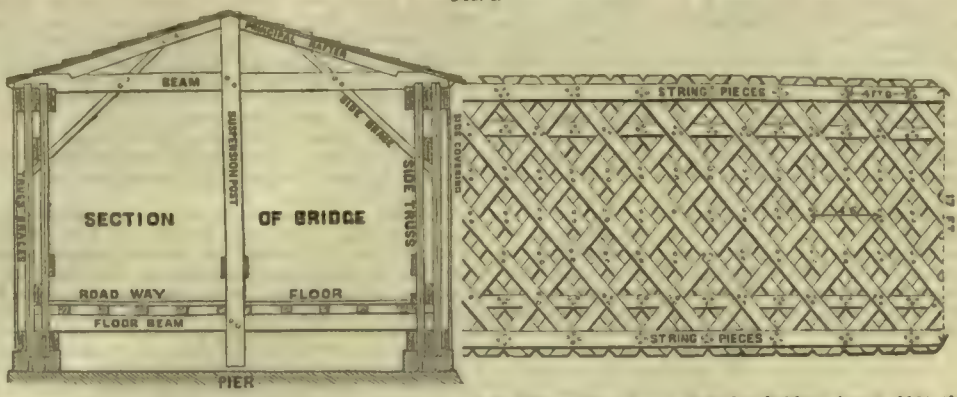

FIG. 3.

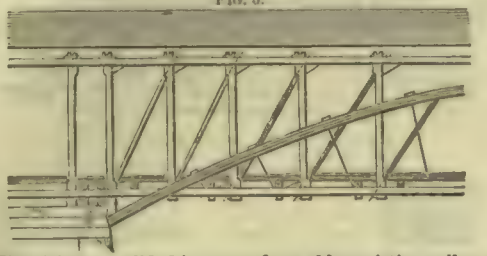
Hence, also, the "lattice bridge" so much in use for ordinary road bridges in this country, and for some of our earlier railroad bridges.

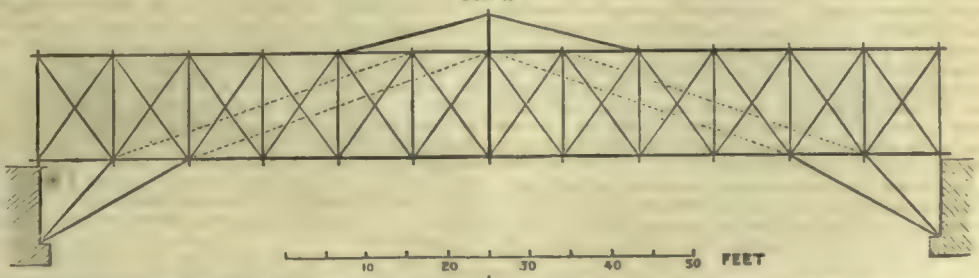


The principles and qualities of the Town lattice (Fig. 4) are too well known to need description. Its cheapness and the facility of its construction adapted it for universal use in

Fig. 4.

our earliest railways they were naturally resorted to, but being deficient in strength, other combinations of timber were resorted to, especially the arch, which (the Burr) truss

Fig. 5.

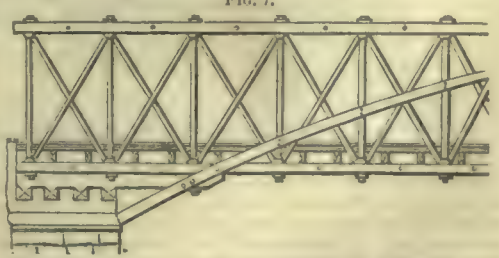


(Fig. 5) is exemplified in some of our older existing railway bridges, and in the well-known road-bridge at Trenton, built in 1804. Other forms of timber bridges (see p. 615), though admirable for their extent and the ingenuity employed in their construction, were likewise deficient in the rigidity essential for railway purposes.

It fell to the part of Col. S. H. Long, U. S. Engineers, in his capacity of chief of the board of engineers of the Baltimore and Ohio R. R., in the year 1828 to devise a suitable timber bridge for the uses of that great undertaking. He aimed at a structure simple in its character, requiring only the skill of a good house-carpenter or joiner, and hence to be of timber, which, both strong and of little weight, is generally procurable upon the route, and is susceptible of rapid replacement in case of destruction by fire or flood, and of which the first cost is very small. The first bridge on this plan, on the Washington road at its intersection with and over a deep cut of the Baltimore and Ohio R. R., 2¼ miles from Baltimore, is thus sketched and described by the inventor (Fig. 6):

"The length, or span, of the bridge is 109 feet; its width

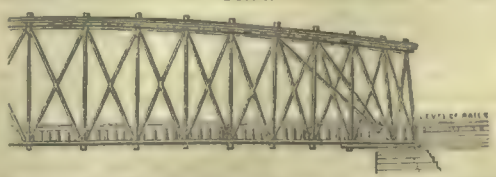
Fig. 6.



from out to out, 24 feet; and its height from bottom to top of its posts is 15¾ feet. It is supported by a double truss-frame on each side, furnished with arch braces from beneath only, the upper arch-braces not being required in a bridge of that length. The exterior string-pieces of each string are only 6 inches square, and the exterior 6″ × 8″. The posts at the ends and at the centre of the bridge, as also the arch-braces, are of the size last mentioned. The other posts and the main braces are 6 inches square. The counter and lateral braces are only 5 inches square.

"The whole of the timber, except the keys, is white pine, with no other seasoning than what it might have acquired in six weeks, during which time the work was in progress, having been framed and raised in that time by six workmen only. Independently of the abutments and exterior covering of the bridge, its cost, inclusive of materials and workmanship of every kind, was only $1145. . . .

"Agreeably to the most approved rules for computing the strength of similar structures, it will sustain on every square foot of its floor, in addition to its own weight, at least 120 pounds, or, equably distributed over the entire surface of its floor, about 110 tons weight."



It was intended by Col. Long that the ravine now spanned by the Carrollton viaduct, so called, and the deep valley of Gadsby's Run, should be crossed by bridges of timber on this plan, and the road bridge, before described by Col. Long, was constructed by him and erected for the purpose of showing that his trussed frame would furnish the desideratum then sought—viz. a structure of timber of sufficient strength and rigidity to meet all the requirements of a railroad bridge, and at a very moderate cost. Subsequently, however, the company changed its policy, and the Carrollton viaduct was built of stone at enormous cost; while the valley of Gadsby's Run was raised to grade by a stone structure and heavy embankment.

Fig. 7.

More recent forms of timber bridges for railroads, built under the Howe patent (Fig. 7), McCallum (Fig. 8), and

Fig. 8.

other trussed-frame bridges, derive their origin from that of Col. Long, the first in this country, at least, who applied

the rectangular trussed frame, pure and simple, to bridges for railroads.

The first bridge built of the Howe truss was in 1838 for Capt. W. H. Swift, U. S. Engineers, when chief engineer of the (now) Boston and Albany R. R., at Warren Village, Mass., and under the specifications entered in the patent of Col. Long. The second bridge built by Mr. Howe was over the Connecticut River at Springfield, for the late Major Whistler, then engineer of the same road (1841–42).

Our great trunk railroads are no longer hampered by the want of capital which generally forbade bridge construction over large rivers and estuaries, yet wooden bridges must prevail in our new railway enterprises, and hence this reminiscence of their early adoption, though anticipating what we have to say in connection with the more general history of timber bridges, is deemed appropriate.

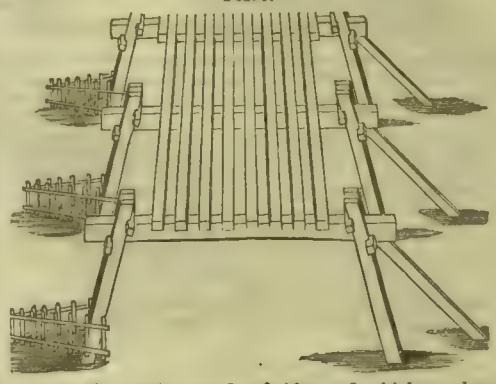
Although the "fallen tree" and its development, the timber bridge, must have been the earliest of bridges yet with the exception of drawings made by Palladio and others from the description given in Cæsar's Commentaries of his bridge over the Rhine, we have no satisfactory account of any ancient bridge.*

This famous bridge has been cited in the works of the most celebrated engineers and architects as worthy of record. It was constructed over the lower Rhine somewhere between Emerich and the Wesel, perhaps (and quite probably when the situation of Cæsar's camp at that time is considered) at the very place where the city first named is now built. Its length must have been somewhere between 550 and 650 yards. Cæsar (according to Rondelet) describes his own work as follows:

"Urged by these powerful motives Cæsar resolved to cross the Rhine with his army. The use of boats offered no sufficient security for such an operation, and, moreover, a resort to this means seemed to him unworthy of his glory and of the honor of the Roman name. On the other hand the establishment of a bridge presented great difficulties on account of the width, depth, and velocity of the current. He persisted nevertheless in regarding this as the only fit means; and the bridge was executed in the following manner in accordance with the idea of it conceived in his own mind.

"Timbers of a foot and a half thickness, sharpened at the foot, and of a length corresponding to the depth of the river, were assembled in couples, allowing an interval of two feet between them. Thus united by means of suitable apparatus, they were let down into the water, not vertically like ordinary piles, but inclined in the direction of the current, and thus driven. Another couple with opposite inclination was then fixed (or driven) 40 feet below the first. These double pieces, thus disposed, received at their extremity a beam of 2 feet thickness which filled the interval between the pieces of each pair, and which was thus supported at each end by double ties.

"This frame-work composed of pieces inclined in opposing directions, strongly connected with each other, formed a very solid combination; for the property of such a disposition of materials is that the force of the current adds to its stability by exerting a strong pressure on the assemblage.



"After making a number of similar structures, placed at equal distances and extending from shore to shore, a continuous flooring was added composed of beams covered with fascines. Besides these arrangements inclined (brace) piles were driven on the lower side and connected with the rest of the work, forming a *whole* capable of resisting the greatest impetuosity of the current.

"The same was done above to protect against floating trees or boats which the enemy might send down the stream with a view of destroying the structure.

"The tenth day after the cutting and assembling of the timbers, the bridge was entirely finished and the army accomplished its passage."

Rondelet gives two "restorations" (as they may be called) of this interesting bridge (see Plate XCVIII. "Art de Batir"), of which the sketch herewith is one;* but the foregoing description is, like all the works of its great author, so lucid as to scarce need pictorial illustration.

Fig. 9.

Among the earlier wooden bridges of which we have record the boldest and most ingeniously constructed was that at Schaffhausen on the Rhine.

A stone bridge that had spanned the Rhine here having fallen, and the project of rebuilding it being found impracticable, Ulric Grubenmann, a common carpenter of Tueffen, produced a model for a wooden bridge, supported only by the abutments on the banks of the river. After some hesitation on the part of the committee of Schaffhausen, his proposal was adopted, and he completed this truly extraordinary work in the year 1758. The total length of the bridge was 364 feet, and its breadth 18 feet. It was eight feet out of a straight line, the angle pointing down the river; and 171 feet from the town abutment. This magnificent and ingenious bridge was destroyed by the French in April 1799.

Fig. 10.

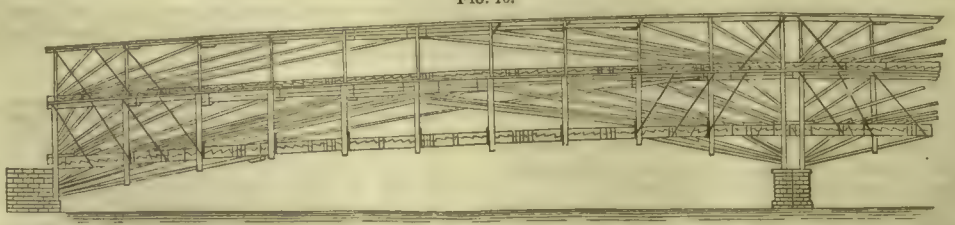


Fig. 10 represents a single span of the bridge.

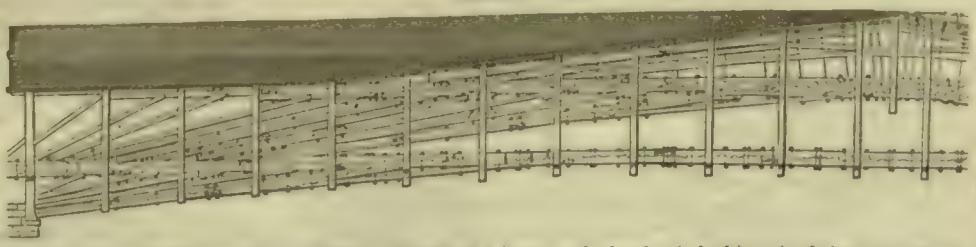
Still more worthy of admiration, though less known, was the bridge of Wettingen over the Limmat, near Baden, constructed by the same Ulric jointly with his brother John Grubenmann. Its span was 366 feet, without intermediate support. This bridge too was destroyed in the campaign of 1799. "The destruction of these bridges," says Rondelet, "would have been an irreparable loss, not only to the public but more especially to the Art of Carpentry had not the plans and details, the knowledge of which cannot be too widely disseminated, been carefully preserved."

Fig. 11 represents a half span.

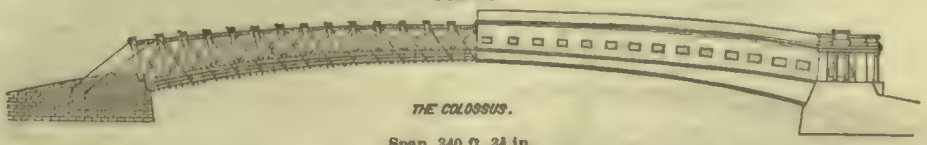
In our own country, until the comparatively recent introduction of iron, timber has been *almost* exclusively employed in Bridge-building, the early history of which describes many noteworthy structures. The most remarkable of these was that over the Schuylkill at Philadelphia, styled by its builder, Lewis Wernwag, "The Colossus of Fairmount." It is thus described by Cresy.



"It was a beautiful piece of carpentry, composed of a single arch, the span of which was 340 feet, and it had no other support than that of the two abutments; the versed sine was 38 feet, and the breadth of the carriage way 30 feet. The principal timbers, which were of large dimension, were all sawn down the middle, for the purpose of ascertaining whether they were perfectly sound; and when applied to the bridge they were placed at a sufficient distance to allow the tenons of 29 king-posts, which radiated to the centre, to pass, without any mortises being cut to receive them; by this means the air circulated freely round all the timbers, and dry rot was prevented: the main ribs consisted

* The oldest wooden bridge on record is the Pons sublicius which existed at Rome 500 years B. C. It is celebrated for the combat of Horatius Cocles, a Roman knight, who saved the city by his noble defence of this bridge. The word *sublicius* is believed to imply wooden piers or piles.

* There is also one in the book of Thomas Pope, cited hereafter.



of three double rows of timber, laid three deep, or one above the other, the whole bound together strongly with wrought iron. Between the tops of the king-posts straining beams were introduced, which kept the heads from approaching each other, and in addition two other timbers, placed diagonally like St. Andrew's cross, were inserted in each of the

Fig. 11.

divisions, strutting the king-posts more firmly and preventing the arch from springing. The abutments, against which the timber arch pressed, were of solid masonry, and carried up considerably higher than the top of the arch. The floor of the bridge was upon girders, laid upon shoulders formed in the sides of the king-posts, to which they were firmly bolted: on the tops of the kings, and in the direction of the transverse girders, were the tie-beams of the roof; these latter not only served to maintain the roof securely, but also the heads of the kings in their perpendicular and proper position. The roof was lightly formed, and the sides of the bridge were close boarded, so that the timbers, or the principles of their construction, could not be seen." Fig. 12 exhibits the arrangement described; its great simplicity compared with the two just before described is striking. The builder asserts that he can build to 500 feet span "by making the ribs of more pieces in depth and thickness and all the parts in proportion."

Fig. 12.

THE COLOSSUS.

Span, 340 ft. 3¾ in.

This beautiful structure was compared by Fanny Kemble in her "Journal," to "a scarf rounded by the wind and flung over the river."

The writer is informed that the upper part of the west abutment had yielded (receded) three or four inches under the thrust of the arch but, apparently, without detriment to stability. On one occasion an unusual load (a heavy stone) was allowed to pass over this single stretch of 340 feet 3¾ inches (the accurate lineal span) which had been refused passage over the Market street triple span bridge. (See Fig. 13.)

Like its famous predecessors of Schaffhausen and Wettingen, this beautiful structure has ceased to exist; not like them a victim of "man's ravage," but of the arch enemy to all wooden monuments—accidental combustion (1838).

Another notable bridge was thrown over the Schuylkill at a much earlier period of which a sketch is given herewith. It is described by Thomas Pope* as follows:

Fig. 13.

"It is composed of three arcs of wood, supported by two stone piers, with two abutments and wing-walls. The western pier is sunk in an astonishing depth of water, perhaps greater than ever any bridge pier was before sunk, in any part of the world; the surface of the rock on which it is placed being forty-one feet nine inches below common high tides. The piers were built with coffer-dams. The dam for the western pier was curiously constructed, from a design furnished by Mr. William Weston, a celebrated hydraulic engineer of Gainsborough, in England. We may have some conception of its magnitude when we are told that eight hundred thousand feet of timber were employed in it."

* * * * * * *

"The eastern abutment and wing-walls are founded on a rock. Those on the western side are built on piles. There are upwards of seven thousand five hundred tons of masonry in the western pier. Many of the stones composing both piers weigh from three to twelve tons. A number of massive chains are stretched in various positions across the piers. These are worked in with the masonry, the exterior of which is clamped, and finished in the most substantial and workmanlike style.

"The frame of the superstructure was designed and erected by Timothy Palmer of Newburyport, Massachusetts. It is a masterly piece of workmanship, combining in its principles that of king-posts and braces with that of a stone arc. Half of each post, with the brace between them, will form the voussoir of an arc, and lines through the middle of each post would describe the radii or joints."

Another notable bridge is described by the same author as follows:

"Piscataqua Bridge. In the year one thousand seven hundred and ninety-four, a bridge was built over the River Piscataqua, seven miles above Portsmouth. Its length is twenty-six hundred feet; of which twenty-two hundred feet are planked. The greater part of this Bridge is built of piles driven into the bed of the river in the common way. But that part which engages the attention of travellers, is an arc nearly in the centre of the river, uniting two islands, over water forty-six feet deep. This stupendous arc of two hundred and forty-four feet on the chord, is allowed to be a masterly piece of Architecture, planned and built by the ingenious Mr. Timothy Palmer of Newburyport. This bridge cost the proprietors sixty-eight thousand dollars."

This bridge is alluded to in the Edinburgh Encyclopædia as one over the "Portsmouth River;" and by Col. Douglass in his work on military bridges, who says: "It was put together with wooden keys, on Price's method of construction, applied to a larger span, except that there is some difference in the form of the keys." The writer observes that the arch is extremely flexible, and that diagonal braces would be an improvement in it. Also that if the three ribs had been placed close above one another, and firmly connected together, the bridge would have been much better adapted to resist any unequal load, because, in such case, they would have formed a solid beam, equal in depth to the sum of their depths.

And even Tredgold treats of it, saying "it would have been still better to have made the same quantity of timber into two ribs, with cross ties and diagonal braces between them; that the method of connecting the parts by means of dove-tail keys is objectionable, as the timber must be greatly weakened by such large mortices, and a very slight degree of shrinkage renders them useless; that it is still more objectionable as applied to the radial pieces, which would have been much better notched on in pairs, and bolted through."

* "A Treatise on Bridge Architecture," New York, 1811. A very curious, and, as a history of bridge-building up to that date, valuable book. The Society and Mercantile Libraries possess copies.

The special object of the work of Thomas Pope was to promulgate the project of a "Patent Bridge" of his own. "A model was built to illustrate a Bridge suitable to span the East River at New York, with a single arc, the chord of which would be 1800 feet, the altitude or versed sine 223 feet, the abutments were built in the form of so many warehouses, and the whole was erected by a scale of $\frac{3}{8}$ of an inch to one foot; the length of model of half bridge, in real measure, is nearly fifty feet. The weight that the unsupported arm of this diminutive Model bore at one time, since finished, has been ten tons; and which has astonished the mind of every beholder."

"The Shipwrights of New York" (among which we find the well-known names of HENRY ECKFORD, Christian Bergh, Adam and Noah Brown, Joseph Webb, &c., &c.) certify to the effect that "we have no hesitation in asserting as our joint opinion, that the strength thus furnished is more than equal to all that can be needed."

The plan is not without merits; but the time when "Rivers North and East may have a Bridge," waited for a Roebling. The inventor gives his plan of construction in great detail, together with a view twice repeated of the entire bridge spanning "the spacious Hudson." But inasmuch as it was to be projected out from its abutments without aid of centreing or "false works," he has given a view (Fig. 14) of the *half* bridge thus projected, with the motto:

FIG. 14.

"Like half a rainbow rising on yon shore
While its twin partner spans the semi o'er
And makes a perfect whole that need not part
Till time has furnished us a nobler art."

But the frontispiece exhibits the "perfect whole" striding the "Broad Hudson," with the more ambitious motto:

"Let the Broad Arch the spacious Hudson stride,
And span Columbia's Rivers far more wide,
Convince the world America begins,
To foster Arts the ancient work of Kings."

Of recent wooden bridges, the Railroad bridge at Bellows Falls, and the Susquehanna Bridge erected by the Philadelphia, Wilmington, and Baltimore R. R. Co., are the most notable—the former with spans of 250 feet has been standing since 1850, and has proved as efficient as any of less dimensions, though it has been subject to uncommon trials. The centre deflection, when this bridge was tested by three heavy locomotives, drawing a freight train at a speed of 25 miles to the hour, was nine-tenths of an inch, the permanent set remaining being about one-sixteenth of an inch. This bridge was designed and built by Parker, and was the first timber bridge for a railroad of so long a span, erected in this or any other country.

The Susquehanna Bridge, also designed by Mr. Parker, is thus described by him:

"The structure between the shores of the river is about three thousand five hundred feet in length. It has thirteen supporting piers and two guard piers at the draw, and two abutments. The piers are built in water varying from ten to forty-five feet in depth. The spans are two hundred and fifty feet in length between bearings. The draw span is one hundred and seventy-six feet long. Height of superstructure twenty-five feet. The superstructure is an improved form of the Howe truss. When completed each truss is to be encased entirely in iron, thus making it fireproof and free from exposure to the weather. The peculiarity of the hydraulic engineering connected with this work is the disuse of the Coffer dam.

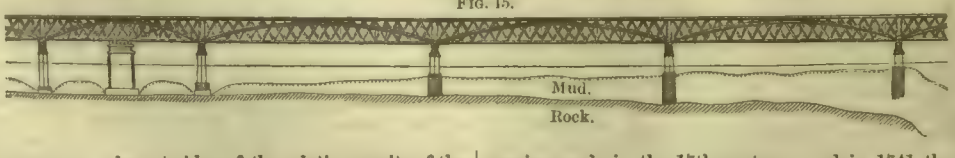
"Instead thereof water-tight wrought-iron caissons have been used.

"The whole cost of the magnificent structure has been something less than $2,000,000.

"The bridge is approached from the main road on the east side by a track laid over heavy trestle work, fourteen hundred feet long. This trestle work is but temporary, and, as soon as practicable, will be replaced by an earth embankment, supported by retaining walls of appropriate masonry. At the end of this is a firm abutment of strong masonry, handsomely constructed of granite from the quarries in the vicinity of Port Deposit, only six miles from the structure. This granite is of a dark color, of elegant appearance when worked, and is said to be the hardest and heaviest in the world—heavier by three pounds to the cubic foot than that of the famous Egyptian Pyramids. There is one of these abutments in each end, similarly constructed.

"The bridge is secured to the piers by means of bolts, three inches in diameter, which pass through holes drilled for that purpose to near the surface of the water, where they are, by means of a ring at the end, attached to a similar horizontal bar that passes through the sides of the pier." The upper ends of these perpendicular bars pass through a heavy oak bolster, and are fastened with a nut at the top, by means of the screw, upon which they can be tightened if occasion should require.

"The timber of this structure has been very carefully selected. It has also gone through the process of Burnettizing, by which its durability is not only increased at least two-fold, but by which it is rendered indestructible by fire. This treatment was applied by Mr. Charles P. Bent, who has an establishment for the purpose at Perryville, and several others upon railroads in different States."



"This process is familiar to our readers, and consists in removing air, etc., from the fibres of the wood, by placing it in an exhausted vessel and then injecting chloride of zinc."

"The timbers of the bridge are secured by means of iron bars and butt seats. These bars are about twenty-five feet long, and vary in thickness from one to three inches, the largest weighing seven hundred pounds. In the construction of the bridge nearly seventeen hundred of these bars are used. The immense weight of the structure may be estimated from the fact that there is used upon each span about two hundred tons of wood and iron. Iron is much more extensively used than is common in timber structures. As an instance, the bottom chords, where most exposed to a tensile strain, are entirely sheathed on the sides with plate iron three-eighths of an inch thick."

"For five years from five hundred to one thousand men have been employed upon this great work. Upon its construction nearly five million feet of timber, twenty thousand cubic yards of masonry, three million pounds of wrought and cast iron have been used."

Fig. 15 exhibits an elevation of four spans, including the draw, of the bridge just described.

FIG. 15.

To convey an adequate idea of the relative merits of the different kinds of "truss" for wooden bridges (known as Burr's, Long's, Howe's, "McCallum's inflexible arch," etc.) would require more space than can be devoted to it in a work not professedly technical. The clearest description and analysis of merits will be found in Spon's Dictionary of Engineering, or Cresy's Encyclopædia.

Although, as we have seen, suspension bridges of a simple character are among the primitive structures of mankind, yet their development into important structures capable of meeting the needs of civilized intercourse, demanded an advance in the scientific knowledge of materials and the principles of construction, which has only been made within the last two or three centuries. Bridges of rope or cordage are described in works on Military Engineering early in the 17th century; and in 1741 the first European Chain Bridge was built in England across the Tees. It was a rude work attracting no attention at the time; and not until 1814 did English engineers apply themselves to their construction. In our own country, in reality, was the Suspension or (as it was called) the "Chain Bridge" first introduced. Thomas Pope states that a "Patent Chain Bridge" was patented by James Finlay in 1808 and that there existed eight of these bridges. In the "Portfolio" of June, 1810, is the following descriptive notice of four of the eight:

First bridge erected on this plan in 1801 was on Jacob's Creek, 70 feet span, 12½ feet wide, and warranted for 50 years (all but flooring), cost $6,000. Exclusive right secured by patent 1808. Largest at Falls of Schuylkill, 306

feet span, aided by intermediate pier; passage 18 feet wide, supported by 2 chains of 1½ inch square bar.

One at Cumberland, Md., supported by two chains of 1¼ inch bar; span 130 feet, 15 feet wide.

Another over the *Potomack* above the Federal city of nearly the same dimensions as at Cumberland. (Fig. 16.)

The "Portfolio" mentions besides the foregoing (making up the eight of Thomas Pope):

Fig. 16.

One over the Brandywine at Wilmington, 145 feet span, no pier, thirty feet wide, supported by four chains of inch and three-eighths bar. Two carriage-ways and one foot path.

One at Brownsville, Fayette County, one hundred and twenty feet long, eighteen feet wide, one inch and a quarter bar.

One near the same place, one hundred and twelve feet long, fifteen feet wide, one inch and a quarter bar.

Finlay says that he entered into an agreement with John Templeman* of Georgetown, Md., concerning the disposition of his patent right, and hence we presume the attributing of the *Poetomemack* bridge to the latter in some publications, as he was probably its *builder*.

This latter bridge has a history: it was standing in the beginning of 1839 when the writer, in company with the present Quarter Master General of the U. S. Army, who has kindly furnished these items of information, crossed it. Not long after it was carried away by a freshet, replaced by a truss bridge (Long's probably), and that by two spans of iron (by Geo. Thom) which fell before completion; when Randolph Coyle built a wooden bridge over the *whole* Potomac bed, doing away with the *causeway* which, in restricting the flood-water area, had caused the destruction of the original "Chain Bridge." This last is thus alluded to in the "Report on the Defenses of Washington." (Prof. Papers, Corps of Eng'rs., No. 20.)

"The Chain Bridge (for the *name* still holds) owed its name to a former suspension structure, long since carried away by floods. It had been replaced by a fine timber trussed bridge of over four hundred yards in length, resting on masonry abutments and seven masonry piers. At ordinary stages the river, rapid and unfordable, flowed beneath the single span next the Virginia shore; the rest of the bed being dry and strewn with fragments of rocks of large size. At high stages the whole width spanned was swept over by a furious flood. This was the sole existing bridge between Washington and Harper's Ferry at the breaking out of the war, the one formerly existing at Berlin having been destroyed by fire. It connected Washington with the Leesburg Turnpike and neighboring parts of Virginia. Its ordinary uses ceased with the outbreak of the war, but it immediately acquired a high military importance. Though not strictly necessary to a mere passive defence of Washington, it had, nevertheless, a high incidental utility as a means of maintaining communication with the Virginia theatre of war, and of throwing forces on the flank of an enemy menacing the lines of Arlington."

The existing timber trusses have decayed, and are soon to be replaced by others of iron.

Thomas Pope, in commenting upon the accounts of the ancient bridge of Bootan, East Indies, says, "the mode of construction is so exactly similar to those we see erected lately in the United States that we are ready to conclude the ancients lived yesterday."

"Were the Chain Bridges erected of late in the U. S. a new invention, the notorious defects contained in the system would remain the same.

"It is an axiom that when a structure of any kind depends wholly on two parts, if one of these parts fail and the other is not competent to support the whole a downfall must ensue; hence we infer there can be no security in a bridge wholly dependent on two chains, &c., &c." Knowing only *chain* bridges he almost anticipates Roebling when the latter says "there is not one good suspension bridge in Great Britain, nor will they ever succeed as long as they remain attached to these *chains*, and present mode of superstructure."

In 1814 Telford undertook a course of experiments upon the tenacity of malleable iron, prompted by the necessity of such knowledge to the testing of the feasibility of such bridges with large spans, and thus epitomizes his results:

"From these experiments I had reason to be satisfied that English iron made with wood charcoal, had sufficient tenacity to bear itself, and a portion to spare equal to the purposes of a bridge across an opening of 1000 feet, and therefore considered myself justified in proceeding to form designs."

The Menai Bridge, commenced in 1819, and finished in 1826, was the culmination of Telford's labor in this connection; but several smaller suspension bridges had been previously erected in England, among others that across the Tweed at Dryburgh Abbey on the system of "inclined wires." In 1818, six months after the completion of the bridge, a violent gale of wind caused so great a vibration of the chains that the longest chains broke, the platform was carried away and the whole bridge destroyed. The vertical motion of the roadway was said to be, just before breaking, as great as the horizontal motion, and sufficiently violent to have thrown a person off the bridge.

The Menai Bridge has a clear span between the summits of the main pyramids of 579 feet 10¼ inches.

The deflection of the chains in the middle.....	43 ft. 0 in.
The clear height of the roadway above high water...	102 ft. 0 in.
Breadth of the platform.....	28 ft. 0 in.

The main chains are on Capt. Brown's plan of straight bars, united by coupling bolts. The main chains are 16 in number, each containing a series of links composed of 5 wrought-iron bars, 9 feet 1¼ inch long, 3¼ inches broad, and 1 inch thick. They are disposed, four chains one under the other, on each side of the central footpath, and four at each outside of the platform. So that there are in all 80 bars in the main chains, and their united section is $80 \times 3\frac{1}{4} = 260$ square inches of iron. The bars are united by coupling plates 16 inches long, 7½ inches broad, by 1 inch thick, and screw-bolts 3 inches diameter, each bolt weighing 56 lbs.

This bridge was seriously injured by a violent gale and has been strengthened.

The Conway Bridge completed at the same time differs but little in construction from the Menai. Its span is but 327 feet.

The Brighton Chain-Pier on the same plan consisted of four spans each of 225 feet running out into the sea 1014 feet from its origin in the esplanade wall and was built in

* John Templeman subsequently constructed the Chain Bridge over the Merrimac three miles above Newburyport. This was a much superior work to those just described. The span was two hundred and forty-four feet, and width thirty feet, with two roadways of fifteen feet each. The abutments were of masonry forty-seven feet long and thirty-seven feet high, upon which supporting towers were erected. Ten chains, three at each outer edge of the bridge, and four in the centre, were made to bear, with perfect safety, five hundred tons.

1822–23. "It withstood the shock of many a violent tempest; but at length, in November, 1836, it yielded to a gale of wind. The roadway of the pier gave way half an hour after midday of the 29th, about which time Osler's anemometer recorded the pressure caused by the wind's force at Birmingham as equal to 11½ pounds on the square foot. The barometer at Greenwich had sunk to 29.24; the wind's force there also being denoted by 11½ lbs. There was a double motion in the pier, for both chains and roadway oscillated laterally, and undulated longitudinally; but the latter movement increased greatly, whilst the former diminished, just before the fracture took place. It was probably owing to this double motion that half the upper part of the roadway, and half the under part, were visible to the spectators at the same instant. As soon as the side rails gave way the undulations greatly increased, and almost immediately afterwards the roadway broke. It was remarked at the time that, had the side-railing been a trussed rail, the pier would probably have withstood the force of the storm."

The Suspension Bridge over the Esk at Montrose, completed in 1829, had a span of 432 feet and a deflection of 42 feet. The iron work built by Capt. Brown was mainly the same as in the two bridges just described. There were no joints to the suspending rods, and the main-chains rested upon detached cast-iron saddles, built into the masonry of the towers, and their ends were secured by cast-iron plates let into the masonry 10 feet under ground. The roadway of this bridge, which weighed 203 tons 9 cwt., was destroyed on the 11th of October, 1838, when the platform fell in one mass, in consequence of the failure of the suspension rods, which having no joints were twisted off close to the floor by the undulatory motion. It was afterwards repaired, when suspension rods of 1⅛ inch diameter were introduced, with flexible joints at the level of the platform.

We need mention but one other European Bridge—a harbinger of our own more magnificent construction in that form of the suspending material which is declared by Roebling the only fit one for such structures—the bridge of Freyburg, in Switzerland, completed in 1834. This bridge has a span, from pier to pier, of 870 feet, and is suspended at the height of 167 feet above the river which flows under it. It is thus 319 feet longer than the Menai Bridge, and 65 feet higher. It is supported on 4 cables of iron wire each containing 1,056 wires, the united strength of which is capable of supporting three times the weight which the bridge will ever be likely to bear, or three times the weight of two rows of wagons extending entirely across it.

It was completed at an expense of about $125,000, and, in 1834, was subjected to various severe trials, to prove its strength. First, 15 pieces of artillery, drawn by 50 horses, and accompanied by 300 people, passed over it at one time, and were collected in as close a body as possible, first on the centre and then at the two extremities, to try the effect of their concentrated weight. A depression of 39½ inches was thus produced in the part most weighed upon; but no sensible oscillation was occasioned. A few days after, the bridge was opened by the bishop and the authorities of the town, accompanied by about 2000 persons, who passed over it twice in procession, preceded by a military band, and keeping step. On this occasion a slight horizontal vibration was produced; but it is very improbable that the bridge, in its ordinary service, will ever receive such a multitude at once.

"The first wire bridge," (says Stuart) "*an American invention*, was over the Schuylkill," and was constructed by Charles Ellet, whose name should be associated with that of Roebling as a pioneer of the wire suspension principle. It succeeded the famous wooden "Colossus" of Lewis Wernwag which we have described. This bridge, of 408 feet span, has recently (1874) been replaced, though still in good condition, by an iron-truss bridge of greater capacity.

In 1846, continues the same writer, in his sketches of the "Civil and Military Engineers of America," the attention of Mr. Roebling* was invited by him (Stuart) to the erection of a railroad bridge across the Niagara River, who, in response, states: "Although the question of applying the principle of suspension to railroad bridges has been disposed of in the negative by Mr. Robert Stephenson, when discussing the plan of the Britannia Bridge over the Menai, on the Chester and Holyhead Railway, I am bold enough to say that this celebrated Engineer has not at all succeeded in the solution of this problem. That a suspension bridge can be built to answer for a railroad, is proven by the Monongahela Bridge, which is only intended for common travel, but with some additional expense could be made stiff enough (it is strong enough) for railroad trains at a moderate rate of speed. Castings of ten tons weight, suspended to two pairs of large timber wheels, have lately been hauled over this bridge; the six-horse coal trains which pass over it hourly weigh seven tons."

"It cannot be questioned that wire cables, when well made, offer the safest and most economical means for the support of heavy weights. Any span within fifteen hundred feet, with the usual deflection, can be made perfectly safe for the support of railroad trains as well as common travel."

* * * * * * * *

"I maintain that wire cable bridges, properly constructed, will be found hereafter the most durable and cheapest railroad bridges for spans over one hundred feet."

To Mr. Roebling, we think, must be conceded the claim of *practically establishing* the sufficiency of the suspension principle for railroad bridges and of developing the manner of their construction. His first great work—the Niagara Bridge—is so well known as to need little description in this place. The span is 821 feet 4 inches from centre to centre of the towers; it forms a slightly curved hollow beam or box of a depth of 18 feet, width at bottom of 24 feet, and at the top of 25 feet, the lower floor of which is used for common traffic, whilst the upper is devoted to the railway. The two floors are connected by two trusses of simple construction, so arranged that their resisting action operates both ways, up as well as down. The suspenders are 5 feet apart. The beams of the upper and lower floor are connected by posts arranged in pairs, leaving a space between for the admission of truss rods. The ends of the posts are secured between the beams, in a manner that no part is weakened, and that any amount of strain can be thrown upon them without injuring or loosening their connections. There are no joints to work loose; and if the timber should shrink, the truss rods simply require tightening. The depressing action of any loads is by these posts transmitted from one floor to the other.

From the end of each pair of posts a truss rod extends each way to the fourth pair of posts, at an angle of 45 degrees. The rods therefore cross each other, and form a diamond figure; they are 1 inch in diameter, with screw ends of an inch and an eighth; by these rods the pressure upon any pair of posts is spread 40 feet apart. All the nuts work on cast-iron plates placed above or below the posts.

Without adding much to the weight of the structure, a considerable degree of stiffness has been obtained by this simple construction. The pressure of an engine and whole train of cars is so much distributed that the depression caused by a light freight or ordinary passenger train is scarcely perceptible. A freight train of twelve loaded cars, with a 25 ton engine, covers about half the length of the floor; and its effect is more noticeable than either a smaller or larger train. When in the centre, the camber is a little flattened; but when near the towers, where the grade forms nearly a straight line, the depression is from 3 to 4 inches. A longer train, of greater weight in proportion, disturbs the equilibrium less, as it covers a greater extent. Passenger trains of fifteen long cars, which frequently cross the bridge, make so little impression that the eye can scarcely detect it.

The height of the railway track above the middle stage of the river, is 245 feet.

The Cincinnati and Covington Bridge over the Ohio, completed in 1867, was erected by the same Engineer. From his report, as quoted by Stuart, the following particulars are extracted:

"The floor of the bridge is formed of a strong wrought-iron frame, overlaid with several thicknesses of plank, and suspended to the two wire cables by means of suspenders attached every five feet, arranged between roadway and footpaths; the latter seven feet wide, and are protected by iron railings towards the river. The roadway is twenty feet wide, forming two tracks of four lines of iron trams, on which the wheels run, each tram being fourteen inches wide, to accommodate all kinds of gauges. The whole width of the floor between the outside railings is thirty-six feet. No stays or other obstructions are put up below the floor, such as may be seen under the Niagara Bridge. No such means to prevent the floor from rising was used in this work; its security and stability are provided for by other appliances. The rock under the Niagara Bridge afforded a very cheap mode of anchorage; it would have been a great oversight on my part not to avail myself of under-floor stays in such a favorable locality. But in the Ohio River no such appendages were admissible.

* Mr. Roebling had previously constructed four *Suspension Aqueducts* on the Delaware and Hudson Canal of 115, 144, 145, 170, feet span, and one for the Pennsylvania Canal over the Alleghany River of seven spans of 162 feet each; also the wire suspension bridge over the Monongahela at Pittsburg, of eight spans of 188 feet each.

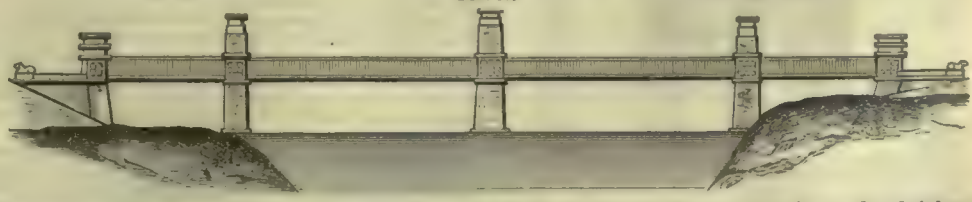
After the abandonment of the trans-montane portion of the Pennsylvania Canal the aqueduct mentioned fell into ruins (1856–59). The stones of its piers were subsequently used in the Fort Wayne R. R. Bridge.

"Great doubts are yet entertained by many engineers, particularly in Europe, in regard to the fitness and safety of suspension bridges for railway purposes. By an additional expenditure of fifty thousand dollars, and a railroad track laid down in the centre of the floor, the Ohio bridge could have been made serviceable for the passage of locomotives and trains at the highest speed. Let any person who doubts this, observe the very slight tremor which is produced on this bridge by a long line of heavily loaded teams, frequently ten in a row, and he will readily understand that but a small addition of rigidity is wanted in order to pass railroad trains."

The principal dimensions are given by Mr. Stuart as follows: "Main span, from centre to centre of towers, one thousand and fifty-seven feet. Side spans, from abutment to centre of tower, two hundred and eighty-one feet. Total length between abutments, one thousand six hundred and nineteen feet. Elevation of floor above low water at tower, ninety-one feet. Elevation of floor above low water at centre, one hundred and three feet. Length of Cincinnati approach from Front street to abutment, three hundred and forty-one feet. Total length, including approaches, two thousand two hundred and fifty-two feet. Number of cables, two, each twelve and one-third inches in diameter. Number nine wires, in each cable, five thousand two hundred. Ultimate strength of one cable, four thousand two hundred and twelve tons. Weight of main span between towers, one thousand five hundred tons. Number of stays in main span, seventy-six—strength of each, ninety tons. Weight of main span between towers, as far as supported by cables, one thousand three hundred tons. Deflection of cables in main span, eighty-nine feet. Permanent tension to strength, one-eighth. Ordinary working tension to strength, one-seventh. Maximum tension to strength, one-sixth. Section of each anchor chain in square inches, one hundred and ninety. Area of each foundation in square feet, eight thousand two hundred and fifty. Cubic contents of masonry of each tower, four hundred thousand feet.

Although not vieing in importance with the bridges just named yet from its, as yet, unrivalled span, and the peculiarity of its site, the Clifton Bridge, Niagara Falls, deserves a notice.*

The end of the bridge resting on the right bank is situated in Porter's Grove, at the foot of Niagara street, 300 yards below the American Fall. The end resting on the left bank, lands upon the main road running along the bank of the river, and is 100 yards below the Clifton House, and about three quarters of a mile below the great Horse-Shoe Fall on the Canada side.



A section of the river on the line of the bridge gives a distance of 1190 ft. from rock to rock at the top cliff, and 850 ft. at the water's surface. The rock on the left bank is 175 ft. above the water, and on the right bank 180 feet. The American Fall is 164 feet. On the Canada side the rock is covered with 2 ft. of earth. It falls off perpendicularly 54 ft. to the débris which covers the fort and slopes away to the water's edge. On the American side it is covered with 20 ft. of drift (clay, sand, and gravel), which, when removed to make room for the towers, exposed a water-worn surface. Here the rock overhangs some 10 ft., and the plumb line strikes the débris at a distance of 80 ft. from the surface.

The span between the points of suspension, or centres of towers, is 1268 ft. 4 in. The deflection of the cables at centre, or greatest depression below the horizontal line, varies from 89 ft. in winter to 92 ft. in summer. The difference of 3 ft. is owing to the effect produced upon them by the changes of temperature, ranging through 100° Fahr. The road way is suspended at an elevation of 183 ft. above the water on the Canada side, and 188 ft. on the American side, while the centre, according to the season, varies from 190 to 193 ft., there being a rise of 4 ft. in the curvature of the bridge in summer, and 7 ft. in winter. The tops of the towers being in the same horizontal plane, are therefore 105 ft. high on the left bank, and 100 ft. high on the right bank. The length of the cables at medium temperature is 1286 ft. between centres of towers; 1828 feet between the anchor pins, where they are connected with the anchor chains, and 1888 ft. in all, between the anchors embedded in masonry on either side. The prolongation of the cables under ground is effected by anchor chains of Lowmoor iron 30 ft. in length, made in links of 10 feet each, firmly built in hydraulic masonry.

But the crowning example of the suspension bridge—the last great work of John A. Roebling—is found in the East River Bridge, connecting the cities of New York and Brooklyn—the stupendous piers of which (themselves wonderful monuments of the engineering skill of the age) are, under the direction of Col. W. A. Roebling, the son of the deceased projector, far advanced toward completion. The superstructure is described under a special heading East River Bridge. Under the heading Foundations, will be found a further account of this work up to date.

A transition from the suspension to the iron *tubular* railway bridge is proper here, owing to controversies which have prevailed among engineers as to the relative merits of the two constructions. The suspension principle was condemned by Mr. Stephenson in discussing the project of a bridge over the Menai Straits; and to this engineer is due the merit of the original *conception* of the tubular bridge, though it was owing to "the determined perseverance" of Mr. Fairbairn (to use his own expression) "that Mr. Stephenson's original conception has been carried into execution." The first work of the kind was the bridge at Conway on the line of railway from Chester to Holyhead. But *the* great typical work of this character is the Bridge over the Menai Straits on the same great railway route (from London to Dublin), eighteen miles distant from Conway. It owed its creation to the necessity imposed by the Lords Commission of the Admiralty of preserving a clear height of water-way of 105 feet from pier to pier. There are two spans over the straits each of 460 feet; and two shorter (230 feet) for the land connections. (Fig. 17.)

Fig. 17.

The history of the experimental development and actual construction of this celebrated bridge has been so fully and so often given that we content ourselves with simply giving a cross section of one of the tubes. (Fig. 18.)

But the most stupendous structure (considering merely *magnitude*)—probably the *last* of the kind—is the Victoria Bridge, over the St. Lawrence at Montreal, on the line of the Grand Trunk Railway to Portland, Maine. It contains twenty-five openings of two hundred and forty-two feet, with the exception of the extra span, which is three hundred and thirty feet, hence the length of tube is six thousand six hundred feet, approached by embankments, the Montreal end being one thousand two hundred feet, the southern shore of eight hundred feet, which, including the abutments, makes a total of nine thousand and eighty-four feet, or one and three-quarter miles nearly. The abutments are, at the base, each two hundred and seventy-eight feet long, divided into cells of twenty-four feet, with intervening tie-walls of five feet, but at the top they correspond exactly with the length of a tube two hundred and forty-two feet in length, and indeed are carried up to the same height, the cells being filled with gravel. To resist the thrust of the ice, both the abutments and piers are furnished with a cutwater, which meets the pier proper thirty feet above summer water, the whole height of the abutment being thirty-six feet above summer water, the centre pier being sixty feet; hence the bridge rises in a grade of one inch in one hundred and thirty-two, or forty feet to the mile, the centre again being a pure level. The centre pier is twenty-four feet in width, the remaining piers are but sixteen feet. These dimensions are directly under the girder, for at the foundation the piers are twenty-two feet in width, and at summer water sixteen feet. Transversely the piers are thirty-three feet under the girder. Thus the dimensions at the junction with cutwater, sixteen by thirty-three feet, extending outwards to the foundation up stream,

* There is, near Bath, England, a *chain* bridge of this name, and, like this, over a chasm of great depth; span 702½ feet; height above the Avon, 257 feet. The chains are those of the dismantled Hungerford (Thames) Bridge. A remarkable wire suspension bridge exists at La Caille, between Geneva and Annécy, over the Cañon des Fées. The floor is 636 feet long, and is 656 *feet above the water*. Built in 1839, overturned and much damaged by a gale in 1861, it has been rebuilt with adequately increased strength.

make the area of the course whence the cutwater is commenced sixteen by ninety feet.

There are three millions of cubic feet of masonry in the Victoria Bridge. That is to say if turned into lineal measure it would reach five hundred and ten miles, or as a solid would form a pyramid two hundred and fifteen feet high, having a base of two hundred and fifteen feet square. These figures will give some idea of the solidity of the structure, and the warrant that exists for its endurance for all time. The stone itself was mostly quarried from Point Claire, and forms the first in the series of the Lower Silurian, and is known by the geological term of Chazy, resting immediately on the calciferous sand-rock and the Potsdam sandstone. At the quarry the stones were taken out in as large masses as in any quarry in the world. We shall be borne out in this statement of this fact in the dimensions of the piers. The courses being three feet ten inches and three feet to two feet six inches above water level, and thence verging into a course eighteen inches under the plates, being in length from seven feet to twelve feet.

This bridge cost $7,000,000. The peculiarity of the erection of these tubes is that they were built *in place*, on false works erected in the rapids. The *ice* which holds the surface of the rapids bound during many months of the winter, was made a useful auxiliary in the construction.

Fig. 18.

Mr. Peter W. Barlow, an eminent English engineer visited America in the summer of 1860 (a fellow-passenger across the Atlantic with the writer) *expressly* to examine the Niagara Suspension Bridge. His conclusions were given in a pamphlet published by Weale. The Civil Engineer and Architects' Journal, 1861, comments upon it as follows: "Are tubular bridges costly blunders? This is in effect the question raised by Mr. Barlow's pamphlet," and, referring to two papers in same Journal, (1860) says "from these two papers it is at least obvious, that in comparing suspended and unsuspended girders the former have greatly the advantage in point of economy. And this conclusion is supported by a very high authority on this subject, Prof. Macquorn Rankine, in two letters in our numbers of December and January last. In the latter of these letters Prof. Rankine arrives at the conclusion that a suspended girder need have only about *one-seventh* of the strength of an unsuspended girder of the same span and required to sustain the same travelling load."

"It is notorious that tubular bridges, of which that over Menai Straits and the Victoria Bridge in Canada are the most conspicuous examples, are enormously expensive. It is notorious that the cost of those two bridges has been ruinous to the companies which constructed them. There is not much difficulty in arriving at the reasons of this result. In the first place, tubular bridges are extremely complicated structures, consisting of a vast number of parts which have to be fitted together with extreme accuracy. In order to prevent the top of the tube from bulging or 'buckling' from the compression to which it is subject, the expedient of a cellular structure of that part of the tube is adopted, and it consists of numerous cells formed of iron plates, with an immense number of joints and rivets. Now all this difficulty of counteracting the tendency to distortion is avoided in suspension bridges, for in them the strains, being tensile instead of compressive, tend to counteract instead of tending to cause distortion. Again, in suspension chains the material is so disposed as to more directly sustain the travelling load than is the case in girders or tubular bridges. In the latter the source of strength is rigidity;—that is, the moment of the elastic forces of tension and compression; and this moment of forces is limited by the depth of the structure; so that, to speak in popular language, the elastic forces can never have a greater leverage than the distance between the top and bottom of the tube. But in suspension bridges the similar leverage is far greater. For the equilibrium of the half-span, the moment of the weight upon it about the abutment is equal to the moment about the same axis of the tension, which acts at the summit of the chain."

It is further observed that the Niagara Bridge "notwithstanding certain defects in its construction has proved in a great degree successful," while instead of the 3000 tons of iron in the 460 feet span of the Britannia (Menai) Bridge, there is in the former, in 821 feet span, but 400 tons of iron, combined with 600 tons of wood.

The extension of railways over the immense territorial areas of Europe and America, and the quite recent application of this powerful agent to the development of new countries, or to the spanning of uninhabited regions in order to connect populous ones, has given a vehement impulse to bridge construction as well as to the inventive faculties of its engineers. Few more instructive and suggestive studies can be made than that of the comparative characteristics of the *recent* railway bridges of India—of Russia—of Holland—of England—and of our own country. These countries are named as exhibiting *typical* constructions which reflect the peculiar civilized *status* of the peoples, and the peculiar *engineering* problems offered by different regions, modified as they are by the different nature of the *building materials* which those regions afford. We cannot enter into this subject, nor can we go at length into modern science and practice of iron bridge construction.

In our own country the problem is presented in almost every possible variety of aspect—rivers of unrivalled magnitude to be spanned by erections to rest upon foundations of the most difficult character, while necessity has rigidly limited outlay. Hence arises a special fertility of invention and a special class of work.

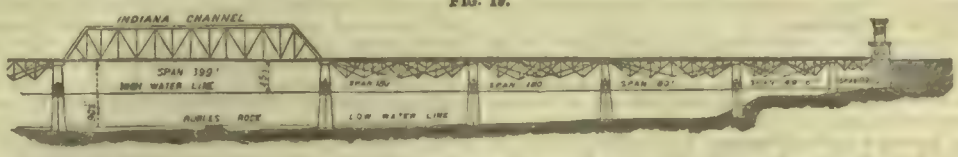
Russia is commencing iron railway bridge-building on a greater scale than any other European country. Hitherto her railway bridges have, for the most part, been made of timber, and are to be replaced. Especially on the Nicolai Railway it has been recently decided to reconstruct sixty-eight wooden viaducts—a decision hastened through the destruction of one 1200 feet long by fire.

Holland has been building great bridges of a remarkable character. The Moerdyck Bridge on the great railway route connecting Antwerp, Rotterdam, and Amsterdam, consists of fourteen spans of 328 feet each. The framed iron girders for this bridge, built on shore, were floated to their destination and, by aid of the tidal rise, elevated to their final positions. The railway bridges in construction, or just completed, over the Maas and Lek at Bommel and Crèvecœur are works of the same character; the former has eight spans of 187 feet and three of 394 feet and has cost over 270,000 pounds, or $1,350,000. In England the great bridge over the Tay (noticed on another page) is styled "the most important civil engineering work now being carried out in Great Britain."

We can allude to but few of the remarkable constructions of our own country.* The Quincy Bridge is the longest bridge spanning the Mississippi, the river at the point of crossing being 3250 feet in width, the navigation channel, however, being only 800 or 900 feet broad. The

* The longest truss *span* in the U. S. is in the Newport and Cincinnati R. R. bridge; the span is 420 feet (400 feet clear opening). In Europe the bridges over the Leck at Kuilenberg (Holland) and Moldau at Prague have 515 feet span. In each of these latter are used over 2000 tons of iron and steel. The longest pivot *draw* is in the just finished railroad bridge over the Mississippi at Louisiana, Mo.—200 feet.

bridge is divided into seventeen spans, two of 250 feet, three of 200 feet, eleven of 137 feet, and one large draw span 360 feet long, the girder of the latter being 36 feet in depth. The piers of the fixed spans are all of masonry, that of the swing is formed of four wrought-iron cylinders 14 feet in diameter, sunk through 50 feet from the water level; upon the top of these a turn-table, 30 feet diameter, rests, and carries the span. This bridge, designed and constructed under Mr. Thomas C. Clarke, cost over a million of dollars.



The bridge at Omaha, over the Missouri, designed by Gen. Dodge, engineer of the Union Pacific Railroad, is 2800 feet in length, divided into eleven spans of 250 feet each, resting upon concrete filled cast-iron cylinders 8 feet 8 inches in diameter. Some of them require to be sunk to a depth of 70 feet below low water, making the total length of column 139 feet. The superstructure of this bridge is formed of ordinary wrought-trussed girders, with cast-iron top member. In addition to the bridge itself, approaches three miles in length are also required, principally formed of trestle work.

The railway bridges over the Mississippi at Dubuque, Iowa; at Hannibal, Missouri; and the great work over the Missouri at Kansas City are noteworthy constructions—as also that over the same river at St. Joseph. The superstructure of this latter bridge is of iron throughout (with floors for both railway and highway traffic) resting on stone piers and abutments sunk to the bed rock. Its total length is divided into three fixed spans of 300 feet each, one of 80 feet, and one pivot draw-span of 365 feet. The character of the river bed renders the sinking of the pier foundations (difficult in all the works just cited) especially interesting.

Fig. 19 represents the part of the bridge over the Ohio at Louisville from the Indiana shore to the nearest (Indiana) channel.

This bridge is the longest iron bridge yet erected in the

Fig. 19.

United States, and it includes amongst its openings two of the largest spanned by trussed girders as yet constructed in America. It carries across the Ohio a line connecting the Louisville and Nashville with the Jeffersonville and Indianapolis Railroad, the line forming a connecting link between two immense railway systems, the northern and the southern. The bridge consists in all of twenty-seven spans, twenty-four over the river, one over the New Albany and Jeffersonville Railroad, and two on the Louisville side; and these spans, with the abutments, make up a length of 5280 feet, or just one mile.

The bridge includes two spans of the lengths of 370 and 399 feet, and a pivot bridge 264 feet in length, this bridge giving two clear openings of 114 feet 6 inches, one on each side of the pivot-pier.

The lowest point of the superstructure over the middle chute is 90½ feet above low water, and over the Indiana "chute" 96½ feet—the low water in the Indiana chute being 6½ feet lower than in the middle chute. The extreme rise of the river at Louisville, above low water, is, we may mention, 40½ feet.

As will be seen by these figures the rails are, except in the case of the two long spans, carried at the level of the tops of the girders, these being of the class known as the Fink truss. In this bridge a pair of diagonal tension bars connects the foot of the principal strut, or "king post," in each truss, with the ends of the top chord. This pair of diagonal bars supports one-half of the whole weight of the truss and its load. Each half span is subdivided by a strut, and two diagonal tension bars extend, one to the nearest end of the top chord, and the other to the top of the centre post. Each quarter span is again subdivided into eighths, and these again, for spans greater than 100 feet, into sixteenths.

The bridge over the Hudson River at Albany connects the New York Central with the Hudson River, Harlem, and Boston and Albany roads.

It consists altogether of fifteen spans (four of 185 feet, and a swing bridge 274 feet long) and has a total length of 1740 feet, or nearly a third of a mile.

The superstructure is entirely of wrought iron, except necessary bearing and joint blocks, which may be of cast iron, and to carry, at the bottom thereof, a double track railway, and also two sidewalks, each sidewalk being 6 feet wide. The bridge to be with two lines of main girders, 26 feet apart in the clear on the straight portion of the bridge, and 27½ feet apart in the clear on the curved part.

But the most remarkable structure is the Illinois and St. Louis Bridge recently erected over the Mississippi River at St. Louis; equally remarkable whether considered in connection with the establishment of its piers (for account of which see Foundations) or its superstructure. (Fig. 20.)

Fig. 20.

From the report of its eminent engineer, Jas. B. Eads, the following account of the superstructure is taken:

"The bridge will have three spans, each formed with four ribbed arches made of cast steel. The centre span will be

515 feet and the side ones 497 feet each, in the clear. The rise of the centre one will be one-tenth of the span; that of the side ones 47 feet 10 inches each.

"The four arches forming each of these spans will each consist of an upper and lower curved member or rib, extending from pier to pier. Each of these members will consist of two parallel steel tubes, 9 inches in exterior diameter, placed side by side. The upper and lower members will be 12 feet apart, measured from the centre of the upper to the centre of the lower tubes. At regular intervals of about 9 feet, these members will be braced from each other by a vertical system of cast-steel bracing on each side of them. These braces will be secured at each end to cast-steel plates, formed something like the voussoirs of a stone arch, and against which the tubes will be abutted and secured every 9 feet throughout the arches. A horizontal system of bracing will extend from pier to pier between the four upper curved members, and a similar system between the four lower ones, for the purpose of securing the four arches in their relative distances from each other, and to sustain them against lateral pressure.

"The two centre arches of each span will be 13 ft. 9½ in. apart from centre to centre, and will have, in addition to the upper and lower horizontal bracing just described, a system of diagonal bracing, securing the upper member of one arch to the lower one of the other arch, and the two other members in like manner. The outside arches are each 15 ft. 1¾ in. from the middle ones, and are joined to the latter by three systems of bracing similar to those described as between the two centre arches. These systems, however, on the outside of the middle arches, extend only from the piers to the under side of the railways, the latter being carried between the two outer and the two inner arches near their crowns. The outside arches being supported in this interval against lateral movement, by rigid connections from both the upper and lower roadways.

"The roadways are formed by transverse iron beams, 12 in. in depth, supported by iron struts of cruciform section resting on the arches at the points where the vertical bracing of the latter is secured. That portion of the railways which passes below the crown of the arches is suspended from them. Between the iron beams forming the roadways, four parallel systems of longitudinal wooden members are introduced, extending from pier to pier, and serving to maintain the iron beams in position. These wooden members are each about 9 ft. long, and their ends rest upon the flanges of the beams, and are there secured from moving. On these the wooden beams for the carriage-way rest in one roadway, and the cross-ties for the railways in the other. From the opposite ends of the iron beams a double system of diagonal horizontal iron bracing serves to bind the whole together, and gives additional support against wind pressure.

"The upper roadway is 34 ft. wide between the footwalks. The latter are each 8 ft. wide, making the bridge 50 feet wide between the railings.

"The railway passages below the carriage-way will each be 13 ft. 6 in. in the clear and 18 ft. high, and will extend through arched openings of equal size in the abutments and piers."

This superstructure is estimated to cost over two millions of dollars.

In 1870 the French Minister of Public Works, at the instance of the "Conseil de l'École des Ponts et Chaussées," despatched one of its engineers, M. Malezieux, to the United States to inspect the public works, who thus comments on American Bridge Engineering.

"A distinctive feature in American Bridge engineering is undoubtedly the almost entire abandonment of plate or lattice girders, and the adoption almost universally (if we except the cases of unusually large spans where the suspension system is resorted to) of one or the other arrangements of trussed structures." M. Malezieux considers that the practice of American engineers in this respect, and also their extended application of the suspension system is worthy of the special attention of their brethren in Europe, and especially in France; and after giving a summary of the general dimensions, etc., of a number of the more important bridges in the United States, he proceeds to describe in detail the principal systems of trussed bridges in use.

An exhaustive analytical discussion of the merits of the "principal systems" of trussing, will be found in the work "Iron Truss Bridges for Railroads," by Col. W. E. Merrill, U. S. Engineers.

The subject of iron railway bridges cannot be dropped without allusion to one of the most remarkable of those structures: the "Royal Albert Bridge," designed to carry the Cornwall railway across the Tamar at Saltash, a few miles above Plymouth, England.

The whole structure consists of nineteen openings, two of which have a clear span of 455 feet; the remaining seventeen are each 69 feet 6 inches in length. The River Tamar is crossed by the two large spans, the smaller ones bringing the railway from the hills on either side of the valley down to the banks of the river, the total length of the entire structure being 2240 feet.

The main stone piers are at the water's edge, and support the ends of the great spans crossing the river. These are of course of the most solid construction, and more resemble the massive columns of Egypt than the works of modern engineers. Each is of granite 29 feet wide by 17 feet thick, and 190 feet in height from the foundation to the summit. The strength required in each of these piers was far surpassed by the resistance which that in the centre of the river must offer, and for this a column was required of such proportions that nothing short of the solid rock would suffice for its foundation. But to reach the rock was a matter of no ordinary difficulty, inasmuch as it lay

FIG. 21.

beneath 20 feet of mud and concrete gravel, over which flowed 70 feet of salt water. To erect a stone pier in the ordinary manner would be here entirely out of the question, but by an ingenious contrivance the granite column requisite to sustain the enormous load to which it is subject was reared. An immense wrought-iron cylinder, 100 feet high and 37 feet in diameter was sunk upon the site of the intended pier, and proper means being taken to exclude the water from the interior of this cylinder, the above-mentioned column was raised within it. Upon this column four octagonal cast-iron pillars, each 10 feet wide and 88 feet 9 inches high, were erected 10 feet apart, and strongly braced together, forming a square of about 30 feet. The weight of each column is 150 tons, each being in pieces 6 feet long, 2 inches thick, and strengthened inside by stout ribs and brackets. As fast as these pieces were cast, planed down, and accurately fitted, they were sent to the centre pier ready for erection. Upon these columns the top framing of the pier is fixed.

Upon this centre pier, and the two side piers, rest the massive ribs by which the great spans are sustained. They consist each of an arched tube and a suspension chain strongly braced together, to which the small side-girders are attached. The arched tubes are in section of

an elliptical form, the major axis of the ellipse being placed in a horizontal position; they are made of stout wrought-iron plates strongly riveted together, and rendered more rigid by stiffeners and diaphragms. The width of each tube is 16 feet 9 inches, and its depth is 12 feet 3 inches, the diaphragms being placed about 20 feet apart.

The rib complete presents the appearance of a double bow, and it may be regarded as such, the tensile action of the chain upon the bed-plates being counteracted by the thrust exerted upon the same by the arched tube. The depth of the rib from the centre of the main tube to that of the main chain is 56 feet 3 inches, or about $\frac{1}{8}$ of the clear span. The alteration of length of the rib, by contraction and expansion under variations of temperature, is provided for to the amount of six inches (although the greatest difference yet observed amounts only to three inches in the entire length of both spans) by placing the frames, which carry those ends of the main tubes which are supported by the side piers, upon 48 wrought-iron rollers, each 3 feet 3 inches long and 3½ inches diameter, in a double cast-iron frame or bed-plate.

The total quantity of wrought-iron used in this structure is 2700 tons; of cast, 1300 tons; masonry and brickwork, 17,000 cubic yards, and about 14,000 cubic feet of timber.

Each of the main ribs was constructed entire, adjacent to the site of the intended structure, and after being tested was floated out on pontoons and raised by hydraulic presses of immense power. The foundations intended to support the bridge were used to sustain these presses. As the spans were raised, by the means described, the iron columns were built up under them. The pressure upon the foundation of the centre pier will amount to more than 8 tons per square foot of bearing area, or double the pressure upon the foundations of the Victoria Tower. (Fig. 21.)

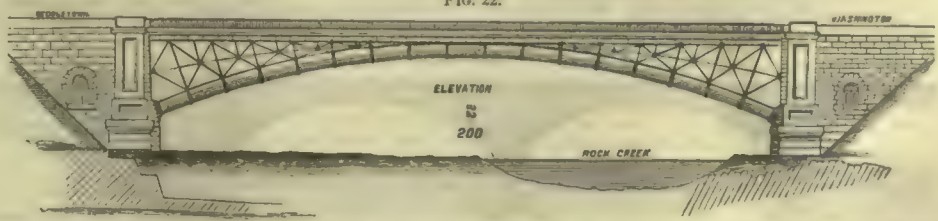
One more example of modern bridge-building for railway purposes must be introduced here. The Tay Bridge is styled ("The Engineer," Apl. 4, 1873), "the most important civil engineering work now being carried out in Great Britain. Indeed, the magnitude of the bridge, and the novelty and ingenuity of the means employed in its erection, entitle it to take rank with the most interesting civil engineering works ever carried to completion." The Tay Bridge will be, when finished, the largest iron bridge in the world. It will cross the river about one and a quarter miles west of Dundee. The total length from shore to shore is 10,320 ft. Commencing from the south, or Fife side, there will be three spans of 60 ft., two of 80 ft., twenty-two of 120 ft., fourteen of 200 ft., sixteen of 120 ft., twenty-five of 66 ft., one of 160 ft., and six of 27 ft. The first three spans (60 ft.), south side, are on a descending gradient of 1 in 100, the two 80 ft. spans are level; the bridge then rises with a gradient of 1 in 353 to the centre of the 200 ft. spans. It again descends with a gradient of 1 in 73.56 to the north shore, passing at a height of about 18 ft. over Magdalen Point and the Esplanade now being constructed.

The bridge thus comprises eighty-nine spans, and at the commencement on the south side the rails are 78 ft. above high water, running over the tops of the girders as far as the 200 ft. spans which cross the navigable channel of the river. Over these fourteen spans the rails run on the bottom of the girders, giving a clear headway of 88 ft. above high water. On reaching the 120 ft. spans on the north side, the rails are again on the top of the girders, which is continued, with the exception of the 160 ft. bowstring span, to the north shore. From the south side the first five spans are on a curve of twenty chains radius. The bridge then runs straight across the river as far as the end of the sixteen 120 ft. spans on the north side; thence the whole of the 66 ft. spans, 160 ft. bowstring, and the 27 ft. spans are on a curve also of 20 chains radius, forming nearly a quadrant of a circle, the length being about 2000 feet. This long curve is necessary to bring the bridge—which runs nearly due north—at right angles across the river into the town, alongside the Caledonian Railway. (See Foundations.)

In the foregoing we have felt constrained for want of space to confine our notices of iron bridges to those which, owing to the amount and character of the moving weight they carry, develop more fully the art of the engineer—railway bridges; but there is another class of bridges, in which, indeed, iron construction for bridge purposes first developed itself, *i. e.* cast-iron arched bridges, which should at least be mentioned.

The first cast-iron bridge erected in England was over the Severn at Colebrook Dale, in the year 1777; it has five arch ribs, with a clear span of 100 feet 6 inches, and a rise of 45 feet, a width of 26 feet, and a sectional area in each rib of 56½ square inches.

In 1796 a more notable bridge, the Sunderland Bridge over the Wear, was completed, having six arch ribs, with a span of 236 feet, and rise of 34 feet, and a width of 32 feet, the sectional area of rib being 46.5 square inches.



In 1806 the Bristol and in 1812 the Bonar bridges were built, the latter having a span of 150 feet, four ribs and 20 feet rise. (These two bridges are described and delineated in the Ency. Ed.)

The Southwark Bridge was built in 1818 with 8 ribs, 240 feet span, and 24 feet rise. The Cauxhall, Tewkesbury, and Plymouth bridges have spans of 78, 170, and 100 feet. The Westminster (renewed in 1859, as mentioned on a later page) has arches partly of wrought and partly of cast iron of 120 feet span, and 20 feet rise.

The foregoing (English) bridges are all still in use. The "Pont de Caroussel" at Paris, built in 1836, has spans of 187 feet, five ribs with 15½ feet rise. The bridge across the Neva at St. Petersburg (built by Joseph Harrison, Jr., of Philadelphia) though subjected to the most severe changes in temperature stands a monument to American professional skill. It has seven spans, with 157 feet as the largest.

In our own country the first example of an iron bridge construction, and, in the beautiful simplicity of conception by which purposes foreign to each other are subserved by the same material agents, the most remarkable one, is the Aqueduct Bridge, over Rock Creek, at Washington City; built by Captain (now Bvt. Maj.-Gen. and Quarter Master General U. S. Army) Meigs. The engraving (Fig. 22) is an elevation, and its distinguished engineer has kindly furnished the following description.

Fig. 22.

"The ribs are circular pipes forty-eight inches in interior diameter of cast-iron, and are 1½ inches thick. No additional thickness is given to them on account of the loading by the bridge.

"The thickness, 1½ inches, is the standard thickness for water pipes of 48 in. under the head of water which these bear, and all the strains caused by their being loaded with a bridge platform and its traffic are at right angles to those caused by the pressure of the water. These two sets of strains therefore do not affect each other plus or minus.

"The joints are flange joints turned plain and smooth and held together by pressure and by screw bolts as in the ordinary method of joining steam pipes. Originally the iron pipes were lined with wooden staves as a non-conductor under an apprehension of danger of injury by freezing. The temperature of the air sometimes, though rarely, here touches 0 or even falls below 0.

"But the wood acted too well as a non-conductor. The iron took its temperature from the air and sunshine, not from the water, hence a diurnal motion from expansion and contraction, which in some of the joints produced never a stream, but a dropping of water.

"This inconvenience led me to an investigation of the conditions of temperature, the quantity and rate of transmission of heat from the water as it passed through the pipes to the air, which satisfied me that it would be safe to withdraw the non-conducting lining. I took it out and the bridge has now stood some 12 years and no trouble from ice in the pipes has ever been noted.

"This bridge is, or was when first erected, unique of its kind."*

The only cast-iron arched bridge since erected (we believe) is the Chestnut Street Bridge, over the Schuylkill, at

* Another arch of cast-iron, of 30 inches diameter, of 120 feet span, carries the water across "College Branch."

Philadelphia, commenced in 1861 and opened for travel July 4, 1866; designed and built under direction of Mr. Strickland Kneass, C. E. It has two main spans (over the waterway) each of 185 feet, each span is composed of six segmental arches with versed sines of 20 ft. placed at distances of 8 feet 8¾ inches, and 7 feet 10¾ inches from centre to centre. They are four feet in depth, and 2½ inches thick, with upper and lower webs of same thickness, and 8 inches wide; thus giving a compressive area of 147.5 square inches to each arch rib. These arches were cast in lengths of 12 feet 10 inches, with end flanches 12 inches wide, having three side-stays from body of segment, and were secured to each other by four screw-bolts 1¼ inches in diameter. The outside arches or ribs are slightly reduced in section. and are cast with ornamental face.

As regards strength of this structure, and treating the arches as built with a succession of voussoirs, and performing functions the same as if built of stone, we find that the horizontal pressure at the crown of each road-way rib is, with 100 lbs. per square foot of transient load, 512,585 lbs., equal to 3,475 lbs. per square inch of section, and at skewback, 529,542 lbs., or 3,590 lbs. per square inch of section. Taking the crushing power of best iron at 107,000 lbs. per square inch, the maximum load that would probably be placed upon it, would give a pressure at crown of but $\frac{1}{8}$ its ultimate strength.

The cost of this bridge was about $500,000.

We have progressed thus far without even mentioning that class of structures to which has seemed pre-eminently to attach the title of BRIDGE and which furnishes the principal theme of most writers, viz., the masonry arched bridge. The arch seems to have been known to the Chinese (see Tomlinson and Ency. Ed.) for many ages. The gateways of the great wall are arched and Kirchee speaks of stone bridges three or four miles long and of an arch of the incredible span of *six hundred feet*. But it is to the Romans that the world is really indebted for the practical application of the arch to bridges. Eight of these bridges over the Tiber are described in history.

But perhaps the most magnificent of all the Roman bridges, and one of the noblest monuments of antiquity, is the bridge of Alcantara upon the Tagus, at the town of that name. The town has probably taken its name from that structure, as the word *alcantara*, in the Arabic, signifies "the bridge." It consists of six arches; its whole length is 670 Spanish feet, and from the bottom of the river to the roadway the height is 205 feet.

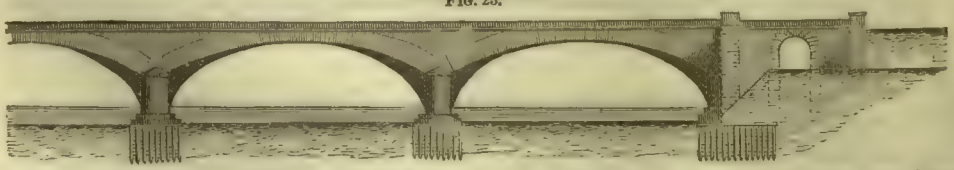
Whatever constructive energy was exerted during the Middle Ages was devoted either to religious purposes (witness the Convents, Churches, and Cathedrals), or to the agencies of War, or of self-preservation, as exhibited in the numberless castles and walled towns. The destructive tendencies of war have always seemed to be peculiarly directed against bridges. It could hardly be expected, therefore, that an age in which every man's hand was against his neighbor should *produce* these adjuncts to the occupations of peace. In days of general insecurity there was no safety for travellers particularly in passing rivers, where violent exactions were made by banditti.

To put a stop to these disorders, sundry persons formed themselves into fraternities, which became a religious order, under the title of Brothers of the Bridge. The object of this institution was to build bridges, establish ferry boats, and receive travellers in their hospitals on the shores of the rivers. It is stated "that Saint Benezet (the patron saint of Avignon) who proposed and directed the building of the bridge of Avignon, was a shepherd, and that he was not twelve years of age when repeated revelations from heaven commanded him to quit his flock and undertake this enterprise."

This bridge, which was composed of 18 arches, was begun in 1176, and completed in 1188. In 1385, during the contentions of the popes, some of its arches were destroyed; three others fell in 1602, from the neglect of repairing a fallen arch. In 1670, the frost was so great that the Rhone for several weeks bore the heaviest carriages; when the thaw followed, the ice destroyed the piers; but the third pier, with the chapel of St. Nicholas, has stood notwithstanding all these accidents (*ibid*).

It is worthy of remark, that the bridge of Avignon was begun under the direction of Saint Benezet in 1176, and that of London begun to be built of stone under the direction of Peter of Colchester, a priest, in the same year (1176). The French "Brothers of the Bridge" accomplished their magnificent and useful work in 12 years, the labours of the English priest occupied 33 years; but this may be accounted for, by considering the interruptions which must be experienced in a river where the tide rises twice every day from 13 to 18 feet.

In London bridge there were 19 arches, and it was 45 feet in breadth. For many ages there were houses along each side of it; but these were removed, the middle pier was taken away, and the space including the two adjacent arches, converted into one arch of 72 feet span, in 1758. The remaining old arches are very narrow, and the piers enormously large, being from 15 to 25 feet in thickness above the sterlings.



Some of the old piers of the Old London Bridge were larger than the original openings of the arches; they consisted of small rubble stones laid in lime-mortar, surrounded by a thin casing of squared stones. The Roman bridges were probably constructed in the same manner. In modern bridges, the piers consist wholly of squared stones, each course being of equal height quite through the body of the pier. The thickness ought to be regulated by the span and rise of the arches, combined with the height of the piers. At the bridge of Neuilly the thickness is only one-ninth part of the span from the springing of the arches. The height is regulated according to circumstances, attention being given to the highest point to which the waters have ever been known to have risen (*ibid*).

The next (in order of time) important bridge was that at Westminster, built in the years 1739–50, consisting of 13 large and two small arches, semi-circular, the middle one having a span of 76 feet. This bridge, of which a Mr. Labalye was the engineer, was not only, for the time, the greatest work of that kind in England, but it formed, in what regards laying foundations in deep water and constructing centres for large arches upon navigable rivers, a new school for bridge-building (Ed. Encyc.).

Like the Old London Bridge it has since been superseded by another structure—in this case with iron arches of from 104 to 120 feet span.

The finest of the earlier French bridges and the greatest work of the celebrated Perronet, is that over the Seine at Neuilly. (Fig. 23.) Built 1768–74.*

FIG. 23.

It consists of five arches, each 120 French, or 128.2 English feet span, and 30 French or 32 English feet rise; the breadth, including the parapets, is 45 French, or 48 English feet. A great peculiarity in this bridge is that the soffits of the arches are shaped to suit the contracted vein of water, as formed in the entrance and exit of pipes. This is accomplished, by making the general form of the body of the arch elliptical, with a rise of 30 French or 32 English feet; but making the headers follow the segment of a circle. This, besides affording facility for the passage of flood waters, gives a great appearance of lightness to the fabric (Ed. Encyc.).

The construction of a magnificent stone bridge, says the Edinburgh Encyc., "is justly looked upon as one of the greatest performances of the masonic art; for if we compare the enormous weight of a great arch, with the strength which the cohesion of the firmest cement can give, we readily admit that it is only by the nicest adjustment and balancing of its parts, that they are hindered from instantly falling to pieces."

And in consonance with the above dictum, the theory of the arch has always formed one of the prominent components of works on theoretic civil engineering, while the main features of treatises on bridge-building have usually been the art of constructing arches, piers, centering and coffer-dams. But this class of works has now become almost purely *monumental*. The "enormous weight of a great arch" is rivalled by its enormous expense, and it imposes the necessity of proportionate care and expense in giving to its piers sure foundations; and these costly piles are

* It is not generally known that this engineer published in 1793 a Mémoire "On the investigation of means to be employed to construct great masonry arches of *two, three, four*, and even *five hundred* feet span, with the view to cross deep valleys (chasms) having rocky escarpments. Par le Citoyen Perronet." The memoir, printed at the Imprimerie nationale executive du Louvre, bears the stamp of *de Prony*. J. G. B.

multiplied, to the great detriment of the water-way of the river, by the limitation of span which masonry arches can compass; or, at least, by the enormous ratio by which cost increases with increase of span. In our country there are, naturally, few examples of masonry arched bridges, properly so called: but it would be an unpardonable omission in an account of *American* Engineering, and would be doing an injustice to its distinguished engineer (now Quarter Master General, U. S. A.) to omit to notice the superb, and unrivaled in span, bridge and aqueduct combined, over the Cabin John Valley*, Potomac Aqueduct. The main road, macadamized by Act of Congress, leading up the Potomac Valley passes over the Cabin John Creek by the "Union" Arch. It is noteworthy as exhibiting the longest (220 feet) stone span in the world. The arch (circular) has a rise of 53½ feet, and is 101 feet high above the bed of the stream. It is of cut granite, 4 feet thick at crown, 6 feet thick at spring; but re-inforced by the spandrils (of coursed rubble and Seneca sand-stone) being laid in course normal to the main arch.

When the centre was struck there was no perceptible motion of the arch which could be detected when watched by two cross-wire telescopes. This fact is worthy of mention as Engineers are all taught to read the descriptions of the first long arches built over the Seine, at Paris, some of which, on striking the centre, moved 18 inches. In fact the arch of Cabin John in warm weather in a great measure, if not entirely, relieved itself from the centre, owing to expansion, before the centre was removed. Its key was laid in a cool season.

The bridge is 20 feet wide. The spandrils are hollow, having the two outer walls and one wall in the middle line or axis of the bridge. Upon these rests a platform of masonry upon which the conduit of brick, 9 feet clear diameter, is built. Made water-tight by asphalte between the brick rings. (For view of this structure see Fig. 6, article AQUEDUCT, by GEN. M. C. MEIGS, U. S. Army.)

The magnificent arched structure carrying the Croton Aqueduct over the Harlem River, is purely an aqueduct. In both these cases the resort to the masonry arch was natural and proper. Save these, the fine viaducts of the Baltimore and Ohio Railway, built in the early days of American Engineering, are the only considerable works of the kind which we recall; and it is safe to say that the future of engineering construction in our country (or in any other, unless for monumental purposes or for exceptional reasons, we might say) will never exhibit a specimen of a great masonry-arched bridge.

The subject of Bridge would not be complete without a few words concerning MILITARY BRIDGES.

Wherever warfare has been so far reduced to a system and a science, as to call into the field, for protracted campaigns, large and organized armies, the very necessities of the case call for some systematic method of passing streams, and, as belonging to it, special organizations of men (*personnel*) for making bridges, and a portable bridge *apparatus*.

The bridge of boats of Xerxes for passing the Hellespont—the timber pile bridge of Cæsar (of which an account has been given) for passing the Rhine, were not ordinary, but *extra*-ordinary constructions necessitated by the magnitude of the obstacles; and they owe their record probably to that peculiarity. It is quite likely, however, that during ages when roads for wheeled vehicles scarcely existed, and, on the other hand, forest timber was abundant, the felled tree (elaborated into a rude bridge), or some such improvised expedient, could generally be resorted to, and that a regular "bridge-equipage," in the modern sense of the term did not exist. The Romans are known to have had a species of "ponton" (as we now call it) to carry with their armies. In fact the wooden boat has naturally offered the readiest means of support to portable bridges; but these, generally large and heavy, are with difficulty transported. Hence, various expedients for creating a vessel of considerable flotation power, yet lighter and more portable than ordinary boats (such as frame-work, covered by skins, canvas, etc.) have been resorted to. The French, the systematizers of the modern "Art of War," were naturally the first to provide a regular organization and established type of construction for the military bridge, and to organize a "*personnel*" by which it should be operated.

Their first *ponton* was of copper. Their system has undergone successive modifications and improvements, and instead of metal, wood is used in their ponton. As fixed in 1853 the French ponton, as described by Gen. Cullum in his work on Military Bridges, is a flat-bottomed wooden boat, 31 feet long: the middle part or body of which, for a length of 16 feet has a trapezoidal section of 5′ 7″ width at top, and 4′ 4″ at bottom, and 2′ 7″ deep; the fore part 8′ 9″ long, diminishes to 2′ 6″ in width at the bow, and has a sheer of 5½″; and the aft part, 6′ 3″ long, diminishes to 4′ 7″ in width at the stern, and has a sheer of 3″. Each bateau weighs 1,455 lbs., is borne on the shoulders of 16 to 20 men, has a flotation of 18,700 lbs., carries 25 infantry soldiers, is convenient for disembarking troops, and can be easily navigated in a rapid current by five men.

The material for the French bateau bridge consists of 8 abutments, 8 trestles, 32 bateaux, 4 mooring-boats, 330 balks (84 abutment, 24 claw, and 231 bateau), 784 chesses, 32 anchors, and all the accessories for forming a bridge of 41 bays, 262 yards long, and 12′ 9½″ wide.

The Russians have a somewhat lighter equipage; the ponton (of canvas) is a flat-bottomed bateau, having, except at the ends, a rectangular section. The length at top is 21 feet, and at bottom 18′ 4″; the width 5′ 4″; and the depth 2′ 4″. The skeleton consists of two side-frames, connected by movable transoms—all of four inch scantling. The canvas cover is 10′ 8″ wide, 30 feet long in the middle, and 23′ 3″ along the edges: both sides being tarred or painted black with a composition, applied hot, composed of hempseed oil, strong loam, india-rubber, soap, wax, and soot. The cover is brought over the ends of the frame, and lashed to the top-transoms; it is secured, along the sides, to the top string-pieces of the side-frames by small nails passing through eyelet-holes along the edges of the cloth. A plank is laid on the bottom for the pontoniers to stand upon. The canvas ponton, frame and cover complete, weighs 718 lbs.; and has a flotation of 13,428 lbs.

The complete bridge is composed of 32 canvas pontons, with bridge-flooring and accessories for 33 bays; and a section of the Birago equipage consisting of 8 trestles and 15 wooden pontons (8 bow and 7 body pieces), with a bridge-flooring for eight bays.

The Austrians, after satisfactory trials in the passage of the broad, deep, and rapid current of the Danube, adopted, in 1841, a system named from its inventer, Col. Birago, of the Austrian Imperial Engineers.

This equipage has fixed and floating bridge-supports, the former consisting of abutments and trestles, and the latter of pontons of one to six pieces assembled together according to the requirements of the bridge for the passage of infantry, cavalry, or artillery, and whether designed for one, two, or three distinct roadways.

The pontons are flat-bottomed, wooden bateaux, of one piece, or from two to six assembled together, end to end, by suitable bolts and fixtures. The *cap* is *adjustable;* being partly supported at the proper height by *suspension*-chains, at one end of which are large rings passed over the tops of the legs, the free ends being run through suspension-rings on the upper side of the cap. After the chains are made taut, and the cap is at its proper height, the latter is held in place by the *toggles* inserted in the last link which has passed through the suspension-rings.

The Birago trestle is composed of a *cap* and two *legs*, to the lower ends of which *shoes* are attached, to increase their bearing surface, and give greater stability to the trestle.

Nothing like a "bridge-equipage" had belonged to our military service until 1846. The Engineer Department had long foreseen the necessity of a corps of well-drilled pontoniers and a bridge-equipage for our army, and year after year had urged their great importance upon the attention of Congress, but not until the 15th of May, 1846, was its sanction given to the project of the department, and when too late to aid the passage of the Rio Grande by our forces, then invading Mexico.

With the sanction of Congress finally obtained, a company of sappers, miners, and pontoniers was organized as part of the Corps of Engineers, and an india-rubber ponton bridge of 46 pontons was prepared by direction of the Chief of Engineers, but under the superintendence of Captain (now Bvt. Major General) G. W. Cullum. Another of 36 pontons was subsequently despatched with the army under General Scott. Owing to the lightness of these pontons only *thirty-five six-horse carriages* are necessary to transport, over the worst roads, a complete train for the formation of a bridge of two hundred yards. For the French bateau bridge of nearly two hundred and forty metres, *seventy-seven six-horse carriages* are used.

The rubber pontons in use for drill purposes at West Point having become unserviceable, and it having become evident that rubber was not adapted to their construction, experiments were undertaken by the then Instructor of Practical Engineering, Captain J. C. Duane. (Vid. "Organization of the Bridge Equipage of the United States Army," Official.)

The immense trains with which our armies are unavoidably encumbered, the long marches to be made, and the

*Previous to the construction of this Aqueduct, the bridge over the Dee, at Chester, England, built in 1833, exhibited the greatest span of any masonry arch in the world. This arch is circular with a chord (span) of 200 feet and a rise of 42 feet. The material is sand-stone.

numerous wide and rapid rivers to be crossed, demand an equipage of the most substantial character. On the other hand, the extended expeditions of light columns, which necessarily attend our military operations, require a train light enough to keep pace with the most rapid cavalry movements.

Hence we require both a reserve and advance-guard train.

The experiments included the trial of the bridge equipages used by those European armies most experienced in the art of military bridge-building.

Pontons were constructed after the models of the French bateau, the Austrian sectional ponton, and the Russian canvas boat. Corrugated-iron boats were procured, corresponding as nearly in form and dimensions to the French and Austrian boats as the nature of the material would permit. A number of Birago trestles were also constructed. All of the above material, with the exception of the iron boats, was prepared by the enlisted men of the Engineer Company ("A") then stationed at West Point.

The bridges formed of this material were exposed as much as possible to the action of heavy loads, storms, the tide, and floating ice. The material was also packed on carriages of various patterns in order to ascertain the best form, both of bridge material and of carriage, for transportation.

The selection of the French, Russian, and Austrian trains for these experiments, was made after a careful study of the various equipages used at present by the armies of Europe. These three nations alone appeared to have definitely settled on their systems, and this after much experience and thorough research.

After experimenting for two years, the conclusion was arrived at that the French ponton should be adopted. Experiments followed to determine *the material* of which the ponton should be made. Life-boats having been successfully made of corrugated-iron, it was presumed it might be, with equal advantage, applied to pontons. It was not only found that to get adequate strength, the weight must be increased beyond that of the wooden ponton, but that iron failed in other respects. In fact, it would not bear land transportation; as, in travelling over a rough road, the joints open by the yielding of either the rivets or sheet iron. When in the bridge, if the boat grounds on an uneven or rocky bottom, a hole is frequently punched through it, and such injuries cannot be repaired in the field. The wooden ponton is not only much less liable to such accidents, but can be readily repaired when they do occur.

Previous to the battle of Gettysburg, a ponton bridge over the Potomac at Harper's Ferry was destroyed, the pontons being scuttled and set adrift above the rapids. About three weeks after, the water having fallen, the boats were recovered, repaired with pieces of hard-bread boxes obtained from the commissary, and used in constructing a bridge at Berlin, over which the entire army passed into Virginia.

With regard to the canvas boat it soon became apparent that it was precisely what we required for our advance-guard train. It is light, simple, strong, easily repaired, and when packed can safely be transported with the superstructure of the bridge as rapidly as any column of troops can move. A strong argument in favor of its adoption was that it had been used successfully by the Russians for more than a hundred years, under every variety of circumstances likely to occur in this country.

The French ponton wagon not being adapted to our rough roads, further experiments ensued to fix upon the selection of a proper carriage for transporting our bridge-equipage.

Through the information gained by these experiments resulted the system of bridge-equipage adopted at the commencement of the late Civil War.

"During the winter of 1861–62, five trains were constructed, each composed of thirty-four pontons and eight trestles—the pontons being nearly of the same form and dimensions of the French bateau. The frame was somewhat different, the ribs being entire and strongly ironed, and the ironing stronger throughout. The stern was provided with a locker. There were also other alterations in the details of construction. The balks were stronger, and the Birago trestle was modified by substituting built beams, instead of solid timber, for the trestle caps and balks.

"At the same time several canvas trains were organized. In constructing the ponton frame, the dimensions and form of the Russian boat were exactly retained. The scantling for the frame was considerably lighter, but, being strongly braced and ironed, the strength was about the same. One train was composed of canvas boats and trestles; being, in truth, a trestle train, with auxiliary pontons to be used only where the depth of water, or muddy bottom, prevented the use of trestles.

"In the month of February, 1862, a ponton bridge composed of about sixty boats of the reserve train, was thrown across the Potomac at Harper's Ferry. The river was then a perfect torrent, the water being fifteen feet above the summer level, and filled with drift-wood and floating ice. The greatest difficulty was experienced in pulling the pontons into position, and it was necessary to make use of ship anchors and chain cables to hold them in place. Notwithstanding these unfavorable circumstances, the bridge was completed in about eight hours, and the corps commanded by General Banks, with all its trains and artillery, passed over it without accident or delay.

"Several of these trains accompanied the army in the Peninsular campaign. The pontons were used in discharging quartermaster and commissary stores at Ship Point; in disembarking General Franklin's command at West Point (York River); and in constructing bridges over Hampton Creek, the streams in front of Yorktown, and the Upper Chickahominy. Finally, a bridge was built over the Lower Chickahominy, about two thousand feet long, over which nearly the whole army of the Potomac, with its immense trains, artillery, and cavalry, passed with promptness and safety.

"After the army had passed the bridge was dismantled and the balks, chess, etc., packed into the pontons, which were formed into rafts and towed by steamers to Washington. The bridge trains were next transported to Harper's Ferry, where a bridge was constructed a second time, but under entirely different circumstances from that built during the previous winter. The water was now not deep enough; and, as it continued to subside shortly after the bridge was laid, many of the pontons grounded on a very uneven and rocky bottom. Some of them were completely out of water, yet the heavy trains continued to move over the bridge without seriously injuring them; and when the water rose, most of them floated as well as ever.

"Discovering in this way that the boats were much stronger than we had supposed, we were enabled to improve the method of bridging tidal streams.

"It had formerly been considered necessary to build out to low-water mark with trestles, so that the ponton should always be afloat. The bridge is now commenced at high-water mark, building with pontons alone. As the water subsides, the pontons nearest shore ground successively, forming a gentle ramp from the abutment to the floating portion of the bridge, instead of making the descent in twenty feet as formerly. This method, of course, applies only to wooden pontons, and to cases where the bottom is favorable.

"During the Fredericksburg campaign, it became necessary to force the passage of the Rappahannock. The enemy having entrenched themselves on the bank, prevented for some time the construction of the bridge; until, at length, troops were embarked in the pontons and ferried across, where they stormed the rifle-pits, and held them until the bridge was completed.

"During the year 1863, the ponton trains accompanied the army in all its marches backward and forward through Virginia, frequently bridging the Potomac, Rapidan, and Rappahannock. In the latter stream, the bridges remained in position all winter; and, notwithstanding the frequent floods and the quantity of ice formed, but few interruptions occurred on these thoroughfares.

"During the campaign of 1864, trains, composed of fourteen pontons and two trestles, accompanied each of the three army corps of the army of the Potomac. These trains attended their corps in the long march from Culpeper to the James River; and, although the roads were frequently very bad, in no instance did they delay the march of the troops, or arrive late when a bridge was to be laid.

"The headquarters train was followed by a canvas train; which, when a crossing was to be made by surprise, was sent forward with the cavalry, who covered the construction of the bridge and held the position till the main body arrived.

"On reaching the James River, a bridge was laid, opposite Charles City Court-House (at a point selected by the writer of this article) about two thousand feet in length. The water was so deep and rapid that the pontons could not be held by their own anchors, and it was found necessary to attach their cables to schooners anchored above and below the bridge." "For the next 40 hours a continuous stream of wagons passed over the bridge, from 4000 to 6000 wagons, some said, 50 miles of wagons, and nearly all the artillery of this army, and by far the larger portion of the infantry and all its cavalry present, and even to its heads of 3000 or more of beef cattle—the most injurious of all—without an accident to man or beast." (*Report of Gen. Benham.*) The length of the bridge was made up of 200 ft. in trestle work and 2000 ft. in pontons (101 in all); depth of the river 85 ft.

"Thus the wooden ponton train through four years of

war during which the bridges constructed were without parallel in number and magnitude, amply fulfilled all the requisites of a good bridge equipage. The frequent crossing of the Potomac, Chickahominy, and James Rivers proved that, even under the most unfavorable circumstances, it could furnish a bridge capable of passing a large army, with its heaviest trains over wide and rapid streams, with safety and despatch.

"Its capabilities in ferrying troops were shown at Ship Point, West Point, and Fredericksburg; and of the mobility of the equipage there was abundant proof in the long marches during the last two years of the war.

"The canvas equipage, also, was perfectly successful as an advance-guard train. In the cavalry raids, it was always able to keep pace with the columns; and, although they frequently marched hundreds of miles, it was invariably ready to furnish a prompt and secure means of crossing all the streams on their route. It also often furnished bridges for the heavy trains of the army over streams of moderate width and rapidity.

"The only part of the bridge equipage which did not realize all our expectations was the Birago trestle.

"As already stated, a train was organized early in the war on the Austrian principle, in which the trestle is the main dependence, the ponton being merely auxiliary. It was supposed that many streams would be encountered which would be bridged best with trestles alone, but none such were met with. In fact, when a stream is more than two feet deep, a ponton bridge may be laid; when less than that depth, if the bottom is hard, it may be forded, and no bridge is required; should the bottom be soft, the trestle legs will usually settle so as to render the bridge unsafe. As it was not deemed advisable to transport with the army a train which could only be used in exceptional cases, this description of equipage was abandoned. The trestle was, however, very useful as an auxiliary, especially with the canvas train; for, as these boats when in the bridge should never be allowed to touch the bottom, it is frequently necessary to build out several bays from the shore before sufficient depth of water can be obtained to float the ponton—and for this purpose nothing could be better than the Birago trestle, which is also equally useful for a similar purpose with the reserve train, when the river bottom is rough near the shore.

"The canvas train was extensively used by the western army, and with such success that it was proposed to employ it exclusively. Experience, however, in the East has clearly proved that this train cannot fulfil all that is required of the bridge equipage of a large army. The bridges of the Potomac and James rivers could not have been built with canvas boats, which will not resist ice and drift-wood; neither are they suited to the disembarkation of troops or the passage of a river by force.

"Experience would therefore lead us to concur with General Barnard in his remarks on this subject, viz.:

"'The numerous proposers of "flying" bridges forget that if a military bridge is intended to be *carried with* an army, it is also intended to *carry* an army, its columns of men, its cavalry, its countless heavy wagons, and its ponderous artillery. It must carry all these, and it must do it with certainty and safety, even though a demoralized corps should rush upon it in throngs. No make-shift expedient, no "ingenious" invention not tested by severe experiment, no light affair of which the chief merit alleged is that it is light, will be likely to do what is required, and what the French ponton has so often done.'"

The experienced engineer officers, from whose Introductory History we quote, constituted a Board which, in 1870, established the present authorized organization. It was based upon the experience we have described in their language.

As now fixed the United States bridge-equipage is composed of reserve and of advance-guard trains. The former are intended to accompany large bodies of troops in the field, and are provided with the material necessary for the construction of bridges of sufficient capacity to pass large armies with their heaviest trains over rivers of any size and rapidity.

The advance-guard equipage is intended for the use of light troops, such as advance guards, cavalry expeditions, etc. It is organized, both as regards material and carriages, with a view to rapidity of movement. At the same time it is capable of furnishing a bridge which will fulfil all the requirements of troops engaged on such service.

The basal elements of these distinct equipages—the French wooden bateau and the Russian canvas ponton—are of dimensions very nearly corresponding to those (already given) of their original prototypes; but with modifications in details of construction derived from our own experience.

The Reserve Equipage is divided into trains, each of which is composed of four ponton divisions and one supply division. Each division is accompanied by a tool wagon and travelling forge.

Each ponton division is complete in itself, containing all the material necessary for constructing a bridge of eleven bays, or 225 feet in length.

Each of these divisions is subdivided into four sections, two of which are ponton and two abutment sections; the former contains three ponton wagons and one chess wagon; the latter, one ponton, one chess, and one trestle wagon each.

The ponton section contains the material for three bays, and should never be subdivided. The division may be increased or diminished at pleasure, by changing the number of its ponton sections.

The supply division is provided with articles necessary to replace material lost or worn out, such as balk, chess, spare parts of carriages, a few complete carriages, etc.

The carriages of this division consist of ponton, chess, and tool wagons, and of forges. Their number and proportion will be determined by the nature of the country in which the army is operating, and by the proximity of the main depot.

The trains of the Advance Guard Equipage are composed of 4 ponton divisions, each of which consists of 8 ponton, 2 chess, and two trestle wagons.

The ponton wagon carries all the material necessary for constructing a complete bay. The division may, therefore, be increased or diminished by one or more ponton wagons without disorganizing it. When a forced march is to be made, and it is desirable to lighten the loads, the chess may be removed from the ponton wagons, the rope from the trestle wagons, and the load of the chess wagons be reduced to 40 chess. The number of the latter wagons in this case must be increased to 5.

The ponton wagons of reserve train are drawn by 8 mules or 6 horses, those of the advance-guard train by 6 mules or 4 horses; the "loads" being about 3000 and 2000 lbs. respectively. It would be out of place to enter more fully into this subject in this work; but these historical details concerning the development of our military bridge system—a matter in which we had no experience whatever—during the war cannot fail to be interesting.

Another interesting branch of the subject—the remarkable constructions applied to the improvisation of railroad bridges, in place of destroyed ones, and the noteworthy system of repair and construction introduced into our military railway service, can only be alluded to. The military railroad construction and repair corps were a part of the Quartermaster's Department, which organized, hired, and paid all their members, and bought and paid for all the material, and possessed and operated the railroads at an expense which at one time amounted to about $2,000,000 per month. Under the Chief of that Department, and especially charged with this duty, the principal organizer and conductor of military railroad transportation and repairs was Brig.-Gen. D. C. McCallum (who has since made a valuable report on this subject), well known as an able civil Engineer and inventor of the "Inflexible Arch Truss;" but the credit of the military railroad operation, and repair and success belong to no individual altogether, but to the Quartermaster's Department, and to the body of Railroad Engineers, superintendents, and operatives who came into its service to aid the country during the war.

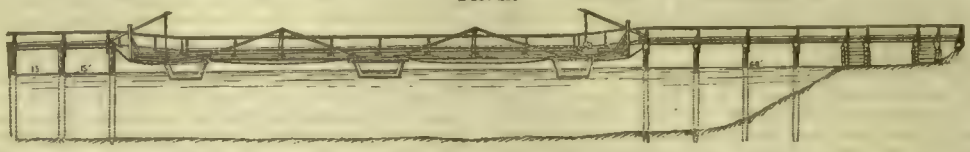
In the occupation, for protracted periods, of the same ground (as in investments, sieges, etc.) military bridges assume frequently a semi-permanent character.

Thus, while the Army of the Potomac occupied a position near Richmond (May and June 1862) its wings were separated by the formidable barrier of the Chickahominy rivulet and swamp. One of the bridges is thus described in the report of the Chief of Engineers of the Army of the Potomac:

"The bridge was built over the stream upon frame trestles; through the swamp it was supported by cribs. The *approaches* to the bridge over the low bottom-lands were either raised corduroy or (on the north side) simply earth raised two or three feet (the soil being here sandy), with a layer of brush one foot below the upper surface; deep lateral ditches being made. The whole structure of the bridge and approaches was about fourteen hundred yards long. The trestle-work and crib-work bridge was mostly done by troops of the Engineer brigade under General Woodbury; the approaches on the north, by the 9th and 22d Massachusetts regiments (Colonels Cass and Gove, both of whom were killed in the battles following), and those on the south side by the 3d Vermont. The bridge was ready for the passage of teams on the 14th, covered with earth, and the approaches entirely completed on the 17th. The bridge proper was 1,080 feet long; roadway, 11 feet wide; number of cribs, 40; of framed trestles, 6." (Fig. 24.)

The combined armies under General Grant occupied positions before Petersburg and Richmond from June 1864 to April 1865. The James River separated the Army of the James (in its final position) from the centre and left. An

Fig. 24.



Woodbury and Alexander's Bridge.

assured communication was indispensable, and at the same time one which would not impede the navigation to our own vessels, whether transports or armed.

Col. P. S. Michie, Chief of Engineers Army of the James, designed and submitted for approval a timber pile bridge with a floating draw (the floats being our ordinary pontons) of which an elevation of a portion, including the "draw," of pontons is here given. (Fig. 25.)

Fig. 25.

The piles of trestles were guarded against ice (which in the winter forms freely in the upper James) by highly inclined guard pieces, the feet of which were secured to piles in the bed of the river. Each trestle was made up of a cap piece and six piles (in pairs) driven into the bed of the river. This bridge constructed late in 1864 was in use up to the close of the war. During the period above indicated the gap in our lines made by the Rappahannock was occupied by one or more ordinary ponton bridges.

Limiting the scope of the word *bridge*, by the radical meaning (as given in our definition) we have omitted in the foregoing nearly all reference to a very essential portion of the art of *bridge-building*, viz.: the establishment of pier and abutment *foundations*. For this subject see "Foundations." Consult "Dictionary of Engineering" (Byrne). "Theory of Strains on girders and similar structures" (Stoney). "The Strains upon Bridge Girders" (Cargill). "Woodbury on the Arch." "Roebling on the Niagara Suspension Bridge." "Boudsot, Ponts Suspendus." "The Pesth Suspension Bridge." "Iron Truss Bridges" (Col. W. E. Merrill). "The Theory of Strains" (Diedrichs). "Theorie élémentaire des Poutres Droites" (Collignon, an excellent little French work); also Humber's great work on Bridges and "Modern Examples" and the published accounts of the Quincy and Kansas City Bridges. (See also Flexure of Beams, by Col. W. E. Merrill, U. S. Engineers.) J. G. Barnard, *U. S. Army.*

Bridge Creek, a twp. of Ouachita co., Ark. Pop. 375.

Bridge Creek, a township of Eau Claire co., Wis. Pop. 1538.

Bridgehamp'ton, a township of Sanilac co., Mich. Pop. 936.

Bridgehampton, a post-village of Southampton township, Suffolk co., N. Y. Pop. 1334.

Bridge-Head. See Tête-de-Pont.

Bridge, Natural. See Natural Bridge.

Bridgenorth (anc. *Bruges* or *Brugia*), a town of England, in Shropshire, on both sides of the Severn, 19 miles S. E. of Shrewsbury, and 123 miles N. W. of London. The upper part of the town is picturesquely built on a rock sixty feet higher than the river. It has an old castle, almshouses, a public library, a blue-coat or charity school, a handsome bridge, and manufactures of carpets, nails, tobacco-pipes, boats, and worsted stuffs. It has a heavy commerce upon the river. It is supposed to have been founded by a daughter of Alfred the Great. Pop. in 1871, 5871.

Bridge of Allan. See Appendix.

Bridgeport, a post-village of Waterloo township and co., Ontario (Canada), 2 miles from Berlin, has extensive water-power and some manufactures. Pop. about 700.

Bridgeport, a post-village of Cape Breton Island, in Sydney township, Cape Breton co., 13 miles from Sydney, with which it is connected by railway, has important coal-mines. Pop. about 300.

Bridgeport, a post-twp. of Jackson co., Ala. P. 1002.

Bridgeport, a post-village, capital of Mono co., Cal., about 160 miles E. of San Francisco. It is near the Sierra Nevada. Pop. of Bridgeport township, 174.

Bridgeport, a township of Nevada co., Cal. Gold is found here. Pop. 1829.

Bridgeport, a village of Green Valley township, Solano co., Cal., on the California Pacific R. R., 39 miles N. E. of San Francisco. Pop. 80.

Bridgeport, a city and seaport, one of the capitals of Fairfield co., Conn., is on an inlet of L. I. Sound, at the mouth of Pequonnock River and on the New York and New Haven R. R., 58 miles E. of New York and 18 miles W. S. W. of New Haven; lat. 41° 10′ 30″ N., lon. 73° 11′ 46″ W. It is the southern terminus of the Housatonic R. R., which extends to Pittsfield, Mass., and of the Naugatuck R. R., which connects it with Waterbury. It is mostly built on a small plain, behind which rises an eminence called Gold Hill, which is about 60 feet above high-water mark, and is occupied by elegant mansions. Bridgeport contains 25 churches, 5 national and 3 savings banks, a public library, and an orphan asylum. It has two daily newspapers, one semi-weekly, and two weekly. It is the third city in size and importance in Connecticut. Since the census of 1870 three square miles of the adjacent town of Fairfield have been added to Bridgeport, and the population has

been largely increased. It derives its prosperity chiefly from its manufactures of carriages, sewing-machines, miscellaneous hardware, machinery, brass and iron castings, leather, cartridges, hats, shirts, saddles, springs and axles, etc. Here are the large manufactories of Wheeler & Wilson's, Elias Howe's, and the Secor sewing-machines, with the Union Metallic Cartridge Co., Wood Brothers' carriage-factory, The New York Tap and Die Co., Glover Sanford and Sons' hat manufactory, and many others. There are 53 corporate companies doing business within the city limits, on an aggregate capital of over $6,000,000. The city has a paid fire department and an electric fire-alarm telegraph. It has two fine parks, and a horse-railroad connecting its eastern, southern, and western extremes. Pop. (in 1870, before the annexation of a part of Fairfield), 18,969; of the township, 19,835.

G. C. Waldo, Ed. of "Daily Standard."

Bridgeport, a post-village of Christy township, Lawrence co., Ill. Pop. 435.

Bridgeport, a post-township of Saginaw co., Mich. Pop. 1171.

Bridgeport, a post-township of Warren co., Mo. Pop. 822.

Bridgeport, a post-village of Sullivan township, Madison co., N. Y. Pop. 217.

Bridgeport, a post-village of Belmont co., O., on the Ohio River, opposite Wheeling, with which it is connected by a bridge. It is on a branch of the Cleveland and Pittsburg R. R., and has a national bank and an active trade. Pop. 1178.

Bridgeport, a post-borough of Fayette co., Pa., on the Monongahela, adjoining Brownsville, 35 miles S. of Pittsburg. Pop. 1199.

Bridgeport, a post-borough of Montgomery co., Pa., on the Schuylkill, opposite Norristown. Pop. 1578.

Bridg'er's Pass, a defile in the Rocky Mountains, in the S. part of Wyoming Territory, about lat. 41° 39′ N., lon. 107° 30′ W. The overland mail route passed through it before the Pacific R. R. was opened. It is described by Fitz Hugh Ludlow as "a narrow gallery, walled by noble precipices of red granite and metamorphic sandstone, rising directly from the traveller's side to the almost perpendicular height of from 1000 to 2500 feet. In some places this gallery appears scarcely more than a crevice of dislocation, a mere crack between stupendous naked rocks, which would match joints exactly if slid back to their old position. Though the passage is in reality ample for an army, the vast height of its lateral walls makes it seem proportionally narrow. This American Simplon is Bridger's Pass. It is several miles in length." (*The Heart of the Continent.*)

Brid'ges, a township of Ozark co., Mo. Pop. 532.

Bridg'et, Saint, or **Saint Bride,** one of the three patron saints of Ireland, lived about 500–520 A. D. St. Bridget's Day is Feb. 1st.

Bridget, Brigit'ta, or **Bir'get,** Saint, a daughter of Birger, prince of Sweden, was born in 1304. She was the mother of Saint Catharine of Sweden, and author of a work entitled "Revelations." (See Brigittines.) Died in 1373. (See Etienne Binet, "Vie de Sainte Brigitte," 1634.)

Bridgeton, a post-village and township of Cumberland co., Me., 38 miles from Portland. It has three woollen mills at the Centre Village, a printing-office, a weekly paper, sash and blind factories, etc., and is accessible by steamboat from the foot of Sebago Lake. Pop. 2685.

Ed. of "Bridgeton News."

Bridgeton, a post-township of Newaygo co., Mich. Pop. 397.

Bridgeton, a city, port of entry, and the capital of Cumberland co., N. J. (a rich agricultural county), is situated on both sides of Cohansey River, a fine tide-water stream, 20 miles from Delaware Bay, 37 miles S. of Philadelphia, and 127 miles S. of New York. Its area is 15.39 square miles, or 9849 acres. Its population was in 1800 about 400; 1829, 1736; 1838, 2315; 1850, 3480; 1860, 5104; 1870, 6830; and now (1873) is 8000. As a port of entry it is second in the State, having a tonnage, Jan. 1, 1873, of 16,067.33 tons. Three steamers and a large number of sailing-vessels, barges, etc. are employed in the direct trade of the city, transporting annually over 150,000 tons, while an equal amount is carried by the different railroads. The receipts of leading articles are, coal, 21,000 tons; pig iron and iron ore, 10,200 tons; lumber, 4,000,000 feet; lime and shells, 175,000 bushels; fertilizers, 1500 tons; and manufactured goods, 30,000 tons. The principal shipments are 110,000 kegs of nails, 2,200,000 feet of gas and water-pipe, 70,000 cases of canned fruits, 290,000 yards of woollen goods, 20,000 boxes window-glass, $200,000 worth of hollow-ware, and 25,000 bushels of grain, potatoes, etc. It is the leading city of Southern New Jersey in the variety and value of its manufactured products, which consist in part of nails, water and gas-pipe, castings, machinery, woollen goods, glass, canned fruits, lumber, brick, shipbuilding, etc. Companies and firms to the number of 143 are engaged in 60 different branches of manufacture, with a capital of $1,231,350, employing 1210 males, 637 females, and 143 children, to whom $632,821 are annually paid as wages, using raw material worth $2,236,339, and producing articles to the value of $3,413,709. The assessed valuation of the city for 1873, about two-thirds of the actual value, was $3,541,000, on which the assessment was $1.35 on $100. The expenses were, State tax, $5,056.47; county, $13,847.29; schools, $17,741.96; city government, $13,301. The city is out of debt. Educational facilities are fine. The South Jersey Institute, for both sexes, opened in 1870, has a handsome and well-appointed building, which cost over $65,000, on a commanding site, with 8 teachers and 100 scholars during the last school year. The West Jersey Academy occupies a fine building on a beautiful location, and has 5 teachers and 50 scholars. Ivy Hall, a select boarding-school for young ladies, has a high reputation, and has 10 teachers and 54 scholars. There are 6 public schools of a high order, with 22 teachers (to whom are paid salaries amounting to $9,469.19) and 1238 scholars. A handsome building for a new school is now being erected at a cost of about $16,000. A good public library has over 1300 volumes. The newspapers comprise 1 daily, circulation 400; 3 weekly, circulation 4200; 2 monthly, circulation 7500 copies. The churches number 13, owning 13 church buildings, 6 chapels, and 8 parsonages, valued at $288,500, with sittings for 6750 persons, and having a membership of 2833. There are national and savings banks, a flourishing board of trade, two building and loan associations, a large number of benevolent societies, and a children's home for the care of destitute children. Three bridges span the river, and the streets are well laid out, graded, and lighted with gas. Water-works are about being erected. It is a railroad centre; the New Jersey Southern, from New York to Baltimore, passes through the city; the West Jersey connects it with Philadelphia; the Bridgeton and Port Norris, 22 miles long, connects it with the celebrated Maurice River oyster-grounds. Several others are projected.

As the head of navigation and a fording-place on the Cohansey, a settlement early grew up. Before the Revolution there were not over 200 inhabitants, but they were staunch patriots. Dr. Jonathan Elmer, a Bridgetonian, was a member of the Revolutionary Congress. A company from Bridgeton served under Gen. Schuyler, and a privateer schooner built here made one successful voyage, but was captured when returning from the second. During the present century the place has had a steady growth, and was incorporated in 1865. The climate is mild and healthy, the city and its surroundings most beautiful, and its inhabitants intelligent and social. Charles E. Sheppard, *Att'y, Member of Board of Trade.*

Bridgeton, a borough of Bucks co., Pa. Pop. 944.

Bridgetown, the capital of the island of Barbados, is on its W. coast, and extends along the N. side of Carlisle Bay, which forms its roadstead; lat. 13° 4′ N., lon. 59° 38′ W. It is the residence of the bishop of Barbados and the governor of the Windward Islands, and has an arsenal and barrack in the vicinity. Pop. about 25,000.

Bridgetown, a post-village of Granville township, Annapolis co., Nova Scotia, on the Windsor and Annapolis R. R., 14 miles from Annapolis, at the head of navigation of Annapolis River, has a fine water-power and one weekly paper. The surrounding country is very fertile. Pop. about 800.

Bridgeville, a post-twp. of Pickens co., Ala. P. 1265.

Bridgeville, a post-village of North-west Fork hundred, Sussex co., Del. Pop. 300.

Bridgewater, a town and river-port of England, in Somersetshire, on both sides of the river Parret, 33 miles by rail S. W. of Bristol. It is neatly built, and the houses are mostly of brick. Vessels of 200 tons can ascend the river to this town. Here is St. Mary's Church, which has a remarkable and lofty spire. This is the native place of Admiral Blake. Bridgewater became a free borough in 1200. Pop. in 1871, 12,101.

Bridgewater, a post-village of New Dublin township, Lunenburg co., 12 miles from Lunenburg, Nova Scotia, has manufactures of lumber, etc., an active trade, and one weekly newspaper. Pop. about 1000.

Bridgewater, a post-village of Elzevir township, Hastings co., Ontario, has mines of iron, copper, and other minerals, and quite extensive water-power and manufactures. White marble is found here. Pop. 450.

Bridgewater, a post-township of Litchfield co., Conn. Pop. 877.

Bridgewater, a post-township of Aroostook co., Me. It has manufactures of lumber, leather, etc. Pop. 605.

Bridgewater, a post-village and township of Plymouth co., Mass., is on the Old Colony and Newport R. R., 27 miles S. of Boston. It contains a State normal school, academy, State almshouse, extensive iron-works, cotton-gin, and other manufacturing establishments, and is the seat of the county agricultural fair. It has a weekly paper and a savings bank. Pop. 3660.

PRATT & Co., PUBS. "BANNER."

Bridgewater, a post-township of Washtenaw co., Mich. Pop. 1379.

Bridgewater, a township of Rice co., Minn. Pop. 957.

Bridgewater, a post-twp. of Grafton co., N. H. P. 453.

Bridgewater, a township of Somerset co., N. J., contains Somerville, the county-seat. Pop. 5883.

Bridgewater, a post-township of Oneida co., N. Y. The village is on the Utica branch of the Delaware Lackawanna and Western R. R., 15 miles S. of Utica. Pop. 1258.

Bridgewater, a post-township of Williams co., O. Pop. 1207.

Bridgewater, a borough of Beaver co., Pa. Pop. 1119.

Bridgewater, a township of Susquehanna co., Pa., contains Montrose, the county-seat. Pop., exclusive of Montrose, 1459.

Bridgewater, a post-township of Windsor co., Vt. It has manufactures of woollen goods, etc. Pop. 1141.

Bridgewater (FRANCIS HENRY EGERTON), EARL OF, born Nov. 11, 1758, was a son of John Egerton, bishop of Durham. He inherited the earldom in 1823, and died without issue in 1829. By his last will he left £8000 to be paid to the author of the best treatise "On the Power, Wisdom, and Goodness of God as manifested in the Creation." He was an Anglican priest. (See BRIDGEWATER TREATISES.)

Bridgewater Treatises, a celebrated series of works named in honor of the earl of Bridgewater. (See preceding article.) The trustees who had the control of his bequest of £8000 pounds placed it at the disposal of Gilbert Davies, president of the Royal Society, who appointed eight gentlemen to write separate treatises illustrative of the power, wisdom, and goodness of God. They are—1. "The Adaptation of External Nature to the Moral and Intellectual Constitution of Man," by Thomas Chalmers, D. D. (1833); 2. "Chemistry, Meteorology, and the Function of Digestion considered with Reference to Natural Theology," by William Prout, M. D. (1834); 3. "On the History, Habits, and Instincts of Animals," by the Rev. William Kirby (1835); 4. "On Geology and Mineralogy," by the Rev. Dr. Buckland (1837); 5. "The Hand, its Mechanism and Vital Endowments, as Evincing Design," by Sir Charles Bell (1837); 6. "The Adaptation of External Nature to the Physical Condition of Man," by John Kidd, M. D. (1837); 7. "Astronomy and General Physics considered with Reference to Natural Theology," by the Rev. William Whewell (1839); 8. "Animal and Vegetable Physiology considered with Reference to Natural Theology," by Peter Mark Roget (1840).

Bridg'man (LAURA), a blind deaf-mute, affording a remarkable instance of the development of intellectual and moral powers under the most adverse circumstances. She was born at Hanover, N. H., Dec. 21, 1829. When two years old, through a severe illness, she lost her sight, hearing, and smell: her sense of taste being at the same time greatly impaired. At the age of eight she was placed under the instruction of Dr. Howe of Boston, principal of the Perkins Institution. She soon learned to read and spell with a manual alphabet; and she afterwards learned to write and to sew, and to play very well on the piano.

Bridgman (WILLIAM R.), U. S. N., born NOV. 28, 1844, in Iowa, graduated at the Naval Academy in 1861, became an ensign in 1862, a lieutenant in 1864, and a lieutenant-commander in 1866. He served in various vessels of the West Gulf and Mississippi River squadrons during 1862 and 1863, participating in the action with Forts Jackson and St. Philip and capture of New Orleans, and in many of the most important fights on the Mississippi.

FOXHALL A. PARKER, U. S. N.

Brid'lington, or **Bur'lington,** a market-town of England, in the East Riding of Yorkshire, and on the North Sea, 54 miles by rail E. by N. of York. Here are remains of a rich priory founded by a grand-nephew of William the Conqueror. Numerous ancient tumuli or barrows occur in this vicinity. Bridlington Quay, a seaport and bathing-place, is on the sea 1 mile S. E. of the town. It has a chalybeate spring and several hotels; also an active trade in corn, which is exported from it. This place is noted for chalk-flint fossils. Pop. of Bridlington and Quay, 5775.

Brid'port, a seaport-town of England, in Dorsetshire, on the Brit or Bride River, 16 miles N. W. of Dorchester. It is surrounded by hills, and consists chiefly of three spacious streets. It has a Gothic church, an almshouse, a town-hall; also manufactures of cordage, sail-cloth, shoe-thread, and fish-nets. The vicinity is celebrated for its butter and cheese. Pop. in 1871, 7666.

Bridport, a post-township of Addison co., Vt. P. 1171.

Briec, a village of France, department of Finistère, 9 miles N. N. E. of Quimper. Pop. 5726.

Brief [Lat. *breve*], **Papal,** a letter addressed by the pope to temporal princes or communities on subjects of discipline or public affairs. It differs from the papal bull in several respects, giving decisions on matters of inferior importance, which do not require the deliberations and assent of a conclave of cardinals. It is not signed by the pope, but by the segretario de' brevi, an officer of the papal chancery. It is written on parchment, and sealed in red wax with the pope's private seal, called the "Fishermen's Ring" (Annulus Piscatoris).

Brief [from the Lat. *brevis*, "short"], in law, an abridged statement of the plaintiff's or defendant's case, prepared by his attorney for the use of counsel. It should contain a summary of the pleadings, a concise statement of the facts involved, the names of the witnesses, the substance of their testimony, and usually observations by the attorney in the nature of suggestions to counsel.

The word "brief" is also employed in this country to indicate the sketch of the argument of counsel, which is either used by him or submitted to the court under its rules. "Brief" is also sometimes employed in the sense of *breve*, to denote one of the writs by which all suits in the higher courts were originally begun.

Brieg, a town of Prussia, in Silesia, on the Oder, and on the railway from Breslau to Oppeln, 29 miles by rail N. of Neisse. It is well built, and has a gymnasium, a good library, and manufactures of hosiery, ribbons, linens, and woollens. Pop. in 1871, 15,367.

Brieg, in Valais. See APPENDIX.

Briel, or **The Brill,** a fortified seaport-town of Holland, in the province of South Holland, and near the mouth of the river Meuse, 13 miles S. S. W. of The Hague; lat. of lighthouse, 51° 54′ 11″ N., lon. 4° 9′ 51″ E. It has a good harbor, is intersected by several canals, and contains several magazines. The capture of this town by William de la Marck in 1572 was the first important event in the long contest between the Dutch and Philip II. of Spain. Van Tromp and De Witt were born here. Pop. 4168.

Brienne, or **Brienne-le-Château,** called also **Brienne-Napoléon,** a small town of France, in the department of Aube, on the river Aube, 23 miles E. N. E. of Troyes. Here was a military school in which Napoleon I. was educated. The place derived its name from a château built by the last count de Brienne. In Jan., 1814, a battle was fought here between Napoleon and the allies, commanded by Blücher and Schwarzenberg, in which the latter were victorious. Pop. in 1866, 2078.

Brienz, Lake of [Ger. *Brienzer-See*], in Switzerland, is formed by the river Aar, at the foot of the Hasli Valley. It is 8 miles long, 2 miles wide, and from 500 to 2100 feet deep. The surface is 1847 feet above the level of the sea. It is surrounded by high mountains, one of which, called the Rothhorn, commands a grand view of the Alps. The surplus water of this lake flows through the Aar into Lake Thun. A small steamer plies on the lake daily.

Brier Creek of Georgia rises in Warren county, flows south-eastward, and after a course of about 100 miles enters the Savannah near Jacksonborough. Mar. 4, 1779, the British, under Prevost, defeated a force of Americans, under Gen. Ashe, on this creek.

Brier Hill, a post-village of Morristown township, St. Lawrence co., N. Y., on the Black River and Morristown R. R., is an active business-place.

Brierre de Boismont (ALEXANDRE JACQUES FRANÇOIS), a French physician, born Oct. 18, 1797, has published numerous treatises on medico-psychological subjects: among others, "De l'Ennui," "Sur le Suicide et la folie-suicide" (rev. ed. 1865), and "Des Maladies Mentales" (1866).

Bries [Hun. *Breznobanya*], a royal free city of Hungary, in the county of Sohl, 20 miles N. E. of New Sohl. Pop. in 1869, 11,766.

Brig, a square-rigged vessel with two masts. It has a boom mainsail, and is otherwise square-rigged—*i. e.* having the sails brought to yards hung horizontally by the middle. The hermaphrodite brig is the same with the BRIGANTINE (which see).

Brigade [It. *brigata*, a "company"], a group of regiments or battalions combined into one body. In the British army it denotes a body formed by the union of two or more regiments or battalions under one commander, called a brigadier. It is a temporary grouping which can be broken up whenever the commander of the army thinks proper. In the U. S. army two or more regiments of infantry or cavalry may constitute a brigade; two or more brigades under one command constitute a division, and two or more divisions an army corps.

Brigade-Major, an officer of the British army whose duties in a brigade are analogous to those of the adjutant in a regiment. When regiments or battalions are formed into a brigade, a brigade-major is detailed, usually from among the captains. He conveys orders, keeps the roster, inspects guards and pickets, directs exercises, etc.

Brigadier', or **Brigadier-General,** the commander of a brigade: an officer who is one degree higher than a colonel, and one lower than a major-general. In the British army a brigadier is an officer (usually a colonel) who for a limited time and for a special service is appointed to the command of a brigade. When this is broken up he either falls back to his colonelcy, or is raised to the rank of major-general.

Brigandine, a part of the defensive armor of the Middle Ages, was an assemblage of small plates of iron sewed upon quilted leather or linen. It formed a sort of coat or tunic, and derived its name from the irregular, light-armed troops called brigans or brigands, who were addicted to marauding and plundering.

Brigan'tes, a powerful nation of ancient Britain, inhabiting what is now the north of England, including the counties of Cumberland, Westmoreland, Durham, York, and Lancaster.

Brigantine, or **Hermaph'rodite Brig,** a two-masted vessel, with the mainmast of a schooner and the foremast like that of a brig. The mainsail of a brigantine is a fore-and-aft sail, like that of a schooner.

Briggs (Charles Frederick), an American writer, born at Nantucket, Mass. He became an editor of the "New York Times," and published, besides other works, "The Adventures of Harry Franco, a tale of the Great Panic" (1839), "The Haunted Merchant" (1844), and "The Trippings of Tom Pepper" (1847).

Briggs (George Nixon), LL.D., an American lawyer and judge, born in Adams, Mass., April 13, 1796. He was a member of Congress for two years, and governor of Massachusetts from 1844 to 1851, and afterwards judge of the court of common pleas. He was a distinguished philanthropist, and for many years president of the Baptist Missionary Union. Died Sept. 12, 1861.

Briggs (Henry), an English mathematician, born near Halifax, Yorkshire, in 1556, was educated at Cambridge. He became in 1619 Savilian professor of geometry at Oxford. He made important contributions to the theory of logarithms, and published in 1624 a great work entitled "Arithmetica Logarithmica," giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 100,000, calculated to fourteen places. Died in 1631.

Briggs (James McPherson), M. D. See Appendix.

Brig'ham (Amariah), M. D., born near New Marlborough, Mass., Dec. 26, 1798. He became superintendent of the lunatic asylum at Utica, N. Y., in 1842. Among his works is "The Anatomy, Physiology, and Pathology of the Brain" (1840). Died Sept. 8, 1849.

Brigham (Rev. Charles H.), born in Boston, Mass., July 27, 1820, graduated at Harvard, was from 1844 to 1866 pastor of the First Congregational church in Taunton, Mass., and since 1865 has been pastor of the Unitarian church at Ann Arbor, Mich. Since 1866 he has been professor of biblical archæology and ecclesiastical history in the Meadville (Pa.) Theological School. He is a prominent member of the American Oriental Society, of the Philological Society, and of the American Association for the Advancement of Science, and is the author of a very great number of contributions to periodical literature.

Brigham City, a post-village, capital of Box Elder co., Utah, near Bear River, and near the Central Pacific R. R., about 50 miles N. of Salt Lake City. It has manufactures of leather, woollen goods, etc. Pop. 1315.

Bright, a post-village of Oxford co., Ontario (Canada), on the Buffalo and Goderich branch of the Grand Trunk Railway, has some manufactures and a postal savings bank. Pop. about 500.

Bright (Jesse D.), born at Norwich, Chenango co., N. Y., Dec. 18, 1812, became a lawyer of Indiana, circuit judge in the State courts, lieutenant-governor, etc., and U. S. Senator from Indiana (1845–62).

Bright (John), an eminent English orator and statesman, born near Rochdale on the 16th of Nov., 1811. He is a member of the Society of Friends. About 1840 he became a personal and political friend of Richard Cobden, and gained distinction as an orator of the Anti-Corn Law League, in advocacy of which he addressed many public meetings. He was elected a member of Parliament for the city of Durham in 1843, and was returned for Manchester in the general election of 1847. Cobden and Bright became the principal leaders of the Manchester school or party, which was not identified with either of the great political parties, but advocated a pacific foreign policy and electoral reform. He was defeated in the election of 1857, because he had opposed the Crimean war against Russia and the Chinese war, but he was elected in the same year by the Liberal voters of Birmingham, which he continued to represent for many years. During the great civil war in the U. S. he expressed his sympathy with the Union cause in several eloquent speeches. After the Reform bill of Russell and Gladstone had been rejected by the House of Commons in 1866, Mr. Bright advocated the cause of electoral reform by vehement speeches at immense public meetings in London, Manchester, Birmingham, and other places. Referring to these speeches, the "European Times" of Dec. 8, 1866, remarked: "In all Mr. Bright's previous career he has never put forth such extraordinary power, such floods of the very highest order of eloquence, on the great question of the day, as during the last four months." In 1867 the friends of reform triumphed, and procured the passage of a bill granting the right of suffrage to every householder in a borough. He entered the cabinet formed by Mr. Gladstone in Dec., 1868, as president of the board of trade, and resigned office on account of ill health about Mar., 1871. As an orator he is distinguished for racy humor, passionate declamation, and nervous diction.

Bright'on, formerly **Brighthelmstone,** a town and fashionable watering-place of England, in Sussex, and on the English Channel, 50 miles S. of London. It is the southern terminus of the London and Brighton Railway. Lat. of lighthouse, 50° 50′ N., lon. 0° 8′ W. It extends 3 miles along the coast, and is sheltered on the N. and N. E. by the South Downs. To resist the inroads of the sea, which formerly undermined the chalk-cliffs at Brighton, a sea-wall of great strength has been constructed. It is 60 feet high, and forms an admirable promenade. In the middle of the town, in an open space called the Steyne, is the Pavilion or Marine Palace, a fantastic structure of Oriental style built by the prince of Wales (George IV.). It was finished in 1827, and is now owned by the corporation of Brighton. The town is well built, and consists mostly of new and elegant streets and terraces. It is a favorite resort for the aristocracy and the opulent classes, has numerous magnificent hotels, two theatres, assembly-rooms, and many boarding-schools. Among its institutions are Brighton College, founded in 1847 for the education of the sons of noblemen, a hospital, and the Sussex Literary and Scientific Institution. Brighton returns two members to Parliament. Steamers ply between this place and Dieppe. A fine terrace, called the Marine Parade, extends about a mile between the Steyne and Kempton, an eastern suburb of Brighton. It has little or no maritime trade, and owes its rapid increase to the salubrity of the air and its attractions to persons in pursuit of health and pleasure. It entertains, on an average, about 20,000 visitors. Pop. in 1871, 90,013.

Brighton, a port of entry of Northumberland co., Ontario, Dominion of Canada, on Lake Ontario and on the Grand Trunk Railway, 69 miles W. S. W. of Kingston. Pop. in 1871, 1357.

Brighton, a post-township of Sacramento co., Cal., on the Central Pacific R. R., 5 miles E. of Sacramento. Pop. 909.

Brighton, a township of Cass co., Ia. Pop. 337.

Brighton, a post-village of Washington co., Ia., is in Brighton township, 50 miles by railroad W. S. W. of Muscatine. It has a national bank and one weekly newspaper. Pop. 785; of the township, 1384.

Brighton, a post-village of Macoupin co., Ill. It has one weekly newspaper.

Brighton, a post-twp. of Somerset co., Me. Pop. 627.

Brighton, a former post-township and village of Middlesex co., Mass. The village is on the Boston and Albany R. R., 5 miles W. of Boston, and has a public library, two national and one savings bank, and one weekly newspaper. Brighton has a celebrated cattle-market and abattoir. Total pop. 4967. The town of Brighton, and also the city of Charlestown and town of West Roxbury, were annexed to Boston Oct. 13, 1873, to become a part of that municipality Jan. 5, 1874.

Brighton, a post-village and township of Livingston co., Mich., 43 miles S. E. of Lansing, on the Detroit Lansing and Lake Michigan R. R. The village is rapidly growing, has good water-power, a manufactory of pumps and cradles, a planing-mill, a foundry, a weekly newspaper, a graded school, and a public library. Pop. 454; of township, 1440. G. W. Axtell, Ed. "Citizen."

Brighton, a township of Franklin co., N. Y. Pop. 204.

Brighton, a post-village of Monroe co., N. Y., is in Brighton township, on the Erie Canal and the Central R. R., about 4 miles E. S. E. of Rochester. Pop. of township, 4304.

Brighton, a post-township of Lorain co., O. Pop. 508.

Brighton, a township of Beaver co., Pa. The village of Brighton is on the W. bank of Beaver River, nearly opposite New Brighton (which see). Pop. 844.

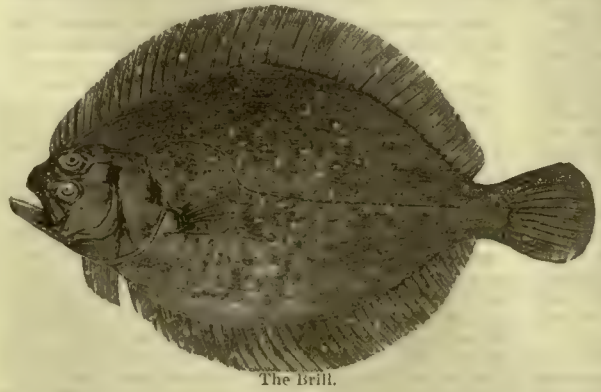
Brighton, a post-township of Essex co., Vt. Pop. 1535. It has manufactures of flour and lumber.

Brighton, a post-village and township of Kenosha co., Wis., about 16 miles W. S. W. of Racine. Pop. 1185.

Bright's Disease (or **Ne'phria**), so called after the English physician, Dr. Bright, who first investigated its character, consists essentially of a degeneration of epithelium of the kidneys. This impairs the excreting powers of the organ, so that the urea is not properly removed from the blood. The disease is characterized by albuminuria. When we apply heat and nitric acid to the urine from a kidney so affected, albumen is coagulated; under the microscope we observe moulds of the tubules of the diseased organ. Headache and sickness of stomach are common symptoms, and dropsy usually attends the disease. The retina is usually attacked by a degenerative inflammatory disease, which impairs the sight, and is detected by the ophthalmoscope.

The causes are, indulgence in strong drinks, exposure to wet and cold, gout, and syphilis. The indications for treatment are, to remove any of those causes which may be present, relieve congestion of the kidneys, at the same time endeavoring to increase strength by iron and other tonics. When considerable dropsy occurs, cathartics may be called for. Bright's disease may be either acute or chronic. The prospect of recovery is small, but patients sometimes attain a comfortable, but generally a precarious, degree of health. Revised by Willard Parker.

Brights'ville, a township of Marlboro' co., S. C. P. 857.



Brigittines, or **Order of the Saviour,** a monastic order affiliated with the Augustinians, founded by Saint Bridget of Sweden in 1344. It originally included monks and nuns, who lived in the same house, but were forbidden to see each other. There are at present few if any Brigittine monks, and not many nuns. Sion House was the only English convent. Œcolampadius, the Reformer, was once a Brigittine monk.

Brignoles, a town in the S. E. of France, department of Var, is beautifully situated in a valley on the small river Calami, 23 miles S. W. of Draguignan. It has a normal school, a public library, and manufactures of broadcloth, silk twist, pottery, soap, and leather. Pop. 5945.

Bri'gus, a port of entry and post-town, capital of Brigus district, Newfoundland. It has a small but good harbor, having over 820 cod-fishing boats and 30 trading vessels, and is visited by steamers from St. John's. It has a convent of Sisters of Mercy and a jail. It has considerable agriculture. Pop. about 2000.

Bril (Paul), an eminent landscape-painter, was born at Antwerp in 1556. He was a pupil of his brother Mattheus, and worked for many years in Rome, where he died in 1626.

Brill (*Rhombus vulgaris*), a fish found on the British coasts, and esteemed as food, though inferior to the turbot, from which it may be distinguished by its want of tubercles on the upper surface, and by the color, which is a reddish sandy brown on the upper side, varied with darker brown, and sprinkled with white pearly spots. It seldom weighs more than eight pounds.

The Brill.

Bril'liant [Fr. *brillant*], a diamond of fine quality formed into a number of facets, so as to refract and reflect the light, by which it is rendered more brilliant. It has a face or flat table in the middle on the top. (See Diamond.)

Bril'lion, a post-township of Calumet co., Wis. P. 672.

Brim'field, a post-village and township of Peoria co., Ill., about 20 miles W. N. W. of Peoria. Pop. 1547.

Brimfield, a post-township of Hampden co., Mass. Pop. 1288.

Brimfield, a post-township of Portage co., O. Pop. 913.

Brim'stone, a commercial and common name for Sulphur (which see), by Prof. C. F. Chandler.

Brin'disi, a fortified seaport of Italy, province of Lecce, situated at the head of a bay of the Adriatic, 38 miles by rail N. N. W. of Lecce; lat. of fort, 40° 39′ N., lon. 18° 1′ E. The ancient *Brundisium* was taken from the Sallentines by the Romans in 267 B. C., and was afterwards the principal naval station of the Romans on the Adriatic. It had an excellent landlocked harbor, and was long one of the most important maritime cities of Italy. It was the port from which the Romans embarked on the voyage to Greece. Virgil died here in 19 B. C. The crusaders used it as their chief port of embarkation to the Holy Land. The harbor having become choked with sand, its importance greatly declined. Here is a mediæval cathedral and an ancient castle. The large steamers of the Peninsular and Oriental Company now enter this port, which has recently been improved. Since 1860 the government has dredged the harbor, so that a depth of nearly six fathoms has been obtained, and has constructed two breakwaters and about 3000 feet of quay. The position of Brindisi has been rendered very advantageous for commerce by the opening of the Suez Canal. A railway extends from this town along the coast to Ancona, Milan, etc. Pop. 8403.

Brind'ley (James), an eminent English mechanic and engineer, born at Thornset, in Derbyshire, in 1716. He made improvements in the machinery of mills, and was the engineer of a canal projected by the duke of Bridgewater from Worsley to Manchester, and completed in 1761. This was the first navigable canal made in England. He was employed as engineer of other canals. Died Sept. 27, 1772.

Brine Shrimp, an active, translucent crustacean, the *Artemia salina*, a branchiopod one inch long, found especially in the half-evaporated sea-water of the salt-works of Lymington, England. The workmen believe that these animals clarify the brines, and they therefore are careful to put them into such brines as appear to be without them. They breed rapidly and become very numerous. *Artemia fertilis* is extremely abundant in the Great Salt Lake.

Brink'ley's, a twp. of Somerset co., Md. Pop. 2536.

Brinvilliers (Marie Marguerite d'Aubray), Marchioness of, a French woman notorious as a poisoner, was married in 1651 to the marquis de Brinvilliers. She poisoned her father, her sisters, and two of her brothers. For these crimes she was tried and put to death July 16, 1676.

Brion (Gustave), a French artist of considerable reputation, was born at Rothau (Vosges) in 1824. His principal pictures are the "Potato Harvest during the Inundation," 1853; "A Funeral in the Vosges," 1855; "A Marriage in Alsace;" "Jesus and Peter on the Water," 1863; "The Dance of the Cock" (Alsace), 1872. A picture by M. Brion, "The Sixth Day of Creation," exhibited in the Salon in 1867, was brought to New York in 1872, where it attracted much attention. Brion is an earnest painter, most at home in scenes in which the half-German, half French peasantry of Alsace take part. C. C.

Bris'bane, a seaport and the capital of Queensland, Australia, on Brisbane River, about 20 miles from its entrance into Moreton Bay, and about 600 miles N. by E. of Sidney. Wool and other produce are exported from this place. It is connected by rail with Ipswich and Dalby, and is in direct steamship communication with London and Liverpool. It is the seat of an Anglican and a Roman Catholic bishop. Pop. in 1871, 19,413.

Brissot de Warville (Jean Pierre), an eminent French Girondist and political writer, born near Chartres Jan. 14, 1754. He published in 1780 a "Theory

of Criminal Laws." In 1785 he was unjustly imprisoned in the Bastile for about four months. With the aid of his friends he founded about 1788 the "Society of the Friends of the Negroes," and visited the U. S. to promote the abolition of the slave-trade. After his return to France he founded and edited the "Patriote Français," an able republican journal. In 1791 he was elected to the National Assembly by the voters of Paris. He was so prominent a leader of the Girondists that they were often called Brissotins. Having been elected to the Convention, he opposed the execution of the king. He was guillotined in Paris Oct. 31, 1793. (See Brissot's "Mémoires pour servir à l'Histoire de la Révolution," published by his son, 4 vols., 1830.)

Bris'ted (Charles Astor), son of the following, born in New York Oct. 6, 1820, educated at Yale College, New Haven, and Trinity College, Cambridge, author of an edition of Catullus (1849), "Five Years in an English University" (1851, revised 1872), "The Upper Ten Thousand" (1852), "Pieces of a Broken-down Critic" (1858), "The Interference Theory of Government" (1867), "Anacreontics" (1872), and a frequent contributor to leading periodicals. Died at Washington, D. C., Jan. 15, 1874.

Bristed (John), an Episcopal clergyman, born in 1779 in Dorsetshire, England, educated at Winchester School, removed to America in 1806, and practised law in New York, studied divinity and was ordained in the Episcopal Church. He was author of "Resources of the British Empire," "Resources of the U. S.," and "Anglo-American Churches." Died at Bristol, R. I., in 1854.

Bris'tle [Lat. *seta*], the name of the stiff strong hairs which grow on the backs of swine, and are used extensively in the manufacture of brushes; also by shoemakers and saddlers as substitutes for needles. Bristles are an important article of commerce. There is a great variety in their color and quality. The white are considered the most valuable. The best bristles are obtained from the hogs of cold climates, as from Russia.

Bris'tol, an important maritime city of England, situated on the Avon at its confluence with the Frome, 8 miles from the sea, 11½ miles by rail N. W. of Bath, and 118 miles by rail W. of London; lat. 51° 27′ N., lon. 2° 35′ W. It is chiefly in the county of Gloucester, and partly in Somersetshire, and it occupies several hills and valleys. It is the terminus of the Great Western, the Bristol and Exeter, and the Midland Railways. Bristol returns two members to Parliament. Among its remarkable buildings are the cathedral, which was founded about 1150; the fine church of St. Mary Redcliffe, which was completed in 1376; the Temple church, which has a leaning tower; the guildhall; the exchange, used as a corn-market; and the new general hospital. The modern portions of Bristol, including Clifton and other suburbs, consist of handsome residences in squares, terraces, crescents, and detached villas. This city has a public library, a bishop's college, a medical school, an infirmary, an asylum for the blind, an asylum for deaf-mutes, and other benevolent institutions. The Avon here, though narrow, is deep enough for large vessels. About £650,000 have been expended in turning this river into a new course, and its old channel now forms a harbor furnished with locks and quays 6000 feet long. Bristol was the first British port between which and the U. S. a regular communication by steam was established. It has an extensive trade with Canada, the U. S., the West Indies, France, Russia, the shores of the Mediterranean, etc. The chief articles of export are copper, iron, brass, coal, salt, and manufactured goods. The manufactures of this city are chiefly cotton goods, refined sugar, glass, woollen goods, chemical products, machinery, and earthenware. Here are extensive shipyards, which turn out excellent vessels. This place was called *Caer-oder* by the Britons, and *Bricstowe* or *Brieстowe* by the Anglo-Saxons. A fortified town existed here as early as 500 A. D. It was formerly the second commercial city in England. During the civil war it was taken alternately by Royalists and Roundheads. Among the distinguished natives of Bristol were Sebastian Cabot and the poets Chatterton and Southey. Pop. in 1871, 182,524.

Bris'tol, a county in the S. E. of Massachusetts. Area, 517 square miles. It is bounded on the S. by Buzzard's Bay, and is drained by the Taunton River and other streams, which afford water-power. It has many good harbors on the sea-coast. The surface is nearly level; the soil is partly fertile. Garden products, wool, and grain are raised. The manufactures of iron, cotton and woollen goods, etc. are very important. It is intersected by several railroads. Capitals, Taunton and New Bedford. Pop. 102,886.

Bristol, a county in the E. of Rhode Island. Area, 25 square miles. It is washed on several sides by Narragansett Bay and Mount Hope Bay, and has great facilities for navigation and the fisheries. The soil is fertile, and the surface is finely diversified. Hay, grain, garden products, and wool are raised. It is intersected by the Providence Warren and Bristol R. R. Capital, Bristol. Pop. 9421.

Bristol, a post-village of Hartford co., Conn., in Bristol township, on the Hartford Providence and Fishkill R.R., 18 miles W. S. W. of Hartford. It has one weekly paper, a large manufacture of clocks, several foundries, machine-shops, stocking-mills, and a printing-office. Pop. of township, 3788. Ed. of "Bristol Press."

Bristol, a post-village, capital of Liberty co., Fla., 59 miles S. W. of Tallahassee.

Bristol, a post-village and township of Kendall co., Ill., on Fox River and the Chicago Burlington and Quincy R. R., 49 miles W. S. W. of Chicago. Pop. 1352.

Bristol, a post-village and township of Worth co., Ia., is about 20 miles S. of Albert Lea, Minn. Pop. 503.

Bristol, a post-village of Washington township, Elkhart co., Ind. Pop. 681.

Bristol, a post-township of Lincoln co., Me., on the Atlantic Ocean. It has important manufactures of lumber, fish oil, barrels, etc. It is on the site of the old city and port of Pemaquid, and was first settled in 1625, unless, as is believed by some, the Dutch settled here still earlier. Pop. 2916.

Bristol, a township of Fillmore co., Minn. Pop. 993.

Bristol, a post-township of Grafton co., N. H., on the Bristol branch of the Northern R. R. This town has a deposit of good graphite, and a mineral spring. It has manufactures of leather, lumber, gloves, paper, hosiery, flannels, etc. It has a high school and a savings bank. Pop. 1416.

Bristol, a post-township of Ontario co., N. Y. P. 1551.

Bristol, a post-township of Morgan co., O. Pop. 1469.

Bristol, a township of Trumbull co., O. Pop. 983.

Bristol, a post-borough of Bucks co., Pa., on the Delaware River, 19 miles above Philadelphia, and nearly opposite Burlington, N. J. It is on the Philadelphia and Trenton R. R., and has almost hourly communication with Philadelphia by steamboats. Here is a national bank, a valuable mineral spring, and one quarterly and one weekly newspaper. Pop. 3269; of township, 2040.

Bristol, a port of entry and capital of Bristol co., R. I., is on Narragansett Bay, 16 miles S. S. E. of Providence and 7 miles S. W. of Fall River. It has a good harbor, which is easy of access and will admit large vessels. It is on the Providence Warren and Bristol R. R. A beautiful eminence called Mount Hope rises about 300 feet high in Bristol township, which has an area of 12 square miles. It has two national banks, and manufactures of cotton goods and other articles. It has one weekly newspaper. Pop. of Bristol township, 5302.

Bristol, a city of Sullivan co., Tenn., is situated partly in Washington co., Va., on the East Tennessee Virginia and Georgia R. R., 130 miles E. N. E. of Knoxville. It is a thriving place, and the seat of King College. It has one weekly and one monthly newspaper in Tennessee, and one weekly newspaper in Virginia.

Bristol, a post-township and village of Addison co., Vt., about 25 miles S. of Burlington. It has an academy, and manufactures of lumber, furniture, barrel staves, boxes, sash and blinds, agricultural tools, etc. Pop. 1365.

Bristol, a township of Dane co., Wis. Pop. 1274.

Bristol, a post-village in Bristol township, Kenosha co., Wis., is on a railroad, 12 miles W. by S. of Kenosha. Pop. of the township, 1140.

Bristol, Marquesses of (1826, in the United Kingdom), earls of Bristol (1714, in Great Britain), Earls Jermyn (1826, in the United Kingdom), and Barons Hervey (1703, in England), a noble family of Great Britain.—Frederick William John Hervey, the third marquess, born June 28, 1834, succeeded his father in 1864. He was member of Parliament for West Suffolk 1859–64.

Bristol Bay, an inlet of the Pacific Ocean, in North America, between Cape Newnham and the peninsula of Alaska.

Bristol Brick, or **Bath Brick,** a variety of brick used for scouring steel table-cutlery and other polished steel surfaces. It is made at various places in England and the U. S., a peculiar fine sand being used in the manufacture.

Bristol Channel, an inlet of the Atlantic Ocean, in the S. W. part of England, is bounded on the N. by Wales and on the S. by Somerset and Devonshire. At the E. end it communicates with the estuary of the Severn. It is the largest inlet of Great Britain, and has a coast-line of 220 miles. The tides rise here to an extraordinary height—at

Bristol about forty, and at Chepstow sometimes seventy, feet. The principal bays are Swansea Bay, Caermarthen Bay, Cardiff Road, the Severn Estuary, and Barnstable Bay.

Bristow (Benjamin H.). See Appendix.

Bris'tow Sta'tion, a post-village of Prince William co., Va., on the Orange and Alexandria R. R., 4 miles W. S. W. of Manassas Junction. A severe engagement took place here the afternoon of Aug. 27, 1862, between the U. S. forces under Gen. Hooker and the Confederates under Gen. Ewell, darkness closing the conflict, with severe loss on both sides. On Oct. 14, 1863, the Confederate general A. P. Hill attacked the force under command of Gen. G. K. Warren, U. S. army, at this place; the attack was handsomely repulsed by Warren, who captured several pieces of artillery and many prisoners.

Brit, the *Clupea minima*, a very small species of herring found on the coasts of New England and the British provinces of North America. It occurs in immense shoals, but is only from one to four inches long, and is chiefly important as furnishing food to larger fishes.

Britan'nia, the ancient name of the island of Great Britain. It was inhabited by rude, uncivilized tribes of Britons (Lat. *Britanni*), who were perhaps, but not probably, the aborigines, when Julius Cæsar invaded the island in 55 B. C. Their religion was a sanguinary Druidism. Many of the Britons were Cymric Celts, while those of the northern part were probably largely Gaelic. (See Briton.) They obstinately resisted the Roman invaders, but without success, and the southern half of the island was conquered by the armies of Vespasian. In the reign of Domitian, Agricola extended Roman power to Scotland, and erected a chain of forts between the friths of Clyde and Forth about 84 A. D. The northern part of the island was inhabited by the Caledonians and Picts, whom the Romans failed to subdue. These warlike barbarians made frequent inroads into the southern province, to obviate which the Romans built the wall of Antoninus about 140 A. D. Another rampart, called the Wall of Hadrian, extending from Solway Frith to the mouth of the Tyne, was completed by Severus about 210 A. D. The part of the island S. of this wall was for several centuries under the dominion of the Romans, who founded many towns (*municipia*), and diffused Roman culture, arts, and civilization in the country. They made numerous roads from London to the provinces, the remains of which are still visible. Many parts of England abound in Roman antiquities, including remains of camps, baths, mosaic pavements, weapons, ornaments, utensils, pottery, sculptures, and coins. It appears that the Romans intended to keep Britain as a permanent conquest, but in consequence of the internal disorders and external dangers that menaced the stability of the Roman empire, the legions were withdrawn from the island about 420 A. D., soon after which it was invaded and conquered by the Saxons. It is said that Cæsar was the first who gave the name *Britannia* to this island, which before his time was called *Albion*. The term *Britannicæ Insulæ*, however, was applied to the British Islands collectively before Cæsar invaded *Albion*. Britannia is usually personified in the fine arts as a woman seated on an insulated rock, leaning on a shield and holding in her hand a spear or trident. (See Camden, "Britannia;" Horseley, "Britannia Romana.")

Britan'nia Met'al, an alloy of tin with a little antimony, zinc, and copper, is largely used in the manufacture of coffee-pots, tea-pots, and other vessels. It is harder than pewter, and not so easily indented or bent. The proportions of the metals combined to make this alloy are various. The average composition in 100 parts is—tin, 85½; antimony, 10¼; zinc, 3; and copper, 1. The present composition of the alloy used at Birmingham, England, is stated to be 90 of tin, 8 of antimony, 2 of copper.

Brit'ish Amer'ica is usually applied to that portion of North America which lies N. of the parallel 49° N., except Alaska. It also extends several degrees farther S., where the great lakes form the boundary between it and the U. S. It is bounded on the N. by the Arctic Ocean, on the E. by the Atlantic and Davis Strait, on the S. by the U. S., and on the W. by the Pacific Ocean and Alaska. The Rocky Mountain chain extends through the western part. The principal rivers are the St. Lawrence, the Mackenzie, the Saskatchewan, and the Churchill. It contains several large lakes—namely, Winnipeg, Athabasca, and Great Slave Lake, and includes a large inland sea, named Hudson's Bay. This vast region was formerly divided into numerous territories or provinces, but in 1873 the whole of it had been admitted into the Dominion of Canada, with the exception of Newfoundland and Labrador.

British America, in a more extended sense, comprises all the British possessions in America, including British Guiana, the British West Indies, etc.

British Burmah. See Burmah, British.

British Colum'bia, a province of the Dominion of Canada, is bounded on the S. by the U. S. (Washington, Idaho, and Montana), on the E. by the Rocky Mountains, and on the W. by the Pacific Ocean. It includes the important islands of Queen Charlotte and Vancouver (which last was formerly by itself a British colony). British Columbia was united to Canada in 1871. The soil of portions of the province near the sea is good, and the climate mild, though rainy; but in the interior the surface is extremely rugged and the climate is severe. The coast-line is characterized by remarkable fiords, called "canals," which are often walled in by mountains. Furs are largely exported. There is much valuable timber, and the fisheries promise to become important. Cod, haddock, herring, halibut, trout, sturgeon, anchovies, and especially salmon, abound. There is much fine grazing-land. Large amounts of gold have been obtained here, and silver, copper, zinc, mercury, coal, and marble are found. Estimated area, 240,000 square miles. Capital, Victoria. Pop. in 1871, exclusive of Indians, 14,043. Total pop. estimated at 50,000. The best harbor is at Esquimault. British Columbia has an Anglican bishop, whose seat is at New Westminster.

Certain islands in the Strait of San Juan de Fuca, having been claimed by both the U. S. and Great Britain, were held under joint military occupation until Oct., 1872, when by a decision of the emperor William I. of Germany, to whom the dispute was referred, they became U. S. territory. These islands, of which San Juan is the most important, are ten in number. Their entire population in 1870, exclusive of the garrisons, was 554.

British Empire. See Great Britain and Ireland.

British Guiana. See Guiana.

British Gum. See Dextrine, by Prof. C. F. Chandler, Ph. D., LL.D.

British India. See India.

Brit'ish Muse'um, The, in London, was established in 1753 by act of Parliament in pursuance of a bequest of Sir Hans Sloane to the nation of his cabinets of natural history and library, numbering 50,000 volumes, in return for a sum of £20,000 to be paid to his heirs. The palace of the duke of Montague on Russel street was purchased for the reception of the collection. In 1801 the Elgin Marbles, in 1823 the library of George III., containing 80,000 volumes, were added to the museum, and it has been subsequently enriched by the Granville library, the Sir William Temple coin cabinets, the Layard and Loftus collection of Assyrian, and the Lady Webster collection of Mexican, antiquities, and other extensive accessions. The building was in 1823–47 enlarged and renovated at a cost of £150,000. The library numbers at present 750,000 volumes, besides 41,180 MSS. and 33,000 documents and state papers. The collections of antiquities are altogether the completest in Europe. The museum contains also the finest collection of vases, among them the famous Portland Vase, and the largest collections of Greek and Roman sculpture in the world, and the cabinets of natural objects embrace every province of science.

Brit'on, a native or citizen of ancient Britain or Britannia (which see); a name given to the aboriginal or ancient inhabitants of that island. When Cæsar invaded Albion in 55 B. C., he found in it two different peoples. The interior was occupied by the primitive or indigenous Celtic inhabitants, who had been driven back from the coasts by a people of probable Gothic descent. The latter had colonized the S. E. part of the island, and were less numerous than the Celtic Britons. The language of the Southern Celtic Britons was very similar to the present Welsh. "The Gaels and Britons," says R. G. Latham, "are the fundamental populations of the British Isles. The Picts were either aboriginal or intrusive. If aboriginal, they were like the Gaels and Britons, Keltic." (See Picts.) When Cæsar invaded the island, the Britons were divided into a number of petty kingdoms or states. Some of these were called *Silures*, *Brigantes*, *Ordovices*, *Trinobantes*, and *Cantii*. Their religion was Druidism. (See Druids.) The primitive Britons were brave and warlike, but, in consequence of their divisions, they were conquered by the Romans without much difficulty. They were rude barbarians, who painted their bodies blue. The term Briton is often applied to a modern inhabitant of Great Britain.

Brittany. See Bretagne.

Brit'ton's Neck, a post-township of Marion co., S. C. Pop. 884.

Britt's, a township of Robeson co., N. C. Pop. 1159.

Brive, or **Brives-la-Gaillarde,** a town of France, department of Corrèze, is situated in a rich plain on the river Corrèze, 44 miles by rail E. of Périgueux. It has

manufactures of muslins, woollen stuffs, silk handkerchiefs, etc.; also a college and public library. Pop. 10,389.

Broadal'bin, a post-township of Fulton co., N. Y. It contains several mills and factories. Pop. 2492.

Broad Arrow, the British government mark placed upon all solid materials used in ships or dockyards, to prevent embezzlement of royal stores. The origin of the mark is obscure. Before 1698 the authorities prosecuted a dealer in marine-stores for having in his possession certain stores bearing the broad arrow of his majesty. The defendant, when asked what he had to say, replied that it was very curious that the king and he should both have the same private mark on their property. The man was acquitted, and this led to the passing of a law that persons in possession of stores or goods of any kind marked with the broad arrow shall forfeit all such goods, with £200 and costs.

Broad Bay, a township of Forsyth co., N. C. Pop. 993.

Broad'cast, in agriculture, is a method of sowing seeds by casting or scattering them abroad, so as to distribute them evenly over the entire surface of the soil, instead of planting them in drills or rows. The operation of sowing broadcast is generally performed by the hand of a man, who carries the seeds in a bag or basket. Clover and timothy seeds are usually sown in this method. In the U. S., wheat, barley, and oats are often sown broadcast.

Broad'cloth, a woollen fabric about four and a half feet wide, extensively used for coats. The best quality of this article is manufactured in France, Germany, and England.

Broad Creek, a hundred of Sussex co., Del. Pop. 3480.

Broad'dus (Rev. Andrew), D. D., born in Caroline co., Va., Nov. 4, 1770, died Dec. 1, 1848. The "Dover Selection" of hymns and the "Virginia Collection," compiled by him, were long popular in several States; and he "was commonly regarded as the most eloquent preacher ever known in Virginia." A rare timidity led him to decline the pastorate of leading Baptist churches in Boston, New York, Philadelphia, and various Southern cities, and he lived and died a country pastor. Some of his sermons, with a memoir by J. B. Jeter, D. D., were published in New York in 1852.

Broad'hagen, a post-village of Logan township, Perth co., Ontario (Canada), 60 miles N. of London. It has a weekly paper. Pop. about 200.

Broad'kiln, a hundred of Sussex co., Del. Pop. 2419.

Broad Mountain, a high ridge in the anthracite coal-region of Pennsylvania, in Carbon and Schuylkill cos. It has an altitude of about 2000 feet above the sea, and is nearly 50 miles long. Its direction is nearly N. E. and S. W. The Mine Hill R. R. crosses this mountain.

Broad River of the U. S. rises at the foot of the Blue Ridge, in the W. part of North Carolina. Having entered South Carolina, it flows in a S. S. E. direction through fertile uplands, and unites with the Saluda at Columbia to form the Congaree. Total length, estimated at 150 miles.

Broad River, a township of McDowell co., N. C. Pop. 399.

Broad River, a township of Lexington co., S. C. Pop. 1116.

Broad River, a township of York co., S. C. Pop. 1455.

Broad Run, a township of Loudon co., Va. Pop. 2582.

Broad'side, in naval warfare, is the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship is sometimes estimated by the weight of her broadside. That of some British war-steamers amounts to 2400 pounds. In printing, a broadside is a sheet of paper containing one large page or printed on one side only.

Broad'sword, a sword with a broad blade, adapted for cutting, but not for stabbing. It is not sharp-pointed. The broadsword was especially used in Scotland.

Broad Top, a township of Bedford co., Pa. Pop. 1626.

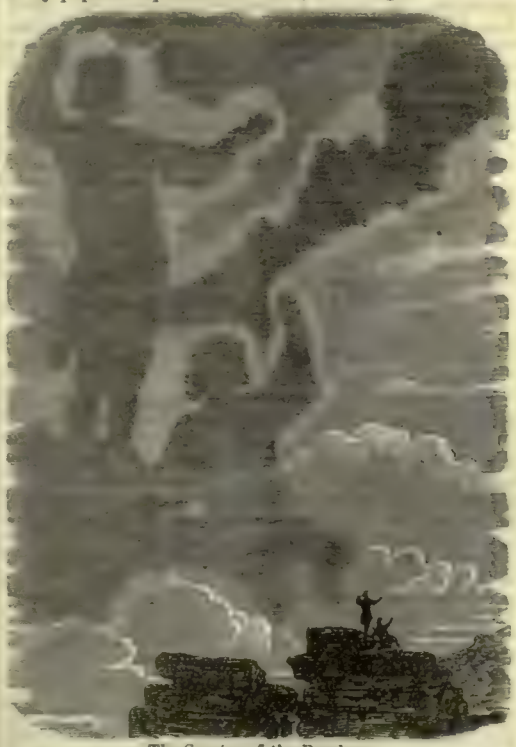
Broad Top, a post-village of Carbon township, Huntingdon co., Pa., near the E. terminus of the Broad Top City branch of the Huntingdon and Broad Top R. R. Pop. 327.

Broad Top Mountain, Pennsylvania, is in the N. E. part of Bedford co. and the S. part of Huntingdon. It rises about 2500 feet above the level of the sea. Here are extensive beds of bituminous coal, for the transportation of which a railroad has been opened from this mountain to Huntingdon.

Broad'us (John Albert), D. D., LL. D., born Jan. 24, 1827, in Culpeper co., Va., graduated at the University of Virginia in 1850, was assistant professor in that university in 1851–53, its chaplain in 1855–57, and pastor of the Baptist church in Charlottesville, Va. (the seat of the university), from 1851 to 1859, since which time he has been professor of the interpretation of the New Testament and of homiletics in the Southern Baptist Theological Seminary, Greenville, S. C. In 1870 he published an excellent "Treatise on the Preparation and Delivery of Sermons," which has passed through several editions, and was republished in London.

Broad'way, a township of Anderson co., S. C. Pop. 1378.

Broad'well, a post-township of Logan co., Ill. Pop. 920.



Brocade [It. *broccata*], a silk fabric variegated with gold and silver threads, or a silk fabric on which figures of flowers, foliage, or other objects are formed by the threads of the warp and woof being raised by the Jacquard loom or other means. Brocade bears nearly the same relation to silk textures as damask to linen fabrics.

Broc'chi (Giovanni Battista), an Italian naturalist, born at Bassano Feb. 18, 1772. He published, besides other works, "Sub-Apennine Fossil Conchology, with Geological Observations on the Apennines, etc." (2 vols., 1814). During a journey to Sennaar he died at Khartoom, on the Nile, Sept. 28, 1826.

Broc'coli, a highly-esteemed garden vegetable, a variety of the cabbage (*Brassica oleracea*). It has considerable resemblance to cauliflower, from which it differs by the purple or green color of its heads, and its greater hardness. It is propagated by sowing the seeds in the spring or in autumn, and transplanting the young plants once or twice. The leaves are often tinged with purple. There are several kinds of broccoli, some of which are preferred for sowing in early spring. Others are sown in autumn, and are ready for use in the ensuing spring.

Brock (Sir Isaac), a British general, born Oct. 6, 1769, who in 1812 captured General Hull and his army at Detroit. He was killed at the battle of Queenstown Oct. 13, 1812.

Brock'en, The, or **Blocks'berg** (anc. *Mons Brocterus*), a mountain of Prussia, in the province of Saxony, 20 miles W. S. W. of Halberstadt, is the highest summit of the Hartz Mountains, and is 3740 feet above the level of the sea. It is cultivated nearly to the top, which commands a fine view in clear weather. The Brocken is the cradle of many popular superstitions. It is, according to an ancient

The Spectre of the Brocken.

belief, the scene of the annual dance of the witches on Walpurgis Night (May 1st). This superstition, in all probability, owes its origin to the phenomenon known as "The Spectre of the Brocken," seen here and elsewhere, which is

simply the reflection of the forms of men and other objects against the sky, the vapors of the atmosphere acting as a vast concave mirror; hence the objects reflected are seen greatly magnified.

Brock'ett (Linus Pierpont), A. M., M. D., born Oct. 16, 1820, at Canton, Hartford co., Conn., educated at Suffield Literary Institution and Brown University, entering the latter in 1837. He studied medicine in New Haven, Conn., Washington, D. C., and New York City, and graduated as M. D. from Yale Medical College in 1843. After practising his profession for some years, he devoted himself to literary pursuits at Hartford, Conn., and from 1847 to 1857 was partner in a publishing-house in that city. Resuming literary labor in 1856, he has been since connected with several religious newspapers, was a large contributor to the "New American Cyclopædia," and has had charge of several departments in the "American Annual Cyclopædia" from its beginning in 1862 to the present time. In 1857, Amherst College conferred on him the honorary degree of A. M. He has published many works, among which the following are best known: "Geographical History of New York," 1847 (with J. H. Mather); "History of Education," 1859; "The National Almanac for 1863;" "History of the Civil War" (with S. M. Schmucker), 3 vols., and 1 vol. 8vo, 1866; "Our Great Captains," 1865; "Philanthropic Results of the Civil War," 1864; "Woman's Work in the Civil War," 1867; "Men of Our Day," 1868 (revised and mostly written anew, 1872); "Woman, her Rights, Wrongs, Privileges, and Responsibilities," 1869; "The Year of Battles, a History of the Franco-German War of 1870–71," 1871; and "Epidemic and Contagious Diseases: their History, Symptoms, and Treatment," 1873. He has also edited and largely rewritten "A Hundred Years' Progress of the U. S.," 1871–73; the American biographies of "Men of the Time," 8th ed., London, 1872; "Una and her Paupers," 1872; "The Thorough Business-Man: Life of Walter Powell," 1873; and has been a frequent contributor to magazine and review literature, etc.

Brockett's Bridge, a post-village of Manheim township, Herkimer co., and Oppenheim township, Fulton co., N. Y., on East Canada Creek, has a cheese-factory, box-shop, tannery, and two churches.

Brock'haus (Friedrich Arnold), an eminent German publisher, born at Dortmund May 4, 1772. He was the founder of the firm of Brockhaus in Leipsic, and published six editions of the "Conversations-Lexikon." He was distinguished for his literary culture, enterprise, and patriotism. He became a citizen of Leipsic in 1817. Died Aug. 20, 1823.—Heinrich, a son of the preceding, was born at Amsterdam Feb. 4, 1804. He succeeded his father as proprietor of the publishing-house, and published new editions of the "Conversations-Lexikon."

Brock'port, a post-village of Monroe co., N. Y., on the Erie Canal and the New York Central R. R., 17 miles W. of Rochester. It is in the heart of a wealthy and populous farming country. It has two well-sustained newspapers, eight churches, and two banks. It has an extensive trade in beans. A State normal school, accommodating from 400 to 500 students, is located here; also the Johnston harvester-works (200 men employed) and Seymour & Morgan mower and reaper works (150 men employed), Ithaca wheel-rake works, and other manufactories. Pop. 2817.
Johnson Brigham, Ed. "Brockport Democrat."

Brock's, a township of Etowah co., Ala. Pop. 490.

Brock's, a township of Henry co., Ala. Pop. 663.

Brock's Gap, a tp. of Rockingham co., Va. P. 1366.

Brock'ton, a tp. and post.-v. of Plymouth co., Mass., was incorporated as North Bridgewater in 1821, and in 1874 received its present name; is a handsome, compact town, 20 miles S. of Boston on the Old Colony R. R.; is one of the first towns in the county for wealth and population, and is an important business-centre. The manufacture of boots and shoes is a leading industry; furniture, carriages, needles and shoe-tools, etc. are also manufactured. Its annual business exceeds $10,000,000; has a national and savings bank, 4 hotels, newspaper, 9 churches, public library, and an efficient fire department; and is the seat of courts for the first Plymouth district. Pop. 8007. A. T. Jones, Ed. "Gazette."

Brock'ville, a port of entry of Ontario, Canada, capital of the county of Leeds, on the St. Lawrence River and the Grand Trunk Railway, 125 miles by railway S. W. of Montreal and 75 miles by railway S. of Ottawa. Hardware, chemicals, white lead, gloves, farming tools, steam-engines, and machinery are manufactured here. It is the southern terminus of the Brockville and Ottawa Railway. It is connected by ferry with Morristown, N. Y., and has three weekly papers. Pop. in 1871, 5102.

Brock'way, a post-tp. of St. Clair co., Mich. P. 1330.

Brockway, a post-township of Stearns co., Minn. Pop. 478.

Brock'wayville, a post-village of Jefferson co., Pa. It has one weekly newspaper.

Broc'ton, a post-village of Portland township, Chautauqua co., N. Y., at the junction of the Lake Shore and Buffalo Corry and Pittsburg R. Rs. It is the seat of a religious community established here in 1867 by T. L. Harris. P. 329.

Bro'derick (David Colbreth), an American Senator, born at Washington, D. C., in 1818. Having removed to California in 1849, he was elected a Senator of the U. S. by the Democrats in 1856. He opposed the extension of slavery, and in 1858 ceased to act with the Democratic party. He was killed in a duel by Judge Terry, a political opponent, near San Francisco, Sept. 21, 1859.

Brod'head, an incorporated village of Decatur township, Green co., Wis., beautifully situated on Sugar River and on the Milwaukee and St. Paul R. R., 90 miles W. of Milwaukee, has a large graded school, five churches, a printing-office, a national bank, a foundry, machine-shops, wagon and carriage factories, large flouring mill, etc., one weekly paper, and an extensive trade. The country surrounding is exceedingly fertile. Pop. 1548.
E. O. Kimberley, Pub. "Brodhead Independent."

Brod'head (John Romeyn), LL.D., an American historian, son of Rev. Dr. Jacob Brodhead, was born in Philadelphia Jan. 2, 1814, graduated at Rutgers College in 1831, and was admitted to the bar in New York City in 1835. After two years he began to devote himself to the study of American history. In 1839 he went to Holland as secretary of the U. S. legation at The Hague. In 1841 he was appointed by Governor Seward to search out and copy documents relating to the early history of New York. When he returned in 1844 he brought with him more than 5000 separate documents, which led Mr. Bancroft to say that "the ship in which he returned was more richly freighted with new materials for American history than any that had ever crossed the Atlantic." These documents were afterwards published in eleven quarto volumes. From 1846 to 1849 he was secretary of legation under Mr. Bancroft in London. From 1853 to 1857 he was naval officer of the port of New York, and in 1855 declined the appointment of consul-general to Japan. Years of patient labor were bestowed upon his "History of the State of New York," the first volume of which appeared in 1853, and the second in 1871. After two or three years of declining health, he died in New York City May 6, 1873. He was a high-toned Christian scholar and gentleman. As an historian he was scrupulously exact and fair.

Bro'die (Sir Benjamin Collins), D. C. L., F. R. S., an English surgeon, born in Wiltshire June 9, 1783, became in 1832 surgeon to William IV., and was created a baronet in 1834. Among his works are "Lectures on Local Nervous Affections" (1837) and "Psychological Inquiries as to the Mental Faculties" (1854). He received the Copley medal of the Royal Society in 1811 for his contributions to physiology. Died Oct. 21, 1862. (See his "Autobiography," 1865.)

Bro'dy, formerly called **Lubicz,** a trading town of Austria, in Galicia, is near the Russian frontier, 50 miles E. N. E. of Lemberg. It has an imperial chamber, a theatre, and a castle; also manufactures of linen and leather. The majority of its inhabitants are Jews. It has an extensive trade with Russia, Poland, and Turkey. Pop. 18,733.

Brog'den, a township of Wayne co., N. C. Pop. 2560.

Broglie, de (Achille Léonce Victor Charles), Duc, a French statesman, was born in Paris Nov. 28, 1785. He married in 1816 the daughter of Madame de Staël. He was a friend of Guizot, and co-operated with him as a leader of the party called Doctrinaires. He was minister of foreign affairs from Oct., 1832, to April, 1834. In 1849 he was a conservative member of the Legislative Assembly. He was elected to the Academy in 1856. Died Jan. 26, 1870.

Broglie, de (Albert), Prince, a writer and diplomatist, a son of the preceding, was born June 15, 1821. He wrote, besides other works, "The Church and the Roman Empire in the Fourth Century" (2 vols., 1856), "La Souveraineté pontificale et la Liberté" (1861), and "La Liberté divine et la Liberté humaine" (1865). He was appointed minister to London by M. Thiers in Feb., 1871, and became minister of foreign affairs in the MacMahon administration in 1873, and favored the royalist cause.

Broil'ing is a simple and expeditious mode of cooking pieces of meat, by laying them on a gridiron over a bright fire or on the coals themselves. Broiling is a quicker sort of roasting. The albumen of the outside being sealed up at once, the meat is rendered extremely nutritious. But to broil meat so as to preserve its odor, juice, and fat requires care and skill.

Broken Arrow, a post-township of St. Clair co., Ala. Pop. 760.

Broken Straw, a township of Warren co., Pa. Pop. 1048.

Broken Wind, a disease of the horse, the nature of which is not well understood, though it is characterized by difficulty in the act of expiration, the horse making a spasmodic effort to expel the air from the lungs. The symptoms are best observed when the horse is exercised, the breathing becoming labored, the nostrils dilated, the eyes bloodshot, showing imperfect purification of blood in the lungs. A broken-winded horse has a bad hollow cough. When the animal is oppressed by work, the pulse is excessively rapid and the heart beats energetically. From this circumstance it is regarded by some as a disease of the heart. Low-bred horses are especially liable to broken wind if fed on innutritious and bulky food, and at the same time kept at hard work. The treatment is unsatisfactory, and we can only hope for palliation by keeping the alimentary canal in order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the best hay in spare quantities—ten to twelve pounds daily. The hay should be cut and wet. Fresh grass in its season is the proper food. Dusty hay and dry meal as food should especially be avoided.

Broker [Norman Fr. *broggour*], in general, a species of agent employed to act as a middleman or negotiator between distinct parties, such as buyer or seller, though this statement would not include a pawnbroker. He differs from a factor, since he does not have possession of the property with which he deals. He is in a certain sense the agent for both parties, though primarily of the party by whom he is employed. Accordingly, until he closes the negotiation he is the agent of the party who employs him. If he were employed to buy, he could not sell his own goods, but must buy of a third person, even though his engagement be gratuitous. Regularly, a broker discloses his agency on the face of the transaction; should he fail to do so, he would, by the general principles of the law of agency, make himself personally liable. When he has closed the negotiation, he usually gives to either party a memorandum of the transaction, and in the case of the sale of goods gives a "bought-and-sold note." For the purpose of complying with the rule of law requiring in certain sales a written memorandum, he is the agent of both parties. A broker is to be distinguished from an auctioneer; a broker may both sell and buy—an auctioneer only sells. A broker buys and sells at private sale—an auctioneer only sells at public sale. His compensation is usually derived from commissions upon the transaction, termed "brokerage." The commission is earned when the negotiation is completed. The real inquiry in such a case is, Did the broker's services result in bringing the buyer and seller together? If that be the case, he will be entitled to his commissions, though the contract, from subsequent causes, was not in fact carried out. On the other hand, if the negotiation failed at the time, and the parties were subsequently brought together by other means, his commissions would not be payable.

In the large cities brokers form a distinct class of persons, devoting themselves to special departments of agency, such as insurance-brokers, stock-brokers, real-estate brokers, produce-brokers, and the like. A person, however, may act as a broker in a single transaction without following the business, and be governed in the main by the rules already stated. (See AGENT for the more general principles governing this subject.)

T. W. DWIGHT.

Bro'mal, $C_2HBr_3O = C_2Br_3O.H$, a compound analogous to chloral, produced by the action of bromine on alcohol.

Brom'berg [Polish *Bydgoszcz*], a town of Prussia, in the province of Posen, on the river Brahe, about 6 miles from its junction with the Vistula, and 65 miles N. E. of Posen. It is on the railway from Berlin to Dantzic, and on the Bromberg Canal, which connects the Vistula with the Oder. It has a normal school and a gymnasium; also manufactures of linen and woollen fabrics, tobacco, Prussian blue, etc. Here are several distilleries, potteries, and breweries. Pop. in 1871, 27,734.

Brome, a county in the S. part of Quebec (Canada), is bounded on the E. by Memphremagog Lake. The soil is fertile. Copper ore is found. Capital, Knowlton. Area, 470 square miles. Pop. in 1871, 13,757.

Brome Grass (*Bromus*), a genus of plants of the order Graminaceæ, with flowers in panicles, spikelets many-flowered, glumes unequal, membranaceous, the outer palet bifid at the extremity and awned beneath. It comprises numerous species, natives of both continents. The *Bromus mollis* grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers. The tall brome grass (*Bromus giganteus*), a native of Europe, grows nearly five feet high, and affords a large bulk of foliage, not much relished by cattle. The *Bromus secalinus*, commonly called chess or cheat, is a troublesome weed which infests grain-fields both in Europe and the U. S. In the latter it is a naturalized or *adventive* exotic. It resembles rye (*secale*) when it is young, hence the specific name *secalinus*. The seeds retain their power of germinating for years. This weed is so common in wheat-fields that many farmers believe that wheat will turn into chess.

Brome'lia, a genus of plants of the order Bromeliaceæ, named after the Swedish botanist Bromel, are natives of tropical America, though many have naturalized themselves in Asia and Africa. The fruit is succulent, and the leaves have spiny serratures on the margins. The genus comprises a number of species, the fibres of which are used for cordage, ropes, nets, etc. Among them are *Bromelia pigua*, which abounds in the Philippine Islands, and is cultivated for its fibre by the Chinese; and the *Bromelia pinguin* of the West Indies, from the fruit of which a vinous liquor is prepared.

Bromelia'ceæ, a natural order of endogenous plants, natives of tropical climates. (See BROMELIA.) They have six stamens and a single style, with a 3-celled ovary. The leaves are hard, rigid, channeled, and often spiny. Some of the species have beautiful flowers. The order comprises more than 150 species, among which are the pineapple (*Ananas sativus*) and the *Tillandsia usneoides*, which is called Spanish moss or old man's beard. It grows in the Southern U. S. on forest trees, from the branches of which it hangs down in long gray threads. The fibre of this is used to stuff mattresses. Many of the species are epiphytic, growing on trees, and are capable of vegetating for a long time without contact with the earth, and will flower if suspended in the air after being severed from their roots. The leaves of some are so formed as to retain near their base a quantity of water, and thus supply travellers with refreshment. Many plants of this order afford valuable fibres, which are used in the fabrication of cordage, cloth, etc. The fibre of the leaves of *Ananas sativus* has been made into a fabric resembling white muslin.

Bro'mide, a chemical term applied to a salt formed by the combination of bromine with a metal. Several bromides, especially bromide of potassium, are used in medicine; others are used in photography.

Bro'mine, or **Bro'mium** [from Gr. βρῶμος, a "strong and fetid odor"], symbol Br, a chemical element discovered in 1826 by Balard. It resembles chlorine in chemical habitudes, and exists in minute quantity in sea-water and the ashes of marine plants. It is also found in many mineral springs, especially those of Kissingen, Kreuznach, and Arnstadt (13.6 grains per imperial gallon), in Germany, Tenbury in Worcestershire (12½ grains), Saratoga and Ballston, N. Y., and in many brines, especially those of Pennsylvania and West Virginia, and in the waters of the Dead Sea (121 grains). Bromine also occurs as a bromide of silver in the mines of Chili and other countries. It is usually extracted from the mother-liquors or bitterns of brines, or from the purification of rock salt and chloride of potassium by the agency of chlorine or of binoxide of manganese and sulphuric acid. Formerly, most of the bromine was obtained at Schœnebeck, Prussia; since the discovery of the Stassfurth deposits larger quantities (21,000 pounds per annum) have been made there. In the U. S. much bromine is made at Tarentum, Sligo, and Natrona, Pa., at Pomeroy, O., and Kanawha, West Va. The total product of these localities is estimated at 125,000 pounds for 1870. To obviate the danger attending the transportation of bromine, much of the bromine of Stassfurth is shipped as bromide of ethyl, from which it is easily set free.

Bromine is a dark reddish-brown liquid, having a powerful suffocating odor and emitting heavy red fumes. Its specific gravity is 2.976; it boils at 145.4° F., and freezes at 19.4°. It is very poisonous; is soluble in alcohol and ether, slightly so in water. Its equivalent is 80. It combines readily with metals; forms hydrobromic acid (HBr) with hydrogen, and with oxygen bromic acid ($HBrO_3$) and hypobromous acid (HBrO), all of which are analogous in their properties to the corresponding compounds of chlorine. Bromine possesses bleaching and disinfecting properties. It is used to a limited extent as a disinfectant, but its most important application is for the manufacture of bromide of potassium (KBr), which is used in medicine and in photography. Bromide of ammonium, cadmium, etc. are also prepared for the latter purpose. The high price of bromine is the chief obstacle to its more extensive use.

C. F. CHANDLER.

Bro'moform, the ter-bromide of formyl ($CHBr_3$), a compound analogous to chloroform and iodoform. It is a heavy, volatile liquid.

Bromp'ton Falls, a post-village of Brompton township, Richmond co., Quebec (Canada), on the Grand Trunk Railway, 94 miles E. of Montreal, has extensive manufactures of lumber. Pop. about 500.

Broms'grove, a market-town of England, in Worcestershire, 16 miles by rail S. W. of Birmingham, is in a richly-wooded valley on the Birmingham and Bristol Railway. It has a fine old church, and a grammar-school founded by Edward VI.; also manufactures of buttons and nails. Pop. 5262.

Bron'chi [plural of the Lat. *bronchus*; Gr. βρόγχος, the "windpipe"], sometimes called **Bron'chia** [Gr. τὰ βρόγχια], are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra the latter divides into two branches or bronchi of similar structure to itself. (See TRACHEA.) Of these bronchi, one goes to each lung, the right being little more than an inch, the left, about two inches, in length. A foreign body entering the windpipe is more likely to fall into the right than into the left bronchus. On entering the lung, the bronchi divide into smaller branches, which again subdivide, until they terminate in small cells, which seem to cluster round their extremities and open into them. These are the air-vesicles. (See LUNGS.)

Bronchi'tis [from *bronchus*, and *-itis*, a suffix denoting inflammation], a diseased condition characterized by inflammation or hyperæmia (congestion) of the mucous membrane lining the air-passages, and usually accompanied by a more or less excessive secretion of mucus from that membrane. Young children, old people, and those who are feeble or ill-nourished are especially liable to it. More or less bronchitis is usually associated with pulmonary consumption, with obstructive heart disease, and with asthma. It is often seen in patients with intermittent fever, typhoid, measles, and smallpox. Perhaps the most fruitful cause is exposure to sudden and extreme changes of the weather, leading primarily to that form of acute bronchitis which is known as a "cold on the lungs." Influenza is an epidemic bronchitis caused by some unknown influence probably existing in the air.

The symptoms of bronchitis are of various character, varying according as the disease is seated in the larger or the smaller bronchi; the disease is also much more formidable in young children and in aged persons than in others. There is especial danger in the case of infants that collapse of small portions of the lung may ensue. Bronchitis may be either chronic or acute. Uncomplicated chronic bronchitis may require the use of sedatives or tonics, with systematic exercise and careful attention to the other hygienic conditions, but the treatment of individual cases will vary with the circumstances and special condition of the patient. The inhalation of medicated vapors and atomized liquids is especially recommended in some cases. Acute bronchitis is in general to be treated by expectorants or emetics, to remove the secretion, and by diaphoretics and counter-irritants, such as mustard, on the extremities and the chest, to relieve the congested blood-vessels of the bronchi. When the case is extreme and suffocation threatened, an infant may be often relieved by a warm bath. There are other special remedial measures which may be resorted to under the advice of the physician.

The diagnosis of bronchitis may be somewhat obscure, but to the practitioner the stethoscope reveals the extent and character of the disease by signs which to the untrained observer might appear insignificant. It may be observed that, except in children and old persons, the great proportion of cases of acute bronchitis recover spontaneously.

REVISED BY WILLARD PARKER.

Bronchocele. See GOITRE.

Brongniart (ALEXANDRE), an eminent French savant, born in Paris Feb. 5, 1770. He became in 1800 director of the porcelain manufactory at Sèvres. In 1815 he was admitted into the Institute. He wrote, besides other works, an "Elementary Treatise on Mineralogy" (1807) and a "Treatise on the Art of Pottery" (1845). He classified reptiles, to the divisions of which he gave the names of Saurians, Batrachians, Chelonians, and Ophidians. Died Oct. 14, 1847.

Bron'son, a township of Branch co., Mich. Pop. 2100.

Bronson, a post-township of Huron co., O. Pop. 980.

Bron'te, a town of Italy, in Sicily, in the province of Catania, near the W. base of Mount Etna, 28 miles N. N. W. of Catania. It has manufactures of paper and woollen goods. Pop. 11,760.

Bronte, a port and post-village of Trafalgar township, Halton co., Ontario (Canada), on Lake Ontario, at the mouth of Twelve Mile Creek and on the Great Western Railway, 26 miles S. W. of Toronto. It has a good harbor for vessels of 300 tons, and has one weekly paper. Pop. about 550.

Bron'té (CHARLOTTE), "Currer Bell," an English novelist, born at Thornton, in Yorkshire, April 21, 1816. Her eccentric father, Patrick Brontë, originally *Prunty*, became curate of Haworth (Yorkshire) in 1820. She lost her mother in 1821, and was sent to a boarding-school, where her health was impaired by impure air and unwholesome food, and then taught until in 1842 she and her sister Emily went to Brussels to learn French. In 1846, Charlotte and her sisters Emily and Anne published a volume entitled "Poems by Currer, Ellis, and Acton Bell." Her first successful work was "Jane Eyre, an Autobiography, edited by Currer Bell" (1847), which was very popular. Her other chief works are "Shirley" (1849) and "Villette" (1852). She was married in 1854 to the Rev. A. B. Nichols, her father's curate, and died Mar. 31, 1855. (See E. C. GASKELL, "Life of Charlotte Brontë," 2 vols., 1857.)

Bronx'dale, a village of Westchester and West Farms townships, Westchester co., N. Y., has manufactures of importance.

Bronx'ville, a post-village of East Chester township, Westchester co., N. Y., on the Harlem R. R., 16 miles from the Grand Central dépôt in New York. It has a large cutlery establishment, good hotels, etc.

Bronze, an alloy of copper and tin in variable proportions, is harder and more fusible than copper, but less malleable. Bell-metal is a variety of bronze, and the cannon commonly called brass are made of this alloy. Bronze was used by the ancients for weapons and utensils before the art of working iron had been invented. The metal which the Romans called *æs* was probably bronze. The brass mentioned in the Bible is supposed to have been either pure copper or an alloy of copper and tin. Bronze is extensively used in the form of statues, machinery, and ordnance. Its hardness and durability render it well adapted for the speculums of telescopes. Bronze when well prepared is the most durable of metallic materials, except gold, platinum, and some rare metals. The French and English have recently issued bronze coins for currency. Tempering produces on bronze an effect directly opposite to that on steel; and in order to render bronze malleable it must be heated to redness and quenched in water. A mixture of 90 parts of copper with 10 of aluminium produces a valuable alloy which is used as a substitute for bronze. The varieties of bronze are composed of the following proportions: Bronze cannon, copper 9, tin 1; Chinese gongs, copper 5, tin 1; musical bells, copper 6, tin 1; house bells, copper 4, tin 1; large bells, copper 3, tin 1; bronze for toothed wheels, copper 10, tin 1; telescope or speculum metal, copper 2, tin 1; bronze for mathematical instruments, copper 12, tin 1.

Bronze, Age of. It is held by some archæologists that when primeval man first began to become civilized, the first weapons of war and utensils for industry were made of stone; that in the next stage of progress (in most nations before the beginning of history) there succeeded a time when copper and its alloys were used in the place of stone for many purposes, as is known to have been true among the Peruvians, and also among some of the ancient races of North America; and that in the third stage men learned how to smelt and work iron. Hence these three hypothetical stages are respectively termed the Age of Stone, the Age of Bronze, and the Age of Iron. These terms are convenient, though it is certain that the so-called ages interpenetrated and overlapped each other. In Denmark and Scandinavia especially there have been interesting and extensive collections made of the relics of the "Age of Bronze," and it appears certain that a large part of these curious weapons and tools (which are in many cases finely wrought) were made in pre-historic times; nevertheless there are many able men who deny that the facts, so far as known, sustain the above-mentioned theory of the origin of civilization.

Bronze Wing, or **Bronze Pigeon,** the name of several species of pigeons, natives of Australia, mostly belonging to the genus *Peristera* of Swainson. They have wings marked with lustrous bronze-colored plumage. The common bronze-wing (*Peristera chalcoptera*) is distributed over all the Australian colonies. It weighs about one pound, and is esteemed as food.

Bron'zing is the covering of articles made of clay, metal, wood, or other material with a substance which gives them the appearance of being made of bronze. Sometimes bronze or some other alloy of copper is actually spread upon the articles to be bronzed; which may be done by the electrotype process, or by applying the powdered alloy by means of *gold size*, which is a mixture of linseed oil and gum animé. There are also certain chemical re-

agents which when applied to various metals will give them a bronzed appearance.

Bronzite, a name which has been given to varieties of Enstatite and Pyroxene (which see).

Brook'dale, a post-village, capital of Rice co., Kan.

Brooke, a county of West Virginia, bordering on Pennsylvania. Area, 75 square miles. It is part of the "Pan Handle," and is bounded on the W. by the Ohio River. The surface is hilly; the soil is fertile. Wool, grain, and dairy products are extensively raised, and the manufacturing interests are important. Coal and iron ore are found in it. Capital, Wellsburg. Pop. 5464.

Brooke (Francis J.) was born at Smithfield, Va., Aug. 27, 1763, served as an officer in the Revolutionary war, became a lawyer in 1788, held various offices, was elected to the Virginia senate in 1800, and became its Speaker, and was for many years a judge of the court of appeals, of which he was for some time president. Died Mar. 3, 1851.—His son, Francis J. Brooke, an officer of the U. S. army, was killed at the battle of Okeechobee, Fla., Dec. 25, 1827.

Brooke (Gustavus Vaughan), born in Dublin, Ireland, about 1818, was educated for the law, but went upon the stage in 1833, and attained eminence as a tragedian, playing with success in the principal cities of Great Britain and the U. S. He was lost on the steamer London while on a voyage to Australia, Jan. 11, 1866.

Brooke (Henry), a dramatist and novelist, born in the county of Cavan, Ireland, in 1706, was a friend of Pope. He wrote, besides other works, "Universal Beauty," a poem, a novel called "The Fool of Quality" (1767), and tragedies entitled the "Earl of Essex" and "Gustavus Vasa." Died Oct. 10, 1783.

Brooke (Sir James), rajah of Sarâwak, was born of English parents in Bengal April 29, 1803. He served in the British army in India, and having formed a project to suppress piracy in the Malay Archipelago, went to Borneo in 1838. He rendered some service to the sultan of Borneo, who in 1841 appointed him governor of Sarâwak. He framed a code of laws for the natives of Sarâwak, and displayed great energy in the extirpation of pirates. He and his coadjutors received £20,000 as "head-money" for the pirates whom they killed. In 1847 he was created a knight by Queen Victoria. Died in England June 11, 1868.

Brook'field, a post-township of Fairfield co., Conn. Pop. 1193.

Brookfield, a township of La Salle co., Ill. Pop. 1230.

Brookfield, a post-township of Clinton co., Ia. Pop. 1040.

Brookfield, a township of Worth co., Ia. Pop. 274.

Brookfield, a post-township of Worcester co., Mass. It is on the Boston and Albany R. R., 67 miles W. by S. of Boston. It has extensive manufactures of boots and shoes, cottons, leather, brick, iron-wares, etc. Pop. 2527.

Brookfield, a post-township of Eaton co., Mich. Pop. 1057.

Brookfield, a township of Huron co., Mich. Pop. 116.

Brookfield, a post-village of Linn co., Mo., on the Hannibal and St. Joseph R. R., is the central station and division head-quarters of the road. Several of its offices, its round-house, and extensive shops are located here. It has a weekly paper, fine schools and churches. There is a coal-mine near the town. Pop. of village, 402; of Brookfield township, 2321. W. D. Crandall, Ed. "Gazette."

Brookfield, a post-township of Carroll co., N. H. Pop. 416.

Brookfield, a post-township of Madison co., N. Y., about 18 miles S. of Utica. It contains the villages of North and South Brookfield, Leonardsville, Clarksville, etc., and has an academy and several manufactories. Pop. 3565.

Brookfield, a township of Noble co., O. Pop. 978.

Brookfield, a post-village and township of Trumbull co., O., near the Erie and Pittsburg R. R., and 180 miles N. E. of Columbus. Pop. 2657.

Brookfield, a post-township of Tioga co., Pa. Pop. 895.

Brookfield, a post-township of Orange co., Vt., 16 miles S. of Montpelier. It has five churches and manufactures of axes, forks, hoes, rakes, etc., and two cheese-factories. Pop. 1269.

Brookfield, a post-township of Waukesha co., Wis. Pop., containing the village of Brookfield Centre, 2281.

Brookhaven, a city, capital of Lincoln co., Miss., on the New Orleans Jackson and Great Northern R. R., 54 miles S. by W. of Jackson. It is an important point in the lumber trade and manufacture. It has a weekly paper, a foundry and machine-shops, and a flourishing female college. Pop. 1614. J. S. Magee, Ed. of "Citizen."

Brook'haven, a township of Suffolk co., N. Y. This township extends across Long Island, and has thirty-three churches, a large number of small villages, and considerable manufactures. Pop. 10,159.

Brook'ings, a county of Dakota, bordering on Minnesota. It is drained by the Big Sioux River, which rises within its limits, and it contains several small lakes. Area, 750 square miles. Pop. 163.

Brook'ite, a mineral named in honor of Brooke the crystallographer, is pure native titanic anhydride. It occurs in reddish, yellowish, or hair-brown crystals, which are more or less translucent and have a brilliant lustre, inclining to metallic. It is found in Perthshire, Scotland, at Tavistock, in Savoy, and other places. A variety found in the Ozark Mountains, Ark., is called *arkansite*.

Brook'land, a township of Henrico co., Va. P. 3612.

Brook'lime (*Veronica Beccabunga*), a perennial plant, a native of Europe, grows in ditches and wet places. It has a procumbent stem and elliptical serrate leaves, which are succulent, and are used in England as an ingredient in spring salads. They are sometimes sold with water-cresses. In the U. S. is found a similar plant, the *Veronica Americana*, or American brooklime.

Brook'lin, a post-village of Whitby township, county and province of Ontario (Canada), 7 miles from Whitby. It has large manufactures of furniture. Pop. about 650.

Brook'line, a post-village and township of Norfolk co., Mass., on the Charles River, which separates it from Boston and Cambridge, and on the Boston and Albany and Boston Hartford and Erie R. Rs. It is a place of residence for people doing business in Boston, and has many fine villas and country-seats. A small part of this township has been annexed to Boston since the census of 1870. Brookline has a public library building costing $50,000, and a granite town-house costing $150,000. It is connected with Boston by a horse railroad, and has one weekly newspaper. Pop. 5650. B. Kingman, Ed. "Transcript."

Brookline, a post-township of Hillsborough co., N. H. Pop. 741.

Brookline, a township of Windham co., Vt. P. 203.

Brook'lyn, a post-township of Conecuh co., Ala. Pop. 937.

Brooklyn, a post-village in Brooklyn township, Alameda co., Cal., is on the E. side of the Bay of San Francisco and 10 miles E. of the city of San Francisco. It is on the Central Pacific R. R. It has a good harbor, a cotton-factory, a pottery, and a large shoe-factory. Pop. 1603; of the township, 2816.

Brook'lyn, a post-village, capital of Windham co., Conn., is about 40 miles E. of Hartford and 2 miles W. of the Quinebaug River, which is the E. boundary of Brooklyn township. It has a national bank. Pop. of the township, 2354.

Brooklyn, a township of Lee co., Ill. Pop. 1235.

Brooklyn, a post-township and small village of Schuyler co., Ill., about 40 miles N. E. of Quincy. Pop. 1071.

Brooklyn, the commercial centre of Poweshiek co., Ia., close to the centre of the county, is the end of the railroad division of the Chicago Rock Island and Pacific R. R., 104 miles W. of Davenport. It has a large brick round-house, 7 church buildings, 2 graded schools, 4 grain-elevators, 1 foundry, 1 flour-mill, 4 hotels, and 2 weekly papers. Pop. 971. Henry Martin, Pub. "Journal."

Brooklyn, a post-township of Hancock co., Me. Pop. 966.

Brooklyn, a post-village of Jackson co., Mich., on the Raisin River and on the Detroit and Hillsdale R. R., 15 miles S. E. of Jackson. Pop. 544; of township, 1691.

Brooklyn, a township of Hennepin co., Minn. Pop. 1024.

Brooklyn, a city, seaport, and capital of Kings co., N. Y., situated at the W. end of Long Island, on New York Bay and the East River, an arm of the sea or estuary which divides it from New York City and connects Long Island Sound with the Atlantic Ocean. Brooklyn is the third city of the Union in population, and is distant from Albany 147 miles, and from Washington 226 miles. Its latitude (at the navy-yard) is 40° 51′ 30″ N., longitude 73° 59′ 30″ W. from Greenwich. Its area as at present constituted is about 16,000 acres or 25 square miles, but it is expected that in 1874 the other towns of the county will be annexed, and its area will then include the whole of Kings county, which is 72 square miles.

Population.—In 1698, Breuckelen had 509 inhabitants;

in 1800, 3298; in 1810, 4402; in 1820, 7545; in 1825, 8800; in 1830, 15,292; in 1835, 24,310; in 1840, 36,233; in 1845, 59,574; in 1850, 96,850; in 1855, 205,250; in 1860, 266,661; in 1865, 296,112; in 1870, 396,350. In 1873 its population is estimated, on the basis of school censuses and directory returns, at 520,000.

Commerce.—Brooklyn is a commercial port of great and constantly increasing importance. The city of New York, naturally desirous of concentrating on its own shores and at its own docks, slips, and piers its vast commerce so long as it could find room for it, discouraged all efforts for the erection of wharves, piers, docks, or warehouses on the Brooklyn side for many years. There had been a government navy-yard in the city limits since 1801, and it had ranked as first class since 1824, but the commerce of the city had no existence beyond a moderate coasting-trade prior to about 1844. In that year the Atlantic Docks Company, incorporated in 1840, completed their first warehouse. This company, after passing through many discouragements, has now 3 miles of wharf accommodation, 40 acres of water-area, warehouses covering 20 acres, 9 steam-elevators, and every facility for shipping and storing cargoes. There have been in this dock at one time 130 sea-going vessels. The Erie Basin, S. of this, has a water-area of 60 acres, and the Brooklyn Basin, still farther S., a surface of 40 acres. Both are surrounded with warehouses, and are thoroughly equipped for accommodating shipping of the largest class. Since 1844 there has been invested in docks and warehouses a private capital of more than $125,000,000 on the shore-line of Brooklyn, which extends 8½ miles, and has 25 miles of dockage, with vast warehouses, piers, slips, docks, and basins along the whole distance. The following statistics, gathered by careful examination in 1872, will give some idea of the extent of this commerce:

In the warehouses of the Atlantic Dock Company, and others S. therefrom to Red Hook Point, there is stored—grain, $20,000,000; sugar and molasses, $15,000,000; provisions, $2,200,000; flour, $1,000,000; lumber and stone, $1,200,000; cotton, $1,500,000; guano, $1,500,000; rags, $500,000; saltpetre and brimstone, $100,000; salt, $500,000; iron, $2,000,000; miscellaneous, including resin, turpentine, etc., $4,000,000; total, $50,000,000; in the section N. from Atlantic Docks to South Ferry, $60,000,000. That which diverges to the Gowanus Canal, comprising coal, building, and other material, valued at $4,000,000; from South to Fulton Ferry, $126,000,000; from Fulton Ferry to Main street, $25,000,000; making an aggregate to this point of $261,000,000 annually stored. These figures seem enormous, but are borne out by facts. The warehouses from Red Hook to Main street are full of merchandise, and literally overflowing. A number of other large warehouses are now (Sept., 1873) in process of erection. From Main street, N. E. to the bridge over Newtown Creek, a distance of 4 miles, there is an extensive commerce. Many shipyards, gas-works, lumber-yards, coal-yards, sugar-refineries, and most of the vast petroleum-refineries and shipping-houses, are on this part of the coast-line. The annual commerce from this section, aside from the navy-yard, is somewhat more than $40,000,000. All through the year, with more or less activity, the business of loading and unloading vessels is going on. It is estimated that 2500 vessels are unloaded every year between Red Hook and Main street. In the business of warehousing alone some 5000 men are engaged along the shore-line.

Brooklyn is already the largest grain dépôt in the world. Immense steam-elevators are employed to lift and deliver the grain. The stores of E. C. Lockwood & Co. have storage for 3,000,000 bushels at a time, employ 1000 hands, and pay to the city a tax of $50,000. The flour-mills of F. E. Smith & Co. deliver 1200 barrels per day. During the receiving season, from October to December, canal-boats arrive by the hundred to be discharged. On the closing of navigation as many as 600 canal-boats loaded with grain lie up for the winter in the basins, in many cases with the captains and their families on board until the cargoes can be sold. The value of the boats engaged in the grain-carrying trade is estimated at $18,000,000. The bulk of grain afloat seeking port frequently amounts to 5,000,000 bushels at one time.

Continuing the shore-line from Main street to the navy-yard, and beyond to the north-eastern boundary, including the large interior dockage made by the Wallabout improvements, on Newtown Creek and at Gowanus Creek and Canal, it is apparent that the capacities of the city for extensive commerce can hardly be over-estimated. These are likely to be greatly aided by the removal of the obstacles at Hell Gate, at the confluence of the East River with the Sound. Five lines of steamships now ply between Brooklyn and their respective ports: The State line, to and from Glasgow; the North American line, to and from London, New-Castle, Christiania, and Bergen; the South American line, with U. S. mail, to and from Rio and other ports; the White Cross line, to and from Antwerp; the Netherlands and Rotterdam line, to and from Rotterdam. The "Brooklyn Eagle" now gives daily reports of arrivals and departures to and from this port.

Manufactures.—Brooklyn is a great manufacturing city. A very large proportion of the goods and wares professedly manufactured in New York City are really produced in Brooklyn, and sent from thence to the New York warehouses. In some classes of goods and wares, such as pianos, cabinet organs, hats, caps, men's and children's clothing, oil-cloths, iron castings and ware, carpets, lace, etc., from one-fourth to one-half of all that is credited to New York City is actually produced in Brooklyn. Considerable quantities of all these wares are also produced and sold direct by Brooklyn dealers and manufacturers. According to the census of 1870, Kings county had 1043 manufacturing establishments, employing 286 steam-engines. The internal revenue office reported for the year ending July 1, 1873, 1440 stationary steam-engines; the same census reported 18,545 persons employed in manufactories; capital employed, $25,287,981; wages paid, $9,273,994; raw material used, $39,899,971; and annual product, $60,848,673. That these statistics very imperfectly represent the manufacturing industry of Brooklyn will appear from an analysis of a few items of this aggregate. The census reports the production of stoves, heaters, etc., at $120,000; at the industrial exposition of Kings county in Sept., 1873, one manufacturer in Brooklyn reports a production of these wares of over $2,000,000 the previous year; tobacco, snuff, and cigar manufacturers reported in the census as producing $4,414,000, paid in the year ending July 1, 1873, a tax of $2,042,016.17, and their entire production was over $8,000,000. The census reported seven establishments for refining sugar and molasses, producing an annual amount of $16,706,851, while at the industrial exposition of Sept., 1873, one of these sugar-refiners reported a production from July, 1872, to July, 1873, of $12,300,000, and another of over $5,000,000; and the production of the whole seven was somewhat more than $24,000,000. Ropes, cordage, and twine, reported by the census as producing $688,641, reported to the internal revenue office for the year ending July, 1873, a production of over $3,000,000; carpets, not specified in the census report, were produced in 1873 to the value of over $1,000,000; hats and caps, put down in the census at $1,074,948, were produced in 1872–73 to the value of $4,100,000; lace, guipure, thread, Nottingham, etc., not mentioned in the census, are produced to the extent of about $1,200,000; artificial stone, not mentioned in the census, is produced to the extent of over $3,000,000; distilled and malt liquors, reported by the census at $2,220,929, paid revenue-tax in 1872–73 on a production of $7,500,000; camphene, not specified in the census, is produced to the extent of over $2,000,000; steel is produced to the extent of $1,500,000; flouring-mill products, in which there are now six large houses engaged, produce annually over $7,000,000, instead of $2,692,000, as reported by the census. The rectification and packing of coal oil, petroleum, and petroleum products in Brooklyn make use of a capital of over $4,000,000, and produce annually of these various articles to the value of over $8,000,000; gas is produced to the extent of about $3,500,000; oil-cloths, about $1,500,000; paper-hangings, $1,300,000; the book, job, and newspaper printing establishments turn out work annually to the value of over $2,300,000; woollen goods are manufactured to the extent of $1,800,000; linseed oil is produced of the value of nearly $2,000,000; drugs and chemicals, including the production of sulphuric acid (of which there are several factories), produce goods to the value of more than $5,000,000. Other large manufactures are of men's, women's, and children's clothing, machinery, shipbuilding, lumber, sawed and planed, sash, doors, and blinds, hardware, marble and stone work, gas and lamp fixtures, tin, copper, and sheet-iron ware, and soap and candles. As the result of careful and thorough examination, continued for several months, the annual production of the Brooklyn manufacturing establishments, aside from those owned in and run from New York City, is stated as between $125,000,000 and $130,000,000.

Finances.—

Tax levy in 1872 for 1873:	
For State purposes	$1,086,530.78
" county "	1,336,177.94
" city "	5,550,981.18
	$8,023,739.90
Assessed value of real estate and personal property	$216,073,170

The census gives, as the true valuation of Kings county in 1870, $700,000,000. The valuation of the other towns of the county in 1873 was $11,626,043. The assessed valuation of 1872 was $207,952,332. The budget of expenditure for the city government in 1873 was—

Principal of city debt		$2,002,540.72
" of certificates		34,000.00
Interest on city bonds		1,021,290.00
" on certificates		11,377.57
One-fifth of one-third of assessments		110,553.91
General purposes		891,500.00
Salaries city officers		295,000.00
Wells and pumps		8,700.00
Health department		50,000.00
Department city works		325,000.00
Fire department		661,650.00
Police department		661,650.00
Board of education		929,666.46
Park commissioners		45,000.00
		$4,900,878.68
Less revenue fund	$471,981.27	
Less surplus and tax arrears	341,134.56	813,115.83
		$4,087,762.85

The debt of the city, funded and unfunded, is about $32,000,000.

Courts.—The principal court of Brooklyn is "the city court," with three judges at salaries of $10,000 each per annum, with civil jurisdiction equal to that of the supreme court, and also criminal jurisdiction. It holds both general and special terms. Number of arraignments and convictions from Jan. 1, 1872, to Jan. 1, 1873, 289; years sentenced, 353; from Jan. 23d to May 23d, 1873, 148 arraignments. In 1872 judgments entered, 1561; motions, 2183; naturalizations, 693. The city has also six district justices' courts and one police court. Terms are also held, in the city, of U. S. circuit and district courts, the supreme court, and county court. The city jail is on Raymond street; the penitentiary, at the corner of Nostrand and Flatbush avenues; the almshouse, hospital, and lunatic asylum are at Flatbush; the city hospital, on Raymond street; the Long Island College Hospital, on Henry street, near Atlantic.

Education.—The public school system of Brooklyn is managed by a board of education of forty-five members. It has under its charge 52 distinct organizations, 46 schoolhouses, 4 colored schools, and 11 evening schools. Number of children in 1870 within the legal school age, resident in the city, between the ages of five and fourteen, 86,842; between the ages of fourteen and twenty-one, 38,355; total, 136,769. This number is now (1873) 175,000. Total school registration to Jan. 1, 1873, 104,628. Daily attendance, including evening schools, 50,500; number of sittings, 48,622; number of teachers, exclusive of evening schools, 915; evening schools, 109; teachers' wages, $563,940.67; value of school property, $1,986,114; average cost of tuition, $10.18; total expenses for all purposes, $812,969.20. This year (1873) upwards of $900,000 will be required. The Catholic schools have a separate organization, attended by religious as well as secular instruction, which comprises 2 colleges, 3 academies, 1 select school, 1 asylum school, 2 industrial schools, 20 parish schools, 2 night schools—30 in all, with a registry of 16,144 scholars. The grades of study are primary, intermediate, and collegiate. Of private schools there are 200. Of schools for female education none stand higher than the Packer Collegiate Institute, organized in 1845, and largely endowed by Mrs. Harriet S. Packer and others. This institute has 38 teachers, 5 males and 33 females; 793 pupils, of whom 153 are in the preparatory department; 53 free scholarships; and had graduated 628 alumnæ in 1872. Its preparatory course occupies five years, and the collegiate course four years. The building and grounds are admirably adapted to their purpose, and have a fine chapel for public worship. The library contains 4000 volumes. The Brooklyn Heights Female Seminary, the Athenæum Seminary, and many others have a high reputation for the instruction of young ladies, and the Adelphi Academy, a more recent institution, on "the Hill," receives pupils of both sexes, and has already attained a high reputation. Its pupils numbered in 1872–73 a little more than 600. For boys and young men, the Brooklyn Collegiate and Polytechnic Institute has a deservedly high character. In 1872 it had 27 teachers, of whom 25 were males and 2 females; 562 pupils, of whom 400 were in the preparatory department, and 162 in the collegiate. Each course (preparatory and collegiate) is for four years. The institute has fine buildings, and a library of 3000 volumes. The Juvenile High School is in some sense a tender for the Polytechnic, being intended for boys under twelve. Mr. Lockwood's academy in Adelphi street and many other of the private schools are of high character. There are two business and commercial colleges in the city—Clarke, Bryant, and Stratton's and Brown's. The Polytechnic has also a commercial and business department. A college or university has been chartered by the Catholics, and buildings are now erecting for it, but it has not yet been organized. There is a medical college, the Long Island College Hospital, founded in 1859, which has 8 professors and 5 other instructors.

Libraries.—The principal libraries of the city are the Mercantile Library, with 45,959 volumes, and rapidly growing; the Long Island Historical Society's Library, with 24,000 volumes; the library of the Brooklyn E. D. Library Association, with 20,000 volumes; the Youths' Free Library at the Brooklyn Institute, 14,000 volumes; the Young Men's Christian Association Library, 6000 volumes; the Law Library, 8000 volumes; Consolidated Public School Library of the Eastern District, 8000 volumes; and the thirty public school libraries of the Western District, numbering together over 37,000 volumes.

Newspapers.—Brooklyn has four daily papers, nine weeklies, and several monthlies, mostly advertising journals. There are, however, two monthly magazines, not of very large circulation. The morning papers of New York City circulate almost as largely in Brooklyn as in New York, but the Brooklyn evening papers have a very large circulation.

Churches.—The first denomination which planted a church in Brooklyn (or, as it was then called, Breuckelen) was the Reformed (late Dutch) Church. Their first church in Kings county was built at Flatbush, then called Midwout, in 1654, but though their dominie, Rev. Theodorus Polhemus, ministered to the few settlers scattered over the present limits of Brooklyn, there was no church edifice in the present city till 1666, when one was built in Fulton street, near the present Hoyt street. A hundred years later (in 1766) this gave place to a second on the same site; in 1807 the third church edifice was erected on Joralemon street, and this was replaced by the present tasteful edifice of that church on the same site in 1835. In 1787 the first Episcopal church was consecrated. It stood on Fulton street, on the present site of St. Ann's building. In 1795 it was reorganized and incorporated as St. Ann's church. The first Methodist Episcopal church was erected in Sands street, and dedicated June 1, 1795. The Protestant Methodists had a church here in 1833, and the Primitive Methodists in 1839. The Roman Catholics erected their first church (St. James's) on the corner of Jay and Chapel streets in 1823. The first Presbyterian church on the present site of Plymouth church was erected in 1822–23. The first Baptist church was organized in 1823, but their church edifice, on Pearl street between Nassau and Concord, was not erected till 1826. The first Unitarian church (Church of the Saviour) was organized in 1833, and purchased the Second Presbyterian church in Adams street in 1835. An effort was made to establish an Independent or Congregational church in this city in 1785, but it failed, and the first Congregationalist church (the Church of the Pilgrims) was organized in Dec., 1844, but the church on the corner of Remsen and Henry streets was not completed till May, 1846. The first Universalist society was organized in 1842, and their church on the corner of Fulton and Pineapple streets was completed in 1843. The first Lutheran church was incorporated and its edifice erected in 1847, in Graham avenue, corner Wyckoff street, E. D., and the first Evangelical Lutheran in Brooklyn on Henry street in 1856. The first Jewish synagogue was built in 1862. The Swedenborgian society was organized in 1859, but did not obtain their present place of worship till 1869. The Moravian church in Jay street is older, but their present church edifice was built in 1869. There are now in the city 250 churches—viz., Methodist Episcopal, 40; Methodist, not Episcopal, 4; Episcopal, 38; Baptist, 33; Roman Catholic, 34; Jewish synagogues, 6; Universalist, 4; Congregationalist, 18; Lutheran, 12; Presbyterian of various connections, 32; Reformed (Dutch), 15; Unitarian, 3; miscellaneous, 11. Many of these church edifices are remarkable for their architectural beauty. The new Roman Catholic cathedral, on Lafayette avenue between Vanderbilt and Clermont avenues, will, when completed, be one of the stateliest ecclesiastical structures in the U. S.; the church of St. Charles Borromeo in Sidney place, St. Peter's, corner of Hicks and Warren, and St. Vincent de Paul, on N. Sixth street, are all very fine edifices. The church of the Holy Trinity (Protestant Episcopal), St. Ann's-on-the-Heights, St. Paul's, Clinton corner Carroll street, St. Peter's, on State street, and Christ church, E. D.; the Lafayette avenue Presbyterian church, Westminster Presbyterian church, and the Ross street Presbyterian church; the Church-on-the-Heights, First Reformed (Dutch), on Joralemon street, the Bedford avenue Reformed church, E. D., and the East Reformed church, also on Bedford avenue, corner Madison street; the Church of the Pilgrims, the South Congregational church, the Central Congregational church on Hancock street, and the Church of the Puritans; the Simpson Memorial M. E. church, the Pacific street M. E. church, First place M. E. church, and Summerfield M. E. church; and the Strong place and the Washington avenue Baptist churches,—are all church edifices noteworthy for architectural taste and beauty.

Benevolent and Charitable Institutions.—The city has

eight hospitals—viz., The Brooklyn City Hospital, on Fort Greene; the Long Island College Hospital, corner of Pacific and Henry streets; the King's County Almshouse and Hospital at Flatbush; St. Mary's Female Hospital and St. Peter's Hospital, both under the care of the Roman Catholic Sisters; the U. S. Naval Hospital; the Brooklyn Eye and Ear Hospital, 190 Washington street; and the Homœopathic Maternity Hospital. There are thirteen infirmaries and dispensaries; three nurseries or crèches; seven orphan asylums, of which four are Roman Catholic, one general, one Episcopal, and one colored. The Children's Aid Society of Brooklyn sustains also a newsboys' home, a home for friendless and unprotected girls, and a nursery. There are also the House of the Good Shepherd, the Home for Poor Boys, the Helping Hand, the "Home" in Concord street, the Association for Improving the Condition of the Poor, the Truant Home, the Industrial School Home, and the Temporary Home for Friendless Women—all benevolent institutions. For the aged and infirm there are the Graham Home for Respectable Aged Indigent Females, the Church Charity Foundation, the "Home" of the Little Sisters of the Poor, and the Baptist "Home," now erecting in the eastern part of the city. The Kings County Inebriates' Home is also one of the city charities. There are also numerous local relief and benefit societies, among them 44 Masonic lodges, 26 Odd Fellows' lodges, 28 United American lodges, and a large number of Good Templars, Sons of Temperance, Father Matthew Total Abstinence Benevolent societies, Hibernian Benevolent, Sons of Erin, German Mutual Benefit, Trades Unions, etc. There is also a society for the prevention of cruelty to animals, three Young Men's Christian associations, an association for Christian work, numerous local, literary, and Christian associations.

Principal Buildings.—The Brooklyn City Hall; the Kings County court-house, costing $550,000, and the adjacent grounds about $650,000 more; the Williamsburg Savings Bank, $450,000; Kings County Savings Bank, $195,000; the Mercantile Library buildings, $219,932; Academy of Music, $200,000; Long Island Safe Deposit building, $150,000; the Academy of Design, in Montague street; the Packer Collegiate Institute, in Joralemon street; the Adelphi Academy; the Church Charity Foundation; the new Brooklyn Orphans' Asylum; the College of St. John the Baptist, Lewis and Willoughby avenues, are all fine buildings.

Public Parks and Cemeteries.—Since the consolidation of 1855 the city has increased the magnitude of its enterprises, public and private, in every direction. Of its parks the principal is Prospect Park, which consists of 522 acres, and is laid out and improved upon a plan of beauty, convenience, and magnificence which will compare with any other in the Union. It has lakes, drives, and boulevards, one of the latter, 202 feet in width, and six miles in length, is adorned with trees, and is intended to reach the ocean; and another extends to East New York. Cost of land taken $2,268,909.70, and expenditure for improvements $1,169,604.70; entire cost to Jan., 1868, $3,438,514.40. A fine parade-ground of 40 acres for the exercise of troops has been added. Washington Park, taken in 1837 (comprising 30 acres), is the remaining height and grounds of old Fort Green or Putnam of the Revolution and of the line of works of 1812. It has been surrounded by an elegant and substantial wall, neatly buttressed and coped, the height itself terraced and laid out in convenient walks and avenues, properly shaded with appropriate shrubbery. The object of these grounds, which will enlist an interest as wide as the Union, is the preservation of the tombs of the martyrs of the prison-ships of the Revolution, of whom 11,000 were buried on the shores surrounding the Brooklyn navy-yard. In the excavation for this work many were unburied and enclosed in large coffins. In 1808 these coffins were borne through the streets on catafalques, orations were made, after which they were deposited in a temporary vault on Jackson street (now Hudson avenue), adjoining the navy-yard wall. Here they rested till June 17, 1873, when they were privately taken up by the park commissioners and placed in their present permanent tomb fronting on Myrtle avenue. There are also five other small parks in the city.

Of the cemeteries, Greenwood is well known as peerless in extent, having 413 acres enclosed, as well as in the beauty of its grounds, the number of burials, and the magnificence of its monuments. The Evergreens, 207 acres, and others, make Brooklyn as eminent in this regard as in her churches.

Railroads and Rapid Transit.—No city is better provided with local railroads traversing it in every direction. Steam does not come within the limits, except in a few cases by dummy-engines. To provide rapid transit by means of tunnelling, a company has been formed, to which $502,000 have been subscribed. While two of the Long Island railroads discharge their passengers at Hunter's Point, the South Side R. R. passes through Williamsburg by a dummy, and has its dépôt in Brooklyn at the foot of S. Eighth street. From all these roads the travel reaches the City Hall and ferries by cross-town cars. There are 26 city railroad companies in the city (one of them, the Brooklyn City, having thirteen routes), and their aggregate length is about 135 miles. There are five ferry companies with twelve ferries; over these ferries nearly 80,000,000 of persons are carried annually. The New York Bridge Company is erecting a suspension bridge over the East River, to connect Brooklyn and New York City. Its estimated cost is about $10,000,000. The trial boring began in 1867, and the last of four anchor-plates was fixed in place July 29, 1873. Two lofty towers stand on either side of the river, the Brooklyn tower now being 184 feet above high water. The New York terminus is opposite the City Hall in Chatham street, the Brooklyn terminus in the square bounded by Fulton, Sands, Washington, and Prospect streets. Total length, 5989 feet. The central span will cross the river from pier-line to pier-line, without impeding navigation, in one single span of 1595 feet 6 inches from centre to centre of towers. There has been received up to Sept. 1, 1873, about $4,000,000, and expended about $3,800,000. All the stock, except $500,000 subscribed by citizens, is held by the cities of New York and Brooklyn.

Waterworks.—These are now managed by a board of commissioners of city works. The water is derived from a number of ponds and streams on the S. side of Long Island, and is raised to its reservoirs by powerful steam-engines. Time has vindicated the completeness of the system and the fine quality of the water for all purposes. Cost $7,000,000. From Jan. 1, 1871, to Jan. 1, 1872—

Total gallons	8,288,509,360	Miles of sewerage	232
Daily supply	22,708,245	Amount expended to Jan. 1, 1872	$239,533.21
Amount of receipts	$971,414.98	Streets paved, miles	298
Expenses of management	$297,225.23	Unpaved, "	210
Number of miles of streets	546	Intersections, "	38

The New City Charter.—This was passed at the recent session of the legislature, June 28, 1873. It increases the salary of the mayor to $10,000, and divides the city into twenty-five wards with thirty-six aldermen till the new census of 1875, after which the representation will be 12,000 to each alderman. This charter has gone into operation.

Annexation Commission.—A legislative commission which sat in Aug. and Sept., 1873, in Brooklyn, composed of six commissioners from Brooklyn and five from the county towns, with power to agree upon terms of annexing the other five towns, Flatbush, Flatlands, New Utrecht, New Lots, and Gravesend to Brooklyn as one city, reported a plan of consolidation which is to be voted upon early in 1874, and will doubtless result in the extension of the city limits over the entire county.

Banks and Associations.—The city has 12 banks of discount, 17 savings banks, 1 trust company, 3 safe-deposit companies, 6 gaslight companies, 2 art associations, 7 clubs, 1 philharmonic society, 1 academy of music, 3 musical conservatories, 2 theatres, 2 minstrel operas, 33 religious and benevolent societies, 1 industrial exposition, 1 gymnasium, 7 libraries and literary societies, 6 public parks, 8 cemeteries, a paid fire department, 8 regiments of the national guard, etc.

History.—Brooklyn was named from Breuckelen ("marshy land"), in the province of Utrecht in Holland, 6 miles from the city of Utrecht, from which some of its earliest settlers came. The first step towards its settlement was the purchase from the Indians in 1636, by Willem Arianse Bennet and Jaques Bentyn, of a tract of 630 acres, lying at Gowanus, between Twenty-seventh street and the New Utrecht line; the second step, the purchase by Joris (George) Jansen de Rapalje of 325 acres at the Wallabout Bay, June 16, 1637.

At the time of the discovery of the Long Island shores in 1609 by Hendrik Hudson, several tribes or settlements occupied Long Island, one of which was at Canarsie, and another, the Mareckawick tribe, at Brooklyn, which, from the spot where they were located (sandy place or shore) at the Wallabout, gave the name *Mareckawick* to that locality. Brooklyn Heights, overlooking the East River, was called in the Indian dialect *Ihpetonga* (highlands). Families of these Indians were at New Utrecht and Gowanus in 1680, on the visit of the Labadists to those places in that year. The first ferry was established by license in 1642, running from Peck Slip to a point near the present Fulton ferry, from this period named "The Ferry." There were at that time five hamlets—"The Ferry;" "Breuckelyn,"

near present Hoyt on Fulton street, where stood the church; "Gowanus," around Gowanus Bay; "Bedford," inland; and "the Wallabout," around Wallabout Bay. The first house known to have been built in Brooklyn was that of Willem Arianse Bennet, located on his purchase, with Jaques Bentyn, from the Indians, prior to 1643, as in that year it was burnt by the Indians in the Indian wars, and replaced by the Schermerhorn House, on or near the same site; and the second probably that yet standing, and known as the De Hart or Bergen house, which was existing and visited by the Labadists in 1680, being then occupied by Simon Aertsen de Hart, grantee of Bennet. George Jansen de Rapalje did not come over from New Amsterdam to occupy his farm till about 1654. Later history has entirely exploded the story that his daughter, Sarah Rapalje, was the first Christian born child in New Netherlands, and also that her birthplace was Brooklyn at the Wallabout. The Labadist manuscript, published by the Long Island Historical Society, shows that this distinction of first birth in the colony probably belongs to a male person, Jean Vigné, who was born in New Amsterdam in 1614, eleven years before the birth of Sarah, who was born in 1625. Besides, it is clear that Sarah, instead of being born at the Wallabout, as often asserted by early historians, was born in Albany (Fort Orange) in 1625, removed with her parents to New Amsterdam in 1626, lived there till after her marriage, between the age of fourteen and fifteen, was a church member in New York, and united with the Brooklyn church by certificate in 1661; was twice married in the Wallabout, gave birth to fourteen children, and died in 1685, aged about sixty. There is no proof that any white person lived upon Long Island prior to 1636.

Immediately upon the establishment of the ferry in 1642, grants of building lots at that point began, and that locality, as well as the other hamlets, increased. The union of all the hamlets into one incorporated jurisdiction named Breuckelen took place in 1646, under Director-General Kieft. The Labadists, who crossed this ferry in Sept., 1679, speak of it as "a considerable thoroughfare," and say, "a considerable number of Indians live upon Long Island, who gain their subsistence by hunting and fishing; and they as well as others must carry their articles to market over this ferry, or boat themselves over, as it is free to every one to use his own boat if he have one, or to hire one for the purpose. The fare over the ferry is three stuivers in German (less than half a cent English) for each person."

In 1665, Breuckelen had attained the leading position among the towns in point of population and wealth, and was granted the privilege yearly of "a fayre and market near the ferry for all graine, cattle, or other produce of the country." Whatever the increase of population, it must have been very gradual, as (to skip a long period) the canvasser for the "New York and Brooklyn Directory" in 1796, passing up "the old road" (Fulton street), and down "New Ferry" (Main street), and through the intervening streets, gives but 125 names. The statistics of population, and the picture painted by Francis Guy of its condition up to 1820, also show that, up to this time, it held but the rank of an inconsiderable village, without institutions, commerce, or manufactures.

Over the spaces now occupied by Prospect Park, Washington Park, Greenwood Cemetery, Evergreen and Cypress Hills Cemeteries, was fought on the 27th of Aug., 1776, the important battle which has been properly designated "the battle of Brooklyn," the first great battle of the Revolution after the Declaration of Independence. The British army was under the command of Lord Howe, the Hessians under Gen. von Heister. Gen. Greene being ill, Gen. Putnam was in command of the American forces. The result is well known. An important pass was left unguarded in Howard's Hills, just beyond Bedford, by which the English troops gained the rear of the American army, and defeated it with heavy loss. Those who escaped within the lines were rescued by the masterly retreat effected by Gen. Washington on the 28th to New York by means of boats and under cover of a heavy fog, by which their movements were concealed. A memorable incident of this battle was the death of Gen. Nathaniel Woodhull of Suffolk co., L. I., while engaged on the 28th, the day after the battle, in driving the cattle eastward. He had entered the "Increase Carpenter house," two miles E. of Jamaica. While there a body of horsemen rode up, commanded by Captain Oliver de Lancey, who struck the general several times with his sword, and wounded him so severely that he died a few days after at New Utrecht, where he had been conveyed as a prisoner.

The Brooklyn navy-yard was begun with the purchase by the U. S. government of 40 acres in 1801, which were converted into a navy-yard, and which was designated in 1824 by the secretary of the navy as one of the first-class navy-yards of the nation. It has since added largely to its domain by other valuable purchases, upon which are placed the U. S. hospital, a dry-dock, and costly buildings for the repair and construction of the largest vessels.

The War of 1812.—On Aug. 9, 1814, the patriotic citizens of Brooklyn and the surrounding country flocked to Fort Greene, and aided in rehabilitating that old fortification and following out the line of earthworks across the island, conformably to the plans of Gen. Joseph G. Swift, after whom one of the forts which cornered on Atlantic street (the "Cobble Hill Fort" of 1776) was named "Fort Swift." Every preparation was made to meet the dangers to which New York was liable from her exposed situation by sea and land. By these precautions or otherwise Brooklyn did not, as in the Revolution, bear the brunt of the first systematic strategic conflict.

The Civil War of 1861–65.—In this emergency the city of Brooklyn was not exceeded by any other city in raising regiments and supplying material aid. Her Sanitary Fair of Feb. 22, 1864, was extraordinary as an effort of local unity and successful effort, the pecuniary realization reaching the magnificent sum of $402,943.74. This was aptly characterized as the first great act of self-assertion ever made by the city of Brooklyn, and did much to bring her citizens together for other efforts.

The village charter of Brooklyn is dated April 12, 1816; the first city charter was passed April 8, 1834; the consolidation act uniting Williamsburg and Greenpoint with it passed April 17, 1854, and took effect Jan. 1, 1855. The new charter was passed in 1873, and went into effect the same year. The institutions which have had the greatest influence upon the social organization and material progress of the city have been the Apprentices' Library and Graham Institute (founded July 4, 1825), the Academy of Music (opened Jan. 15, 1861), the Mercantile Library Association, the Atlantic Docks, and the Long Island Historical Society.
